

The AudioSource EQ 200 as a Pre-Amplifier: Connecting the EQ 200 to Multiple Sources and an Amplifier

The EQ 200 can be used in place of a pre-amplifier to connect several devices to an amplifier, with the added benefit of full spectrum equalization for all your audio sources. This setup does not make use of any "tape loops" and does not include a receiver.

The schematic below is for connecting the EQ 200 to several music sources: MP3, PC, Satellite Radio, CD, or TAPE with the output being sent to an amplifier. Any input on the EQ 200 can be used for any source device listed in any order of arrangement. The chart shows which front panel controls to activate according to which EQ input you are using. Your set up may vary.

When making or changing connections, it is always wise to unplug the power cords of your components – or at least make sure the power is "Off", so you won't hear any unexpected "pops" during connection of cables.

EQ 200 Front View

Note: A green oval indicates a green LED light in the button. Red ovals indicate a red LED light in the button. Buttons show a green LED light when pushed in, and red LED light when not pushed in.
