Color Changing Fluorescent

The Lightolier linear fluorescent color changing luminaires provide high power accenting of walls, coves and ceilings as well as backlighting configurations.

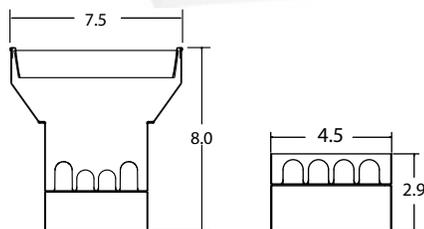

These new Color Changing Fluorescent fixtures are available in three channel (red, green, and blue) and, for high-quality warm whites, four channel (red, green, blue and 3000K white) utilizing T5 and T5 HO linear fluorescent lamps.

The Fluorescent Basic is an excellent luminaire for backlighting architectural details where there are large

translucent panels, or for cove applications where a 180 degree spread of light is desired.

The Fluorescent Directional provides a symmetric 80 degree beamspread, minimizing spill-light and focusing the beam for applications such as wall and ceiling washing. The luminaire has two integral lenses for uniform mixing and focusing. A parabolic louver provides perpendicular cut-off.

Fixtures can be installed end-to-end for continuous run applications and contain a separate dimming ballast for each channel. Internal electronics convert DMX commands to a 0-10V signal for smooth transitions. Data connections utilize standard CAT5 cables.

Fluorescent Directional
Available in both 3
and 4 channel.
