RX Section

The TH-21A/AT/E uses a double super-heterodyne type receiver with a IF frequency of 16.3MHz and a second IF frequency of 455kHz.

The received signal from the antenna is amplified by RF amplifiers Q1 : 2SC2176(H) and Q2 : 2SC2668(Y), which are in connected cascade, and applied to BPF L6–L8. The RF signal is then applied to the first mixer, Q3 : 2SK192A, where it is mixed with the first local oscillator signal from the PLL. The first mixer output passes through a 16.3MHz MCF (F1) and becomes the first IF signal. This signal is amplified by IF amplifier Q4 : 2SC2714(Y) and is applied to IF unit Q1 : MC3359P

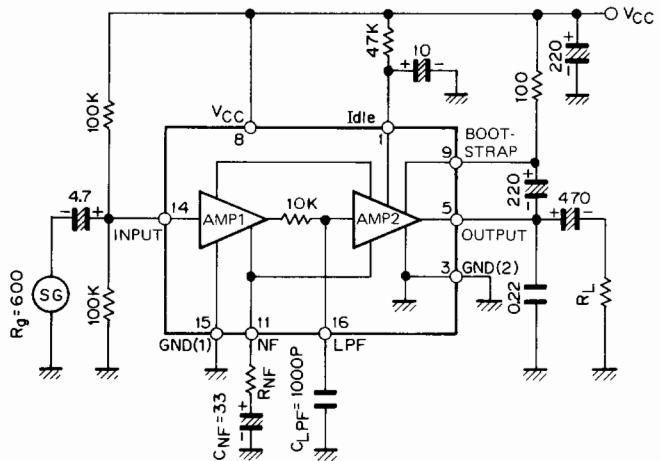

Fig. 1 TA7331F Block diagram (IF unit Q2)

Item	Rating
Noninal center frequency (fo)	16.3MHz
Pass bandwidth	fo ± 7.5kHz or more at 3dB
Attenuation bandwidth	fo ± 25kHz or more at 18dB
Guaranteed attenuation	30dB or more within fo ± 1MHz Spurious : 15dB or more at fo ~ fo + 500kHz.
Ripple	0.5dB or less
Insertion loss	1.0dB or less
Terminal impedance	1kΩ/1.5pF

Table 2 MCF (L71-0426-05) (RF unit F1)

Item	Rating
Center frequency of 6dB bandwidth (fo)	455kHz ± 1.5kHz
6dB bandwidth	± 7.5kHz or more
40dB bandwidth	± 15kHz or less
Ripple	1.5dB or less (455 ± 5kHz)
Guaranteed attenuation	27dB or more within fo ± 100kHz
Insertion loss	6dB or less at 455kHz
Terminal impedance	1.5kΩ

Table 3 Ceramic filter (L72-0335-05) (IF unit F1)

Q1 consists of the second mixer, second local oscillator, second IF amp, FM demodulator, squelch noise amp and control circuits.

The demodulated audio signal from Q1 is amplified by AF amplifier Q2 : TA7331F, on the IF unit, via the AF volume control (VR1 on the switch unit) to drive the speaker.

The squelch circuit, (an auxiliary circuit of the receiver section) detects the high frequency noise component of the demodulated audio output from Q1.

This signal is applied to pin 12 of Q1 via the squelch control, (VR2 on the switch unit). The noise component applied to pin 12, is amplified and then output at pin 13. The output at pin 13 is rectified by D1 and D2 : 1N60As and fed to pin 14. When this rectified voltage is applied to pin 14, the squelch trigger circuit functions, pin 16 is grounded, and Q4 : 2SC2412K and Q3 : 2SB698(E,F) turn OFF. When Q3 turns OFF, AF amp IC Q2 : TA7331F is muted and no audio is output. When a signal is received, the noise level contained in the demodulated output of Q1 reduced, and the squelch trigger circuit does not function. Therefore, Q4 and Q3 turn ON, the AF amp IC is powered, and audio output is obtained.

CIRCUIT DESCRIPTION

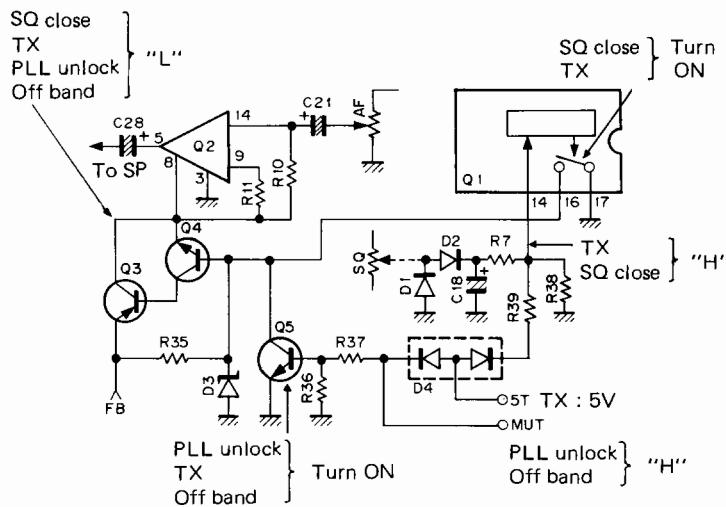

Fig. 2 Squelch-mute circuit

TX Section

The VCO local oscillator Q14 : 2SC2714(Y) frequency in transmit is one half the actual TX frequency. The output of VCO buffer amp Q16 : 2SC2671(H) is doubled by Q5 : 2SC2668(Y) and fed through a BPF to obtain the TX frequency. The output of the BPF is fed to pre-driver, Q6 : 2SC2347, driver Q7 : 2SC2053, and is then amplified by the final amplifier Q8 : 2SC1947.

	V _{CBO}	V _{EBO}	V _{CEO}	IC	P _C	P _C	T _J	T _{stg}	T _a
Test Conditions			R _{BE} = $\infty \Omega$		T _c = 25°C	T _a = 25°C			25 ± 3°C
Maximum Rating	35V	4V	17V	1A	10W	1W	+175°C	-65 ~ +175°C	

Table 4 2SC1947 Max. rating (RF unit Q8)

Signals from the microphone and the tone circuits are amplified by mic amp Q6 : NJM4558M. The signal is then applied to voltage variable capacitor diode D16 : 1S2208 of the VCO circuit to modulate the VCO signal. The transmitter section also consists of the power selector circuit and the tone circuit.

To select the power, the emitter resistor R23 (10Ω) of driver Q7 is controlled by the HI/LO switch (S1) on the IF unit. When R23 is grounded, the output power is about 1W. When R23 is opened, the output power becomes about 150mW.

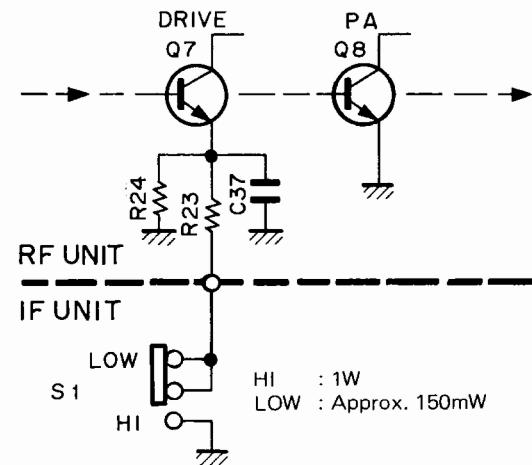

Fig. 3 Power select circuit

Several different tone circuits are available to provide access to repeaters. Circuits vary depending on country of destination.

- 1) In E (W) type models (for European countries), when the TONE switch (a non-locking type) is held depressed, the radio enters TX mode and a tone signal of 1750Hz is emitted.
- 2) In E (T) type models (for the United Kingdom), when the TONE switch is pressed, the radio will enter TX mode and a tone burst of 1750Hz is transmitted.
- 3) The optional tone encoder (TU-6) may be installed in A/AT versions. With the TU-6, any one of 37 frequencies between 67.0–250.3Hz can be transmitted. When the TONE switch is pressed, the tone signal is continuously transmitted.
- 4) In AT type models, a DTMF (Dual-Tone Multi Frequency) system is also used. When a key is pressed, the unit enters TX mode and transmits a dual tone signal as long as the key is held depressed.

CIRCUIT DESCRIPTION

PLL Circuit

In RX mode, the VCO oscillates at frequency of 1/2 the first local oscillator [63.85 – 65.8475MHz (T,W,X ; 63.85–64.845MHz)]. In TX mode, the VCO oscillates at a frequency of 1/2 the TX frequency [72–73.9975MHz (T,W,X ; 72 – 72.9975MHz)].

During reception, D15 turns ON to connect C104 into the oscillator circuit which causes the oscillation frequency of the VCO to drop.

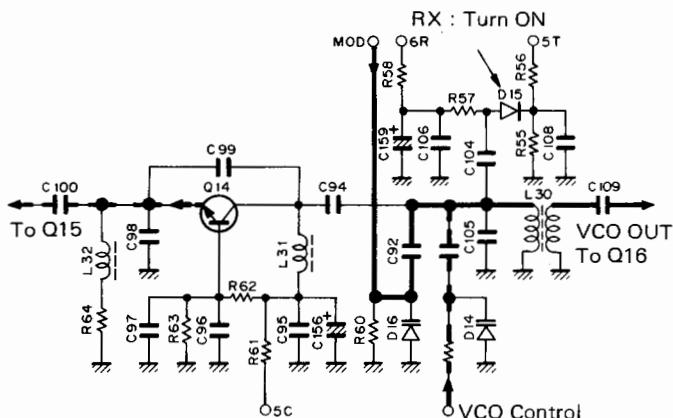

Fig. 4 VCO circuit

The output of the VCO is amplified by Q15 : 2SC2714(Y) and mixed with the HET oscillator Q9 : 2SC2714(Y) signal by PLL mixer Q10 : 2SC2668(Y).

The frequency of the HET oscillator is determined by the crystal selected by the OFFSET switch. Q9 in connection with BPF L25 and L26 acts as a frequency doubler.

The output of PLL mixer Q10 passes through a LPF (L28, C79, C80) to obtain a 2–3.995MHz signal (T,W,X ; 2–2.995MHz). This signal is amplified by Q11: 2SC2668(Y) and is applied to programmable counter Q3 : TC9122P. The signal input to Q11 is divided by 1/400 at 144.00MHz and 1/799 at 147.99MHz (T,W,X ; 1/599 at 145.99MHz). The actual divide ratio is determined by the thumb-wheel switch, (S2) on switch unit, settings.

The output of Q3 is compared with the (5kHz) reference signal by the phase comparator Q13 : TC5081AP. The 10.24MHz reference oscillator signal is divided by 1/2048 in Q12 : TC5082P to obtain the phase comparator reference frequency. The control voltage output of Q13 is fed through a passive type LPF to voltage variable capacitor diode D14 : ITT310TE of VCO circuit to control the VCO frequency.

Peripheral circuits of the PLL are the +5kHz circuit, and PLL unlock circuits. The +5kHz circuit is used to obtain the 5kHz TX and RX frequencies. In RX mode, when the 5k switch, S3 on switch unit, is set to off, D6 of the PLL HET oscillator circuit is forward biased effectively by passing. When the 5k switch is set to ON, the D6 turns off, which connects TC4 and C61 to crystal (X2) in series.

When a capacitor is connected to the crystal in series, the frequency of oscillation increases. Use TC4 to adjust the +5kHz frequency. The PLL unlock circuit is described in the control circuit section.

CIRCUIT DESCRIPTION

Control circuit

A constant regulated 5V is obtained from voltage regulator Q19 : LV517. The 5C signal is available in both TX and RX modes, and is used as a reference voltage on the 6R and 5T AVR's.

The 6R output of Q20 : 2SC1037K is supplied to the RX section and the 5T output is supplied to the TX section. When the PTT switch is pressed, Q7 : 2SA1037K and Q8 : 2SA2412K are forward biased, and the TC line is grounded to place the radio in transmit mode.

The function of the power supply circuit is described in the table below.

	TC	Q23	Q26	Q22	Q24	6R	5T
RX	H	ON	OFF	ON	OFF	O	X
TX	L	OFF	ON	OFF	ON	X	O

Table 5 Function of power supply circuit

In unlock mode (when PLL is unlocked), the unlock signal "H" is felt at pin 1 of Q13 : TC5081AP. The unlock signal passes through D17 : MA152WA/2, to control Q23 and Q26 and switches the radio to RX. When a frequency is selected out side the normal amateur band, the anti-lock signal (AL) "H" is generated in the switch unit and is applied to D22 : 1SS133 of RF unit, which also places the radio in RX.

When the unlock or anti-lock signal is generated, an logic "H" is fed to the MUT pin (of the IF unit) through D17/2 or D18 : 1SS133 to stop AF amp operation.

During transmitt, the 5T signal is replies to IF unit Q5 : 2SC2412K and Q1 : MC3359P via D4 : MA152WA to stop AF amp operation.

DISASSEMBLY

TOP CASE REMOVE METHOD

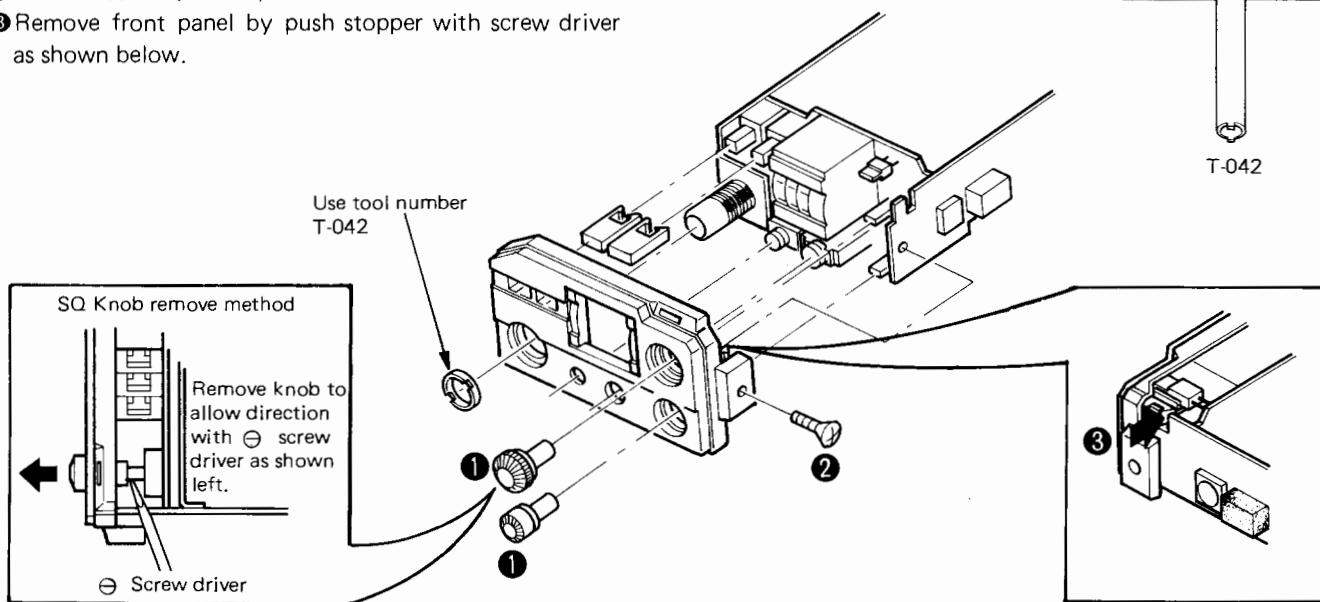

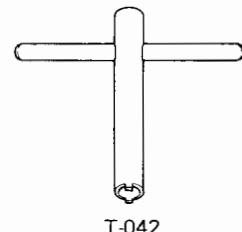

- ① Remove screw (M2 x 5) 3.
- ② Remove front case as allow mark direction holding the stop pin with something \ominus screw driver as shown right.

FRONT PANEL REMOVE METHOD

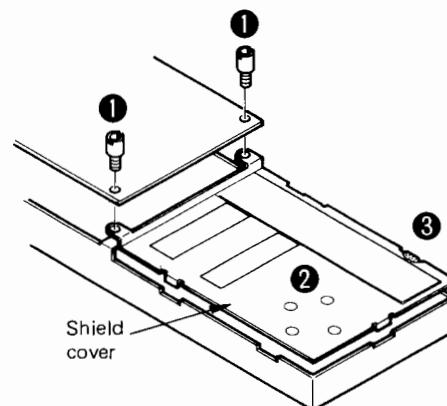

- ① Remove screw on RCA connector and AF, SQ knob.
- ② Remove screw (M2 x 8) 1.
- ③ Remove front panel by push stopper with screw driver as shown below.

TOOL

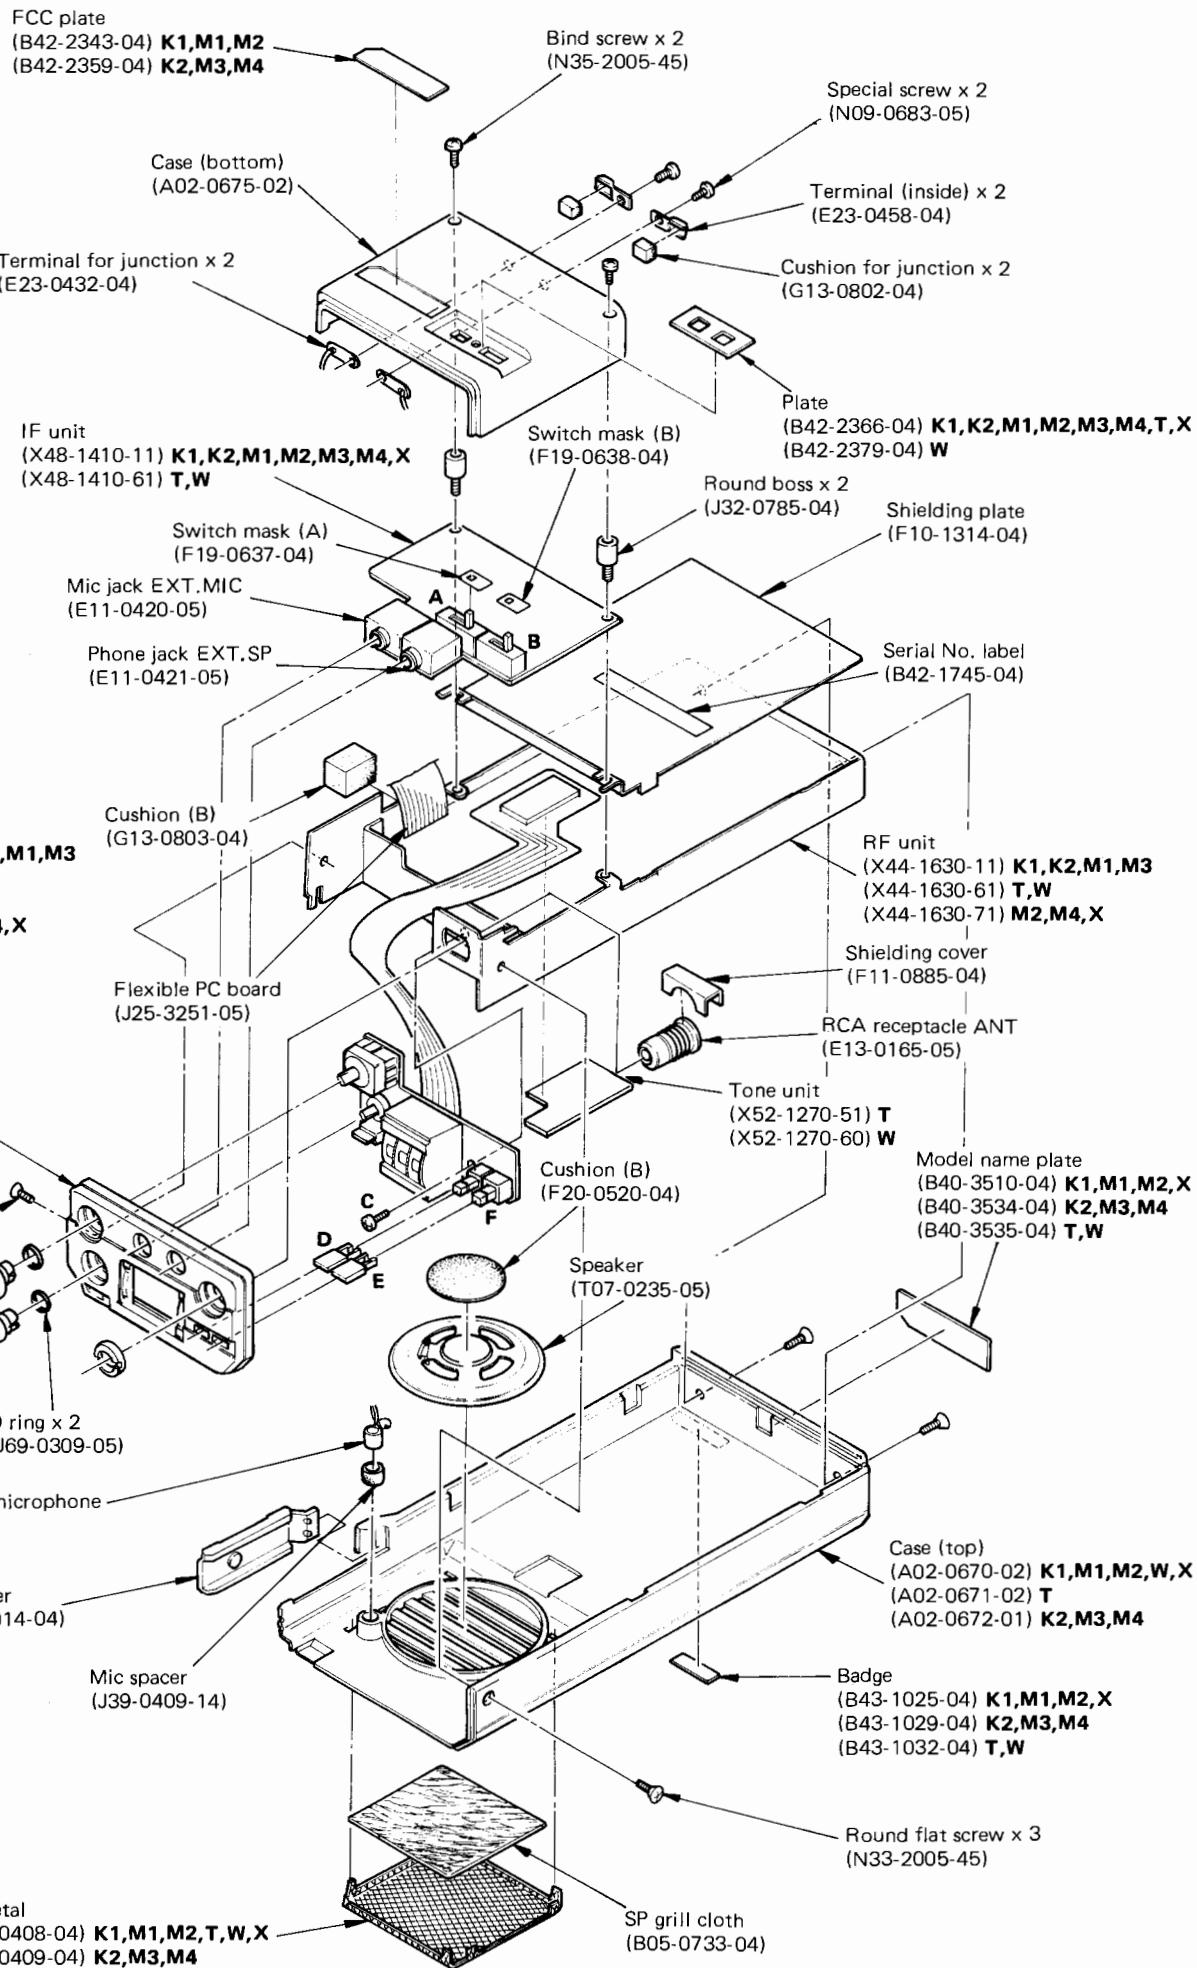

SHIELD COVER REMOVE METHOD

- ① Remove the top boss which tightened the IF unit.
- ② Remove solder at four spots with solder wick.
- ③ Remove solder heating spot with soldering iron.

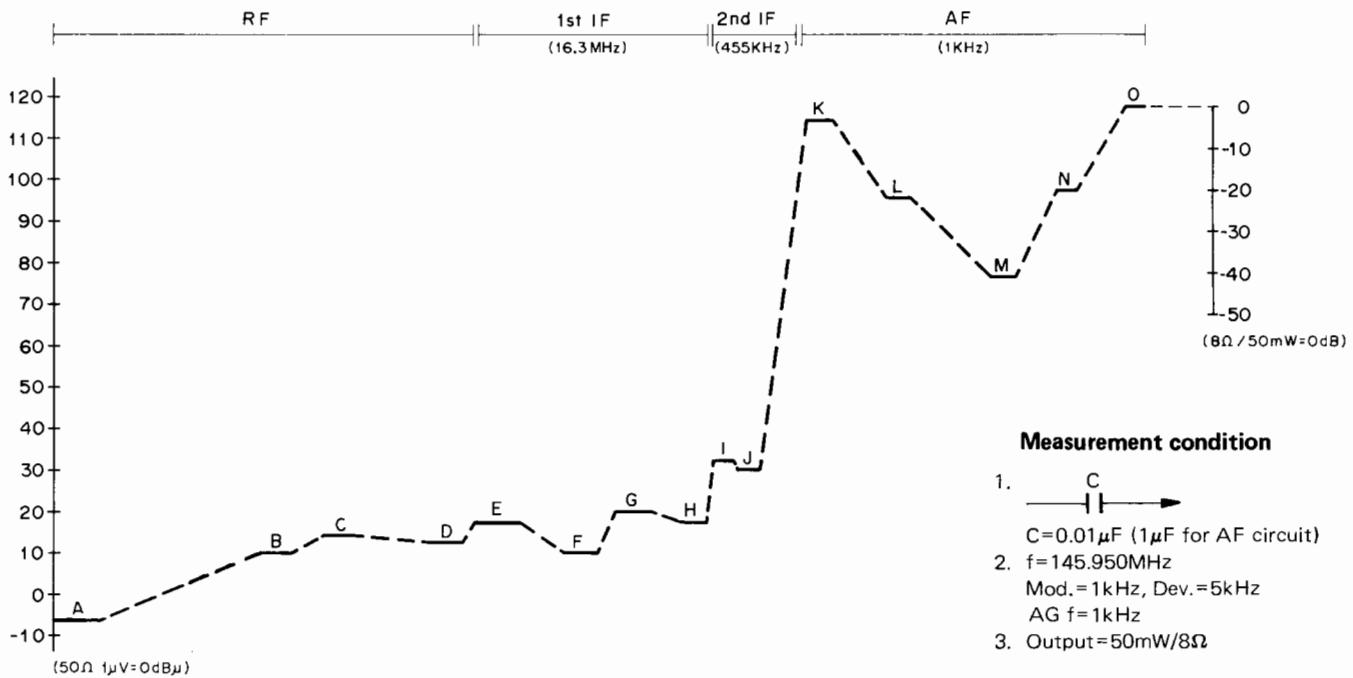

TH-21A/AT/E DISASSEMBLY

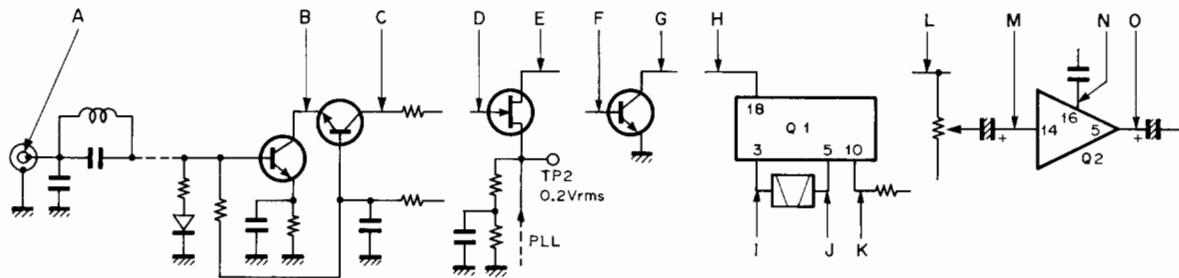

LEVEL DIAGRAM

RX SECTION

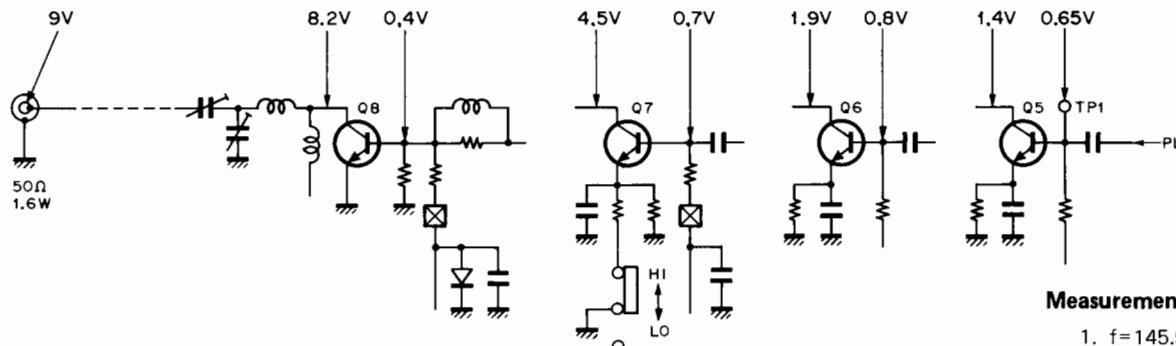

Measurement condition

1. $C = 0.01\mu\text{F}$ ($1\mu\text{F}$ for AF circuit)
2. $f = 145.950\text{MHz}$
Mod. = 1kHz, Dev. = 5kHz
AG f = 1kHz
3. Output = $50\text{mW}/8\Omega$

TX SECTION

Measurement condition

1. $f = 145.950\text{MHz}$
2. Output = 1.6W

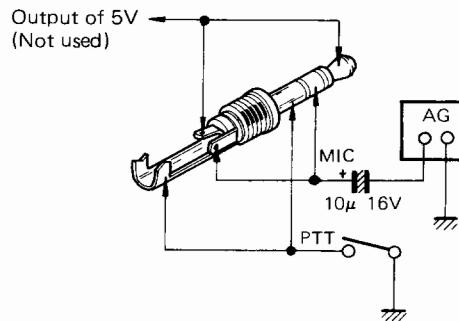

ADJUSTMENT

PREOPERATION

Unless otherwise specified. Set the controls as follows.

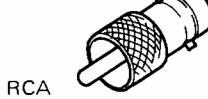

POWER/VOL OFF
HI/LOW HI
SQL MIN

- When adjusting the trimmers or coils, use a non-induced adjusting rod of bakelite, etc.
- When adjusting the RX section never transmit to prevent SSG damage.
- Connect MIC connector as shown right.
- Uses following RCA-BNC adaptor plug (MODEL AJ-3) for ANT connection.
- The output level of SSG is indicated as SSG's open circuit.

MODEL AJ-3

BNC-J

TX/RX Section (Common)

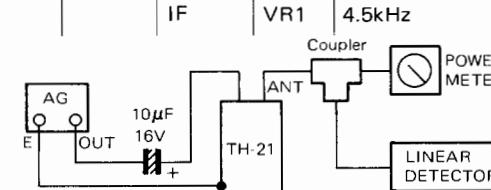

Item	Condition	Measurement			Adjustment			Specification/ Remarks
		Test-equipment	Unit	Terminal	Unit	Part	Method

Output voltage	8V DC ±5%
Output current	900mA (at input voltage of 13.8V DC with max. load)
Weight	Approx. 260g

DC-21 PARTS LIST

Parts No.	Re-marks	Description	Ref. No.
A02-0677-02	*	Battery case	
A02-0678-03	*	Battery case cover	
E03-0203-05		DC jack	
E23-0451-04	N	Terminal board (A) x 2	J1
E30-1791-05		Cord with plug	
E30-1796-05		Cord with cigarette plug and fuse	
F05-2023-05		Fuse 2A	
J42-0439-05		Cord bushing	
L15-0305-05		Choke coil 1mH	L1
NJM7808A		IC	IC1
SLH-34-VC3		LED (Red)	D3
U05B		Diode	D1
V06C		Diode	D2

SMC-30 SPECIFICATIONS

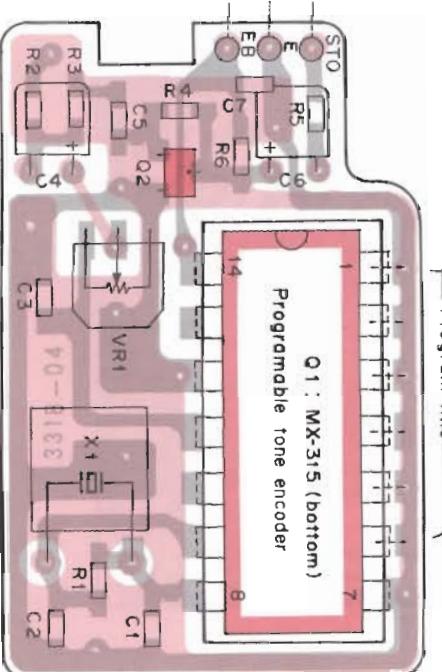

- SPEAKER**
Speaker 40mmφ
Max. Input 0.5W
Input impedance 8Ω
- MICROPHONE**
Type Electret condensor
Sensitivity -67dB
Output impedance 2kΩ
Frequency response 200Hz~5kHz
Operating temperature -20°C~+60°C
Dimensions 51W x 73H x 3D (mm)
(Projections excluded)
- Weight 130g (Code included)

TU-6 SPECIFICATIONS

Oscillator frequency	1MHz ± 0.1%
Usable frequency range	37 EIA
Specification Group Frequencies	(67.0~250.3Hz)
Weight	3g
Setting the frequency	Cut and connect pins 1~6 of the IC to the PC board pattern by soldering to set the frequency.
• "0" in the table indicates the connection.	• "1" in the table indicates the disconnection.

SPECIFICATIONS**General**

Frequency range	144 – 146MHz ; TH-21E, TH-21A (Oceania version only)
	144 – 148MHz ; TH-21A/AT
Signal type	F3 (FM)
Operating temperature	-20°C ~ +50°C
Antenna impedance	50Ω
Power supply voltage	5.8V – 10.0V (rating voltage ; 7.2V)
Power consumption	At reception standby ; Less than 28mA At transmission (Hi) ; Less than 600mA (Low) ; About 300mA
Dimensions	57 (65.5) W x 120 (127.5) H x 28 (32) D mm The numbers in the parenthesis include projections parts.
Weight	Approx. 290g (including antenna and Ni-Cd batteries)

Transmitter section

Output power	Hi ; 1.0W, Low ; approx. 150mW
Modulation system	Reactance modulation
Max. frequency deviation	±5kHz
Unwanted reflection	Less than -60dB
Microphone	Condenser type

Receiver section

Reception system	Double superheterodyne
Intermediate frequency	1st ; 16.3MHz, 2nd ; 455kHz
Sensitivity	S/N more than 28dB at -6dB μ (0.5μV) input 12dB SINAD ; less than -12dB μ (0.25μV)
Squelch sensitivity	Less than 0.25μV
Selectivity	-6dB at more than 12kHz -40 dB at less than 28kHz
AF output	More than 250mW (8Ω load, distortion 10%)

Design and specifications subject to change without notice.
