## **Introduction**

WMR-G54 Wireless ADSL Router allows you to share the single internet account. With built-in NAT, this Router allows up to 253 users on the Ethernet LAN simultaneously and up to 16 users on the 802.11g/b Wireless LAN simultaneously. WMR-G54 has the throughput speeds of up to 54Mbps and advanced Orthogonal Frequency Division Multiplexing (OFDM).

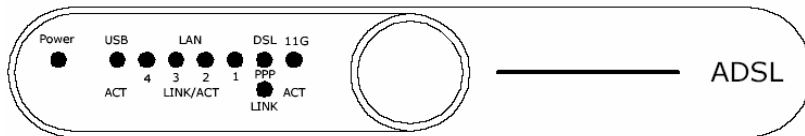

In case of home usage, WMR-G54 acts as a gateway for Internet connection sharing. You can connect the Wireless ADSL Modem Router to your Internet connection directly, and use the wireless LAN to connect your computers to the Internet.

## **A Look at the Hardware**

### **Front Panel**

The WMR-G54 Wireless ADSL Modem Router has nine Light Emitting Diodes (LEDs), or link lights, on its front panel. The

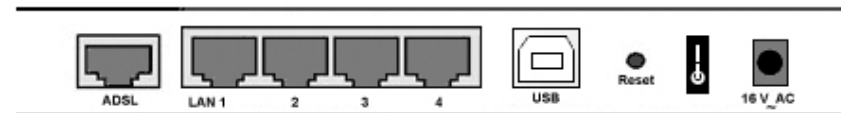

following table defines the behavior for each LED:

LED	Represents	Activity / Status
Power	Power	The Power LED will light up when the device is powered on.
USB	USB Connection	<ul style="list-style-type: none"> <li>- Steady on – USB is connected to a host PC.</li> <li>- Blinking – Data is being transferred over the USB connection.</li> </ul>
1, 2, 3, 4	LAN Connection	<ul style="list-style-type: none"> <li>Steady on - when there is a connection to the unit.</li> <li>Blinking – Data is being transferred.</li> </ul>
DSL	DSL Connection	<ul style="list-style-type: none"> <li>- Off - ADSL link is not connected.</li> <li>- Blinking During Off - ADSL is handshaking and receiving signal.</li> <li>- Steady on - ADSL link is connected.</li> <li>- Blinking During steady on - Data is being</li> </ul>

		transferred over the ADSL connection.
PPP Link	PPP Connection	Blinking – PPP is connected.
11G	Wireless LAN	<ul style="list-style-type: none"> <li>- Steady on – Wireless LAN access point is enabled.</li> <li>- Blinking – Data is being transferred over the Wireless LAN connection.</li> </ul>

## Back Panel

Connector	Description
ADSL	Connect one end of the RJ-11 cable to the ADSL port and connect the other end to the ADSL line.
LAN 1-4	Accepts a RJ-45 Ethernet cable for connecting up to 4 network devices.
USB	For USB connection (optional), connect the USB

	cable to the USB port and connect the other end to the computer.
Reset	Use an object, such as a stretched paper clip, to press the button for at least 3 seconds. LAN 1, 2, 3, 4 LED will light up for a short time and then be off. You can release the button now to reset the device to its factory-default settings.
On/Off	Turn on the router by pressing up the power switch to the “On” position.
Power	Connect the power adapter to this Power port, and then plug the other end of the power cable into a power outlet.

## Hardware Installation

Thank you for purchasing the 54Mbps/11Mbps Wireless ADSL Modem Router WMR-G54. The following instructions will walk you through installation of the router.

Step 1. Connect the ADSL port of the router into your ADSL wall socket with the provided cable.

Step 2. Connect the LAN port of the router to the Ethernet port of your computer with the Ethernet cable provided.

Step 3. Connect the 16V AC power adapter to the power socket of router, and plug the adapter into a mains power socket. Switch on the router. If the power is turned on, the PWR LED on the front panel will illuminate.

## Configure the Router for the first time

### Configuring IP Settings on Your Computer

To configure WMR-G54 Wireless ADSL Modem Router for the first time, the configuration PC must have a static IP address. Use 192.168.1.x (x is any number between 2 and 254) and subnet mask 255.255.255.0. Specify gateway as 192.168.1.1 and enter DNS server IP.

## For Windows 2000/Windows XP

1. Right-click on **My Network Places** icon on the desktop and then click **Properties** in menu.

2. Double-click **Local Area Connection** icon and then click **Properties** button.

3. Scroll down to highlight **TCP/IP (your network card)** and

then click **Properties** button.

4. Check the radio button for **Specify an IP address**. In the IP address box, type the assigned IP address 192.168.1.x (x is any number between 2 and 254).
5. In the Subnet mask box, type the subnet mask 255.255.255.0.
6. In the default gateway box, type the default gateway IP address. For example, 192.168.1.1.
7. Click **OK** button in the TCP/IP Properties window to complete the PC configuration, and click **Close** or the **OK** button to close the Network window.

## **Configuring with Web Browser**

### Before you begin

Make sure that you get the setup information you need (for example, VPI, VCI, and type of encapsulation) from your

Internet Service Provider (ISP).

The ADSL Modem Router can be configured with your web browser. The product provides a very easy and user-friendly interface for configuration.

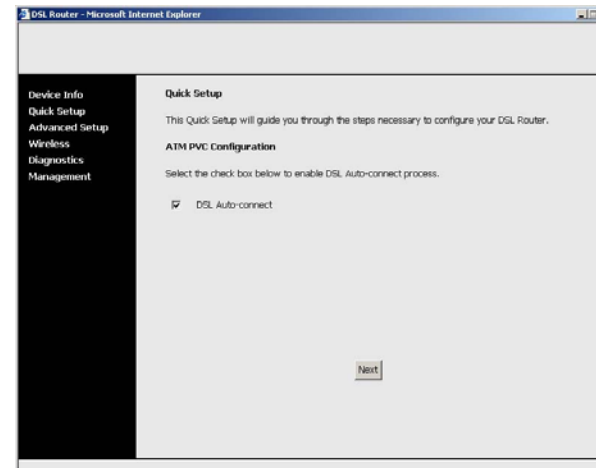

1. Open your web browser. Enter `http://192.168.1.1` in the web browser's address field, and press the enter key.

2. A login window will appear. Enter **admin** in the User Name field and enter **admin** in the Password field.

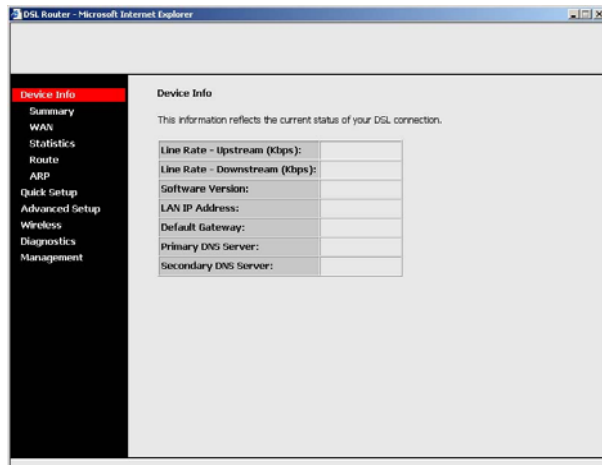

3. After login, WMR-G54 Web UI screen will appear.

## I. Device Info

The **Device Info** page contains information of the software version of your device and some settings, such as IP Address and gateway.

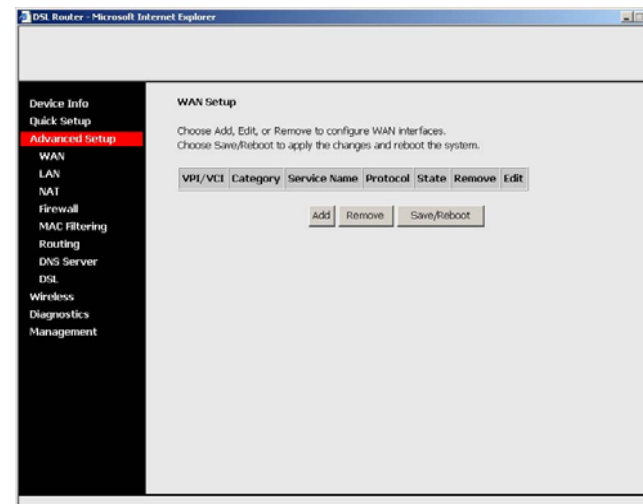

## II. Quick Setup

The Quick Setup will guide you through the steps necessary to configure your DSL Router.

## III. Configure WAN (DSL) Connectivity

1. Click the **Advanced Setup** tab on the left frame.
2. Click the **WAN** tab on the left frame. A **WAN Setup** page will appear on the right frame. Click the **Add** button.

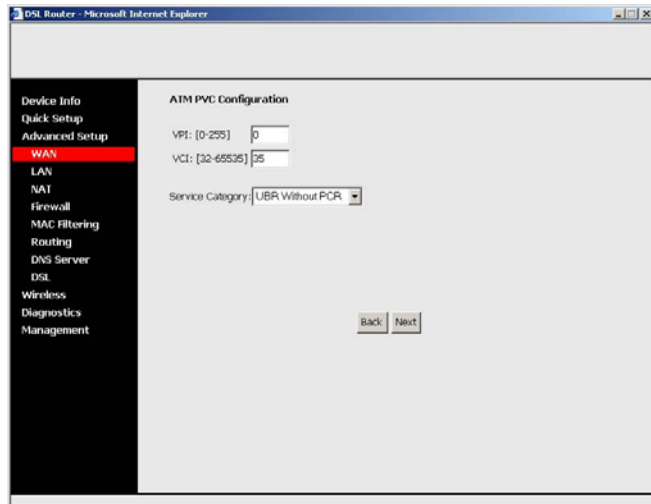

3. The **ATM PVC Configuration** page will appear. Enter the appropriate **VPI** and **VCI** values. Select appropriate **Service Category**. Click **Next**.

 PVC is identified by the VPI (Virtual Path Identifier) and VCI (Virtual Channel Identifier). Consult your ISP to get the numbers. The valid range for the VPI number is from 0 to 255 (The default value is 0.). The valid range for the VCI number is from 32 to 65535 (The default value is 35).

 There are five service categories provided: UBR Without PCR,

UBR With PCR, CBR, Non Realtime VBR, and Realtime VBR.

4. A **Connection Type** page will appear. There are several ways for the device to have a public IP address and then to access the Internet. You have to check with your ISP about which way is adopted. Check the radio button of your connection type.
5. Scroll down to select the appropriate Encapsulation Type.

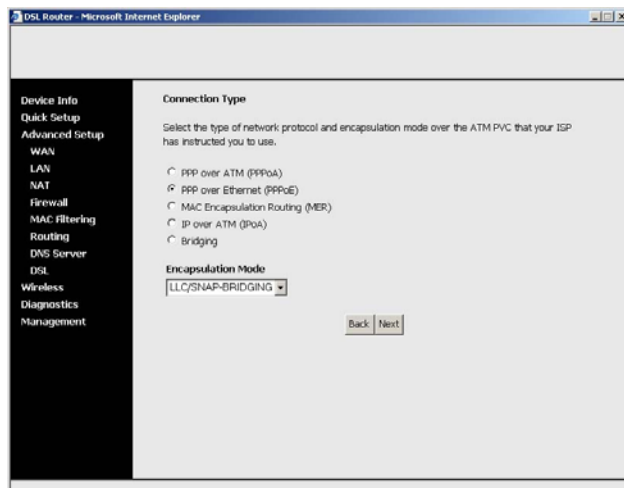

WMR-G54 ADSL Modem Router supports the following five network operating modes over an ATM PVC WAN interface:

- PPP over ATM (PPPoA)
- PPP over Ethernet (PPPoE)
- MAC Encapsulated Routing (MER)
- IP over ATM (IPoA)
- Bridging

 The steps to configure **PPP over ATM (PPPoA)** are similar to PPPoE.

### PPP over Ethernet (PPPoE)

1. Select the **PPP over Ethernet (PPPoE)** radio button and scroll down to select the appropriate **Encapsulation Mode**. There are two encapsulation types available: LLC/SNAP-BRIDGING and VC/MUX. Then click the **Next** button.

2. In the PPP Username and Password page, enter the user name and password supplied by your ISP in **PPP Username** and **PPP Password** fields.

3. Check the box **Disconnect if no activity** if you want to enable the function of automatic disconnection. It will auto-disconnect the ADSL Modem Router when there is no activity on the line for a period of time.

**PPP IP Extension** is a special feature deployed by some service providers. Unless your ISP specifically requires this setup, do **NOT** select it.

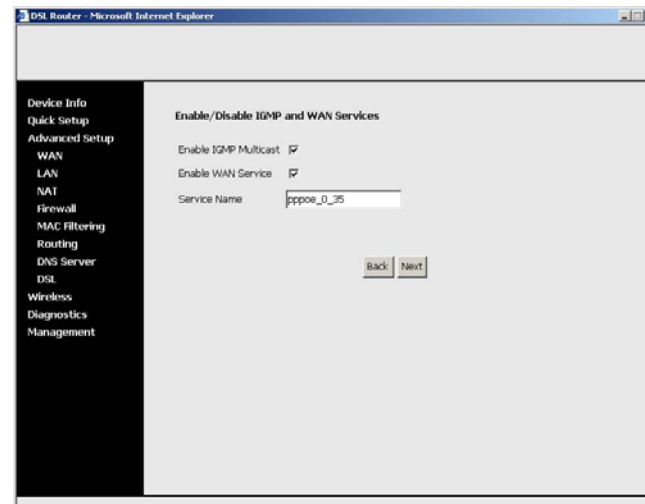

The PPP IP Extension supports the following conditions:

- Allows only one PC on the LAN
- The public IP address assigned by the remote using the PPP/PCP protocol is actually not used on the WAN PPP interface. Instead, it is forwarded to the PC's LAN interface through DHCP. Only one PC on the LAN can be connected to the remote since the DHCP server within the ADSL router has only a single IP address to assign to a LAN device.
- NAT and firewall are disabled when this option is selected.
- The ADSL Modem Router becomes the default gateway and DNS server to the PC through DHCP using the LAN interface IP address.
- The ADSL router extends the IP subnet at the remote service provider to the LAN PC. That is, the PC becomes a host belonging to the same IP subnet.
- The ADSL router bridges the IP packets between WAN and LAN ports, unless the packet is addressed to the router's LAN IP address.

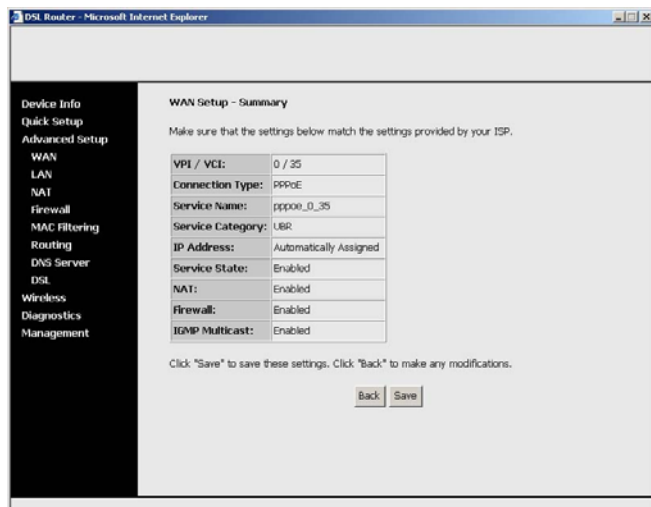

4. Click the **Next** button.

5. Check the box **Enable IGMP Multicast** if you want to enable IGMP multicast. Check the box **Enable WAN**

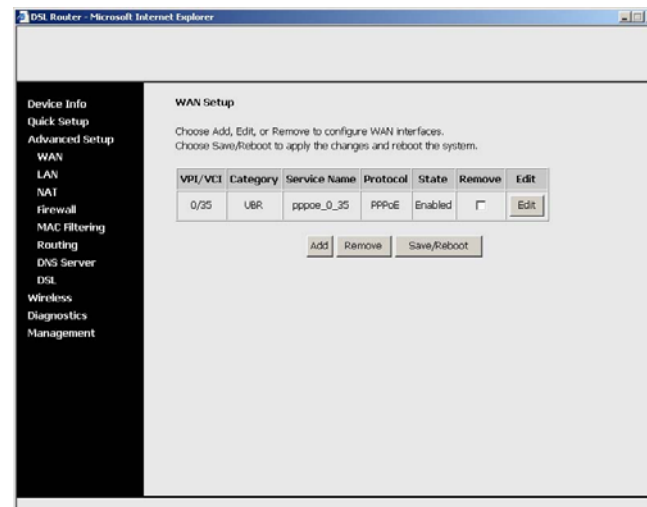

**Service** if you want to enable WAN Service. Click **Next**.

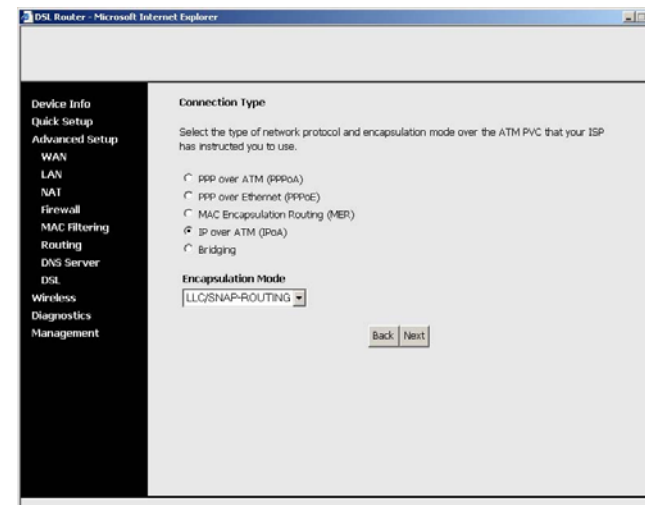

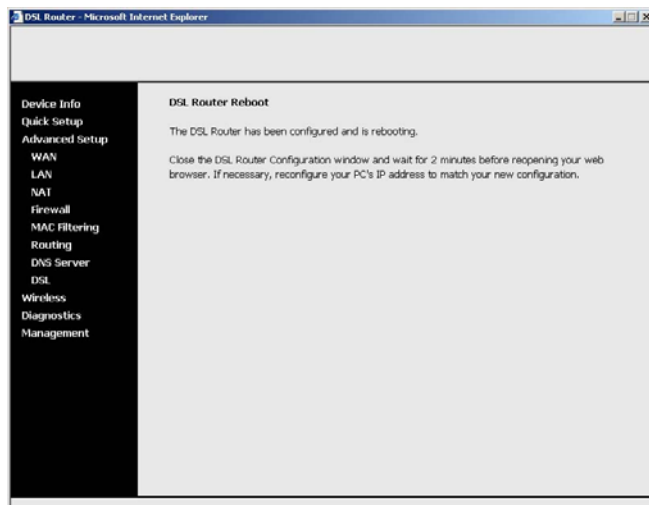

6. The WAN Setup – Summary page displays a summary of all WAN setting profiles. Click the **Save** button to save all the settings.

- The WAN Setup page will appear. Click the **Save/Reboot** button. The router will reboot automatically with the new settings in effect.

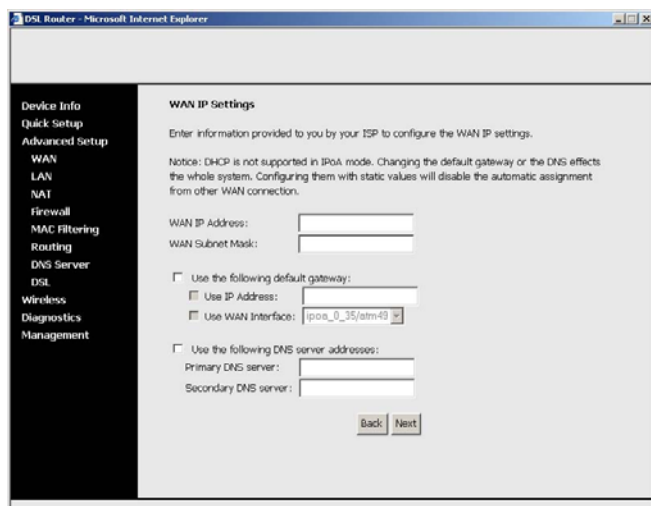

- Close your Web UI window and wait for about 2 minutes before reopening your web browser.

## IP over ATM (IPoA)

1. Select the **IP over ATM (IPoA)** radio button and scroll down to select the appropriate **Encapsulation Mode**. There are two encapsulation types available: LLC/Snap-Routing and VC/MUX. Then click **Next** button.

2. DHCP is not supported over IpoA. Enter your WAN IP address, WAN Subnet Mask, gateway IP address and DNS server IP address provided by your ISP to configure the WAN IP settings. Then click the **Next** button.

3. The Network Address Translation Settings page will appear. If you want to enable the NAT function, check the box **Enable NAT**. If NAT is enabled, it will display a NAT submenu on the left panel after the unit reboots.

NAT occurs when multiple IP addresses on a private LAN are converted to one public address. This public address is sent out to the Internet. NAT increases security because the IP address for a PC connected to the private LAN is never transmitted to the Internet. NAT also allows xDSL/cable routers to be used with low-cost Internet accounts, where only one TCP/IP address is

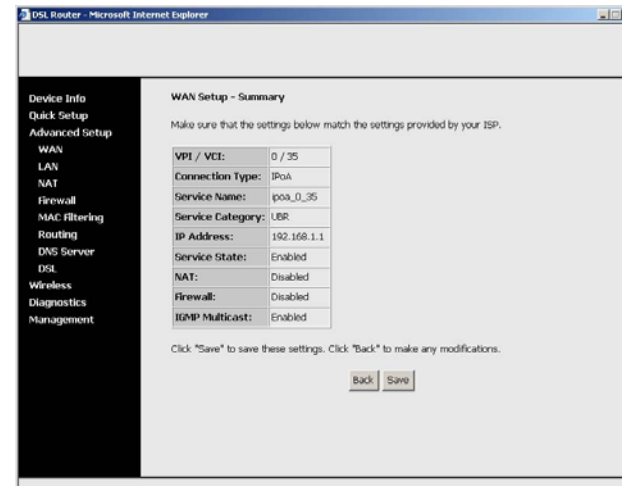

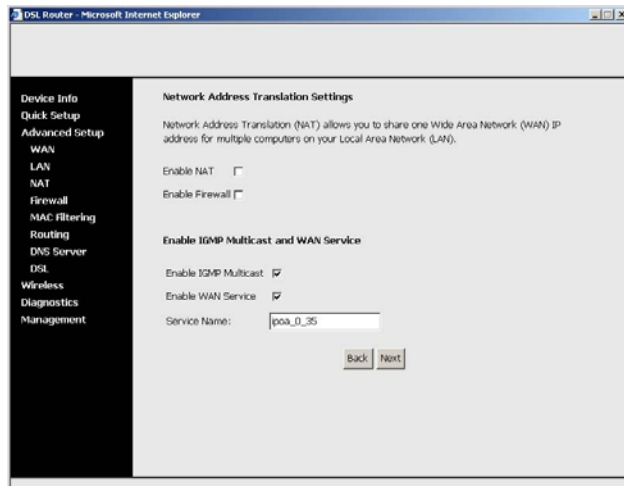

provided by the ISP. The user may have many private addresses masked by the single address provided by the ISP.

4. If you want to enable the Firewall function, check the box **Enable Firewall**. If the Firewall is enabled, it will display a Firewall submenu on the left panel after reboot.

Firewall will reject any unsolicited data from the Internet to access the computer on your LAN. Basically, if you do not request data, the data will not be allowed by the firewall to pass.

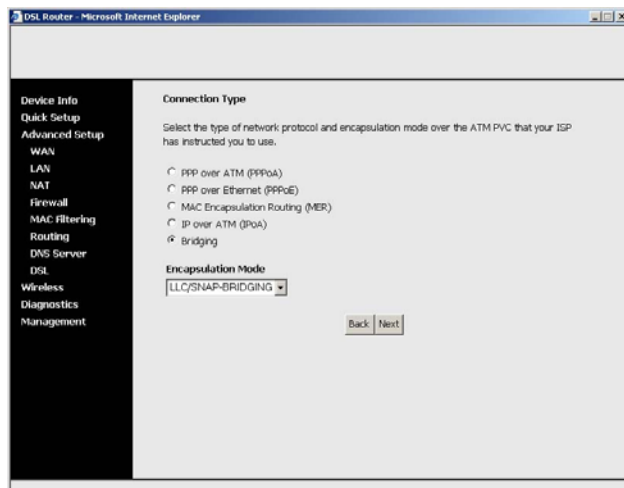

5. If you want to enable IGMP Multicast, check the box **Enable IGMP Multicast**. If you want to disable it, uncheck the box.
6. The default of WAN service is Enable. If you want to disable WAN service, uncheck the box **Enable WAN Service**.
7. Enter a desired name in the **Service Name** field. It is used to identify the service.
8. Click the **Next** button.

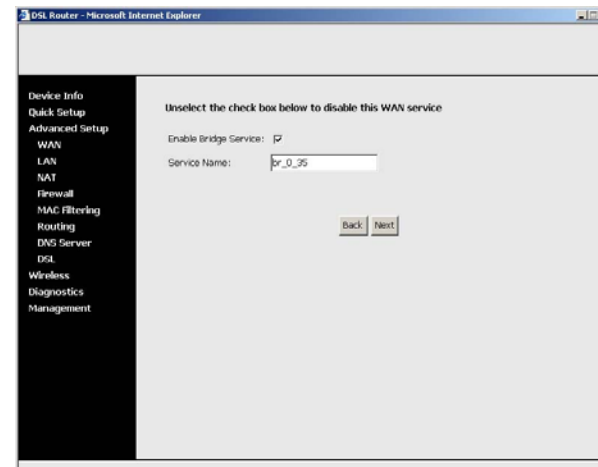

8. The WAN Setup – Summary page displays a summary of all WAN setting profiles. Click the **Save** button to save all the settings.
9. The WAN Setup page will appear. Click the **Save/Reboot** button. The router will reboot automatically with the new settings in effect.

## Bridging

1. Select the **Bridging** radio button and scroll down to select the appropriate **Encapsulation Mode**. There are two encapsulation types available: LLC/Snap-Bridging and VC/MUX. Then click the **Next** button.

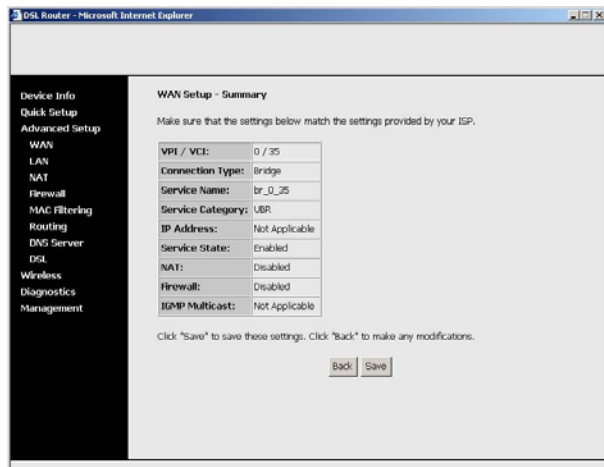

2. Check the box **Enable Bridge Service**. Enter a desired name in the **Service Name** field. It is used to identify the service. Then click the **Next** button.

 The LAN IP in bridge operating mode is needed for local users to manage the ADSL Modem Router. And no IP address is needed for the WAN in bridge mode.

3. The WAN Setup – Summary page displays a summary of all WAN setting profiles. Click the **Save** button to save all the settings.

- The WAN Setup page will appear. Click the **Save/Reboot** button. The router will reboot automatically with the new settings in effect.

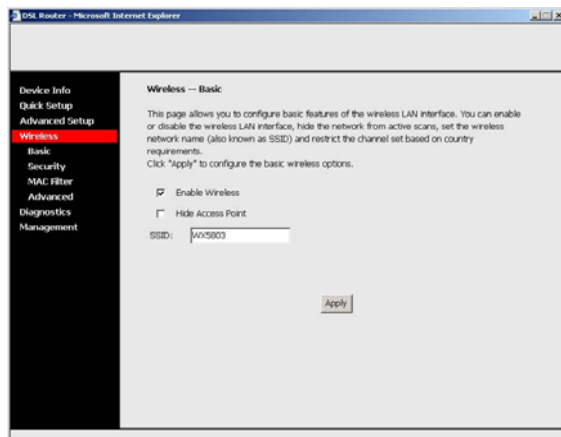

- Close your Web UI window and wait for about 2 minutes before reopening your web browser.

## IV. Configure Wireless Connectivity

1. Click the **Wireless** tab on the left frame. A **Wireless - Basic** page will appear on the right frame. Check the box **Enable Wireless**.

2. Check the box **Hide Access Point** and then your WMR-G54 will not respond when a ping is sent by any user on the Internet. This feature is helpful if you do not want to let other Internet users to check the status of your WMR-G54. However, the station will not be able to find your WMR-G54.

3. Enter a desired name in **SSID** field. This SSID is a network name that identifies the wireless devices in the network. The default value is **WMR-G54**. All workstations and access points must use the same SSID to be able to communicate with one another. The SSID is a 32-character field, and the value is case sensitive.

4. Click the **Apply** button.

## Europe – EU Declaration of Conformity

This device complies with the essential requirements of the R&TTE Directive 1999/5/EC. The following test methods have been applied in order to prove presumption of compliance with the R&TTE Directive 1999/5/EC:

- EN 60950 (2000-06)  
Safety of Information Technology Equipment
- EN 300 328-1/-2 (2001-12)  
Technical requirements for spread-spectrum radio equipment
- EN 301 489-1 (2000-08)
- EN 301 489-17 (2000-08)  
EMC requirements for spread-spectrum radio equipment

This device is a 2.4 GHz wireless LAN transceiver, intended for home and office use in all EU and EFTA member states, except in France, Belgium and Italy where restrictive use applies.

In Italy the end-user should apply for a license at the national spectrum authorities in order to obtain an authorization to use the device for setting up outdoor radio links.

In Belgium there is a restriction in outdoor use. The frequency range in which outdoor operation in Belgium is permitted is 2460 – 2483.5 MHz.

This device may not be used for setting up outdoor radio links in France. For more information see <http://www.anfr.fr/> and/or <http://www.art-telecom.fr>
