

TRANE®

Propeller Unit Heaters/Unitary

17.4 to 705.6 MBh

**Two Versatile Models - Various Sizes
Easy Installation**

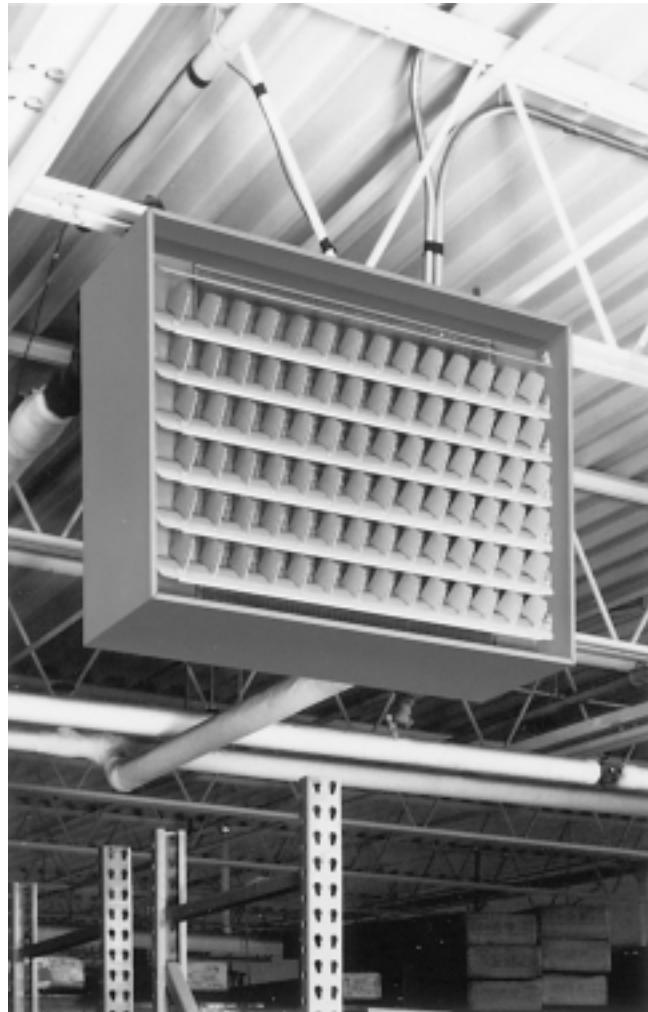

Introduction

The Industrial Designed Model P Unit Heater

The square, compact design of the Model P and rectangular Model S allow easy handling and installation. In most cases, only one person is needed to carry a unit. And because both feature compact Sigma-Flo® fins they're lightweight, making them easy to hoist and put into place.

What's more, the Model P can be stored standing on end. This means several units can be loaded on a single skid for moving from one point to another. Trane maintains a complete stock of both Model P and S units that are available to ship anywhere in the United States.

The Clean-Line Appearance of the Model S Unit Heater

Yet, the benefits of this compact design go beyond ease of installation. They continue with attractive styling. The Model S unit's simple, clean-line symmetry and the Model P unit's classic modern shape enhance any industrial facility.

Features and Benefits

Trane propeller unit heaters feature the largest selection of standard sizes from any line in the industry. In fact, vertical Model P and horizontal Model S unit heaters provide enough 'off-the-shelf' selections to fit almost any application. The versatile two-in-one Model P is available in 15 sizes with capacities from 41.3 MBh to 705.6 MBh while the companion standard and bypass Model

S is available in 29 sizes with the capacities from 17.4 MBh up to 404 MBh. Both are designed for durability, attractiveness and compactness. These features combined with economical operation, give strategically sized Trane unit heaters an edge unmatched by any other manufacturer.

Two Units in One – the Versatile Model P

The Trane Model P can be quickly field converted from standard to low final temperature PL design simply by removing the unit's patented knockout air ports. This unique two-in-one design allows the stocking wholesaler to cut inventories in half and still meet most customer application requirements.

Patented Trane louver cone diffusers allow directional flexibility of heated air.

The Space-Saving Model S

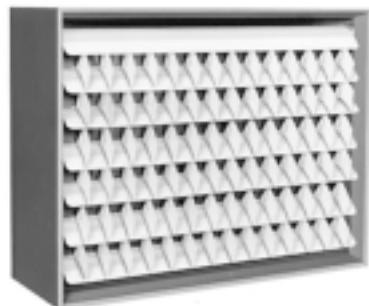

The Model S features attractive, functional styling in a space-saving, compact design. In addition, Trane offers an exclusive bypass Model S design to meet low final temperature, high cfm requirements. This design uses a modified coil which allows some of the air to flow over the top of the coil without being heated. This cooler band of air prevents the heated air from rising so warm air throw is increased while efficiency is improved.

Trane Model S features louvered discharge as standard.

Put Heat Where It's Needed

Exclusive louver fin diffusers featured on Trane unit heaters put heat where it's needed.

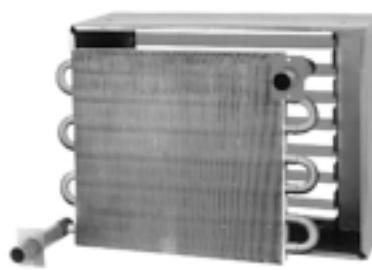

These patented Trane diffusers provide an unlimited combination of air diffusion patterns as well as greater air throw distance. In fact, when the louver cone diffuser is added to the Model P, up to 45 percent greater air throw distance is possible.

On Model S units, the combination of horizontal louver blades and patented vertical diffuser fins provide four-directional control of air delivery. Optional low cost louver fin diffusers can be adjusted to provide up to 25 percent more air throw.

Features and Benefits

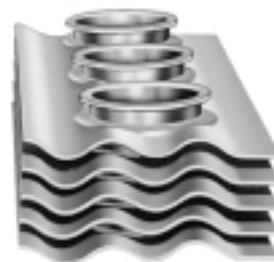

The Model S Coil

The Model S unit heater features a unique single tube serpentine coil. This compact, efficient coil has piping connections at the back for added space savings, convenience and appearance. Model S single circuit coils use threaded connectors at the back of the unit.

Compact Design

Trane designed Model S and P propeller unit heaters for easy installation and low maintenance. The Trane Sigma-Flo® fin design allows coil size to be reduced while maintaining high capacity performance equal to larger flat-fin coils. Reduced size and weight makes Trane unit heaters easy to handle and install.

The Model P Motor

The Model P motor is mounted below the top panel inside the heater casing. This reduces unit height and permits the unit to be installed closer to the ceiling for added headroom.

Rectangular Draw-Thru Coils

The Model P draw-thru coils use short lengths of steel pipe threaded for supply and return connections. These features make piping connections much easier for the installer.

Features and Benefits

Model P

A

Exclusive Trane designed aluminum fans provide smooth, nonsurge performance. This, in turn, provides efficient, quiet operation.

B

High performance Sigma-Flo® fins in a one-row coil have more efficient heat transfer characteristics than flat fin coils.

C

Steel pipe headers are electrically induction-brazed to coil tubes.

D

Top panel features knockout air ports that, when removed, convert the unit from standard to low final air temperature, higher cfm operation.

E

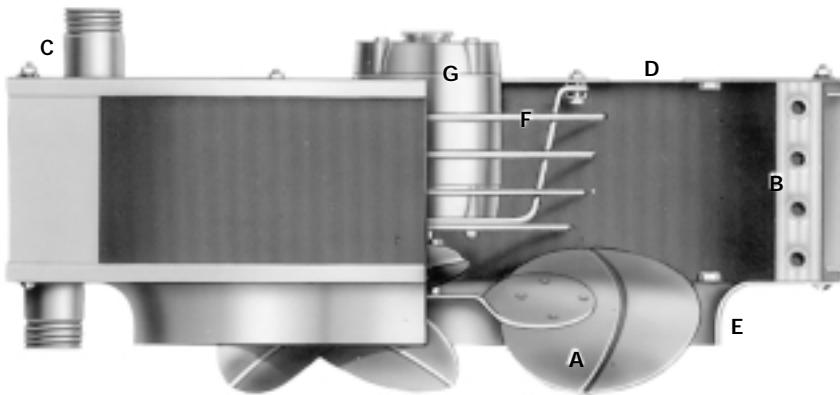

Bottom plate provides drawn fan orifice to assure smooth airflow.

F

Sturdy motor mounts absorb vibration and anchor the motor securely.

G

Totally enclosed industrial designed motors feature built-in overload protection.

Model S

A

Exclusive, compact one-row serpentine coil features high performance Sigma-Flo fins.

B

One-piece wraparound casing with picture-frame front panel combines attractiveness with durability.

C

Heavy-gauge, one-piece back panel can be easily removed for quick coil access.

D

Rear connections and a compact design provide more headroom than conventional units.

E

Sturdy fan guard provides stronger motor mount and quiet operation.

F

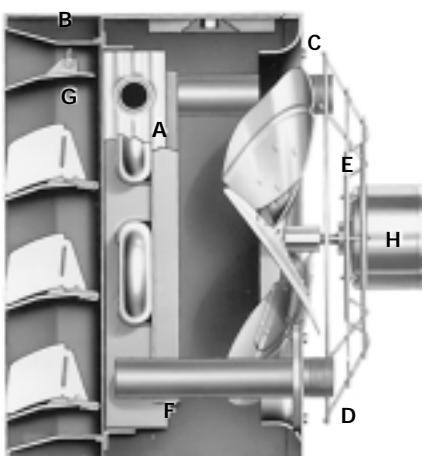

Unique coil supports anchor coil tubes without restricting expansion.

G

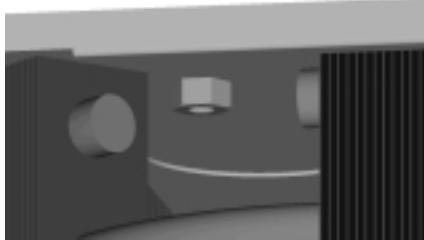

Trane horizontal louvers stay in position with the exclusive louver keeper design.

H

Totally enclosed industrial design motors feature built-in overload protection.

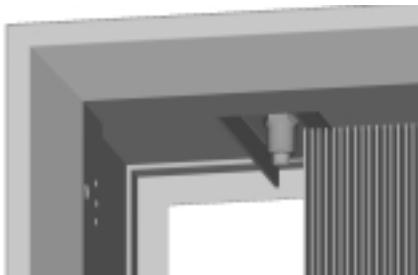

Features and Benefits

Model P

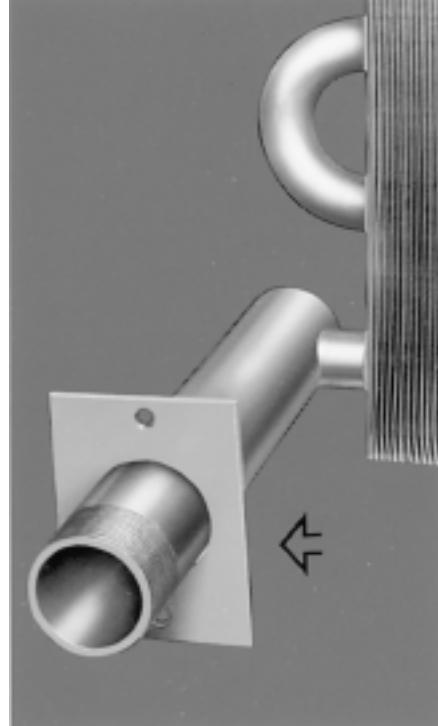

Simple Hanger and Piping Connections
The Model P uses weldnut type hanger connections, while the Model S uses a nutsert type hanger connection. Hanger rods screw easily into threaded anchor points. Piping connections can be made equally as easy. Model P units provide threaded connections for inlet and outlet, top and bottom.

Model S

Fully Accessible for Easy Maintenance
Model S and P unit heaters are fully accessible for maintenance. Only four main bolts are needed to disassemble the Model P. And when quick access is needed, the Model S features a one-piece back that can be easily removed and slid over pipes without breaking connections.
Motors can also be easily removed. Both units feature totally enclosed motors with thermal overload protection. As an added benefit, Model P fan-motor assemblies can be conveniently removed from below through the fan outlet.

External Couplings
The Model S provides threaded connections for supply and return on the back of its casing. In addition, back connections reduce the amount of space needed for installation.

Application Considerations

General Rules

In locating or spotting Trane Propeller Unit Heaters – either the Model S Horizontal or Model P Projection Unit Heater – the following general rules should be considered.

1. Spot units at points of greatest heat loss. Blanket outside doorways effectively and provide ample coverage for exposed window areas.
2. Units, especially in the case of the Model S Horizontal Unit Heater, should be arranged to blow toward or along exposed walls, preferably striking the wall at a slight angle so that the heated air exerts a wiping effect along the wall. Balance of units required to supply Btu requirements should be spaced strategically in balance of the area.
3. Unit heaters should be arranged to blow into open spaces such as aisles and not directly at any worker. An exception to this rule involves the use of the Model P Unit Heater equipped with the Louver Cone Diffuser. This combination can be used effectively over closely spaced bins or machines without regard for open space. But not even the Model P Unit Heater with Louver Cone Diffuser should be in such close proximity to the workers to cause discomfort.
4. The Trane solid-state speed control will provide maximum capacity flexibility and quieter operation. Note that this speed controller is available only on selected models.
5. Mounting heights and distance of throw recommendations as given elsewhere in this catalog should be carefully observed.
6. In the case of Model P Units, they should be spotted so that they will most effectively prevent stratification of excessively warm air at the ceiling. By carefully observing this rule, this type of unit may be used between seasons to tap waste heat at the ceiling and drive it down to occupied zones, thereby eliminating the need for added heat on the system.
7. Do not spot units close to any obstruction that will impede the full and natural air delivery of the unit.

Typical Factory

In the typical industrial building, where ceilings are high, Model P Unit Heaters may be used without diffusers.

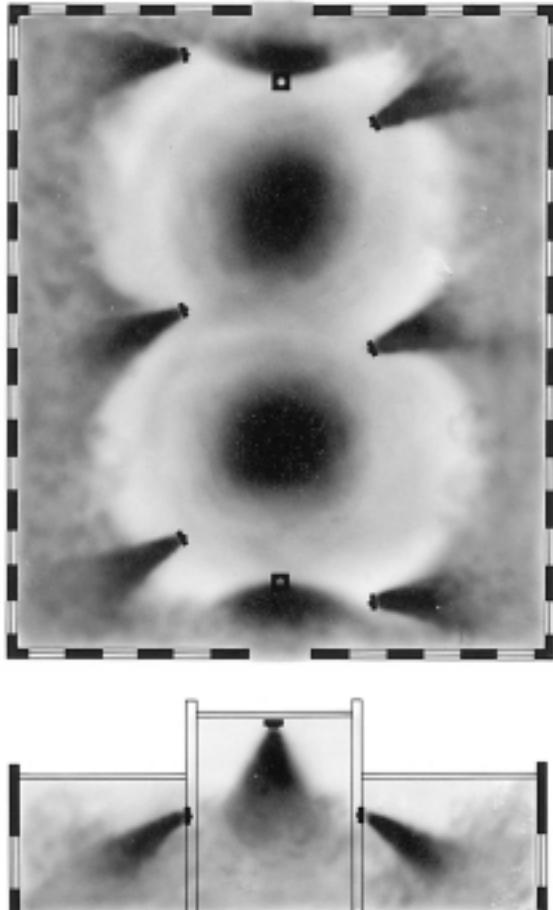

Figure AC-1 – The floor plan and elevation of a typical industrial building showing how a Trane Unit Heater System will heat various parts. Where ceilings are high in the main manufacturing section, large Projection Heaters without diffusers are used. Where ceilings are exceptionally high, as in crane bays, Model P Units with Louver Cone Diffusers provide up to 45% greater throw to top the “ceiling heat reservoir.” Model P Units with half closed Louver Cones blanket doorways. Model S Units with Louver Fins blanket windows.

In plants where the ceilings are exceptionally high, such as in crane bays as illustrated in Figure AC-1, Model P Units with Louver Cone Diffusers can increase the downward projection of heat by as much as 45% over units without diffusers.

Model P Units with the Louver Cone Diffusers can also be used to blanket doorways effectively, as shown in Figure AC-1 by simply adjusting half of the louvers vertically, and half closed. Model S horizontal-type units are ideal for mounting in plant areas where ceilings are low. In fact, due to the

extremely small height of the Model S, and because all piping connections are made at the back of the unit, the Model S provides a greater saving in headroom than other horizontal unit heater makes. As illustrated in Figure AC-1, the Model S Unit Heaters may be mounted conveniently from the ceiling, or from building structural supports and beams. With Louver Fin Diffusers, they are ideal for blanketing windows, and Model S “Bypass” Unit Heaters, provide further flexibility of application where greater throw and more effective distribution of air in the living zone is required.

Application Considerations

General Notes

The following general notes on piping propeller unit heaters are presented based on competent engineering and installation practice:

1. Suspend unit heaters securely with provisions for easy removal.
2. Make certain units hang level vertically and horizontally.
3. Provide for expansion in supply lines (note swing joints in suggested piping arrangements).
4. Provide unions adjacent to unit heaters in both supply and return laterals. Also provide shut-off valves in all supply laterals.
5. Use 45° angle runoffs from all supply and return mains.
6. Provide at least 7" (more if necessary) clearance above tops of Model P Projection Unit Heaters. Motors are removable from below on all sizes. It is desirable to form dirt pockets with pipe of the same size as the return tapping of the unit heater. Pipe in the branch-off should be the same size as the tapping in the trap. Beyond the trap, the return lateral should be increased one size to the return main.

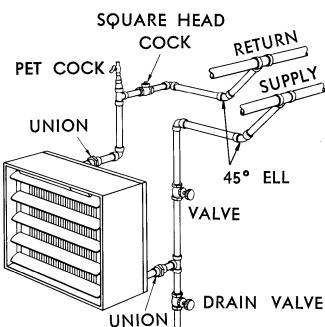

Figure AC-2

Hot Water System – Using Circulating Pump

Overhead supply and return mains are used with bottom connections to mains. Manual vent (pet cock) is used at high point on return main. Automatic air vent may be substituted if desired. Refer to Figure AC-2.

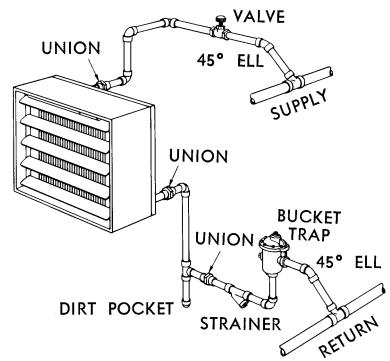

Figure AC-3

High Pressure Steam System

Overhead supply main is used with lower return main. Where steam pressure fluctuates over a wide range, a swing check valve should be placed in the return lateral between strainer and bucket trap to prevent reverse flow of condensate of flash steam when pressure drops suddenly. Top of bucket trap must be located below return outlet of coil for complete drainage of condensate. Refer to Figure AC-3.

Application Considerations

Table AC-2 - Supply and Return Sizes at 2 Psi

Capacity In Lbs. Of Steam Per Hour	Size Of Supply	Size Of Gravity Return
39	1"	3/4"
87	1 1/4"	3/4"
134	1 1/2"	1"
272	2"	1 1/4"
449	2 1/2"	1 1/2"
822	3"	2"

Note: This table is based on 1/2 lb. drop per 100 ft. of equivalent run of steam line and approximately 1/4 lb. drop in the return line per 100 ft. increase steam run-outs one size if more than 8 ft. long.

Vapor or Vacuum System

Lower supply and return mains are used. Piping should be similar to that used with overhead supply main if it is separately vented and trapped. Bottom supply for steam mains may be used if steam is dry. Refer to Figure AC-4. For proper pipe size, refer to Table AC-2.

Hot Water System with Circulating Pump

Lower supply and return mains are shown. Overhead supply and return main connections, similar to those in Figure AC-2 may be used. The automatic air vent is shown here but a manual vent (pet cock) may be substituted. Refer to Figure AC-5.

High Pressure Steam System

Overhead supply and return mains are used. The top of the bucket trap must be located below bottom return outlet of coil for complete drainage of condensate. Refer to Figure AC-6.

Selection Procedure

Trane Propeller Unit Heaters

Both Model S and Model P Propeller Unit Heaters are ideally suited to such a wide variety of installations that there can be no hard and fast rules regulating their selection.

In determining the type and size of the units for any building, the following points are generally considered:

BTU Requirements

While the choice of units depends upon several important factors, the total Btu requirement is usually determined first. In calculating heat loss, methods as recommended by the ASHRAE Guide may be used, or any other procedure which is known to be acceptable.

Type of Building

Once the total Btu requirement is known, the type of building together with its architecture and its purpose is considered.

In the many cases where a combination of space characteristics is found, a combination of Model S and Model P Unit Heaters may be used to create the most satisfactory heating system.

The Model P Unit Heater has the natural ability to tap the reservoir of heated air which collects at the ceiling level and return it to active service in the floor zone.

The Model P can be used on either high or low ceilings. From high mounting positions the Model P will allow ample clearance for moving objects and can project heat down into occupied areas regardless of obstacles which would restrict the flow of air from horizontal units.

From low mounting positions the Model P, with proper diffusion, can be used without disturbing nearby occupants with direct blasts of high velocity heated air, or requiring return lines so low as to leave insufficient head room.

The superior horizontal action of the Model S, on the other hand, is ideal for creating a wiping effect of warm air along exposed walls which neutralizes drafts at their source, beaming heat down narrow aisles and production lines, and blanketing large windows, doors and other points of high heat loss.

Spacing of Units

It is the usual practice to divide the building into areas with like exposures, or in relation to heat load distribution desired.

In general, Model S Unit Heaters may be selected for buildings where direct horizontal air currents are desired and where there are no obstacles to interrupt the flow of air from the heaters.

Model P Unit Heaters are successfully used where high or low mounting heights are required and should ordinarily be specified with diffusers, depending upon the mounting height and application.

Mounting Heights

The *maximum effective mounting height* is determined by the outlet temperature of the air, the outlet velocity, the cfm for which the heater is designed, and if a diffuser is used – the setting of its blades.

The higher the outlet temperature of the air, the more difficult it is to force it down into the living zone.

The cfm also affects the mounting height as a large volume of air will travel farther than a small volume under the same initial conditions of temperature and velocity.

In the preliminary planning stages, it is well to remember that the lowest possible mounting height is desirable in order to get the most heat down to the floor line and to allow the greatest possible diffusion adjustment to provide tailor-made distribution for each area.

In providing for the use of diffusers please remember, adjustment of a Louver Cone Diffuser to deflect the air toward the horizontal immediately lowers the mounting height limit.

Adjustment for lateral deflection with the Louver Fin Diffuser shortens the distance of throw.

Diffusion

The use of Trane Louver Cone or Louver Fin Diffusers influences the selection of units in two principal ways: First: It is seldom necessary to install

oversized heaters to extend the maximum effective mounting height of the Model P or the distance of throw of the Model S. Conversely, Trane Diffusers enable extremely low mounting since the adjustable blades direct heat where it is wanted without creating uncomfortable hot spots near the units.

Second: After the original selection has been made, units may be located with confidence because adjustments in heat distribution are possible to accommodate future changes or unforeseen draft conditions.

Air Changes

Better diffusion and more even temperatures can be maintained in a heated space when the rate of air recirculation through the heaters is relatively high. For buildings where large numbers of people are engaged, it is desirable to provide for a greater number of air changes than for sparsely occupied areas.

A greater number of small units are used where wide diffusion and even temperatures are necessary. A few centrally located units of large capacity would be used where there are few occupants.

Comfort Conditions and Economy

Air circulation, diffusion and spacing of units are closely related to economy and comfort in the selection of unit heaters. The more units used to provide the required number of Btu's, the more comfortable will be the conditions for personnel. On the other hand, a few large units can be selected to provide plenty of heat at low first cost, but may be slower in response and thorough distribution of heat.

Here again, adjustable diffusion equipment can go a long way toward saving the buyer first cost expense while still providing completely satisfactory comfort conditions.

Selection Procedure

Formula

The following formula is used to arrive at final air temperature volume when 70 F (Standard Air Basis) is known or vice versa:

$$\text{Cfm at final temp.} = \text{Cfm at } 70\text{ F} \times \frac{460 + \text{Final temp.}}{460 + 70}$$

$$\text{Cfm at } 70\text{ F} = \text{Cfm final air} \times \frac{460 + 70}{460 + \text{Final temp.}}$$

Determining Special Steam Capacities

Where capacity of the unit under standard conditions is known – 2 lbs. steam, 60 F entering air – and it is desired to know the capacity of this same unit under different steam and air conditions, follow instructions given in Example 1 below.

Where a set of conditions is given – Btu, temperature rise, final temperature, cfm, steam pressure available, etc. Refer to Example 2.

Useful Data

$$\frac{\text{Btu}}{240} = \text{Sq. ft. of radiation (EDR)}$$

$$\frac{\text{Sq. ft. of radiation}}{4} = \text{Lbs. of condensate per hour}$$

$$\frac{\text{Btu}}{\text{Latent heat}} = \text{Lbs. of water per hour}$$

$$\text{Cfm} \times \text{Temp. rise} \times 1.085 = \text{Btu.}$$

$$\text{Specific heat of air (70 F)} = .241$$

$$\text{Specific weight of one cubic foot of air (70 F)} = .075.$$

$$\text{Cfm} \times 60 = \text{cfh.}$$

$$\text{Therefore, } .241 \times .075 \times 60 = 1.085$$

Example 1

Given: Model 60S Horizontal Propeller Unit Heater with a rated capacity of 60,500 Btu at 2 lbs. steam with 60 F entering air.

Desired: Capacity of this unit using 15 lbs. steam and 40 F entering air.

Under 40 F and across from 15 lbs. in SP-2, page 14, we find the factor 1.34. $60,500 \times 1.34 = 81,070$ Btu per hour.

Equivalent Direct Radiation

If working in EDR, rather than Btu, multiply the EDR by the same factor in the same way. Thus:

$$252 (\text{From Table 3}) \times 1.34 =$$

$$338 \text{ sq. ft. or } \frac{81,070}{240}$$

Determining Amount of Condensate

To determine the amount of condensate, divide the capacity in BTU by the latent heat of steam:

$$\frac{81,070}{945} = 86 \text{ lbs per hour.}$$

$$945 = \text{Latent Heat of Steam at 15 psi.} \\ (\text{See Table SP-9, page 18.)}$$

Determining Final Temperature

Final temperature of air leaving Trane Unit Heaters may be determined as follows:

$$\text{Inlet Air Temp.} + \frac{\text{Btu rating}}{\text{Cfm at } 70\text{F} \times 1.085} = \text{FinalTemp}$$

$$\text{Inlet Air Temp. } 40\text{F} + \frac{81,070}{815(\text{from table 3}) \times 1.085} = \text{FinalTemp}$$

Example 2:

Problem: A Trane Model S Horizontal Unit Heater is desired to deliver 280,000 Btu per hour in a garage where ventilation is required. Entering air temperature is 40 F. Steam at 30 lbs. pressure is available. Temperature to be maintained is 70 F.

Solution: Under 40 F and across from 30 lbs. in Table SP-2 page 14, find the factor 1.51.

Equivalent capacity of required unit at 2 lbs. steam 60 F entering air is

$$\frac{\text{Required Btu per hour}}{\text{F}} = \frac{280,000}{1.51} = 185,400 \text{ Btu}$$

From Table SP-3, page 15, select a Number 186S Unit Heater with a capacity of 185,200 Btu per hour with standard coil, and at 2 lbs. steam and 60 F entering air.

The capacity of this unit at 30 lbs. steam and 40 F entering air is
 $1.51 \times 185,200 = 279,650$ Btu per hour.

Surplus Capacity

While the ventilation load is being handled, any air entering the space over the desired room temperature should be considered in the heating calculations. This surplus capacity can be found by multiplying the difference between the final temperature leaving the heater and the room temperature to be maintained by 1.085 and that by the cfm. That amount of heat can be used to offset heat losses.

Selection Procedure

Model S

Maximum mounting heights for Model S Unit Heaters are given in Table SP-1. When equipped with standard Louver Fin Diffusers the distance of throw may be increased as much as 25% by "toeing-in" the vertical blades. *Distance of throw decreases in proportion to the amount of deflection given the airstream to either side of the heater.* Mounting the unit at or below maximum mounting height will insure that heated air reaches the living zone.

Model P

Maximum mounting heights for Model P Unit Heaters are given in Table SP-10, page 19. These distances are figured from the floor line to the bottom plate of the unit heater. Where ceilings are unusually low, a nearly horizontal flow of air can be obtained by equipping these units with Louver Cone Diffusers. The individually adjustable blades of the Louver Cone permit an infinite variety of adjustments to meet any on-the-job problems. By setting the blades vertically to straighten the airstream, as much as 45% increase in throw can be obtained.

Table SP-2 – Factors for Determining Steam Capacity of Model S Horizontal Unit Heaters at Various Pressures and Temperatures

Table Based on 2 PSIG and 60 F Entering Air

Steam Pressure PSIG	Temperature of Entering Air (F)

Notes:

To determine the Btu per hour capacity of a Model S Horizontal Unit Heater at any steam pressure and entering air temperature multiply rated capacity at 2 psig steam 60 F entering air (Table SP-3) by factor from above table. Factors in italics: Units should not be operated when entering air is below freezing at steam pressures below 10 psig.

Selection Procedure

Table SP-3 – Model S Horizontal Unit Heater Steam Capacities

2 Lbs. Steam 60 F Entering Air Temp

Size	Motor HP	Motor RPM	BTU Per Hour	EDR	Condensate Lbs. Per Hr. Standard Units	Final Temp	CFM 70 F Air Basis	Outlet Velocity	Oper. Weight

720-P-L	3	1120	620,000	2580	642	108	11,900	12,750	2380	325

Notes:

Constant speed units are rated at capacities shown in regular type; capacities in italic faced type apply only to units with multi-speed motors.

To determine BTU per hour capacities at various steam pressures and entering air temperatures, use conversion factors from Table SP-7, page 18.

Final temperatures at new conditions can be calculated by applying basic formula.

Table SP-6 – Maximum Spread (Ft.)

Unit No.	42P	64P	80P	102P	122P	146P	166P	202P	252P	280P	336P	384P	500P	600P	720P
Spread (Ft.)	15	17	20	24	26	27	28	32	35	37	45	50	54	57	60

Note:

The "spread" is the diameter of the comfort zone at floor level, projected by the Model P unit without the louver cone diffuser, based on two pounds steam pressure and 60 F entering air.

	2	1.52	1.45	1.37	1.29	1.22	1.15	1.07	1.00	0.93	0.86	0.80	0.73
	5	1.58	1.50	1.42	1.34	1.27	1.20	1.12	1.05	0.98	0.91	0.85	0.78
	10	1.64	1.57	1.49	1.41	1.34	1.27	1.19	1.12	1.05	0.98	0.91	0.85
	15	1.70	1.62	1.55	1.47	1.40	1.32	1.25	1.18	1.11	1.04	0.97	0.90
	20	1.75	1.67	1.60	1.52	1.45	1.37	1.30	1.23	1.16	1.09	1.02	0.96
	30	1.83	1.75	1.68	1.61	1.53	1.46	1.39	1.32	1.25	1.18	1.11	1.04
	40	1.90	1.82	1.75	1.68	1.61	1.53	1.46	1.39	1.32	1.25	1.18	1.11
	50	1.96	1.87	1.81	1.74	1.67	1.59	1.52	1.45	1.38	1.31	1.24	1.17
	60	2.02	1.94	1.87	1.79	1.72	1.64	1.57	1.50	1.43	1.36	1.29	1.22
	70	2.07	1.99	1.92	1.84	1.76	1.69	1.62	1.55	1.47	1.40	1.33	1.27
	75	2.10	2.02	1.94	1.86	1.79	1.71	1.64	1.57	1.49	1.42	1.36	1.29

Note:

To determine the Btu per hour capacity of a Model P projection unit heater at any steam pressure and entering air temperature, multiply rated capacity at 2 psig steam 60 F entering air (Table SP-5) by factor from above table.

Additional Selection Data

Motor and Fan Speeds

Motor and fan speeds are selected to provide efficient performance. The solid-state speed control will provide an infinite number of speeds between the highest and the lowest catalogued fan speeds. The speed control is not calibrated in specific fan speeds. For use on units with 115 volt/60 cycle/1 phase, 1/8 hp and smaller standard motors only.

Standard and Bypass Units

Standard models meet most requirements and are most economical. Bypass units meet conditions as mentioned above, and are also used where low final temperature is specified.

25 and 50 Cycle Unit Heat Capacities

Table SP-8 shows the Btu, cfm, and the hp required on unit heaters when operated on 25 or 50 cycle circuits. The multipliers in Table SP-8 may be applied to standard 60 cycle unit capacities to determine the capacities of the same unit when operating on 25 or 50 cycle current. These multipliers may be used on units catalogued at 1050 to 1150 RPM.

For the smaller Trane Unit Heaters catalogued at 1550 RPM, the capacity data in the catalog may be applied to either 25 or 50 cycle service.

Table SP-8 – Factors for Determining Unit Heater Capacities at 25 or 50 Cycles

RPM	Multiplier To Be Applied To 60-Cycle 1100 RPM Ratings		
	25 CY	50 CY	BTU CFM HP
1425	1425	117	1.25 1.95
950	950	.87	.833 .572
710	710	.7	.623 .242

Notes:

*LS = Low speed.

**PL = Model P low final temperature model with all air ports open.

Figures in bold face show maximum mounting height with louver cone diffusers set vertically.
To meet CSA and OSHA requirements, Model P Unit Heaters mounted lower than 8.0 ft. from the floor must be equipped with an OSHA fan guard. Above table based on 60°F entering air temperature. In providing for the use of diffusers, it must be remembered that adjustment of a LCD to deflect air toward horizontal immediately lowers the mounting height limit.

Unit Size	Steam Pressure (PSI)

Hot Water Selection Example

Selection Procedure

Select the proper size of unit heater for whatever application desired, as illustrated by the following examples.

Example 1:

Select a Model S horizontal unit heater to deliver 95 MBH with 220°F entering water temperature (EWT), 70°F entering air temperature (EAT) and a 30°F water temperature drop (WTD).

Step 1.

Determine GPM:

$$\text{GPM} = \frac{\text{Btu/hr}}{(485) \text{WTD}} = \frac{95000}{485 \times 30} = 6.53$$

Step 2.

Refer to Table SP-11 to select the conversion factor at 220° EWT and 70° EAT. Factor is 1.058.

Step 3.

Determine equivalent MBH at standard conditions (200° EWT, 60° EAT).

$$\text{Equiv. MBH} = \frac{\text{MBH}}{\text{Factor}} = \frac{95}{1.058} = 89.8$$

Step 4.

Select unit size by entering the hot water tables at the 200°F EWT column. Select the unit which will provide 89.8 MBH at 6.53 GPM. In this example, the selection indicates a Model S 126W2 unit heater, from Table PD-2, page 28.

To determine the actual capacity of this Model S 126W2 at operating conditions (220° EWT and 70° EAT) proceed as follows.

Step 1.

Determine the MBH at 6.53 GPM by interpolation in the 200° column. (In this case 90.8 MBH.) Multiply this MBH by the conversion factor 90.8 MBH x 1.058 = 96 MBH.

Step 2.

The GPM remains constant = 6.53 GPM.

Step 3.

Calculate the water temperature drop

$$\text{WTD} = \frac{\text{Btu/hr}}{\text{GPM} \times 485} = \frac{96000}{(6.53) (485)} = 30.3$$

Selection Procedure

Step 4.

Determine the pressure drop at 6.53 GPM. Pressure drops are cataloged for both standard wall (SWT) and heavy wall. (HWT) tube coils. In this example, if a SWT coil is selected the pressure drop, by interpolation is 2.38 feet of water.

Step 5.

Calculate the final air temperature

$$\begin{aligned} \text{F.T.} &= \text{E.A.T.} + \frac{\text{Btu/hr}}{\text{CFM} \times 1.085} \\ &= 70 + \frac{96000}{1661 \times 1.085} = 70 + 53.2 = 123.2^\circ \end{aligned}$$

Example 2

Determine the capacity of a Model 336P unit heater operating at 180° (EWT), 100° (EAT) and 15° (WTD).

Step 1.

Find conversion factor (in Table SP-11) = 0.546

Step 2.

Adjust the water temperature drop

$$\text{Adj. WTD} = \frac{15}{.546} = 27.5^\circ$$

Step 3.

Multiply the MBH (interpolated) at 27.5° WTD, 200° EWT and 60° EAT by the factor to obtain the MBH at desired conditions.

$$0.546 \times 224.9 = 123.0 \text{ MBH}$$

Step 4.

$$\text{WTD} = 27.5 \times 0.546 = 15^\circ$$

Step 5.

$$\text{GPM} = \frac{\text{Btu/hr}}{485 \times \text{WTD}} = \frac{123,000}{(485)(15)} = 16.9$$

Step 6.

Pressure drop interpolated at 27.5° WTD for a SWT coil is 1.82 feet of water.

Step 7.

Calculate final temperature

$$\begin{aligned} \text{F.T.} &= \text{E.A.T.} + \frac{\text{Btu/hr}}{\text{CFM} \times 1.085} \\ &= 100^\circ + \frac{123,000}{5210 \times 1.085} = 121.8^\circ \end{aligned}$$

Note:

If a constant water temperature drop is desired, apply the conversion factor to the WTD and to the desired MBH and enter 200° EWT column at these conditions. Select the unit which will provide the equivalent MBH at the adjusted WTD. The GPM can then be interpolated from the table at the adjusted WTD. To determine the actual capacity at operating conditions proceed as outlined in example #2.

If a constant GPM is desired, enter the 200° EWT column at the given or calculated GPM. Select the unit which will provide the equivalent MBH at this GPM. To determine the actual capacity at operating conditions in this case proceed as outlined in example #1.

Motors

Standard motors are 115/60/1, totally enclosed, with thermal overload protection for all units through size 280P. Standard motors for 42P, 64P and 80P are standard pole, sleeve bearing. The 102P motor is permanent split capacitor type with sleeve bearings. Motor for unit sizes 122P through 280P are permanent split capacitor type with permanently lubricated ball bearings. Motors used on unit sizes 336P through 720P are 230/460/60/3, totally enclosed, with permanently lubricated ball bearings. Unit sizes smaller than 336P are also available with 230/460/60/3 motors.

All motors, fractional hp and integral hp, have Class "B" insulation. The 115/60/1 motors used as standard on unit sizes 42P through 102P can be operated at multiple speeds with the addition of a solid-state control.

All units available with explosion-proof motors.

* Standard features of stock vertical heaters.

**For the 3-phase and explosion-proof motors, the OSHA guard ships separately.

Motors

Totally enclosed, 115/60/1 Class "B" insulated, shaded pole and PSC motors are STD. 1/25 through 1/8 hp are sleeve bearing. 1/6 through 3/4 hp are ball bearing. All single phase motors have built-in overload protection. Sleeve bearing motors can be oiled. Ball bearing motors are permanently lubricated. The 115/60/1 motors used as standard on unit sizes 18S through 100S can be operated at multiple speeds with the addition of a solid-state control. All units available with explosion-proof motors.

*Standard features of stock horizontal unit heaters.

**Units equipped with 115 volt totally enclosed motors come with a standard fan guard/motor mount. Units equipped with 3 phase or explosion proof motors come with no guard and the motors are base mounted.

Motor Mount Type-1

Motor Mount Type-2

Note:

Motor Mount Type-1 is used on all standard single-phase motors.

Motor Mount Type-2 is used on three-phase, explosion proof 1 or 3-phase, and other special motors.

Mechanical Specifications

Model P

General

The "NRTL/C" indicator adjacent to the CSA mark signifies that the product has been evaluated to the applicable ANSI/UL and CSA Standards, for use in the U.S. and Canada.

NRTL, i.e. Nationally Recognized Testing Laboratory, is a designation granted by the U.S. Occupational Safety and Health Administration to laboratories which have been recognized to perform certification to U.S. Standards.

Casing

Formed by two square steel plates. Bottom plate forms orifice for air delivery. Air ports stamped in top plate as standard for easy removal for low final air temperature.

Fan

Trane high efficiency Model A fan with aluminum blades is quiet, factory balanced and sturdy for standard or spark-proof applications.

Coils

Hot water-steam coils are rectangular 3 or 4-sided, one-pass, multiple circuit, with aluminum Sigma-Flo® fins mechanically bonded to tubes. Standard coils are seamless copper tubing. Coils tested at 375 psi under water. Supply and return connections are steel pipe. Standard coils have .025 copper tubing suitable for use on steam pressure to 75 psi or hot water up to 225 psi or 325 F. When Specified) Heavy .049 red brass tubing suitable for 75 psi steam or up to 425 deg. F water at 300 psi – .049 cupro-nickel tubing suitable for 75 psi steam or up to 450 deg. F water at 400 psi – .049 steel tubing suitable for 450 deg. F water at 400 psi.

Motors

Standard motors are 115/60/1, totally enclosed, with thermal overload protection for all units through size 280P. Standard motors for 42P, 64P and 80P are shaded pole, sleeve bearing. The 102P motor is permanent split capacitor

type with sleeve bearings. Motor for unit sizes 122P through 280P are permanent split capacitor types with permanently lubricated ball bearings. Motors used on unit sizes 336P through 720P are 230/460/60/3, totally enclosed, with permanently lubricated ball bearings. Unit sizes smaller than 336P are also available with 230/400/60/3 motors.

All motors fractional hp and integral hp, have Class "B" insulation. The (115/60/1) motors used as standard on unit sizes 42P through 102P can be operated at multiple speeds with the addition of a solid-state control.

All units available with explosion-proof motors. Only sizes 42P, 64P, 102P and 146P are available from stock with 115/60/1 explosion-proof motors.

Louver Cone Diffuser

(When Specified) Available for complete versatility in air diffusion patterns. Adjustable 18-gauge steel blades held in set position by spring steel clips.

Model S

General

The "NRTL/C" indicator adjacent to the CSA mark signifies that the product has been evaluated to the applicable ANSI/UL and CSA Standards, for use in the U.S. and Canada.

NRTL, i.e. Nationally Recognized Testing Laboratory, is a designation granted by the U.S. Occupational Safety and Health Administration to laboratories which have been recognized to perform certification to U.S. Standards.

Casing

Two-piece with "picture frame" front formed into wraparound sides, top and bottom. Adjustable horizontal louvers are standard. 18 gauge back panel with deep-draw fan orifice for extreme rigidity. Steel supply and return pipe tap connectors bolted to back. Casings phosphatized to prevent corrosion and painted with blue gray baked enamel.

Fan

Trane designed and built high efficiency Model A fan with aluminum blades is quiet, factory balanced and sturdy for standard or sparkproof applications.

Coils

Hot water-steam headerless coils are single tube, single serpentine on all sizes except 230 thru 354 which have two circuits. Fins are aluminum Sigma-Flo, mechanically bonded to seamless copper tubing. All coils one-row deep in air flow direction. Coils tested at 400 psi air under water. Standard coils have .031 copper tubing suitable for use on steam pressures to 75 psi or hot water up to 200 psi or 325 F.

(When Specified) Heavy .049 red brass tubing suitable for 75 psi steam or 390 deg. F water at 260 psi — .031 cupro-nickel tubing suitable for 450 deg. F water at 400 psi — .049 steel tubing suitable for 450 deg. F water at 400 psi. (When Specified) Coils with turbulators (Suffix W) available for high performance on hot water.

(When Specified) Coils with fin series 132 (Suffix 2) for high performance on hot water or steam.

(When Specified) Bypass Model S units with modified coils for air bypass. Unit

sizes have odd numbers (19, 77, 243, etc.).

Motors

Totally enclosed, 115/60/1 Class "B" insulated shaded pole and PSC motors are STD. $\frac{1}{50}$ through $\frac{1}{8}$ hp are sleeve bearing, $\frac{1}{6}$ through $\frac{3}{4}$ hp are ball bearing. All single phase motors have built in overload protection. Sleeve bearing motors can be oiled. Ball bearing motors are permanently lubricated.

The 115/60/1 motors used as standard on unit sizes 18S through 100S can be operated at multiple speeds with the addition of a solid-state control.

All units available with explosion-proof motors. Only sizes 18S, 42S, 90S and 126S are available from stock with 115/60/1 explosion-proof motors.

Louver Fin Diffuser

(When Specified) For versatility in lateral diffusion, used with standard louvers, provides four-direction control. Ships separately and clips onto horizontal louvers.
