1. Important Notes

Solid state equipment has operational characteristics differing from those of electromechanical equipment. Safety Guidelines for the Application, Installation and Maintenance of Solid State Controls describes some important differences between solid state equipment and hard-wired electromechanical devices. Because of this difference, and also because of the wide variety of uses for solid state equipment, all persons responsible for applying this equipment must satisfy themselves that each intended application of this equipment is acceptable.

In no event will CREVIS be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, CREVIS cannot assume responsibility or liability for actual use based on the examples and diagrams.

Warning!

- ✓ **If you don't follow the directions, it could cause a personal injury, damage to the equipment or explosion**
- Do not assemble the products and wire with power applied to the system. Else it may cause an electric arc, which can result into unexpected and potentially dangerous action by field devices. Arching is explosion risk in hazardous locations. Be sure that the area is non-hazardous or remove system power appropriately before assembling or wiring the modules.
- Do not touch any terminal blocks or IO modules when system is running. Else it may cause the unit to an electric shock or malfunction.
- Keep away from the strange metallic materials not related to the unit and wiring works should be controlled by the electric expert engineer. Else it may cause the unit to a fire, electric shock or malfunction.

Caution!

- ✓ **If you disobey the instructions, there may be possibility of personal injury, damage to equipment or explosion. Please follow below Instructions.**
- Check the rated voltage and terminal array before wiring. Avoid the circumstances over 50°C of temperature. Avoid placing it directly in the sunlight.
- Avoid the place under circumstances over 85% of humidity.
- Do not place Modules near by the inflammable material. Else it may cause a fire.
- Do not permit any vibration approaching it directly.
- Go through module specification carefully, ensure inputs, output connections are made with the specifications. Use standard cables for wiring.
- Use Product under pollution degree 2 environment.

3. Dimension

3.1. NA-9189

4. Mechanical Setup

4.1. Total Expansion

The number of the module assembly that can be connected is 32. So the maximum length is 426mm Exception. ST-2748 is excepted to calculate maximum length because that is double width module.

4.2. Plugging and Removal of the Components.

DANGER

Before work is done on the components, the voltage supply must be turned off.

As above figure in order to safeguard the FnIO module from jamming, it should be fixed onto the DIN rail with locking level. To do so, fold on the upper of the locking lever.

To pull out the FnIO module, unfold the locking lever as below figure.

4.3. Internal FnBus/Field Power Contacts

Communication between the NA series and the expansion module as well as system / field power supply of the bus modules is carried out via the internal bus. It is comprised of 6 data pin and 2 field power pin.

DANGER
Do not touch data and field power pins in order to avoid soiling and damage by ESD noise.

5. MODBUS Electrical Interface

5.1. FnBus System

• Network Adapter Module

The Network Adapter Module forms the link between the field bus and the field devices with the Expansion Modules.

The connection to different field bus systems can be established by each of the corresponding Network Adapter Module, e.g. for SyncNet, PROFIBUS, CANopen, DeviceNet, Ethernet/IP, CC-Link, MODBUS/Serial, MODBUS/TCP etc.

• Expansion Module

The Expansion Modules are supported a variety of input and output field devices. There are digital and analog input/output modules and special function modules.

• Two types of FnBus Message

- Service Messaging
- I/O Messaging

FnBus Pin Description

No.	Name	Description
1	Vcc	System supply voltage (5V dc).

MODBUS/TCP Network Setup is like following.

ATTENTION

The use of an incorrect supply voltage or frequency can cause severe damage to the component.

MODBUS/TCP IP Address Setup

● IP-Address Setup using ARP

A way to change the adapter IP address could be applied using such as Command Windows (only applicable same subnet). This new IP address remains during power cycle.

DOS Prompt

```
>ping      192.168.123.236          //current IP address
>arp       -a                      //view Ethernet physical address
>arp       -d  192.168.123.236      //delete arp table
>arp       -s  192.168.123.237 00-14-F7-00-00-00
                                         //assign static arp table with new IP address
                                         //”00-14-F7-00-00-00” is Ethernet Address
                                         //See Adapter Label

>ping      -n 1  -l 741 192.168.123.237    //assign new IP address
>arp       -d *                    //clear all arp table
>ping      192.168.123.237        //check response of adapter new IP address
```

After IP-Address setup using ARP.

IP Address = 192.168.123.237

Subnet Mask = 255.255.255.0

Gateway = 192.168.123.254

Note!

The default IP address are: 192.168.123.1

● IP-Address Setup using BOOTP

If the adapter BOOTP enabled, the adapter sends BOOTP request message of 20 times every 5sec.

The following is an example of adapter IP-Address setup that can be used with a third party BOOTP server.

- ✓ Rockwell Automation's BOOTP server

5.2.3. I/O Process Image Map

An expansion module may have 3 types of data as I/O data, configuration parameter and memory register. The data exchange between network adapter and expansion modules is done via an I/O process image data by FnBus protocol. The following figure shows the data flow of process image between network adapter and expansion modules.

5.2.4. MODBUS Interface Register / Bit Map

- Register Map**

Start Address	Read/Write	Description	Func. Code
0x0000 ~	Read	Process input image registers (Real Input Register)	4, 23
0x0800 ~	Read/Write	Process output image registers (Real Output Register)	3, 16, 23

0x0800 ~	Read/Write	Process output image bits All output registers area is addressable by bit address. Size of output image bit is size of output image register * 16.	1, 5, 15

5.3. Example

5.3.1. Example of Input Process Image(Input Register) Map

Input image data depends on slot position and expansion slot data type. Input process image data is only ordered by expansion slot position when input image mode is uncompressed (mode 0, 2). But, when input image mode is compressed (mode 1, 3), input process image data is ordered by expansion slot position and slot data type. Input process image mode can be set by special register 0x1114(4372). Refer to 6.3.3.

5.3.2. Example of Output Process Image(Output Register) Map

Output image data depends on slot position and expansion slot data type. Output process image data is only ordered by expansion slot position when output image mode is uncompressed (mode 0). But, when output image mode is compressed (mode 1), output process image data is ordered by expansion slot position and slot data type. Output process image mode can be set by special register 0x1115(4373). Refer to 6.3.3.

6. MODBUS/TCP INTERFACE

6.1. MODBUS/TCP Protocol

The MODBUS messaging service provides a Client/Server communication between devices connected on an Ethernet TCP/IP network. All MODBUS/TCP messages are sent via TCP on registered port 502.

6.1.1. Comparison of MODBUS/TCP And MODBUS/RTU

This header provides some differences compared to the MODBUS RTU application data unit used on serial line:

- ✓ The MODBUS ‘slave addresses’ field usually used on MODBUS Serial Line is replaced by a single byte ‘Unit Identifier’ within the MBAP Header. The ‘Unit Identifier’ is used to communicate via devices such as bridges, routers and gateways that use a single IP address to support multiple independent MODBUS end units.
- ✓ All MODBUS requests and responses are designed in such a way that the recipient can verify that a message is finished. For function codes where the MODBUS PDU has a fixed length, the function code alone is sufficient. For function codes carrying a variable amount of data in the request or response, the data field includes a byte count.
- ✓ When MODBUS is carried over TCP, additional length information is carried in the MBAP header to allow the recipient to recognize message boundaries even if the message has been split into multiple packets for transmission. The existence of explicit and implicit length rules and use of a CRC-32 error check code (on Ethernet) results in an infinitesimal chance of undetected corruption to a request or response message.

MODBUS/TCP

MBAP Header	Function	Data
7 chars	1 char	Up to 252 chars

MODBUS/RTU

Start	Address	Function	Data	CRC Check	End
≥ 3.5 chars	1 char	1 char	Up to 252 chars	2 chars	≥ 3.5 chars

Function and data field of MODBUS/TCP are identical to function and data field of MODBUS/RTU.

6.1.2. MODBUS/TCP MBAP Header

The MBAP (MODBUS Application Protocol) header contains the following fields.

Fields	Length	Description	Client	Server
Transaction Identifier	2 bytes	Identification of a MODBUS Request /Response transaction.	Initialized by the client	Recopied by the server from the received
Protocol Identifier	2 bytes	0 = MODBUS protocol	Initialized by the client	Recopied by the server from the received
Length	2 bytes	Number of following bytes	Initialized by the client (Request)	Initialized by the server (Response)
Unit Identifier	1 byte	Identification of a remote slave connected on a serial line or on other buses.	Initialized by the client	Recopied by the server from the received

- ✓ Transaction Identifier - It is used for transaction pairing, the MODBUS server copies in the response the transaction identifier of the request.
- ✓ Protocol Identifier – It is used for intra-system multiplexing.
The MODBUS protocol is identified by the value 0.
- ✓ Length - The length field is a byte count of the following fields, including the Unit Identifier and data fields.
- ✓ Unit Identifier – *This field is used for intra-system routing purpose. Typically MODBUS server must be returned with the same value set by MODBUS client.*

6.2.7. 8 (0x08) Diagnostics

MODBUS function code 08 provides a series of tests for checking the communication system between a client (Master) device and a server (Slave), or for checking various internal error conditions within a server.

The function uses a two-byte sub-function code field in the query to define the type of test to be performed. The server echoes both the function code and sub-function code in a normal response. Some of the diagnostics cause data to be returned from the remote device in the data field of a normal response.

Configuration of Node address

- Check duplication node address.

Configuration of Master

- Check configuration of master
 - Check whether to do download or don't
 - Check composition is right
- Configuration of communication baud rate
I/O size
Configuration of each node

Ground and environment

- Check ground is contacted
- Check environment factor (temperature, humidity, etc) is in less than regular limit
