FCC Caution

FCC Part 15.19 Caution:

1. This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:
 - (1) this device may not cause harmful interference and
 - (2) this device must accept any interference received, including interference that may cause undesired operation
2. This device and its antenna(s) must not be co-located or operating in conjunction with any other antenna or transmitter.
3. Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user authority to operate the equipment.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

The antennas used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter.

FCC Statement in User's Manual (for class B)

FCC Section 15.105

"Federal Communications Commission (FCC) Statement"

This equipment has been tested and found to comply with the limits for a class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.

- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

CE Statement of Conformity

Our product has been tested in typical configuration by Ecom Sertech Corp and was found to comply with the essential requirement of "Council Directive on the Approximation of the Laws of the Member States relating to Electromagnetic Compatibility" (89/336/EEC; 92/31/EEC; 93/68/EEC)

Chapter 1 Introduction

1.1 Product Appearance

LED Indicator Status Description:

LED	Function	Color	Status	Description
	System status	Green	On	System is ready to work
			Blinking 120ms	1. Power is being applied and system boot in progress 2. Reset or firmware upgrade in progress
 	Wireless activity & WPS status	Green	On	Wireless is connected
		Green	Blinking 30ms	Wireless Tx/Rx activity
	WAN port activity	Green	Blinking 120ms	WPS function in progress
			On	100Mbps Ethernet is connected
		Green	Blinking 30ms	100Mbps Ethernet Tx/Rx activity
			On	10Mbps Ethernet is connected
	LAN port activity	Green	Blinking 120ms	10Mbps Ethernet Tx/Rx activity
			On	100Mbps Ethernet is connected
		Green	Blinking 30ms	100Mbps Ethernet Tx/Rx activity
			On	10Mbps Ethernet is connected

Chapter 2 System and Network Setup

The BRF71N is an easy to setup and wireless device for various application and environment, especially for large installs such as hotels, offices space, warehouses, hot-spots and more.

To begin with BRF71N , you must have the following minimum system requirements. If your system can't correspond to the following requirements, you might get some unknown troubles on your system.

- ✍ Internet Account for XDSL/Cable Modem
- ✍ One Ethernet (10/100mbps) network interface card.
- ✍ TCP/IP and at least one web browser software installed (E.g.: Internet Explorer, Firefox, Safari 、 Chrome latest version).
- ✍ 802.11b 、 g 、 n wireless adapter for wireless mobile clients.
- ✍ Recommended OS: WinXP, Visata or Win7 / Linux.
- ✍

2.1 Build Network Connection

Administrator can manage the settings for WAN, LAN, Wireless Network, NTP, password, VPN, Firewall, etc.

Please confirm the network environment or the purpose before setting this product.

2.2 Connecting BRF71N

Prepare the followings before the connection:

- ✍ PC or Notebook for setup
- ✍ Ethernet cable

1. Make sure you are under "Router Mode".
2. Connect BRF71N to xDSL/ Cable modem with the Ethernet cable, WAN to LAN.
3. Turn on your Computer.

2.3 Network setup

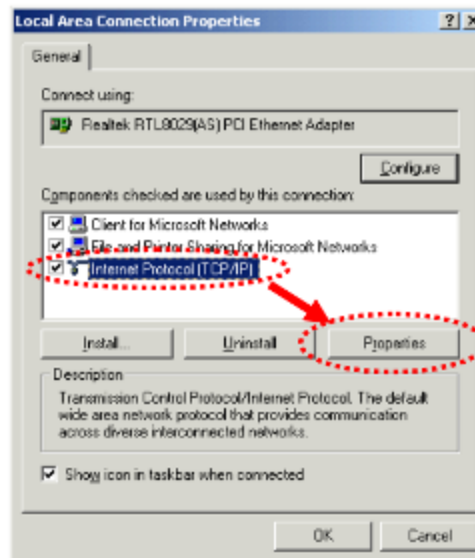

After the network connection is built, the next step is setup the router with proper network parameters, so it can work properly in your network environment. Before you connect to the wireless router and start configuration procedures, your computer must be able to get an IP address from the wireless router automatically (use dynamic IP address). If it's set to use static IP address, or you're unsure, please follow the below instructions to configure your computer with dynamic IP address:

If the operating system of your computer is....

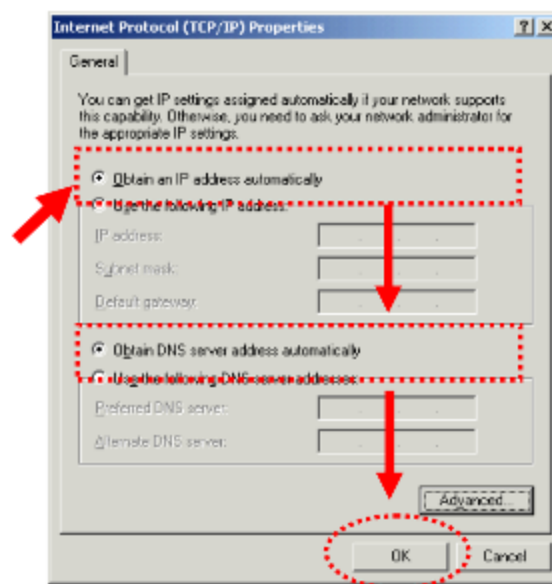

- Windows 2000 - please go to section 2.3.1
- Windows XP - please go to section 2.3.2
- Windows Vista/Win7 - please go to section 2.3.3

2.3.1 Windows 2000

Click "Start" button (it should be located at lower-left corner of your computer), then click control panel. Double-click Network and Dial-up Connections icon, double click Local Area Connection, and Local Area Connection Properties window will appear. Select "Internet Protocol (TCP/IP)", then click "Properties".

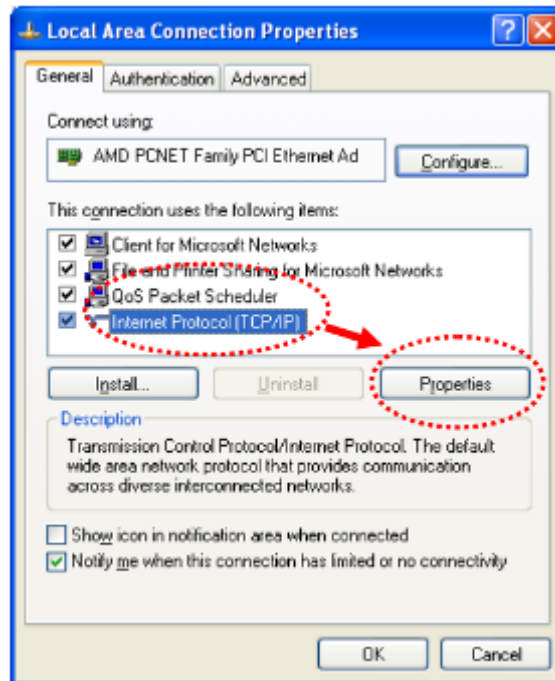

1. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”, then click “OK”.

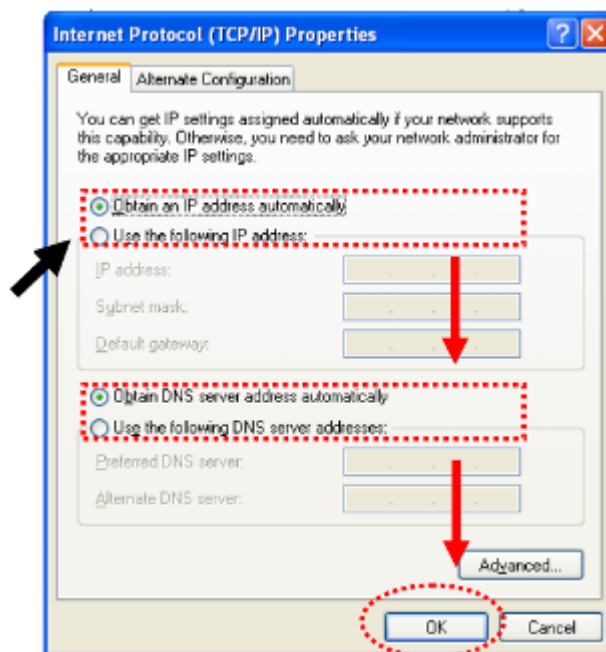

2.3.2 Windows XP

1. Click “Start” button (it should be located at lower-left corner of your computer), then click control panel. Double-click Network and Internet Connections icon, click Network Connections, then double-click Local Area Connection, Local Area Connection Status window will appear, and then click “Properties”.

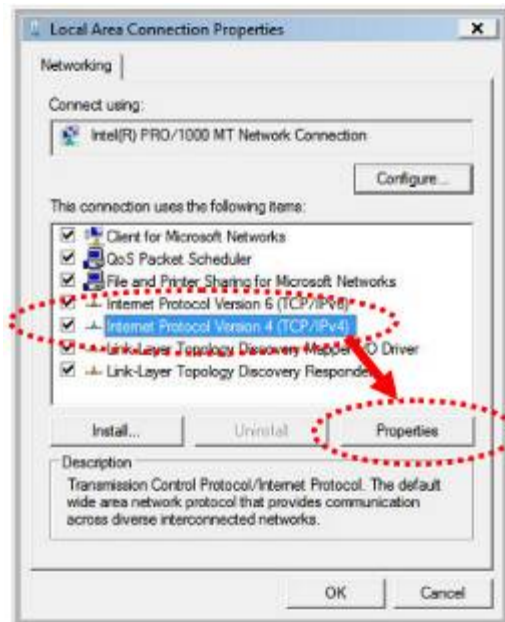

2. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”, then click “OK”.

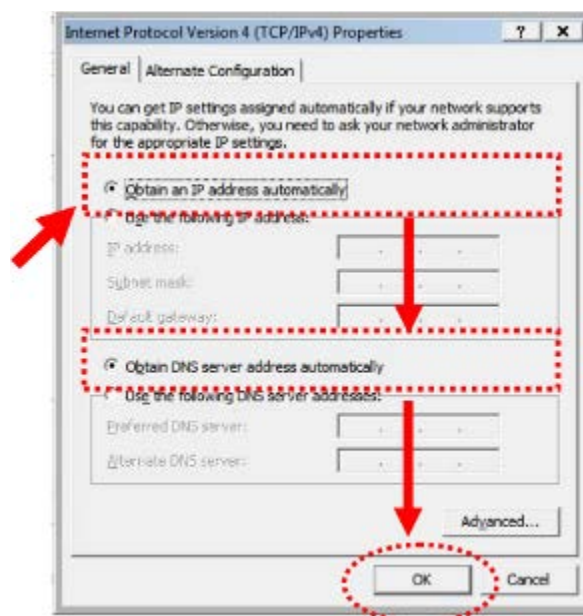

2.3.3 Windows Vista / Windows 7

1. Click “Start” button (it should be located at lower-left corner of your computer), then click control panel. Click View Network Status and Tasks, and then click Manage Network Connections. Right-click Local Area Network, then select “Properties”. Local Area

Connection Properties window will appear, select “Internet Protocol Version 4 (TCP / IPv4)”, and then click “Properties”.

2. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”, then click “OK”.

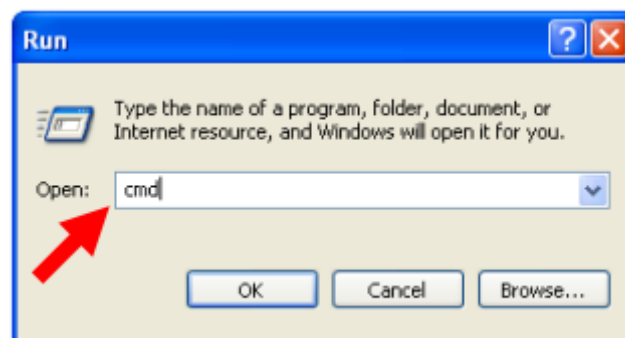

2.4 Router IP Address Lookup

After the IP address setup was completed, please clicks “start” → “run” at the bottom-lower corner of your desktop:

Input “cmd”, and then click “OK”.

Input “ipconfig”, then press “Enter” key. Please check the IP address followed by “Default Gateway” (In this example, the gateway IP address of router is 192.168.1.1)

```
C:\Documents and Settings\demo>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 
    IP Address. . . . . : 192.168.1.100
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.1.1

C:\Documents and Settings\demo>
```

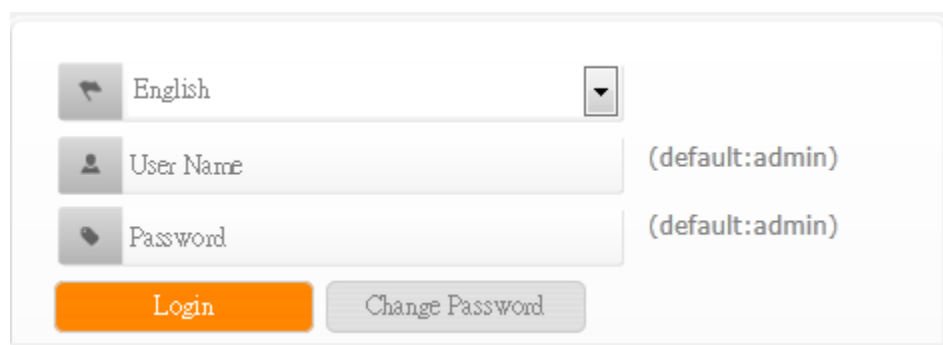

NOTE: If the IP address of Gateway is not displayed, or the address followed by 'IP Address' begins with "169.x.x.x", please recheck network connection between your computer and router, and / or go to the beginning of this chapter, to recheck every step of network setup procedure.

2.4.1 Log into Web GUI

After your computer obtained an IP address from wireless router, please start your web browser, and input the IP address of the wireless router in address bar, and the following message should be shown. Please click "admin" to login the BRF71N .

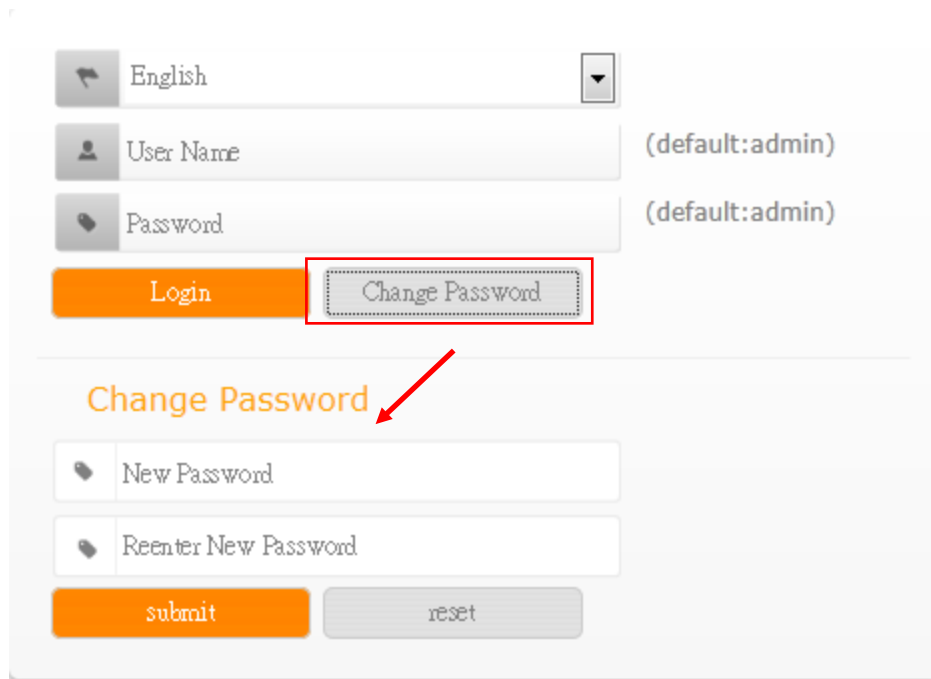

Enter the User name and Password in to the blank and then Click **Login**. The default values for User Name and Password are **admin** (all in lowercase letters).

A screenshot of a web login form. At the top, there is a language dropdown menu set to "English". Below it are two input fields: "User Name" and "Password". To the right of the "User Name" field is the text "(default:admin)". To the right of the "Password" field is the text "(default:admin)". At the bottom of the form are two buttons: an orange "Login" button and a grey "Change Password" button.

Users can set or change user name and password used for accessing the web management interface in this section.

Input User Name and New Password, then input Confirm Password again.

Chapter 3 Internet Connection

This Chapter describes how to setup BRF71N to the internet. The BRF71N is delivered with the following factory default parameters.

Default IP address: 192.168.1.1

Default IP subnet mask: 255.255.255.0

Web login user name: admin

Web login password: admin

3.1 Using as a broadband router

↔ Open a Web browser, and enter <http://192.168.1.1> (Default Gateway) into the blank.

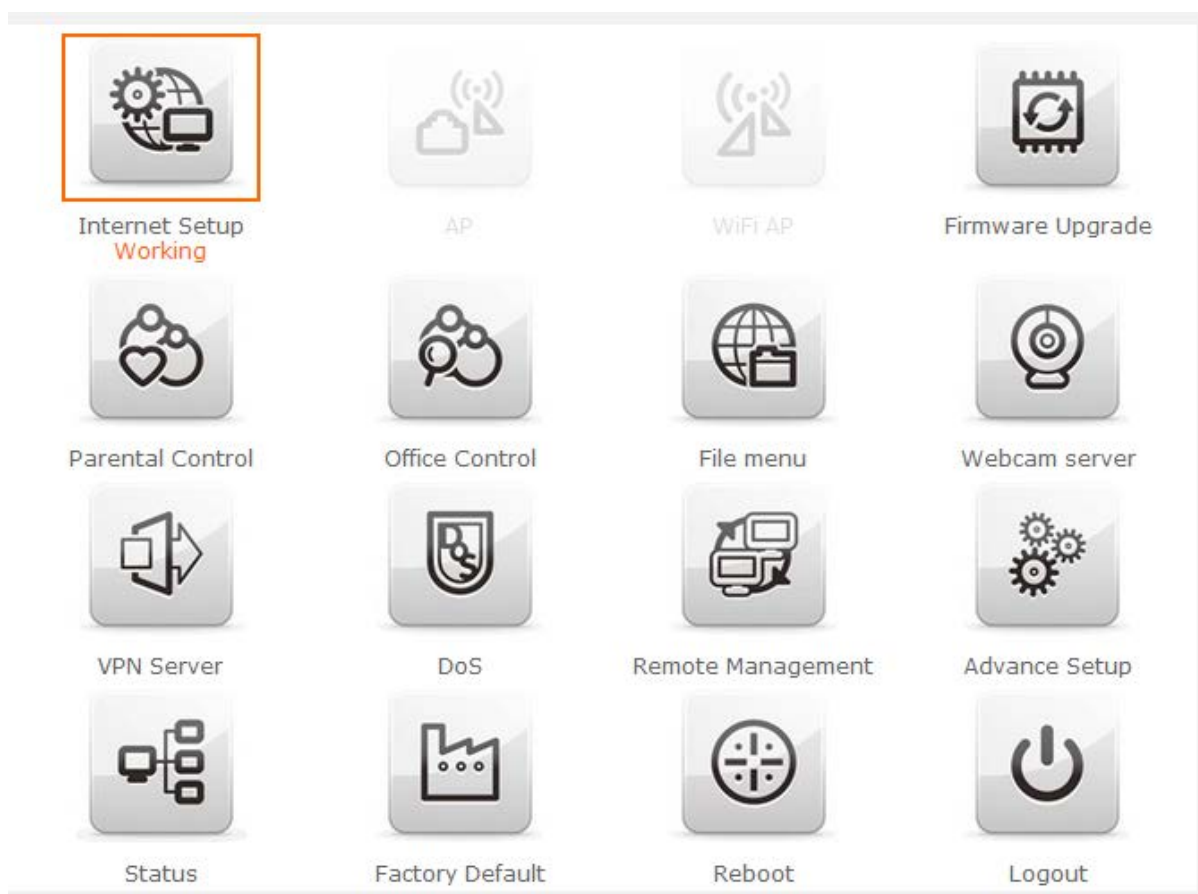

↑ Enter the User name and Password into the blank and then click **Login**. The default values for User Name and Password are **admin** (all in lowercase letters).

The image shows two parts of the Sapido web interface. The top part is the login page, which includes a language dropdown set to 'English', input fields for 'User Name' (default: admin) and 'Password' (default: admin), and 'Login' and 'Change Password' buttons. The bottom part is the 'Status' page, which displays network information. On the left, it shows 'Firmware Version : Ver1.0.0_iphone', 'Operation Mode : DHCP', and 'Uptime : 00 : 02 : 15 : 18'. The main area lists WAN status (Start button), WAN IP Address (0.0.0.0), DNS 1, 2, and 3 (all 0.0.0.0), Attain IP Protocol (DHCP), Gateway (0.0.0.0), and WAN Setting (Forwarding Setting...). A network diagram on the right shows a router connected to a DHCP server, with a client and a USB device connected to the router. Red callouts highlight the 'Download pdadd' button, the 'Status page' icon, and the 'Logout' button.

3.2 Home button menu

Click Home button icon to enter MENU as below.

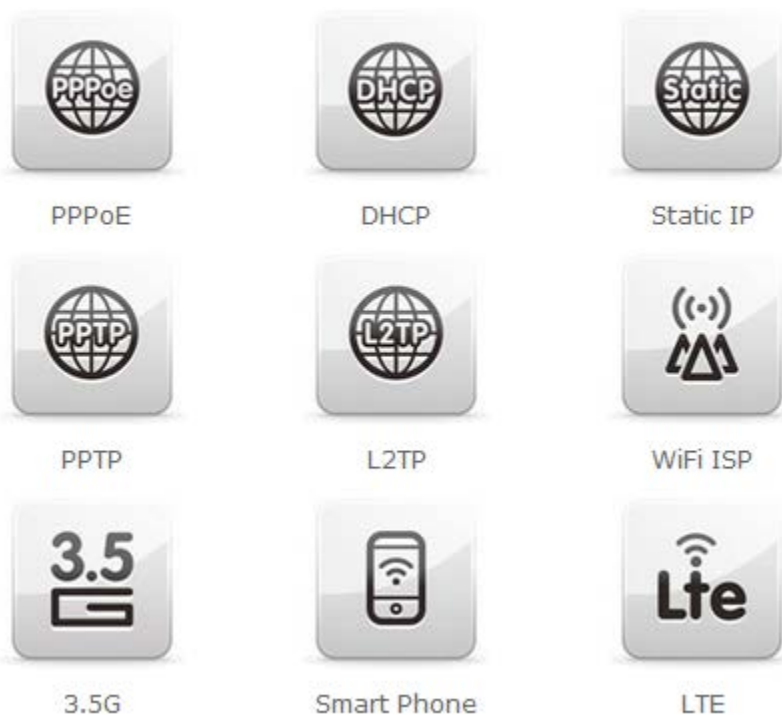

Item	Description
Internet Setup	There are several different method to access Internet , PPPoE 、 DHCP 、 Static IP 、 PPTP 、 L2TP 、 WiFi ISP
AP (HW switch)	If a router is already set at the house, and you want to make the wireless LAN communication
WiFi AP (HW switch)	When you connect to the internet wirelessly through PC and wireless device without wireless LAN function equipped.
Firmware Upgrade	This function allows you upgrade the BRF71N firmware to new version. Please note do not power off the device during the upload because it may crash the system.
Parental control	You can use URL filter 、 MAC Filter Schedule and Wireless Schedule to limit access Internet.
Office Control	For office environment , there are Multiple AP 、 Wireless Access Control 、 IP Filtering 、 IP Binding and QoS
File Menu	There are Samba Storage and FTP server features
Webcam server	For image record
VPN Server	PPTP/L2TP general setup introduction.
DoS	Denial of Service

Remote management	This page allow you to access the GUI on WAN.
Advance Setup	Advance setting menu
Status	You could check WAN, LAN, Client network in status.
Factory Default	You could reset the current configuration to factory default.
Reboot	This function is used to reboot
Logout	This page is used to logout.

3.3 Internet Setup

Click **Internet Setup** icon to enter WAN setup as below. The Internet Setup is depended on the service that you contract with the provider. The BRF71N provides five selections for the Internet Mode type, **PPPoE, DHCP, Static IP, PPTP and L2TP**、**WiFi ISP**、**3.5G**、**Smart Phone**、**LTE**. Check with your ISP if you don't know the WAN type.

Chapter 4 GUI Function Setup

4.1 Firmware Upgrade

This function can upgrade the firmware of the router. There are two methods for user upgrade firmware: Auto upgrade and Manual upgrade.

Caution: To prevent that firmware upgrading is interrupted by other wireless signals and causes failure. We recommend users to use wired connection during upgrading.

Note: The firmware upgrade will not remove your previous settings.

4.1.1 Auto upgrade

It provide auto detect new firmware from Internet, and user can select to upgrade new version or not.

5.2.2 LAN

Use this page to set up the local IP address and subnet mask for your router. Please select **LAN Interface Setup** under the **IP Config** menu and follow the instructions below to enter the LAN setting page to configure the settings you want.

LAN Interface Setup

IP Address:	<input type="text" value="192.168.0.1"/>
Subnet Mask:	<input type="text" value="255.255.255.0"/>
Gateway:	<input type="text" value="192.168.0.1"/>
DHCP:	<input type="text" value="Server"/> ▼
DHCP Client Range:	<input type="text" value="192.168.0.100"/> - <input type="text" value="192.168.0.200"/> <input type="button" value="Show Client"/>
DHCP Lease Time:	<input type="text" value="480"/> (1 - 10080 minutes)
Static DHCP:	<input type="button" value="Set Static DHCP"/>
Domain Name:	<input type="text" value="Sapido_Router"/>
802.1d Spanning Tree:	<input type="text" value="Disabled"/> ▼
Clone MAC Address:	<input type="text" value="000000000000"/>

Item	Description
IP Address	The default value of LAN IP address is 192.168.1.1 for this router.
Subnet Mask	Input Subnet Mask, normally it is 255.255.255.0.
Gateway	Input ISP Default Gateway Address. If you don't know, please check with your ISP.
DHCP	Enable or disable DHCP services. The DHCP server will automatically allocate an unused IP address from the IP address

	pool to the requesting computer if enabled.
DHCP Client Range	Define the DHCP client range and then the DHCP server will assign an IP to the requesting computer from this range. The Show Client will display every assigned IP address, MAC address, and expired time. The default range is 192.168.1.100 - 192.168.1.200.
DHCP Lease Time	IP available time
Static DHCP	Please refer IP Binding
Domain Name	The name of device
802.1d Spanning Tree	IEEE 802.1d Spanning Tree Protocol (STP) is a link layer network protocol that ensures a loop-free topology for any bridged LAN. The main purpose of STP is to ensure that you do not create loops when you have redundant paths in your network. Loops are deadly to a network.
Clone MAC Address	Copy the MAC address from the device you had registered to your ISP if your ISP asks for the specific MAC Address.

5.2.3 DDNS

You can assign a fixed host and domain name to a dynamic Internet IP address. Each time the router boots up, it will re-register its domain-name-to-IP-address mapping with the DDNS service provider. This is the way Internet users can access the router through a domain name instead of its IP address.

Note: make sure that you have registered with a DDNS service provider before enabling this feature.

Dynamic DNS

☐ Enable DDNS

Service Provider : 

Domain Name :

User Name/Email :

Password/Key :

Note:

For TZO, you can have a 30 days free trial [here](#) or manage your TZO account in [control panel](#)

For DynDNS, you can create your DynDNS account

Item	Description
Disable Wireless	Turn off the wireless service.
Band	Select the frequency. It has 6 options: 2.4 GHz (B/G/N/B+G/G+N/B+G+N).
Mode	Select the mode. It has 3 modes to select: (AP, Client, WDS, AP+WDS). Multiple AP: Please check Section 4.1.2.1. * In Wi-Fi AP mode only support Client mode.
Network Type	<ul style="list-style-type: none"> Infrastructure : one of the two methods for connecting to wireless networks with Wi-Fi enabled devices such as laptops, Pda's I-phone etc. These devices are connected to wireless network with the help of Access point (AP). Wireless Access Points are usually routers or switches which are connected to internet by Ethernet port. Ad hoc : By using ad hoc mode, devices are capable for communicating directly with each other. No Access point (routers / switches) is required for communication between devices and all devices in the range connect in peer to peer communication mode.
SSID	Service Set identifier, users can define to any or keep as default.
Channel Width	Please select the channel width, it has 3 options: 20MHz / 40MHz / Auto
Control Sideband	Enable this function will control your router use lower or upper channel.
Channel Number	Please select the channel; it has Auto, 1, 2~11 or 13 options.
Broadcast SSID	User may choose to enable Broadcast SSID or not.
WMM	Enable / Disable Wi-Fi Multimedia
Data Rate	Please select the data transmission rate.
Associate Clients	Check the AP connectors and the Wireless connecting status.
Enable MAC Clone (Single Ethernet Client)	Clone the MAC address for ISP to identify.
Enable Universal Repeater Mode (Acting as AP and	Allow to equip with the wireless way conjunction upper level, provide the bottom layer user link in wireless and wired way in the

Client simultaneously)	meantime. (The IP that bottom layer obtains is from upper level.) Please also check Section 4.1.2.2
SSID of Extended Interface	While linking the upper level device in wireless way, you can set SSID to give the bottom layer user search.
Multiple AP	BRF71n can register up to 4 SSIDs (wireless LAN group). It can be used as if there are multiple wireless LAN access points with one product. Each SSID could be set with different data rate, WMM and access type
Save & Apply	Click on "Save" to save the setting data. The "Apply" button can execute current configuration

5.4.2 Advanced Settings

Wireless Advanced Settings

Fragment Threshold: (256-2346)
 RTS Threshold: (0-2347)
 Beacon Interval: (20-1024 ms)
 Preamble Type: ☒ Long Preamble ☐ Short Preamble
 IAPP: ☒ Enabled ☐ Disabled
 Protection: ☐ Enabled ☒ Disabled
 Aggregation: ☒ Enabled ☐ Disabled
 Short GI: ☒ Enabled ☐ Disabled
 WLAN Partition: ☐ Enabled ☒ Disabled
 20/40MHz Coexist: ☒ Enabled ☐ Disabled
 RF Output Power: ☒ 100% ☐ 70% ☐ 50% ☐ 35% ☐ 15%

Refresh

Save

Apply

Item	Description
Fragment Threshold	To identify the maxima length of packet, the over length packet will be fragmentized. The allowed range is 256-2346, and default length is 2346.
RTS Threshold	This value should remain at its default setting of 2347. The range is 0~2347. Should you encounter inconsistent data flow, only minor modifications are recommended. If a network packet is smaller than the present RTS threshold size, the RTS/CTS mechanism will not be enabled. The router sends Request to Send (RTS) frames to a particular receiving station and negotiates the sending of a data

	frame. After receiving an RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission. Fill the range from 0 to 2347 into this blank.
Beacon Interval	Beacons are packets sent by an access point to synchronize a wireless network. Specify a beacon interval value. The allowed setting range is 20-1024 ms..
Preamble Type	PLCP is Physical layer convergence protocol and PPDU is PLCP protocol data unit during transmission, the PSDU shall be appended to a PLCP preamble and header to create the PPDU. It has 2 options: Long Preamble and Short Preamble.
IAPP	Inter-Access Point Protocol is a recommendation that describes an optional extension to IEEE 802.11 that provides wireless access-point communications among multivendor systems.
Protection	Please select to enable wireless protection or not.
Aggregation	Enable this function will combine several packets to one and transmit it. It can reduce the problem when mass packets are transmitting.
Short GI	Users can get better wireless transmission efficiency when they enable this function.
WLAN Partition	Shut down the communication between the connected wireless LAN devices. If you set up as "Enabled", devices connected with the router, such as a printer, will not be able to use. Default Setting: "Disabled"
20/40MHz Coexist	Configure 20/40MHz coexisting scheme. If you set up as "Enabled", "20MHz" and "40MHz" will coexist. Normally use as "Disabled". Default Setting: "Disabled"
RF Output Power	Users can adjust RF output power to get the best wireless network environment. Users can choose from 100%, 70%, 50%, 35%, and 15%.

5.4.3 Security

Here users define the security type and level of the wireless network. Selecting different methods provides different levels of security. **Please note that using any encryption may cause a significant degradation of data throughput on the wireless link.** There are five Encryption types supported: "None", "WEP", "WPA", "WPA2", and "WPA-Mixed". Enabling WEP can protect your data from eavesdroppers. If you do not need this feature, select "None" to skip the following setting

Wireless Security

[Help](#)

Select SSID:

Encryption:

Authentication Mode: ☒ Enterprise (RADIUS) ☐ Personal (Pre-Shared Key)

WPA Cipher Suite: ☐ TKIP ☒ AES

WPA2 Cipher Suite: ☐ TKIP ☒ AES

RADIUS Server IP Address:

RADIUS Server Port:

RADIUS Server Password:

Item	Description
WEP	<p>WEP is the most general encryption scheme among wireless LAN security, configure the common encrypted key (WEP Key) for access point and wireless LAN handset. WEP key length are "64bit", "128bit", and "256bit" (This product corresponds up to 128bit), larger the value is, more the character can be set, and encryption strength will enhanced.</p> <p>* If you configure the encryption key as "5 letters in half-width alphabets and numbers" or "Hexadecimal in 10 digits", please select "64-bit".</p> <p>* If you configure the encryption key as "13 letters in half-width alphabets and numbers" or "Hexadecimal in 26 digits", please select "128-bit".</p>
WPA / WPA2	<p>WPA/WPA2 is wireless LAN security standard which is strengthen over WEP. On WPA-PSK/WPA2-PSK, uses encrypted key called pre-shared key, and set up common encryption key for access point and wireless LAN handset like WEP. There are "AES" and "TKIP" as encryption scheme. "TKIP" automatically updates the key at regular intervals, check and approve the communication, so it can communicate safer than WEP key which uses single encryption key for long time. "AES" is harder to decode comparing to "TKIP", so it can say tougher encryption scheme than "TKIP"</p>
WPA-Mixed	Support WPA and WPA2 at the same time
802.1x Authentication Radius	For radius server authentication
Personal (Pre-Shared Key)	<p>* If you configure Pre-Shared Key as "Hexadecimal in 64 digits", please select "Hex (64 characters)".</p> <p>* If you configure encryption key in "8 to 63 letters in half-width alphabets and numbers", please select</p>

	"Passphrase

5.4.4 Access Control

Please refer [Wireless Access Control](#)

5.4.5 WPS

This page allows user to change the setting for WPS (Wi-Fi Protected Setup). Using this feature could let your wireless client atomically synchronize it's setting and connect to the Access Point in a minute without any hassle. SAPIDO BRF71N could support both Self-PIN or PBC modes, or use the WPS button (at real panel) to easy enable the WPS function.

PIN model, in which a PIN has to be taken either from a sticker label or from the web interface of the WPS device. This PIN will then be entered in the AP or client WPS device to connect.

PBC model, in which the user simply has to push a button, either an actual or a virtual one, on both WPS devices to connect.

BRF71n WPS only support no encryption and WPA2

Please follow instructions below to enable the WPS function.

1. Setup Wireless LAN with WPS PIN :

- (1). Get the WPS PIN number from wireless card and write it down.

(2).

(3). Fill in the PIN number from the wireless card in Client PIN Number field, and then click "Start PIN".

Wi-Fi Protected Setup

(4). Click PIN from Adapter Utility to complete the WPS process with the wireless router.

(5). Wireless dongle should connect to BRF71n

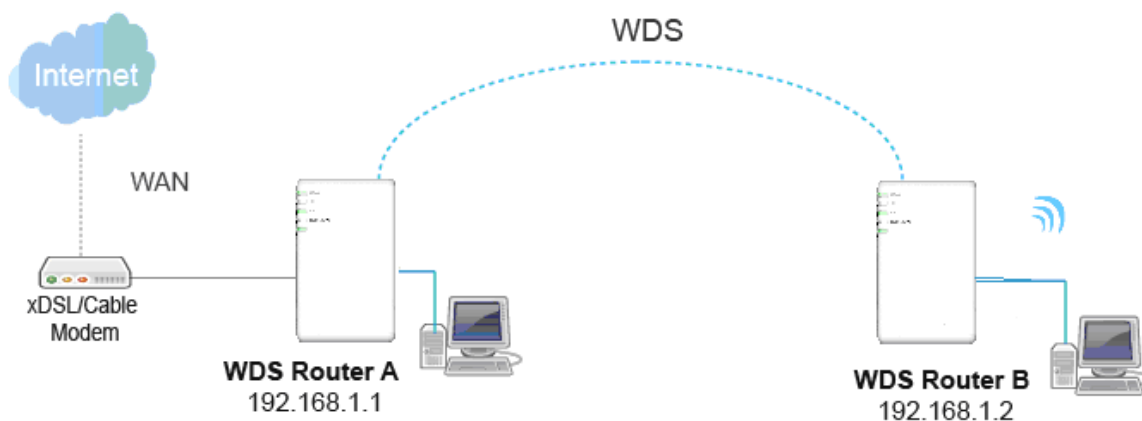

2. Start PBC:

- (1). Press the BRF71n WPS button and wait for WPS LED blinking
- (2). Press the dongle WPS button
- (3). Wireless dongle should connect to BRF71n

5.4.6 WDS

When selected in the Basic Settings page and enabled here, Wireless Distribution System (WDS) enables the router to be used as a wireless bridge. Two Wireless-N Routers in bridge mode can communicate with each other through their wireless interfaces. To accomplish this, all wireless routers should be set to the same channel and the MAC address of other AP / Routers should be entered in the table.

The WDS explanation is as the following picture.

Router_A :

↔ Set the connection mode to “AP+WDS” from “Wireless Basic Setting”, and then select the channel number (in this example is "11"). Click Apply Changes to save the setting.

Wireless Basic Settings

5.4.7 Schedule

Please refer [Wireless Schedule](#)

5.5 NAT

This section contains configurations for the BRF71N 's advanced functions such as: virtual server, and DMZ to provide your network under a security environment.

5.5.1 DMZ

The DMZ feature allows one local user to be exposed to the Internet for special-purpose applications like Internet gaming or videoconferencing. When enabled, this feature opens all ports to a single station and hence renders that system exposed to intrusion from outside. The port forwarding feature is more secure because it only opens the ports required by that application.

DMZ

☐ Enable DMZ

DMZ Host IP Address :

Refresh

Save

Apply

Item	Description
Enable DMZ	It will enable the DMZ service if you select it.
DMZ Host IP Address	Please enter the specific IP address for DMZ host.

5.5.2 Virtual Server

The Virtual Server feature allows users to create Virtual Servers by re-directing a particular range of service port numbers (from the WAN port) to a particular LAN IP address.

Virtual Server

[Refresh](#)
[Save](#)
[Apply](#)

Item	Description
Forwarding Rule	Bridge or NAT mode
Tag	Add VLAN tag to packet
VID	Set VLAN ID (1~4096)
Priority	It indicates the frame priority level. Values are from 0 (best effort) to 7 (highest); 1 represents the lowest priority
CFI	Enable or Disable CFI

5.10 System

This section including **Wake on LAN**, **Change Username/Password**, **Upgrade Firmware**, **Profiles Save**, **Remote Management**, **Time Zone**, **UPnP**, **Route Setup**, **VPN Passthrough**, and **Wan Type Auto Detection**. It is easy and helpful for users making more detailed settings.

5.10.1 Wake on Lan

Switch your computer ON through your LAN or the Internet . To support WOL you must have a computer with Motherboard that supports WOL, as well as a Network Controller (NIC) supporting

this function. Most of the newer Motherboard (circa 2002 and On), have an On Board NIC that supports WOL. Otherwise you need to install a PCI NIC that is WOL capable.

Wake on Lan Schedule

Help

☐ Enable Wake on LAN Schedule

Enable NTP client update	Please select to enable NTP client update or not.
Automatically Adjust Daylight Saving	Please select to enable Automatically Adjust Daylight Saving or not.
NTP Server	Please select the NTP server from the pull-down list, or you can enter the NTP server IP address manually.
Save & Apply	Click on Save to save the setting date, the Apply button for execute current configuration.

5.10.7 UpnP

UPnP Setting

Enable/Disable UPNP: ☒ Enabled ☐ Disabled

Enable/Disable AV
UPnP: ☒ Enabled ☐ Disabled

Refresh

Save

Apply

⏪ UPNP

Universal Plug and Play (UPnP) is a standard of networking protocols promulgated by the UPnP Forum. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components. BRF71N supports UPnP function, and can cooperate with other UPnP devices. When you activate UPnP, please click My Network Places. Users will see an Internet Gateway Device icon. By click the icon, users can enter the GUI of the router. If you do not wish to use UPnP, you can disable it.

⏪ AV UPNP

AV UPnP media server is the UPnP-server that provides media library information and streams media-data (like audio/video/picture/files) to UPnP-clients on the network. It is a computer system or a similar digital appliance that stores digital media, such as photographs, movies, or music and shares these with other devices. User can plug in USB disk to product USB port and use AV UPnP client to play USB disk media-data (like audio/video/picture/files)

5.10.8 Route Setup

Dynamic routing is a distance-vector routing protocol, which employs the hop count as a routing metric. RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops allowed for RIP is 15

Static routing is a data communication concept describing one way of configuring path selection of routers in computer networks. It is the type of routing characterized by the absence of communication between routers regarding the current topology of the network. This is achieved by manually adding routes to the router routing table.

Routing Setup

[Help](#)

Chapter 6 Q & A

6.1 Installation

1. Q: Where is the XDSL Router installed on the network?

A: In a typical environment, the Router is installed between the XDSL line and the LAN. Plug the XDSL Router into the XDSL line on the wall and Ethernet port on the Hub (switch or computer).

2. Q: Why does the throughput seem slow?

A: To achieve maximum throughput, verify that your cable doesn't exceed 100 meter. If you have to do so, we advise you to purchase a bridge to place it in the middle of the route in order to keep the quality of transmitting signal. Out of this condition you would better test something else.

- ✓ Verify network traffic does not exceed 37% of bandwidth.
- ✓ Check to see that the network does not exceed 10 broadcast messages per second.
- ✓ Verify network topology and configuration.

6.2 LED

1. Why doesn't BRF71N power up?

A: Check if the output voltage is suitable, or check if the power supply is out of order.

2. The Internet browser still cannot find or connect to BRF71N after verifying the IP address and LAN cable, the changes cannot be made, or password is lost.

A: In case BRF71N is inaccessible; you can try to restore its factory default settings. Please press the "Reset" button and keep it pressed for over 7 seconds and the light of STATUS will vanish. The LEDs will flash again when reset is successful.

3. Why does BRF71N shut down unexpectedly?

A: Re-plug your power adapter. Then, check the STATUS indicator; if it is off, the internal flash memory is damaged. For more help, please contact with your provider.

6.3 IP Address

1. Q: What is the default IP address of the router for LAN port?

A: The default IP address is 192.168.1.1 with subnet mask 255.255.255.0

2. Q: I don't know my WAN IP.

A: There are two ways to know.

Way 1: Check with your Internet Service Provider.

Way 2: Check the setting screen of BRF71N . Click on **Status & Log** item to select **Network Configuration** on the Main Menu. WAN IP is shown on the WAN interface.

3. How can I check whether I have static WAN IP Address?

A: Consult your ISP to confirm the information, or check Network Configuration in BRF71N's Main Menu.

4. Will the Router allow me to use my own public IPs and Domain, or do I have to use the IPs provided by the Router?

A: Yes, the Router mode allows for customization of your public IPs and Domain.

6.4 OS Setting

1. Why can't my computer work online after connecting to BRF71N ?

A: It's possible that your Internet protocol (TCP/IP) was set to use the following IP address. Please do as the following steps. (Windows 2000 & XP) **Start > Settings > Network and Dial-up Connections >** double click on **Internet Protocol(TCP/IP) >** select **obtain IP address automatically >** Click on **OK** button. Then, open Internet browser for testing. If you still can't go online, please test something else below.

- ✓ Verify network configuration by ensuring that there are no duplicate IP addresses.
- ✓ Power down the device in question and ping the assigned IP address of the device. Ensure no other device responds to that address.
- ✓ Check that the cables and connectors or use another LAN cable.

2. Q: Why can't I connect to the router's configuration utility?

A: Possible Solution 1: Make sure that your Ethernet connect properly and securely. Make sure that you've plugged in the power cord.

Possible Solution 2: Make sure that your PC is using an IP address within the range of 192.168.1.2 to 192.168.1.254. Make sure that the address of the subnet mask is 255.255.255.0. If necessary, the Default Gateway data should be at 192.168.1.1. To verify these settings, perform the following steps:

Windows 2000, or XP Users:

1. Click on Windows **Start** > click on **Run** > input **cmd** > click on **OK** button.
2. At the DOS prompt, type **ipconfig/all**.
3. Check the IP Address, Subnet Mask, Default Gateway data. Is this data correct? If the data isn't correct. Please input **ipconfig/release** > press **Enter** > input **ipconfig/renew** > press **Enter**.

Possible Solution 3: Verify the connection setting of your Web browser and verify that the HTTP Proxy feature of your Web browser is disabled. Make these verifications so that your Web browser can read configuration pages inside your router. Launch your Web browser.

Internet Explorer Users:

1. Click on **Tools** > **Internet Options** > **Connections tab**.
2. Select **never dial a connection**, click on **Apply** button, and then click on **OK** button.
3. Click on **Tools** and then click on **Internet Options**.
4. Click on **Connections** and then click on **LAN Settings**.
5. Make sure none of the check boxes are selected and click on **OK** button.
6. Click on **OK** button.

Netscape Navigator Users:

1. Click on **Edit** > **Preferences** > double-click **Advanced** in the Category window.
2. Click on **Proxies** > select **Direct connection to the Internet** > click on **OK** button.
3. Click on **Edit again** and then click on **Preferences**.
4. Under category, double-click on **Advanced** and then click on **Proxies**.
5. Select **Direct connection to the Internet** and click on **OK** button.
6. Click on **OK** button.

3. **Q: Web page hangs, corrupt downloads, or nothing but junk characters is being displayed on the screen. What do I need to do?**

A: Force your NIC to 10Mbps or half duplex mode, and turn off the "Auto-negotiate" feature of your NIC as a temporary measure. (Please look at the Network Control Panel, in your Ethernet Adapter's Advanced Properties tab.)

4. Q: Why can't I connect to the Web Configuration?

A: you can remove the proxy server settings in your web browser.

6.5 BRF71N Setup

1. Q: Why does BRF71N 's setup page shut down unexpectedly?

A: If one of the pages appears incompletely in BRF71N 's setup pages, please click on Logout item on the Main Menu before shutting it down. Don't keep it working. Then, close Internet browser and open it again for going back to the previous page.

2. Q: I don't know how to configure DHCP.

A: DHCP is commonly used in the large local network. It allows you to manage and distribute IP addresses from 2 to 254 throughout your local network via BRF71N . Without DHCP, you would have to configure each computer separately. It's very troublesome. Please Open **Internet browser** > Input **192.168.1.1 in the website blank field** > Select **DHCP Server** under the **IP Config Menu**. For more information, please refer to 3.3.2 (Router Mode) or 4.3.1 (AP Mode).

3. Q: How do I upgrade the firmware of BRF71N ?

A: Periodically, a new Flash Code is available for BRF71N on your product supplier's website. Ideally, you should update BRF71N 's Flash Code using **Firmware Upgrade** on the **System Management** menu of BRF71N Settings.

4. Q: Why is that I can ping to outside hosts, but cannot access Internet websites?

A: Check the DNS server settings on your PC. You should get the DNS servers settings from your ISP. If your PC is running a DHCP client, remove any DNS IP address setting. As the router assign the DNS settings to the DHCP-client-enabled PC.

5. Q: BRF71N couldn't save the setting after click on Apply button?

A: BRF71N will start to run after the setting finished applying, but the setting isn't written into memory. Here we suggest if you want to make sure the setting would be written into memory, please reboot the device via **Reboot** under **System Management** directory.

6.6 Wireless LAN

1. Q: Why couldn't my wireless notebook work on-line after checking?

A: Generally, Wireless networks can sometimes be very complicated to set up, particularly if you're dealing with encryption and products from different vendors. Any number of variables can keep your workstations from talking to each other. Let's go over some of more common ones.

For starters, verify that your router and your workstation are using the same SSID descriptions. SSID acts as a password when a mobile device tries to connect to the wireless network. The SSID also differentiates one WLAN from another, so all access points and all devices attempting to connect to a specific WLAN must use the same SSID. A workstation will not be permitted to connect to the network unless it can provide this unique identifier. This is similar to the function of your network's Workgroup or Domain name.

When you're experiencing conductivity problems, it is always best to keep things simple. So next you are going to do is that, please disable any WEP encryption you might have configured.

Successful implementation of encryption also includes the use of a shared key. A HEX key is the most common, but other formats are also used. This key identifies the workstation to the router as a trusted member of this network. Different manufacturers can implement this key technology in ways that might prevent them from working correctly with another vendor's products. So pay attention to detail is going to be the key to a successful installation.

Next make sure the router and the NIC are configured to use the same communications channel. There are normally 11 of them, and the default channel can also vary from vendor to vendor. You might also want to confirm that the router has DHCP services enabled and an address pool configured. If not, the NIC won't be able to pick up an IP address. I have run across a few access points that offer DHCP services but do not assign all of the needed IP information to the NIC. As a result, I was able to connect to the network, but could not browse the web. The point is, don't assume anything. Verify for yourself that all of the required settings are being received by the workstation.

Finally, you might want to keep the system you're trying to configure in the same room as the router, at least during the initial configuration, in order to minimize potential interference from concrete walls or steel beams.

2. Q: My PC can't locate the Wireless Access Point.

A: Check the following:

- ✓ Your PC is set to Infrastructure Mode. (Access Points are always in Infrastructure Mode.)
- ✓ The SSID on your PC and the Wireless Access Point are the same. Remember that the SSID is case-sensitive. So, for example "Workgroup" does NOT match "workgroup".
- ✓ Both your PC and the Wireless Access Point must have the same setting for WEP. The default setting for the Wireless Router is disabled, so your wireless station should also have WEP disabled.
- ✓ If WEP is enabled on the Wireless Router, your PC must have WEP enabled, and the key must match.
- ✓ If the Wireless Router's Wireless screen is set to Allow LAN access to selected Wireless Stations only, then each of your Wireless stations must have been selected, or access will be blocked.
- ✓ To see if radio interference is causing a problem, see if connection is possible when close to the Wireless Access Point. Remember that the connection range can be as little as 100 feet in poor environments.

3. Q: Wireless connection speed is very slow.

A: The wireless system will connect at highest possible speed, depending on the distance and the environment. To obtain the highest possible connection speed, you can experiment with following:

- ✓ Access Point location: Try adjusting the location and orientation of the Access Point.
- ✓ Wireless Channel: If interference is the problem, changing to another channel may show a marked improvement.
- ✓ Radio Interference: Other devices may be causing interference. You can experiment by switching other devices off, and see if this helps. Any "noisy" devices should be shielded or relocated.
- ✓ RF Shielding: Your environment may tend to block transmission between the wireless stations. This will mean high access speed is only possible when close to the Access Point.

4. Q: Some applications do not run properly when using the Wireless Router.

A: The Wireless Router processes the data passing through it, so it is not transparent. Use the Special Application feature to allow the use of Internet applications which do not function correctly. If this does solve the problem, you can use the DMZ function. This should work with almost every application, but:

- ✓ It is a security risk, since the firewall is disabled.
- ✓ Only one (1) PC can use this feature.

5. Q: I can't connect to the Wireless Router to configure it.

A: Check the following:

- ✓ The Wireless Router is properly installed, LAN connections are OK, and it is powered ON.
- ✓ Make sure that your PC and the Wireless Router are on the same network segment.
- ✓ If your PC is set to "Obtain an IP Address automatically" (DHCP client), restart it.
- ✓ If your PC uses a Fixed (Static) IP address, make sure that it is using an IP Address within the range 192.168.1.129 to 192.168.1.253 and thus compatible with the Wireless Router's default IP Address of 192.168.1.254. Also, the Network Mask should be set to 255.255.255.0 to match the Wireless Router. In Windows, you can check these settings by using Control Panel ~ Network to check the Properties for the TCP/IP protocol.

6. Q: The WinXP wireless interface couldn't communicate the WEP with SAPIDO BRF71N's wireless interface.

A: The default WEP of WinXP is **Authentication Open System - WEP**, but the WEP of SAPIDO BRF71N is only for **Shared Key - WEP**, it caused both sides couldn't communicate. Please select the WEP of WinXP from Authentication Open System to **Pre-shared Key - WEP**, and then the WEP wireless interface between WinXP and SAPIDO BRF71N would be communicated.

6.7 Support

1. Q: What is the maximum number of IP addresses that the XDSL Router will support?

A: The Router will support to 253 IP addresses with NAT mode.

5. Q: Is the Router cross-platform compatible?

A: Any platform that supports Ethernet and TCP/IP is compatible with the Router.

6.8 Others

1. Q: Why does the router dial out for PPPoE mode very often?

A: Normally some of game, music or anti-virus program will send out packets that trigger the router to dial out, you can close these programs. Or you can set the idle time to 0, then control to dial out manually.

2. Q: What can I do if there is already a DHCP server in LAN?

A: If there are two DHCP servers existing on the same network, it may cause conflict and generate trouble. In this situation, we suggest to disable DHCP server in router and configure your PC manually.

Chapter 7 Appendices

7.1 Operating Systems

1. Microsoft : Windows 2000, XP, Vista, Windows 7.
2. Apple : Mac OS X 10.4.7, Leopard and the following related versions.
3. Linux : Redhat 9, Fedora 6 & 7, Ubuntu 7.04 and the following related versions.

7.2 Browsers

1. Internet Explorer ver. 6 and 7 and the following related versions.
2. FireFox ver. 2.0.0.11 and the following related versions.3.
3. Safari ver. 3.04 and the following related versions.

7.3 Communications Regulation Information

Should any consumers need to learn more information, services and supports, please contact the supplier of your product directly.
