

Foreword

This series product is specific on network video surveillance including wired box ip camera, wireless box ip camera, wired dome ip camera wired IR waterproof ip camera, etc. It uses processor with high-performance chips to realize audio/video capture, compression, transmission, and the standard Motion-JPEG coding algorithm can confirm the clear-fluent effect of video transmission. It supports user to view real-time video and remote control via browser such as IE, super client software and APP platform.

The series IP camera is available to enterprises, chain store, factory, home and any place need to monitor and view through internet. It is easy to install and user-friendly operate.

Please check if the accessories are all in before installation. If there is any missing, please contact seller timely.

List of items:

IP camera	-1 pc	
Bracket (refer to model)		— 1 рс

1 Product Overview

IP Camera is designed as web server running on network, it can transmit real-time video to anywhere through internet, and user can view real-time live video via web browser any time. It is available to large stores, schools, factories, houses, etc.

Basic function: IPCAM can transmit real-time live video data to remote place through internet with hardware compression method MJPE which providing high-quality video image and 25fps frame rate on LAN/WAN (local area network/wide area network).

The IPCAM video data transmission is basic on TCP/IP protocol, built-in web server supporting Internet Explore, thus, it make more easy to manage and maintain devices to remotely configure, start and upgrade firmware, etc.

Please check if the items are all in before installation of IP camera, if there is some missing, please contact seller

2 Features

- powerful high speed video protocol processor
- high sensitive and high definition CMOS sensor
- 0.3 megapixels resolution
- IR night vision

•Optimized Motion-JPEG video compression algorithm, realize to transmit high definition image through narrow bandwidth

- multiuser management and password
- support browser (IE browser, Firefox browser, Google browser, etc)
- support wireless network(WiFi/802.11/b/g)
- support dynamic DNS (DDNS)

- 3 -

MH3E-E-A1

- support max size 32G SD card, snapshot and record on alarm
- motion detection
- support two-way audio
- image snapshot
- support mobile phone view
- log
- support network protocols: HTTP/TCP/IP/UDP/STMP/DDNS/SNTP/DHCP/FTP

Certification	Certificate	ISO FCC CE SASO RoHS

3 Appearance and interface

3.1 Device appearance

Picture 1- device appearance

3.2 Device interface

Picture 2- device interface

power: external power adapter DC 5V/2A

Ethernet interface: 10/100M self-adaptable Ethernet interface, can connect to many network devices, such as hub, router, switch, etc.

Network light: flickering when network connecting

- 5 -

Power light: always on when power on **SD card:** support 32G SD card

I/O interface: one channel alarm input with 3, 4 pins (input grounded, low electric level trigger); TTL control for output with 1, 2 pins (1, 2 short-circuit).

4 Network connection

Picture 3- network connection guide

4.1 Connection instruction

Connect camera to router and connect power adapter before accessing IP Camera, and check the network light and power light if it is normal, confirm the cable status is good. To connection mode in picture 3:

- 1) camera-1 and camera-2 separately connect to two different LANS
- 2) the two LANS must directly connect to internet, and there is router
- in the LAN, the connection mode can be ADSL or optical fiber, etc.
 - 3) computer-3 can access internet

4.2 Access instruction

For accessing camera, it should configure some simple settings on the cable in good status:

- 1) computer and camera should be in the same subnet
- To access camera via inner access link(ip link), it should confirm the

- 6 -

MH3E-E-A1

computer to be in the same subnet with the camera, otherwise it needs to configure the IP for IP Camera, for example: camera-1 in picture5 has IP 192.168.1.126 (it is in subnet 192.168.1), PC-1' s IP is 192.168.0.100 (it is in subnet 192.168.0), then PC-1 can not access Camera-1 through inner link, so we should change Camera-1' s IP into 192.168.0.126; 2) computer and camera are in different LAN, but both can access internet Refer to picutre3 camera-1 and computer-2, if we want to access camera-1 through computer-2, then need to configure some settings following 1), to confirm computer-1 can access camera-1, then configure router-1 (do port forwarding in router-1), to transfer the computer-2' s access apply

to go through router-1 then to camera-1. Normally, computer-2 only can

PC	ADSL modem	IP camera
ADSL Settings		
Using ADSL Dialup		
ADSL User		
ADSL Password		
	Set Refresh	

4.3 Connect network via ADSL

reach router-1 without port forwarding for camera-1.

✤ Connect camera to router through cable.

- Configure parameters via IP Camera tool (refer to: <u>5.1 IPcamera tool</u>).
- Login device by administrator, access PPPOE settings page to input user and password.
- ✤ After information input click "Set" by enabling DDNS service meanwhile to restart device.(refer to: <u>5.6 DDNS configuration</u>)
- Connect to internet via ADSL then we can access camera by domain name link through internet.

4.4 Access network through router

Connect device to LAN via cable
 Configure device's parameters.(refer to: 5.1 IPcamera tool)
 Access device with administrator.
 Access ddns settings page to enable DDNS service then click "Set" to restart device. (Refer to: 5.6 DDNS configuration)
 Access with ddns link through internet.

In picture 3, camera-1 and computer-1 are in different subnets, run Devfind.exe in CD, click search, then select searched IP Camera to modify the parameters, refer to picture 4.

		OK Refresh	

Picture 12- wifi configuration

5.5 DDNS configuration

In picture 3, router-1 obtain wide area network IP address through ADSL, the IP address is dynamic, we could not know the real-time IP address of the device from internet, therefore, we need to obtain the address through DDNS server in internet, camera-1 will send message to the DDNS server for each defined-interval time, the DDNS server analyze the IP address of router-1 it connected, then we can obtain the IP address from DDNS server. Therefore, the domain name stands for the dynamic IP address, if the device can not be found by IP address, the domain name is not available.

Manufacture DDNS settings

The manufacture has set up DDNS server in internet, and distributed domain name for each device, the domain name has build in device, as picture 13. Input the domain name link to browsers, the link will change into the real IP address of the device and start to connect device.

IP Came	ra Options

	Automatic port mapping UPnP	
	⊙ Enable ⊂ Close	
		OK Refresh

Picture 13- DDNS configuration

Note 1: the ddns function is realized by transferring method, when access device through domain name link, it will automatically change into device's IP and port.

Note 2: if the device can be accessed by IP address but not domain name link, please verify the DNS configuration if it is available, and confirm the DNS is the same with LAN settings.

Third party DDNS configuration

The product also can support third party DDNS, such as Oray.

Note: the third party DDNS realizes the function by analytical methods, after inputting the ddns in browser, the characters would not change, if the port is not 80, need to add a colon and port behind the ddns, such as:

<u>http://easyn. 3322. org:81</u>

5.6 E-mail service configuration

2.3 DEVICE MANAGEMENT

2.3.1 Add device

E I

Firstly click "Config" button on label list to access device management page.

6.5 Device management

1. Add device

Firstly click "Config" button on label list to access device management page. [Add list]

• At first time run, the default list is null, click "Add Area" button, pop up "Add Area" dialog, and input a name on name blank to add an area into device list. That is the first area, so there is no belonging area of it, it means the belonging area is null.

Notice: it can support 128 areas presently

Search Click to search devices in LAN

Select All Select all devices in list

[Add device]

• Search and add device in LAN:

Click search button, then select device in search list to add, click

>> button to add device to area.

• Add device manually:

Click Add Device button then pop up add device dialog, as below:

Add Device	×
Name:	Channel: ¹
IP or Domain name:	Port: 80
User Name: admin	Password:
Area: 11 💌	
	OK Cancel

[Name] Device name, support custom, length less than 30 byte. Only display name instead of IP after input name.

【 Channel 】 Support different channel on case that one device has many channels, presently device only supports one channel.

【IP or Domain name】 Device IP or domain name

[Port] Device http port, default is 80

[User name] Device login name, default is admin

[Password] Device login password, default is admin

[Area] Device displaying area

After input all needed information, click OK button to finish ADD

2.3.2 Group management

• Add group:

Click Add Group button, input group

name into pop-up dialog then click OK Notice: support 20 groups

Add G						x

1. Non-cycle preview

Click "+" in front of device's name or IP, then double click Channel 01 or drag Channel 01 to the window to view video. It displays a blue triangle after device connected Channel 01, if the display as a device does not connect. And if the display as a device does not connect.

Right click on one area, it pops up dialog as:

[Connected All] connect device in selected area

[Disconnected All] disconnect device in selected area

[Arm All] devices in selected area arm

[Disarm All] devices in selected area disarm

[Start Manual Record of Area] enable manual record in selected area

[Stop Manual Record of Area] disable manual record in selected area

[Main Stream All] connect device with main stream in selected area

[Sub Stream All] connect device with sub stream in selected area

If device is in connection, it should be disconnected then reconnect, then the stream changes to sub stream, otherwise, it is still in main stream.

[Auto Adjust All] device in selected area auto adjusts view proportion[Full Display All] device in selected area adjusts image proportion according to the size of window of multi-picture view.

【Check Time All】 device in selected area synchronize time with PC. Notice: Please double click Channel 01 below device or drag Channel 01 to window to view video.

Select one device; right click on Channel, pop-up dialog as:

- 22 -MH3E-E-A1

【 Connect 】 connect one channel of selected device, only support Channel 01 presently.

【 Start Manual Record 】 enable manual record for selected channel, label auto changes into label of disable-manual-record label.

[Main Stream] connect device with main stream, on tick means current selection is main stream.

[Sub Stream] connect device with sub stream, on tick means current selection is sub stream.

[Auto Adjust] selected channel auto adjusts view proportion

[Check Time] selected channel synchronizes time with PC.

Right click on preview window, pop-up dialog as:

Full Screen
Auto Adjust
Photo
Record
Stop Display

(Full Screen **)** select full screen for software full screen view, double click to view full screen for single window.

【 Auto Adjust 】 on tick to display according to image proportion, off tick to display according to window's size of multi-picture view.

[Photo] snapshoot selected window then save to hard disk, default format is JPG.

[Record] enable manual record for selected window, auto on tick Record [Stop Display] stop display for selected window

Notice: after stop display, device is still in connection, if device is on recording, it keep recording after stop display.

2. Cycle preview

Only support cycle mode to view video on group list mode, it needs to set groups before enabling cycle mode, details refer to instruction of "Group Management".

Click **Click** enable cycle mode, click again to disable cycle mode.

For cycle mode view, to set cycle time, click "Config" then "Record Management" to configure cycle time, default value is 5 seconds.

6.7 PTZ control

1. PTZ control

We can move PTZ to 8 directions through controlling direction buttons, and drag the slider to change PTZ moving speed, "-" is for slowing, "+" is for accelerating.

[Save] click "Save" button to enable configuration

[Exchange User] click "Logout", after that, click on other page to re-login

7 Port forwarding

Referring to picture 3, computer-1 can access camera-1, for computer in internet (such as computer-2, computer-3) to access camera-1, it needs to expose the camera-1 in internet, the method is to do port forwarding in router-1 to enable it accesses internet. Access router setting interface through computer-1, for different router it has different setting interface. Therefore, the way to do port forwarding may be some different, please refer to the manual of the router. To most routers, we can find "virtual server" or forwarding rules page, input the camera-1's LAN IP address and port then enable it. For example as below picture:

EasyN [®]

NW725 Plus		Version:V1.2.09
Convenient Setup System Information	Virtual Serivce DMZ Setting UPnP Port Trigger	Application and Game This item provides configuration items and

	ID Description Internal Host IP Address Protocol External Port Internal Port Del	
	1 ipcamera 192.168.1.104 TCP 104 104 Del	

Note: for more cameras accessing internet, we need to do port forwarding for each

camera, and we should set different ip and port to each camera to avoid confusion. If the port is not 80, and for inner(local area network) access, the link format should be IP address added colon and port, for example:<u>http://219.134.170.92:81</u>

8 Appendix

8.1 Common issue

Forgot account?

Press reset button (on the bottom of device) on powered condition about 10 seconds to reset to factory settings..

Default administrator user: admin

Default password: admin

✤ The image is white.

Please adjust video parameters for camera (mode, brightness, contrast, saturation, etc).

If the background light is too strong, please adjust the range to view.

$\boldsymbol{\diamond}$ The camera finder can not find device.

Please check if the camera and computer are in the same subnet. And if the cable or power adapter is not good, it will cause the problem too. [Normally, the power light (yellow) is always on, the network light (green) is always flickering].

If it is the firewall limiting the access of camera finder.

$\boldsymbol{\diamondsuit}$ The remote access does not work.

1) If device works on LAN? If it can, then confirm the ddns if it is correct;

2) To check port forwarding in router if it is correct;

3) Does the network provided by ISP (network runner) can support to set up virtual server?

8.2 Warranty instruction

- a) Warranty for one year dues to this warranty card (not include man-made damage). Late for warranty time, need to pay fee for service.
- b) If damage is caused by non-correct use or other reason not included in warranty, it can enjoy free repairing on warranty card except component fee.
- c) Send product with warranty card to manufacturer or seller when searching for repairing.
- d) Open shell and tear sealing label is not in warranty.
- e) It would not accept damaged device caused by transform or extra-adding.

Below cases are not in warranty

- a) The periodic inspection, maintenance, repair or replacement parts caused by normal wear and tear.
- b) Damage caused by fall, extrusion, artificial flooding, moisture and other man-made caused damage.
- c) Damage caused by flood, fire, lighting and other natural disasters or force majeure factors.
- d) Device ever repaired by non-authority.

List above refers to relevant provision if there is some change.
