

## EMI TSOP6 EVB Universal Evaluation Board User's Manual

ON Semiconductor®

<http://onsemi.com>

### EVAL BOARD USER'S MANUAL

#### Board Description

The EMI TSOP6 EVB universal Evaluation Board was designed to provide a flexible and convenient platform to quickly evaluate, characterize and verify the performance and operation of all twelve NB2XXXXA EMI devices, and all of their possible configurations. This user's manual provides detailed information on board contents, layout and its use. It should be used in conjunction with the appropriate NB2XXXXA datasheet: ([www.onsemi.com](http://www.onsemi.com)). See Table 1.

#### Board Features

- Accommodates the Electrical Characterization of the NB2XXXXA, Reduced EMI Series in the TSOP-6 Package
- Multiple Configurations – Refer to NB2XXXXA Configurations Tables 1 and 2
- 26  $\Omega$  Series Termination Resistor Installed on MODOUT
- 15 pF Output Load Capacitor Installed on MODOUT
- Selectable Jumpers for SELECT Pin Logic Levels

Twelve EMI products share the same TSOP-6 (TSOT-23-6) package, but have minor pin configuration differences. See Table 2.

Figure 1. NB2XXXXA TSOP-6 Pinout

## LAB SETUP PROCEDURE

### Lab Setup and Measurement Procedure

#### Equipment Used

- Agilent Signal Generator #81110A (or Crystal)
- Real-Time Oscilloscope, Frequency Counter or Spectrum Analyzer
- Agilent #6624A DC Power Supply
- Digital Voltmeter

#### Power Supply Connections

The NB2XXXXA has a positive supply pin,  $V_{DD}$ , and a negative supply pin, GND.

Power supply “anvil” terminals are provided for  $V_{DD}$  and GND. Use of “minigrabber” banana plug cables work well for connections to the power supply.

Figure 3. Power Supply Configuration

Table 3. POWER SUPPLY CONFIGURATIONS

Device Pin	Single Power Supply
$V_{DD}$	$V_{DD} = +3.3 \text{ V}$
GND	$GND = 0 \text{ V}$

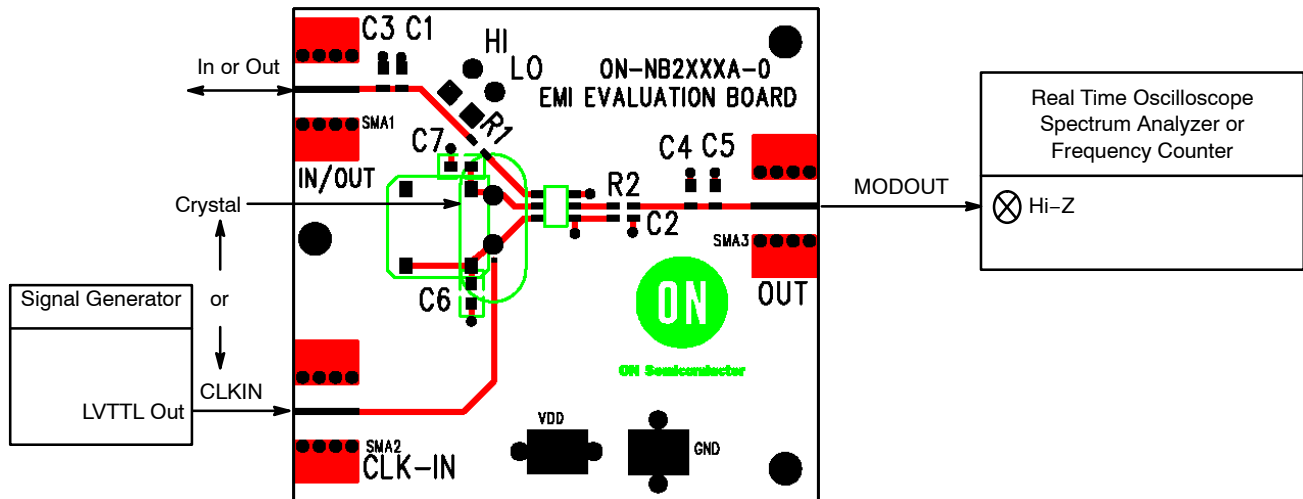

Figure 4. Input / Output Configuration

## NB2XXXXA

### Lab Test Set-up Procedure

To monitor the MODOUT output on an oscilloscope, spectrum analyzer or frequency counter:

1. Connect a power supply to the evaluation board.  
(see Figure 3)  
Connect  $V_{DD}$  to +3.3 V  
Connect GND to 0 V
2. Connect an external clock reference to the CLKIN Pin 3 or install a crystal and appropriate (see CLKIN) crystal load capacitors to Pins 2 and 3.
3. Connect the MODOUT output to the measurement instrument.
4. For the MODOUT output, the NB2XXXXA board provides a series 26  $\Omega$  source termination resistor and a load capacitor pad for each output; 15 pF is installed.

### Board Layout

The evaluation board is constructed with FR4 material and 50  $\Omega$  trace impedance, designed to minimize noise and crosstalk.

### Layer Stack

- L1 Signal (top)
- L2 Ground
- L3  $V_{DD}$  (positive power supply)
- L4 Blank (bottom)

### Pin 1 – IN / OUT Configuration

Pin 1 of the EMI TSOP6 EVB universal evaluation board can be configured to serve as an input or output, depending on device.

See Tables 1 and 2.

An SMA connector is provided to access Pin 1.

If Pin 1 is an input, a 0  $\Omega$  resistor may be used at R1.

If Pin 1 is an output, C1 can be used to install an output load capacitor, ie. a 15 pF capacitor. C1 and C3 can be used to parallel two output load capacitors. Also, a 26  $\Omega$  series termination resistor should be installed at R1.

When Pin 1 is an input, the select header pins, HI and LO, can manually control the Pin 1 logic level via the appropriate jumper/shunt. A connection from each header must then be made to the Pin 1 metal trace. When either HI or LO are jumpered, Pin 1 is forced to  $V_{DD}$  (logic High) or GND (logic Low).

### MODOUT Output Series Resistor

An R2 resistor pad is provided to series terminate the MODOUT output and is installed with a 26  $\Omega$  resistor. This series resistor complements an internal 24  $\Omega$  resistor to match the 50  $\Omega$  trace impedance.

### MODOUT Output Load Capacitor

An output load capacitor pad is provided to load the MODOUT output and is installed with a 15 pF capacitor. C4 and C5 can be used to parallel two output load capacitors for various combinations of capacitive loads, if needed.

### CLKIN

An SMA connector is provided for CLKIN if an external clock source is used on Pin 3. **The metal trace at the crystal pad is intentionally open for crystal use, and must be shorted for a connection to Pin 3 for external clock use.** The unused component pad labeled C6 (used for the crystal load capacitor) may be used for a 50  $\Omega$  resistor to ground to terminate a signal generator.

**Table 4. PIN 1 INPUT/OUTPUT**

Device	Pin #1	R1	C1 (or C3)
See Table 2	Input	0 $\Omega$	Open
See Table 2	Output	26 $\Omega$	15 pF

# EMITSOP6EVB

## NB2XXXA Output Loading

### Series Termination Resistor

Clock output traces over one inch should use series termination. To series terminate a 50 Ω trace (a commonly used trace impedance), place a 26 Ω resistor in series with the clock line, as close to the clock output pin as possible. The nominal impedance of the clock output is 24 Ω.

Figure 5. Output Loading for Test / Evaluation

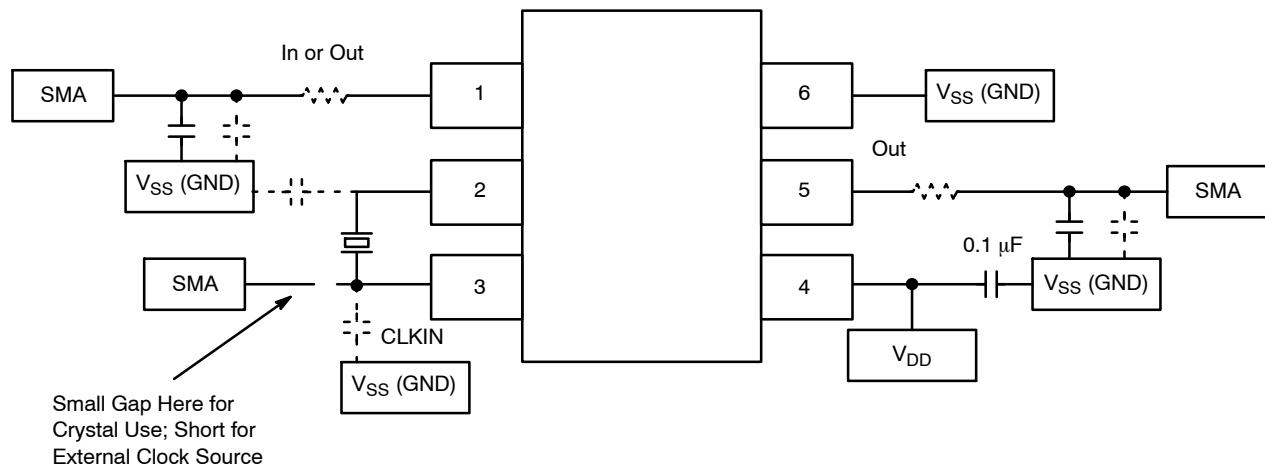

Figure 1. NB2XXXA Evaluation Board Schematic

Table 5. NB2XXXA EVALUATION BOARD BILL OF MATERIALS

	Component	Description	Qty
SMA 1 – 3	Connector	SMA Connector	1–3
C2	Capacitor	0.1 μF, 10%, KEMET, C0603C104K5RAC, Installed	1
C6 – C7	Capacitor (Crystal Load)	27 pF, Not Installed	2
C1, C3, C4, C5	Capacitor	15 μF, C5 Installed	1–4
	Jumper Header	100 mil, Berg	4
	Jumper		2
R1 – R2	Resistor	26 Ω or 0 Ω, R2 Installed with 26 Ω	2
C6	Resistor (optional)	50 Ω, 0.1%, 0.25 W	1
	Power Supply Connector	Anvil – Keystone #5016	2
U1	NB2XXXA	TSOP–6 device (Installed by User)	1
X1	Crystal (See Crystal Chart)	Fundamental Mode, Parallel Resonant, Ecliptek www.ecliptek.com	1
	Pin Recepticle	Through-Hole Crystal Connector	2
	Capacitor	VDD to GND Bypass Capacitors	1
		10 μF – 22 μF	1
		0.01 μF – 0.1 μF	1
