The structure of activator "Keep well!"

Activator "Keep well!" Made of high quality textile materials filled with borosilicate and sodium borosilicate glass microspheres. Is a pillowcase of red, thick, abrasion-resistant fabric dimensions 470 x 360 mm, which are sewn sealed containers filled with the aforementioned material. For ease of fixing the activator is provided on the body with Velcro straps. The microspheres are included in the product, return the the body accumulate and infrared heat, are also have on their surface a negative electric charge. Actuator is designed to impact on the body with the negative charges, replenishing the lack of the body negative electric potential. At the same time activator provides uniform heat distribution, owing to the return IR radiation emitted by the body. The product creates a negative charge and reduces the positive charge of the body, and allows you to achieve a sufficient degree of the load on the human body, as well as provide a pleasant physiological position of the body.

The purpose of activator "Keep well!"

Activator is designed to provide a uniform distribution of heat accumulation due to return of IR radiation emitted by the body. The product creates a negative charge and reduces the positive charge of the body, and allows you to achieve a sufficient degree of the load on the human body, as well as provide a pleasant physiological position of the body. Activator "Keep well!" is a source of remote wave action, the purpose of which is to restore the negative charge around the body, or imitation and shortfalls of natural negative charge of the earth's surface.

Activator "Keep well!" is used efficiently and contributes to the improvement of the following diseases:

- Varicose veins, thrombophlebitis, chronic venous insufficiency and lymphovenous, thrombophlebitis of superficial and deep vein;

- Cardiovascular system: hypertension I-II degree, ischemic heart disease and stable angina, dystonia, myocardial infarction, arrhythmia, tachycardia, hypotension;
- central and peripheral nervous system: spinal cord injury, spinal cord injury, spinal circulatory disturbance, ischemic cerebral stroke, neuritis, neuropathy of different origin, neuralgia, neurosis, neurasthenia, headache, depression, spring fatigue, chronic fatigue, stress, insomnia, worsening of concentration;
- peripheral vascular disease, atherosclerosis I-II-III stage Raynaud;
- diseases and injuries of the musculoskeletal system: deforming osteoarthritis, polyarthritis of various etiologies, bruises, strains, sprains, fractures, rheumatism;
- bronchopulmonary disease: acute pneumonia, chronic bronchitis, bronchial asthma (except hormone), tuberculosis (inactive form);
- diseases of the gastrointestinal tract: gastric ulcer and 12 duodenal ulcer, chronic gastritis, pancreatitis, biliary dyskinesia, colitis;
- ENT-pathology: rhinitis, chronic rhinitis, rhinosinusitis, chronic pharyngitis, chronic otitis, laryngitis, tracheitis;
- subacute and chronic diseases of the genitourinary system: cystitis, urethritis, pyelonephritis, prostatitis, impotence and decreased potency, painful menstruation, menopause;
- Skin: sluggish granulating wounds, burns, frostbite, bedsores, eczema;
- restore and maintain the cosmetic effect: wrinkles, restore the complexion, reduce swelling and STI.
- preoperative and postoperative rehabilitation: adhesive disease, improving the immune status.

Using of the activator "Keep well!"

before using the Activator "Keep well!" recommended "charge" by shaking or heat from various heat sources: heating radiator, sun, hair dryer, iron, etc. at temperatures up to 50 ° C. Microspheres should soften inside pillowcases. Compacted or hardened microspheres inside of the activator indicate the lack of negative charge on the surface and the need for "charging" with one of the methods above.

The contact of the activator "Keep well!" to the body during the first 15 days should be limited to 2 hours per day. In future sessions of application may be gradually increased and adjusted independently without restriction in period of work, rest and sleep as needed and desired.

Activator "Keep well!" Cleanses the accumulated toxins from the blood vessels. Human blood is composed of water 78 - 82%. To make the process of remov-

ing toxins from the body is most effectively observe the correct mode of consumption of water - from 2 to 3 liters per day, depending on body weight. Clean water is a natural alive natural drug that displays a split and dissolved products from the body. Due to the required amount of water vascular wall gain elasticity and strength, blood becomes less viscous and liquid that has a positive effect on lowering blood pressure inside blood vessels and improve blood flow and reduce the load on the heart muscle.

Activator "Keep well!" can be applied depending on the current need, for example, fixed by wrapping the thigh, the calf muscle to the varicose veins on a shoulder lower back at various inflammations. Possible to use as a rug on which you can put your feet, sit with hemorrhoids, deterioration of potency, an inflammation of the prostate gland, as well as lying on your back on the activator, affecting the patient spine, lower back, kidneys, chest for colds or pillow your head to improve sleep and improve the blood supply to the brain, termination headache.

Recommendations for the storage and use of the activator "Keep well!"

The activator is stored in a dry place, do not let it become wet. To bring activator condition ready for use and increasing the negative charge on the surface to be placed in the heat in expanded form, such as a heating radiator, under direct sunlight affect domestic hair dryer, etc. Also, a negative electric charge is formed by shaking activator. Activator "Keep well!" can be used not only by direct contact with the body, but also through the fabric of clothing (pants, socks, shirts). If necessary to avoid contamination of the activator is recommended to use a thin natural fabric or gauze as a cover. Unacceptable wash activator in liquid solutions. When pollution is applied exclusively, dusting brush, a sponge or damp cloth.

Precautions in handling of the activator "Keep well!"

The use of an activator in accordance with the instruction ensures the preservation of its long-standing stated qualities and characteristics and suitability to work effectively.

Unacceptable:

- Cut
- Rip
- Pierce
- hitting activator
- When shaking beat activator other items
- Abruptly sits down and step on the activator
- Heat above 50 ° C

If you do spill filler - the microspheres and in contact with mucous membranes, rinse with water. After contact with the microspheres in the mouth do not swallow, rinse with water. Dispose of as household waste.

Warranty

TM «Keep well!»

Warranty period - 1 year from date of purchase.

Manufacturer: Ukraine, PE "Ukrekobezpeka" 33 Hersonskaya str., Lugansk 91005 . Phone: +380-503-388-103, +380-967-185-109.

Textile filled with microspheres - activator " Keep well!".

Ingredients: rubberized fabric tent, raincoat fabric, borosilicate and sodium borosilicate glass microspheres.

Hygiene Certificate — № 05.03.02-04/35398 from 30.04.2013

test specifications U 13.9-3192121179-002:2013.

Answers to questions related to the application of the activator "Keep well!"

Question: What should be the duration of a session of application the activator?

Answer: Timing of application of the activator "Keep well!" is not limited to the time when the use of an activator is not sharply reducing pressure. Reduce the duration of the session in the first 15 - 20 days to 2 hours per day, in case of sudden pressure reduction. Listening to yours feelings.

Вопрос: Explain the reason why sometimes the pressure is reduced when using an activator "Keep well!"?

Ответ: Upon contact with the body, the activator, creating a single closed system of the presence of the negative electric charges on the surface directs them into the body. Activator nourishes the negative charge diseased cells of vessels. It helps to restore the integrity of the walls of blood vessels, eliminate spasms, destruction of cholesterol deposits, partitioning erythrocyte factions within the blood vessels, reducing blood viscosity and purification of the blood vessels. This not only helps to reduce high blood pressure and normalization of the blood vessels, but also provides long-term effect.

Вопрос: Why the filler in the activator initially soft and friable becomes hard?

Ответ: Red blood cells and blood vessel walls healthy people initially have a negative charge. Charges with a plus sign in the body become a source of inflammatory and disease processes. Neutralized with positive sign blood cells lost negative charge is not able to repel each other, are glued together and the walls of vessel. Thus clots formed. On the surface of the filler (the microspheres) activator "Keep well!" has a pronounced negative electric charge. Diseased or inflamed area of the body that came into contact in the electric field of the activator communicates with it opposite charges. As a result, in blood vessels erythrocytes released from the positive charge and received natural negative charge repel each other, removing the grouping and clusters on vessel walls. At the same time, the microspheres - microscopic glass spheres that had given negative charge, and received in exchange a positive charge, are attracted to each other. Thus the filler of activator acquires hardness. Hardened activator is less effective and therefore requires its "charge". To restore the negative charge of the activator it should be shaken and put for a while in a warm place up to 50 ° C. As soon as the filler material softens, the activator is ready for use. The restoration activator take 10 to 30 minutes, depending on the temperature of the heat source and the degree of solidification. Activator should not be warm, not Achieve its heating, but the filler - the microspheres must be soft.
