

**CES EduPack™ 2014**

# **CES EduPack User Manual and Getting Started Guide**

April 2014

**GRANTA**  
M A T E R I A L   I N S P I R A T I O N

## 4 Getting Started with CES EduPack

The following exercises give an overview of CES EduPack and will teach you how to use the core functionality. The exercises in Chapter 5 go into further detail and explore some of the software's more specialized features. There is also comprehensive help file within the software that gives more detailed guidance, as well as case studies with loadable project files.

### 4.1 Brief Description of CES EduPack

The main tools in CES EduPack are:

- **BROWSE**            Explore the database and retrieve records via a hierarchical index or tree.
- **SEARCH**           Find information via a full-text search of records.
- **SELECT**           The central hub of CES EduPack, used to apply the Rational Material Selection methodology. A powerful selection engine that identifies records that meet an array of design criteria and enables trade-offs between competing objectives.
- **CHART**            Create charts and add formatting and labels to illustrate your point.

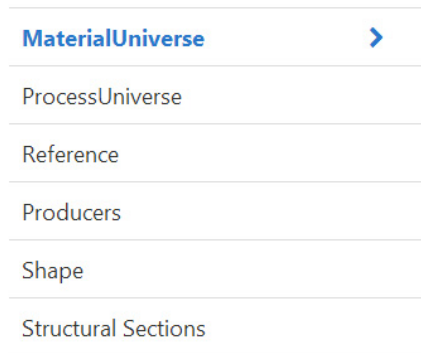

The following exercises cover the use and functionality of these tools.

## 4.2 Browsing and Searching

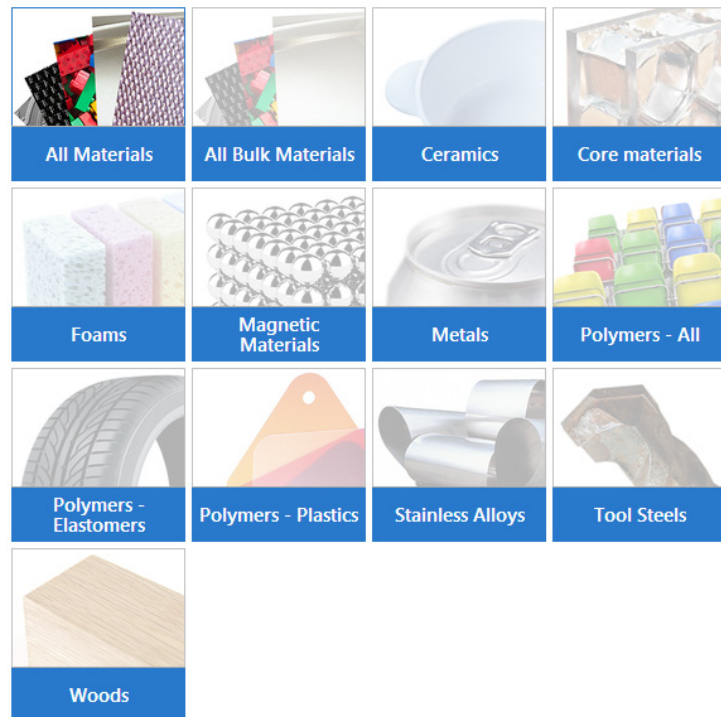

### Exercise 1 Opening the Database

If you have more than one database installed, CES EduPack will show the Databases dialog. The following exercises use the **MaterialUniverse** and **ProcessUniverse** tables, which are part of every Granta database.

#### 1. Select a table

#### 2. Filter by subset

The Edition Homepage will open, showing a list of the available tables and a graphic for each subset. Click on a subset name to show its description. Use the information icon next to the database name to show a detailed description.

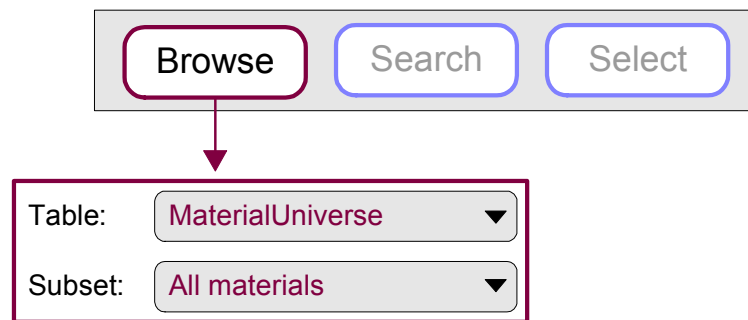

- Swap between the available subsets and see how they have different applications and data  
*Click on a subset in the Edition Homepage to select it. The information displayed is for the currently-selected subset. Notice that the **Browse** tree in the left pane updates to the currently selected subset.*

- Change to the PROCESSUNIVERSE table  
*Click on ProcessUniverse and notice that the **Browse** tree in the left pane updates to show the new table.*

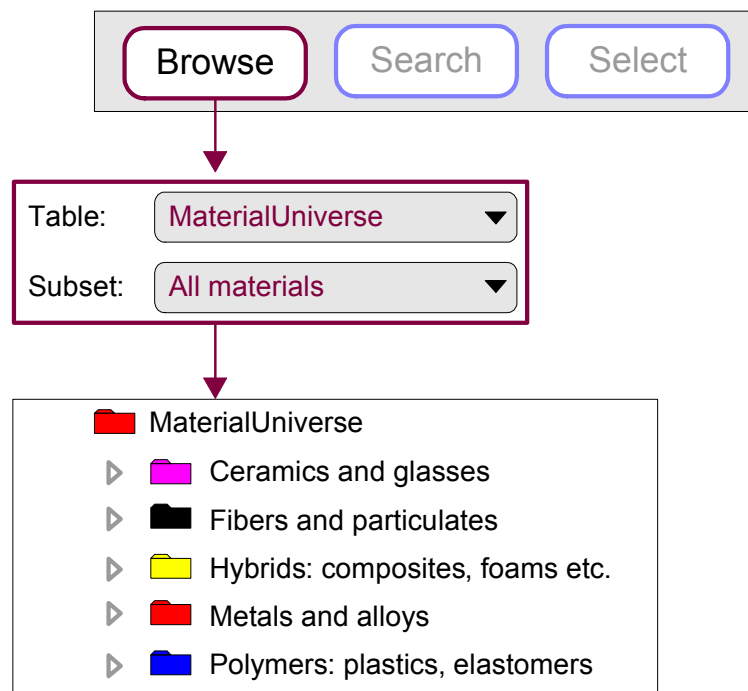

- CLOSE the HOMEPAGE  
*Click on the cross at the top of the Homepage tab. This page can be reopened at any time from **View menu - Home**.*

- Change to the MATERIALUNIVERSE table

*With the Homepage closed, navigate to different tables using the **Table** drop-down in the **Browse** pane.*

There are also links to online resources, for both students and educators, from the homepage.

**Exercise 2 Browse Materials**

Select the **Table** MaterialUniverse and the **Subset** All materials.

- Find a record for STAINLESS STEEL

- Find a record for CONCRETE

- Open the GENERIC record for POLYPROPYLENE

*Generic records are records at the folder level and give general information on the material, rather than data on a specific variant. Generic records have their own icon . Double-click to open.*

- Open a POLYPROPYLENE record

*Double-click on the record name in the tree*

Click on hyperlinked attribute names. In Level 1 and Level 2 databases, this will bring up a Science Note, giving details of the underlying science and calculations for the attribute. In Level 3 databases, this will bring up the design note, which provides background information on properties, test notes, and selection guidelines. From a design note, there will also be a link to the corresponding Science Note.

Right-click on the datasheet to see a context menu with further actions e.g., locate in Browse tree, copy the datasheet, print the datasheet, export the data to an FE package format.

## 4.3 Material Selection

### Exercise 5 Selection Using a Limit Stage

- Find materials with:

|                          |                           |
|--------------------------|---------------------------|
| MAX. SERVICE TEMPERATURE | > 200 °C                  |
| THERMAL CONDUCTIVITY     | > 25 W/m.°C               |
| ELECTRICAL RESISTIVITY   | > 1e15 $\mu\text{ohm.cm}$ |

Use the limit bars for guidance on suitable values. Enter the limits – minimum or maximum as appropriate – and click **Apply**. If a reference record is set, its values for each property will be shown to the right of the min/max entry boxes.

Example results: Aluminum nitride, Alumina, Silicon nitride.

Some properties have discrete values, rather than numeric ranges.

- Edit this limit stage and search for materials with non-opaque TRANSPARENCY. Under **Optical Properties**, refine by transparency using the drop-down and tick **Translucent**, **Transparent**, and **Optical quality**. Click **Apply**.  
Example results: Alumina (translucent) and Diamond.

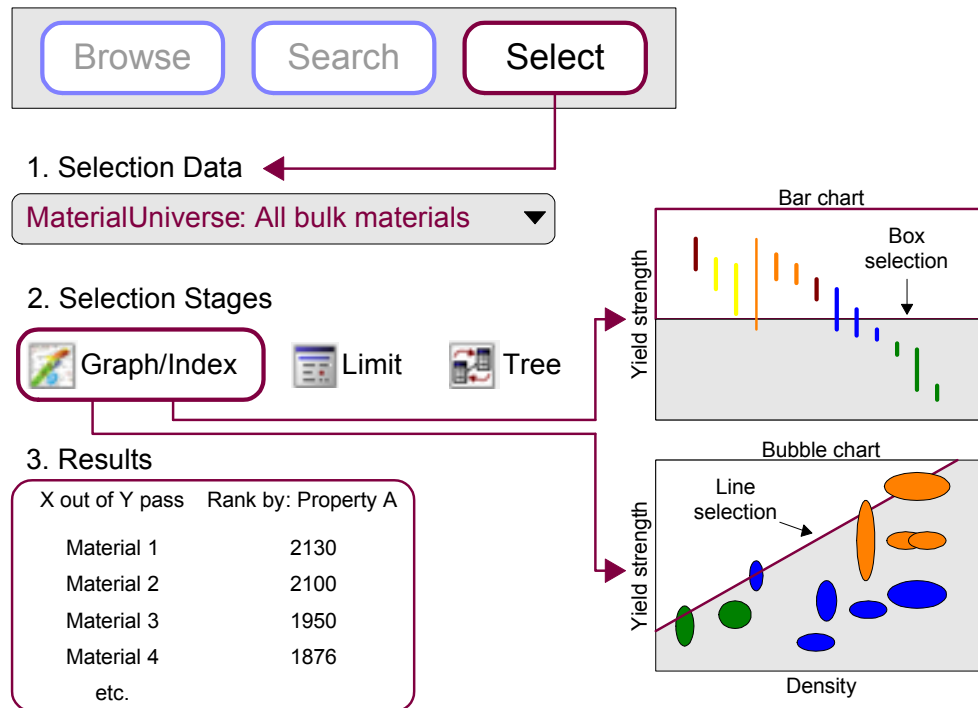

- DELETE THIS STAGE

## Exercise 6 Selection Using a Graph Stage

When plotted on a Graph Stage, records can also be filtered using the charting Box and Line Selection tools. This provides a more qualitative approach to filtering.

- Make a BAR CHART of YIELD STRENGTH ( $\sigma_y$ )

Set the y-axis to **Yield strength (elastic limit)**.

- Use a BOX SELECTION to find materials with high values of YIELD STRENGTH

Click **Box Selection** , then click-drag-release to define the box.

- Add DENSITY ( $\rho$ ) to the other axis

Either: highlight Stage 1 in Selection Stages, right-click and choose **Edit Stage** from the menu; or double-click the axis to edit.

- Use a BOX SELECTION to find materials with high STRENGTH and low DENSITY

- Use a LINE SELECTION to find materials with high values of the specific strength  $\sigma_y / \rho$

Click **Gradient-Line Selection** , then enter slope in the dialog, in this case 1. Click on the graph to position the line through a particular point. Click above or below the line to select an area, in this case above the line for high values of  $\sigma_y / \rho$ . Drag the line upwards to refine the selection to fewer materials.

- Rank the results by specific strength (YIELD STRENGTH / DENSITY)

Rank by Stage 1: Performance Index and click on results column to reverse the order.

Example results: CFRP, Titanium alloys, Magnesium alloys.

- DELETE ALL STAGES

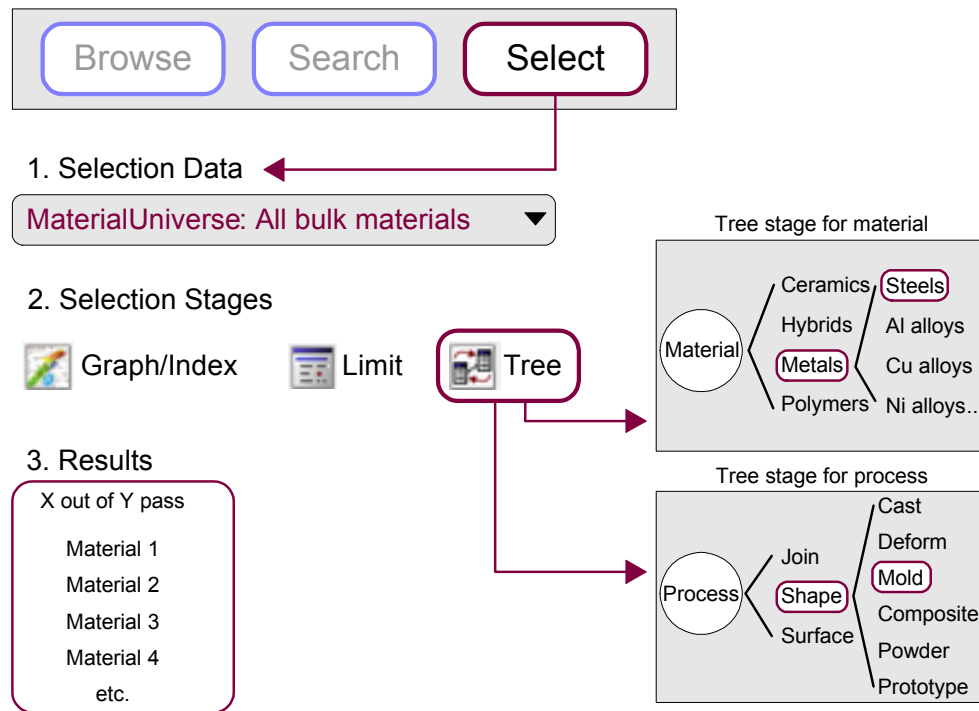

Using a Tree Stage, records can be filtered based on their links to records in other data tables, or based on the database hierarchy (tree).

### Exercise 7 Selection Using a Tree Stage

- Find materials that can be MOLDED

In the Tree Stage window, select ProcessUniverse, navigate to **Molding**, and click **Insert** followed by **OK**.

- DELETE THIS STAGE

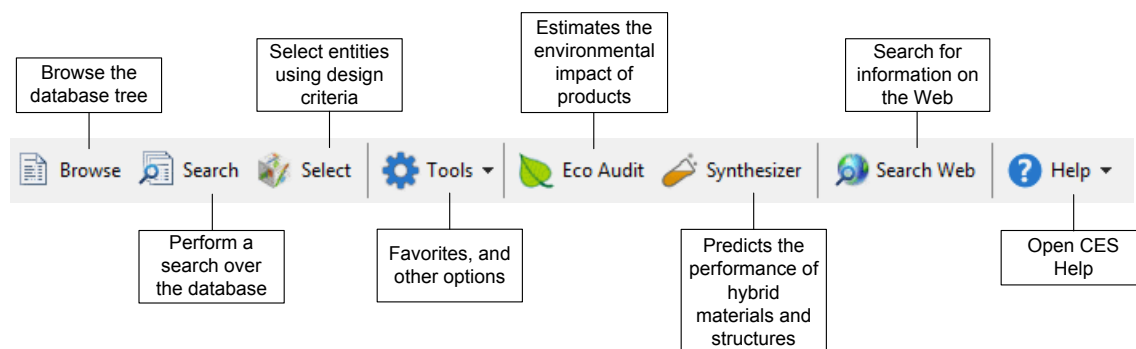

- Find processes to join STEELS

Select Processes: Joining processes. In the Tree Stage window, select MaterialUniverse, expand **Metals and alloys** in the tree, select **Ferrous**, and click **Insert** followed by **OK**.

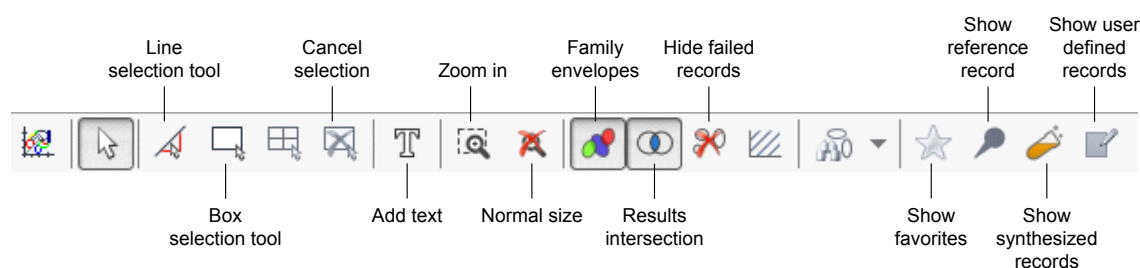

- DELETE THIS STAGE

## 5 Toolbars and General Information

### Standard Toolbar

### Graph Stage Toolbar

### File Types

|       |                                   |
|-------|-----------------------------------|
| *.gbd | Granta Database file              |
| *.ces | CES EduPack Project file          |
| *.cet | Selection Template file           |
| *.frl | Favorites file                    |
| *.prd | Eco Audit Product Definition file |

**Physical Constants and Conversion of Units**

|                                  |  |
|----------------------------------|--|
| Absolute zero temperature        | -273.2°C                                     |
| Acceleration due to gravity, g   | 9.807 m/s <sup>2</sup>                       |
