M.U. IO-CB/DO-32TS-2/07.07
Cod. J30-478-1ADO-32TS E

User manual

Contents

CANopen I/O module 32 Digital Outputs mod. IO-CB/DO-32TS

g2 SERIES

32 digital outputs

Each of the output terminals can be programmed as standard optoisolated output with polarity control and filtering

Applicable standards

The DO-32TS module is suited for the CiA DS301 protocol [1] and implements the CiA DS 401 standard Device Profile [2].

Warning

1) **The product described in this manual should only be installed, operated and maintained by qualified application programmers and software engineers who are familiar with automation safety concepts and applicable national standards.**
2) **This product supports the Parameter defaults indicated by CiA standards, in addition, some parameters have a factory set (value present in the module when comes from the factory). The default values can be loaded with the restore command, but after the restore, factory set values are lost.**

Characteristics

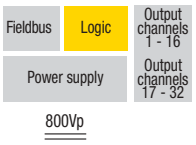
Technical data

Number of channels	32
Polarity (high side)	Source (PNP)
Output voltage	24 Vdc (nominal)
Output current	0.5 A
Total continuous output current max.	16 A
ON/OFF delay	<5 ms

General

3 way isolation	Channel to Channel	No
	Channel to Logic	800 Vp
	Logic to Serial Bus	800 Vp
	Power Supply to Logic	800 Vp
Power supply	24 Vdc; -15...+25%	
Power consuption	3 W	
Overvoltage protection	40 Vdc	
Dimensions	L: 152; H: 110; W: 65	
Weight	350 g	
Safety regulations EN61010-1	**Isolation class II** (50Vrms) Installation cathegory II Pollution degree 2	
CE marking	EN61131-2	

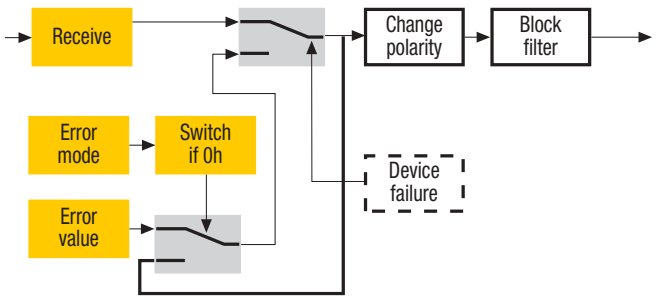
3 way isolation diagram



Environment

	Operating	Storage
Temperature	-10...+65°C	-40...+85°C
Relative Humidity	5...95% non condensing Appropriate measures must be taken against humidity >85%	5...95% non condensing For a short period, slight condensation may appear on the housing
Mounting	Vertical, free air	
Protection	IP20	
Vibrations (3 axes)	10...57Hz 0.0375mm 57...150Hz 0.5g	
Shock (3 axes)	15g, 11ms half sine	

Functional Block Diagram



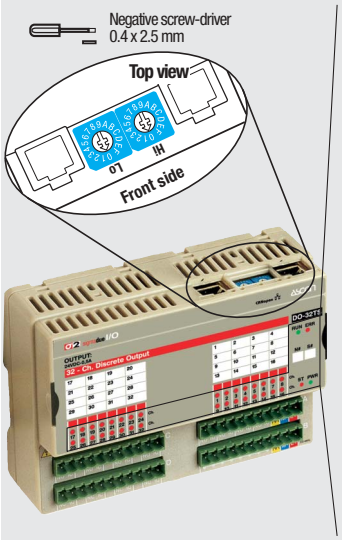
PDOs used by the module

RPDO	Properties	Mapped objects	Index	Sub-index
RPDO 1	COBID: 200h+ NodeID Transmission Type: 01h *	DigOutput 8_1	6200h	01h
		DigOutput 8_2	6200h	02h
		DigOutput 8_3	6200h	03h
		DigOutput 8_4	6200h	04h

Note: * The Transmission Type is configurable:
01h is the factory set (value present in the modules when come from the factory);
FFh is the default value.

Hardware Set-up

Hexadecimal rotary switches, service and I/O LEDs



Service LEDs	Status	Meaning
RUN	ON	Operational
	Blinking	Pre-operational (CANopen)
	Single flash	STOPPED
	OFF	Device in RESET state
ERR	ON	BUS OFF
	Single flash	Warning limit reached
	Double flash	Error Control Event
	Triple flash	Sync Error (CANopen)
	OFF	No error. Device working
ST	ON	DIAG Error
	Blinking	INIT and DIAG running
	Single flash	Baud rate setting
	OFF	Module OK and ready
PWR	ON	Module Power Supply ON
	OFF	Module Power Supply OFF

I/O LEDs	Status	Meaning
OUT 1...32	ON	Output active
	OFF	Output inactive

Bit Rate and Node ID configuration

Bit rate

Lo switch	Baud rate kbps	Bus length m
1	20	2500
2	50	1000
3	100	500
4	125	500
5	250	250
6 *	500	100
7	800	50
8	1000	25

Node ID

Hi switch	Lo switch	Valid ID Node
0	1	01h (address 1)
0	2	02h (address 2)
↓	↓	↓
7	F	7Fh (address 127D) *

Notes: * Default value

Procedure for Node ID and Bit Rate configuration

The HI and LO hexadecimal rotary swithches set the module's Bit Rate and CAN Node ID. During the configuration, the module must be **off line** and the CAN bus must be physically disconnected.

To configure the module, follow the procedure:

1 Turn the Power OFF
2 Set the **HI** switch to "F"
3 Select the desired Bit Rate value by setting the **LO** switch following the table (e.g. "8" for 1 Mbps)
4 Turn the Power ON
5 Shift the **HI** switch to "E" (all the module service LEDs should flash)
6 Turn the Power OFF. Now configure Node ID
7 Set the **HI** and **LO** switches to the desired valid Node ID following the table
8 Turn the Power ON.

Alternatively, at step 7 set the value 00h. Then, at the next Power ON, the last valid stored value will be resumed as Node ID.

Default values: Bit Rate = 20 kbps, Node ID = 127D
Factory set values: Bit Rate = 500 kbps, Node ID = 127D

Parameter configuration

Configuring the Output Channels

The Output functional block diagram is consistent with the standard profile CiA DS401 [2].

Index 6200h – Write Output 8-bit

This object writes a group of 8 outputs:
1 = output active,
1 = output not active.

The output signalling from a CAN message is processed first.
Two preprocess items are performed:

- **Polarisation Index 6202h – Polarity Output 8-bit**

This object defines the polarity of a group of 8 output lines. Output polarity can be inverted individually:
1 = output inverted,
0 = output not inverted.
If the object is not supported, the device behaves according to the default value.

- **Masking Index 6208h – Filter Mask Output 8-bit**

This object defines an additional output filter mask configurable for 4 outputs.
1 = output is set to the received output value
0 = do not care, the received output value is neglected for the corresponding output channel and the old output value is kept.
If the object is not supported, the device behaves according to the default value.

Error mode

In error mode, the outputs behave according to the following two entries:

Index 6206h – Error Mode Output 8-bit:

This object indicates, whether an output is set to a pre-defined error value (see 6207h object) in the event of an internal device failure or of a 'Stop Remote Node' status.
1 = output value takes the pre-defined condition specified in object 6207h
0 = output value is kept if an error occurs

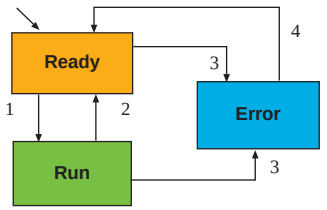
Index 6207h – Error Value Output 8-bit:

On condition that the corresponding Error Mode is active, device failures set the outputs to the value configured by this object.
0 = Output is set to '0' in case of fault, if object 6206h is enabled
1 = Output is set to '1' in case of fault, if object 6206h is enabled.

Commands

Index 200Ch – Operating mode:

the device has its own internal state machine. It is possible to move through this by sending appropriate values to the Index 200Ch, following the table below.



Transition	Operating mode value	Storage
Init	-	At Power-Up, the Device is in the "ready" state. Transition 1 is also executed if Index 200Ch - Operating Mode contains the default value 1
1	01h	Operating mode "RUN" is activated
2	00h	Return to the initialisation "ready" state. The transition is performed: • following an operator's command
3	FFh	The "error" state is automatically assigned by the device (and the operating mode value is read only) when: • an attempt is made to execute an unexpected command
4	00h	This value causes an exit from the "error" state, after the error condition is acknowledged. The only transition is to the "ready" state

Emergency messages

The module automatically sends emergency messages including error codes. The communication errors are descrided in CiA DS301 [1]. The error codes are expressed as a DEVICE SPECIFIC ERROR type of code, one for each channel: 0xFF01 for channel 1 and 0xFF02 for channel 2. The codes indicating a specific condition are also inserted, following the table below:

Error code	Error
0000000000	**No error** –This code is generated when exiting an error contidion, to notify the end of one of the error states
0000000007	**Error Wrong Command** – An attempt to execute a command from an illegal state

	0	1	2	3	4	5	6	7
Emergency Message	01h	FFh	21h	00h	00h	00h	00h	0yh
	COB – ID = [entry 1014h] + NodeID							

Error code

Parameter Store/Restore

This module allows parameters to be saved in a non volatile memory. In order to avoid storing parameters by mistake, storage is only executed when a specific signature is written to the appropriate subindex. The signature is “save”.

Similarly, the default values of parameters, according to the communication or device profile, are restored. On receipt of the correct signature in the appropriate subindex, the device restores the default parameters and then confirms the SDO transmission. The signature is “load”.

The new configuration becomes active after a reset, i.e. after a “Power OFF/Power ON cycle” or an NMT “Reset Node” message.

Byte	0	1	2	3	4	5	6	7
Store Parameter	22h	10h	10h	01h	73h	61h	76h	65h
					s	a	v	e
	COB – ID = 600h + NodeID							
Restore Parameter	22h	11h	10h	01h	6Ch	6Fh	61h	64h
					l	o	a	d
	COB – ID = 600h + NodeID							

SDO Messages

The entries of a device Object Dictionary are accessed trough SDO (Service Data Object) messages. The basic SDO messages are as follows, as based on the Client – Server request and response model:

Byte	0	1	2	3	4	5	6	7
Read request	40h	Index		Sub-Index	Reserved			
	COB – ID = 600h + NodeID							
Read response	4xh *	Index		Sub-Index	Data			
	COB – ID = 580h + NodeID							
Write request	22h	Index		Sub-Index	Data			
	COB – ID = 600h + NodeID							
Write response	60h	Index		Sub-Index	Reserved			
	COB – ID = 580h + NodeID							

* This code is type dependant.
Please refer to the CIA DS301 Profile for more details.

Object Dictionary (with default values)

⚠ In order to configure the module, it is necessary to connect it to a PC with the CAN interface and the superivisory software installed. The configuration can be obtained by writing the desired values to the module's variables listed in the Object Dictionary.
