Notice for this monitor

Aside from general purposes like creating documents, viewing multimedia content, this product is also suited to applications such as graphics creation and digital photo processing, where accurate color reproduction is a priority.

This product has been adjusted specifically for use in the region to which it was originally shipped. If the product is used outside the region, it may not operate as specified in the specifications.

This product may not be covered by warranty for uses other than those described in this manual.

The specifications noted in this manual are only applicable when the following are used:

- Power cords provided with the product
- Signal cables specified by us

Only use optional products manufactured or specified by us with this product.

It takes about 3 minutes (under our measurement conditions) for the performance of electrical parts to stabilize. Please wait 3 minutes or more after the monitor power has been turned on, and then adjust the monitor.

It is necessary to wait at least 30 minutes after turning on the power, in order to obtain correct measurement results.

Monitors should be set to a lower brightness to reduce changes in luminosity caused by long-term use and maintain a stable display.

When the screen image is changed after displaying the same image for extended periods of time, an afterimage may appear. Use the screen saver or power save function to avoid displaying the same image for extended periods of time.

If the monitor displays continuously over a long period of time, dark smudges or burn-in may appear. To maximize the life of the monitor, we recommend the monitor be turned off periodically.

Periodic cleaning is recommended to keep the monitor looking new and to prolong its operation lifetime (refer to [“Cleaning” \(page 4\)](#)).

The LCD panel is manufactured using high-precision technology. Although, missing pixels or lit pixels may appear on the LCD panel, this is not a malfunction. Percentage of effective dots: 99.9994% or higher.

The backlight of the LCD panel has a fixed lifetime. When the screen becomes dark or begins to flicker, please contact your local EIZO representative.

Do not press on the panel or edge of the frame strongly, as this may result in display malfunctions, such as interference patterns, etc. If pressure is continually applied to the panel, it may deteriorate or damage your panel. (If the pressure marks remain on the panel, leave the monitor with a black or white screen. The symptom may disappear.)

Do not scratch or press on the panel with any sharp objects, as this may result in damage to the panel. Do not attempt to brush with tissues as this may scratch the panel.

When the monitor is cold and brought into a room or the room temperature goes up quickly, dew condensation may occur on the interior and exterior surfaces of the monitor. In that case, do not turn the monitor on. Instead wait until the dew condensation disappears, otherwise it may cause some damage to the monitor.

Cleaning

Attention

- Chemicals such as alcohol and antiseptic solution may cause gloss variation, tarnishing, and fading of the cabinet or panel, and also quality deterioration of the image.
 - Never use any thinner, benzene, wax, and abrasive cleaner, which may damage the cabinet or panel.
-

The stains on the cabinet and panel surface can be removed by using the provided ScreenCleaner.

To use the monitor comfortably

- An excessively dark or bright screen may affect your eyes. Adjust the brightness of the monitor according to the environmental conditions.
- Staring at the monitor for a long time tires your eyes. Take a 10-minute rest every hour.

Attention

Be careful of the following points when using the built-in calibration sensor.

Do not touch the built-in calibration sensor.

It may reduce the measurement accuracy of the built-in calibration sensor, or result in injury or equipment damage.

Attention

- A high temperature or high humidity environment may affect the measurement accuracy of the built-in calibration sensor. We suggest storing and using the monitor under the following conditions.
 - Temperature 30 °C or less
 - Humidity 70% or lessAvoid storing or using the sensor where it may be exposed to direct sunlight.
 - Since adjustment accuracy of the monitor by the build-in sensor may be affected, leave the level of ambient light that enters the sensor part of the built-in sensor unchanged largely while measuring.
 - The use of the monitor hood is recommended.
 - While measuring, do not bring your face or any objects close to the monitor, do not look into the sensor.
 - Set the monitor in the environment so that external light does not enter the sensor directly.
-

The setting details differ depending on the color mode selected.

When the color mode is Standard Mode (Custom / Adobe®RGB / sRGB / EBU / REC709 / SMPTE-C / DCI / REC2020)

Each color mode setting status can be adjusted according to personal preference.

Attention

- It takes about 3 minutes (under our measurement conditions) for the performance of electrical parts to stabilize. Please wait 3 minutes or more after the monitor power has been turned on, and then adjust the monitor.
- The same image may be seen in different colors on multiple monitors due to their monitor-specific characteristics. Make fine color adjustment visually when matching colors on multiple monitors.

Note

- Use the values shown in “cd/m²”, “K” and “%” as a guide only.

Function	Adjustable range	Description	Note
Color Mode	Custom Adobe®RGB sRGB EBU REC709 SMPTE-C DCI REC2020 CAL1 CAL2	Select the desired mode according to the monitor application.	• For more information on the adjustment status of each mode, see “2-3. Switching the display mode (color mode)” (page 17). • Regarding “CAL1 / CAL2”, see page 24.
Brightness	40 cd/m ² to 350 cd/m ²	The screen brightness is adjusted by changing the brightness of the backlight (light source from the LCD back panel).	• If the entered value cannot be set, the value will appear in magenta. In such a case, change the value.

Function		Adjustable range	Description	Note
Advanced Settings	Temperature	Native 4000 K to 10000 K Adobe®RGB sRGB EBU REC709 REC1886 REC2020 SMPTE-C DCI	The color temperature can be adjusted. The color temperature is normally used to express the color of “White” and/or “Black” by a numerical value. The value is expressed in degrees “K” (Kelvin). The screen becomes reddish at a low color temperature, and bluish at a high color temperature, like the flame temperature. The gain preset values are set for each color temperature setting value. Specify color temperature in units of 100 K, or select a color temperature that complies with each standard.	- When you select “Native”, the original color of the monitor (Gain: 100% for each RGB) is displayed. “Gain” allows you to perform more advanced adjustment. When gain is changed, the color temperature is changed to “User”.
	Color Gamut	Native Adobe®RGB sRGB EBU REC709 REC1886 REC2020 SMPTE-C DCI	Set the color reproduction area (color gamut). “Color gamut” is the range of colors that devices such as monitors, digital cameras and printers can express. Various standards are defined.	- When you select “Native”, the original color gamut of the monitor is displayed. - The method of displaying colors outside the monitor's color gamut can be set within the defined color gamut. For more information, see “Clipping” (page 23).
	Gamma	1.6 to 2.7 Adobe®RGB sRGB EBU REC709 REC1886 REC2020 SMPTE-C DCI	Adjust the gamma. The brightness of the monitor varies depending on the input signal, however, the variation rate is not simply proportional to the input signal. The control performed to keep the balance between the input signal and the brightness of the monitor is called “Gamma correction”. You can set the gamma, or select the gamma curve defined by each standard.	-
	Hue	-100 to 100	Adjust the hue.	Using this function may make some color gradations unavailable for display.
	Saturation	-100 to 100	Adjust the color saturation.	- Using this function may make some color gradations unavailable for display. - The minimum value (-100) changes the screen to monochrome.

Function		Adjustable range	Description	Note
Advanced Settings	Clipping	On Off	The method of displaying colors outside the monitor's color gamut can be set within the defined color gamut. • “On” Displays colors based on the standard values. The colors outside the gamut of the monitor are clipped. • “Off” Displays colors with priority on the color gradation rather than the color accuracy. The primary colors outside the gamut of the monitor (blue in the diagram) are adjusted to the colors most similar to those that can be displayed by the monitor.   Color gamut of monitor  Color gamut defined by standard  Color gamut displayed on screen	• The diagrams on the left are conceptual diagrams, and do not display the actual color gamut of the monitor. • This setting will be disabled if “Native” is selected at “Color Gamut” (page 22).
	XYZ Format	On Off	When you set this function to “On”, XYZ signals for Digital cinema are converted into RGB signals for display on the monitor.	• This function can only be configured if “Color Gamut” (page 22) is set to “DCI”. • When you select “On”, the “Color Gamut” setting can no longer be used.
	Gain	0% to 100%	The brightness of each color component red, green, and blue is called Gain. The hue of “white” can be changed by adjusting the gain.	• Using this function may make some color gradations unavailable for display. • The gain value changes according to the color temperature. • When gain is changed, the color temperature is changed to “User”.
	Black Level	0% to 100%	You can adjust the brightness and chromaticity of black by adjusting the black level of red, green, and blue respectively. Please use a black test pattern or background for adjustment of the black level.	• To further darken the black when the value of the black level is 0, lower the brightness value.

● SelfCalibration

This product is equipped with a built-in calibration sensor. By setting the calibration targets and execution schedule in advance using ColorNavigator, the calibration sensor automatically operates and regularly calibrates the monitor. This automatic calibration function is called “SelfCalibration”.

The adjustment content of SelfCalibration differs depending on the color mode that is executed.

- Calibration Mode (CAL mode: CAL1 / CAL2): The conditions that have been adjusted using ColorNavigator and the measurement device are maintained.
- Standard Mode (color mode excluding CAL1 / CAL2): the monitor's color reproduction gamut is updated and each display mode in Standard Mode is adjusted as follows:
 - The temperature is adjusted so that it is as close as possible to the specified value.
 - The gamut values are adjusted so that they are close to each specified value.
 - Information on brightness is updated.

When using ColorNavigator, no operations or settings are required on the monitor, however, in environments where ColorNavigator cannot be used, you can execute SelfCalibration on the monitor as a standalone unit. In this section, the settings for executing SelfCalibration on the monitor as a standalone unit are explained.

Attention

- It is necessary to wait at least 30 minutes after turning on the power, in order to obtain correct measurement results.

Note

- SelfCalibration can also be executed when there are no PC signals being input.
- Because the brightness and chromaticity vary as you use the monitor, it is recommended to calibrate the monitor periodically.
- The measurement results from the built-in calibration sensor can be correlated with the measurement results from the external measurement device that you want to use as a reference. For details, refer to the ColorNavigator User's Manual (stored on the CD-ROM).

Procedure

Use the following procedure to set up SelfCalibration. The steps differ according to the color mode used for executing SelfCalibration.

Calibration Mode (CAL mode)	Standard Mode
1. In “Color”, set the following functions: • “Color Mode”: Select the color mode to apply for SelfCalibration. • “SelfCalibration”: Set to “On”. • “Target”: Set a calibration target for SelfCalibration. 2. In “SelfCalibration”, set the following functions: • “Settings”: Set the calibration schedule and monitor date and time for SelfCalibration.	1. In “SelfCalibration”, set the following functions: • “Settings”: Set the calibration schedule and monitor date and time for SelfCalibration. • “Standard Mode”: Set “SelfCalibration” to “On”.

Execute			-	SelfCalibration can be executed manually regardless of the schedule.	After selecting "Execute", warming up may be executed before the built-in calibration sensor comes out.
Settings	Schedule	Start time	Power Save Immediately Off	Select the timing to execute SelfCalibration upon reaching the time set in the schedule. "Power Save" To be executed under any of the following conditions. - When the monitor is in "Power Save" mode or power is off at the set time. - The monitor shifts to the power saving mode or the power is turned off when the time period set in the schedule has elapsed. "Immediately" SelfCalibration is executed immediately at the set time. "Off" SelfCalibration is not executed.	Upon reaching the set time, the power indicator will blink in white (quickly twice).

● Signal Settings

The signal settings are used to configure advanced settings for input signals, such as the screen display size and color format.

	DisplayPort	HDMI				
		PC signal	Video signal			
Picture Expansion	√	√	-	Full Screen Aspect Ratio Dot by Dot	The screen size of the monitor display can be changed. • “Auto” The monitor automatically changes the screen size according to the resolution information and aspect ratio information sent from the input signal. • “Full Screen” Displays an image in full screen. Images are distorted in some cases because the vertical rate is not equal to the horizontal rate. When using video signal (480p/i, 576p/i) input, the image will be displayed in full screen while maintaining the 16:9 aspect ratio. • “Aspect Ratio” Displays an image in full screen. However, since aspect ratios are maintained, part of an image may not be visible in horizontal or vertical direction. When using video signal (480p/i, 576p/i) input, the image will be displayed in full screen while maintaining the 4:3 aspect ratio. • “Dot by Dot” Displays the image at the set resolution or at the size specified by the input signal.	• Example settings - Full Screen  - Aspect Ratio  - Dot by Dot (input signal) 
	-	-	√	Auto Full Screen Aspect Ratio Dot by Dot		
Input Color Format	√	-	-	Auto YUV RGB	The color format of the input signal can be specified. Try changing this setting if colors are not displayed correctly.	• This setting is required when a DVI device is connected to the monitor via the HDMI connector port using a DVI-HDMI conversion connector.

If the signal is displayed on the monitor in its restricted form, the blacks will be faint, the whites dull, and contrast will be reduced. The brightness range of such signals can be extended to match the actual contrast ratio of the monitor. • “Auto” (recommended) The monitor automatically recognizes the brightness range of input signals and displays images appropriately. • “On” The brightness range of the signal is extended to 0 – 255 for display. • “Off” The input signal brightness range is not extended.	• Example settings - On  - Off  • If “Range Extension” is set to “On” while an unlimited signal is displayed, black to white gradation may be lost

Signals of 24 frames or 30 frames per second for images such as movies, computer graphics, and animations are automatically identified and the most suitable images are displayed.	- If distorted images are displayed when “Film Detection” is “On”, set it to “Off”. “Film Detection” is only enabled during 1080i signal input.
	Safe Area Marker	-	√	√	On Off	The “safe area” is an area in which images can be displayed on any display device. When you set this function to “On”, this function displays the safe area frame during for instance video editing, to enable positioning while confirming at a glance that subtitles and menu windows come within the safe area.	When the “Picture Setup” setting in the “Administrator Settings” menu is set to “Dual”, the safe area frame is displayed only when both the left and right screens are the same resolution.
	Safe Area Size	-	√	√	80% to 99%	The size of the safe area can be set.	-

Auto Input Detection	On Off	When this function is set to "On", the monitor automatically recognizes the connector through which signals are input, so that the screen can be displayed. When an external device enters the power saving mode, the monitor automatically displays another signal. When set to "Off", the monitor displays the signal from the selected connector regardless of whether a signal is input or not. In this case, select the input signal to display using the operation switch (INPUT) on the front of the monitor.	- When the main power is turned on/off, the signal is detected automatically regardless of the setting for this function. - When the "Picture Setup" setting in the "Administrator Settings" menu is set to "Dual", we recommend that this function be set to "Off".
Menu Rotation	0° 90°	This function allows you to change the orientation of the Setting menu to align with the installation orientation.	- Be sure that the cables are correctly connected. - When using the monitor screen in a portrait position, the graphics board supporting portrait display is required. When placing the monitor in a portrait position, settings of your graphics board need to be changed. Refer to the User's Manual of the graphics board for details. Also, visit the EIZO website (http://www.eizoglobal.com). - When using this product in a portrait position, you need to remove the stand and attach an arm. You cannot rotate the monitor into the portrait position with the stand attached as is.

Function	Adjustable range	Description	Note
USB CHARGE Port	Normal Charging Only	The "CHARGE" USB downstream port of the monitor supports USB 3.0 quick charging. By changing this setting to "Charging Only", devices connected to the "CHARGE" port can be charged more quickly than when using the "Normal" setting.	• Make sure to complete any communication between connected USB devices and the PC before switching this setting. When the setting is switched, all communication will be temporarily interrupted. • Devices that are connected to the "CHARGE" port must support quick charging. • When "Charging Only" is set, data communications between the PC and connected devices via the "CHARGE" port are not possible, and therefore, connected devices will not work. • When "Charging Only" is set, charging is possible even when the monitor and PC are not connected by USB cable.
Power Save	On Off	This function allows you to set the monitor to the power saving mode, depending on the state of an external device connected to it. The monitor changes to power saving mode about 15 seconds after signal input ceases to be detected. When the monitor has shifted to power saving mode, images are not displayed on the screen. • Exiting power saving mode - If the monitor receives input, it automatically exits power saving mode and returns to the normal display mode.	• At the time of shifting to power saving mode, a message that indicates the transition is displayed 5 seconds in advance. • Turning off the main power switch or unplugging the power cord completely shuts off power supply to the monitor. • When the monitor is in power saving mode, devices connected to the USB downstream port will still work. Therefore, power consumption of the monitor varies even in the power saving mode, depending on the connected devices.
Indicator	Off / 1 to 7	The brightness of the power switch and the operation switches when the screen is displayed can be set. (Default setting: 4)	-
Beep	On Off	You can turn off the beep that sounds each time a switch is operated.	-
Input Skip	Skip / -	This function allows skipping of input signals that will not be used when the input signals are switched.	• Set at least one mode to "-".
Mode Skip	Skip / -	This function allows skipping of modes that will not be used when selecting modes. Please use this function if display modes are limited, or if you want to prevent randomly changing the display status.	• Not all modes can be set to "Skip". • In the default settings, available calibration modes (CAL modes) differ depending on each input signal.
Monitor Reset	-	Restore all settings to their default values except for the following settings. • Settings in the "Administrator Settings" menu • The "Settings" – "Clock Adjustment" item in the "SelfCalibration" menu	• Regarding the default setting, see "Main Default Settings" (page 55).

Chapter 5 Troubleshooting

If a problem still remains after applying the suggested remedies, contact your local EIZO representative.

5-1. No picture

Problem	Possible cause and remedy
1. No picture Power indicator does not light up.	- Check whether the power cord is connected properly. - Turn the main power switch on. - Touch . - Turn off the main power, and then turn it on again a few minutes later.
Power indicator is lighting white.	Increase “Brightness” and/or “Gain” in the Setting menu. (See “Color” (page 21))
Power indicator is lighting orange.	- Switch the input signal. - Move the mouse or press any key on the keyboard. - Check whether the PC is turned on. - If the computer is connected to the DisplayPort, use the following procedure to switch the DisplayPort version. - Touch  to turn off the monitor. - While touching the leftmost switch, touch  for more than 2 seconds to turn on the monitor. The “Administrator Settings” menu appears. - Select “Signal Format”. - Switch the DisplayPort version. - Select “Apply”, and then select ENTER.
Power indicator is flashing orange and white.	The device that is connected using DisplayPort / HDMI has a problem. Resolve the problem, turn off the monitor, and then turn it on again. Refer to the User's Manual of the output device for further details.
2. The message below appears.	This message appears when the signal is not input correctly even though the monitor is functioning properly.
This message appears when no signal is input. Example: 	- The message shown left may appear, because some PCs do not output the signal immediately after power-on. - Check whether the PC is turned on. - Check whether the signal cable is connected properly. - Switch the input signal.
The message shows that the input signal is out of the specified frequency range. Example: 	- Check whether the PC is configured to meet the resolution and vertical scan frequency requirements of the monitor (see “1-3. EIZO LCD Utility Disk” (page 11)). - Reboot the PC. - Change to the appropriate setting using the graphics board's utility. Refer to the User's Manual of the graphics board for details.

5-2. Imaging problems

Problem	Possible cause and remedy
1. The screen is too bright or too dark.	Use “Brightness” in the Setting menu to adjust it. (see “Color” (page 21)). (The LCD monitor backlight has a limited life span. When the screen becomes dark or begins to flicker, contact your local EIZO representative.)
2. Afterimages appear	- Afterimages are particular to LCD monitors. Avoid displaying the same image for a long time. - Use the screen saver or power saving function to avoid displaying the same image for extended periods of time.
3. Green/red/blue/white dots or defective dots remain on the screen.	This is due to LCD panel characteristics and not a malfunction.
4. Interference patterns or pressure marks remain on the screen.	Display a white or black image over the entire screen. The symptom may disappear.
5. Noise appears on the screen.	- When inputting HDCP system signals, normal images may not be displayed immediately. - Depending on the graphics board, the 4096 × 2160 signal may not be output normally, and noise may appear. Check the graphics board specification.
6. (DisplayPort or HDMI input) The screen looks strange.	- Try changing “Input Color Format” in the Setting menu (see “Input Color Format” (page 31)). - For HDMI signal input, try changing “Signal Format” in the Setting menu (see “Signal Format” (page 40)).
7. The image does not display on the entire screen.	- Try changing “Picture Expansion” in the Setting menu (see “Picture Expansion” (page 31)). - Try changing “Signal Format” in the Setting menu (see “Signal Format” (page 40)). - Check if the resolution is set to 4096 × 2160. Refer to the User’s Manual of the graphics board for details on the settings. - Depending on the graphics board, the 4096 × 2160 resolution may not be output. Check the graphics board specification.

5-3. Other problems

Problem	Possible cause and remedy
1. The Setting menu/Mode menu cannot be displayed	• Check whether the operation switch lock function works (see “Key Lock” (page 38)). • Operation switches are locked when ColorNavigator is running. Exit the software.
2. The monitor connected with the USB cable is not detected. / USB device connected to the monitor does not work.	• Check whether the USB cable is connected correctly (see “6-4. Making Use of USB (Universal Serial Bus)” (page 50)). • If a peripheral device is connected to the “CHARGE” port, try checking the “USB CHARGE Port” setting (see “USB CHARGE Port” (page 35)). If it is set to “Charging Only”, the peripheral device will not work. • Try changing to a different USB port. If the PC or peripheral devices works correctly by changing the USB port, contact your local EIZO representative. (Refer to the manual of the PC for details.) • Reboot the PC. • If the peripheral devices work correctly when the PC and peripheral devices are connected directly, contact your local EIZO representative. • Check whether the PC and OS are USB compliant. (For USB compliance of the respective devices, consult their manufacturers.) • Check the PC’s BIOS setting for USB when using Windows. (Refer to the manual of the PC for details.)
3. Audio is not output.	• This monitor does not support the HDMI/DisplayPort audio signals.

5-4. Built-in calibration sensor and SelfCalibration problems

Problem	Possible cause and remedy
1. The built-in calibration sensor does not come out/stays out.	Turn off the main power, and then turn it on again a few minutes later.
2. SelfCalibration cannot be executed.	- Check whether the date and time are set correctly on the monitor (see “Clock Adjustment” (page 30)). - Check whether the execution schedule been set (see “Schedule” (page 28)). - Check whether the calibration targets are set correctly (see “Target” (page 25)). - Set the SelfCalibration target using ColorNavigator.

Chapter 6 Reference

6-1. Attaching the Optional Arm

An optional arm (or an optional stand) can be attached by removing the stand section. Please refer to our web site for the corresponding optional arm (or optional stand). <http://www.eizoglobal.com>

Attention

- When attaching an arm or stand, follow the instructions of their User's Manual.
- When using another manufacturer's arm or stand, confirm the following in advance and select one conforming to the VESA standard. Use the screws securing the unit and the stand.
 - Clearance between screw holes: 100 mm × 100 mm
 - Plate thickness: 2.6 mm
 - Must be strong enough to support weight of the monitor unit (excluding the stand) and attachments such as cables.
- When using an arm or stand, attach it to meet the following tilt angles of the monitor.
 - Up 45°, down 45°
- Connect the cables after attaching an arm or stand.
- Do not move the removed stand up and down. Doing so may result in injury or equipment damage.
- The monitor, arm, and stand are heavy. Dropping them may result in injury or equipment damage.
- When installing the monitor in portrait mode, turn the monitor screen 90° in clockwise direction.

Attachment procedure

1. To prevent damaging the panel surface, lay the LCD monitor on a soft cloth spread on a stable surface with the panel surface facing down.

2. Remove the stand.

Prepare a screwdriver.

Using a screwdriver, remove the screws (four) securing the unit and the stand.

3. Attach the arm or stand to the monitor.

- 2. While holding the cable holder closed, pull it from the stand.**

6-3. Connecting Multiple External Devices

The product allows you to connect multiple external devices and switch between them for display.

Connection examples

Note

- The input signal changes each time the operation switch (**INPUT**) on the front of the monitor is touched. When the signal is switched, the active input connector name appears at the lower right corner of the screen.
- This product automatically recognizes the connector through which signals are input and displays images on the screen accordingly. For more information, see [“Auto Input Detection” \(page 34\)](#).

6-4. Making Use of USB (Universal Serial Bus)

This monitor is equipped with a USB hub. It works as a USB hub when connected to a USB-compatible PC, allowing the connection of peripheral USB devices.

Note

- This product supports USB 3.0. When connecting peripheral devices that support USB 3.0, high-speed data communication is possible (however, only when the USB cable used to connect the PC and peripheral device is USB 3.0 compliant).

● Required System Environment

- A PC equipped with a USB port
- Windows 8.1 / Windows 8 / Windows 7, or Mac OS X 10.7.5 or later
- EIZO USB cable (UU200SS (USB 3.0))

Attention

- This monitor may not work depending on the used PC, OS or peripheral devices. For USB compatibility of peripheral devices, contact their manufactures.
- When the monitor is in power saving mode, devices connected to the USB downstream port will still work. Therefore, power consumption of the monitor varies depending on the connected devices, even in the power saving mode.
- When the main power of the monitor is off, a device connected to the USB downstream port will not operate.
- When the “USB CHARGE Port” setting in “Preferences” is set to “Charging Only”, a peripheral device will not work if connected to the “CHARGE” port.
- Ensure that communication between all peripheral devices connected to the monitor and the PC is ended before switching the “USB CHARGE Port” setting. When the setting is switched, all communication will be temporarily interrupted.

● Connection Procedure (Setup of USB Function)

1. Connect the monitor first to a PC using the signal cable, and start the PC.
2. Connect the USB cable between the USB downstream port of the PC and the USB upstream port of the monitor.
The USB hub function is set up automatically upon connection of the USB cable.
3. Connect the peripheral USB device to the USB downstream port of the monitor.

Chapter 7 Glossary

Adobe® RGB

This is a definition of the practical RGB color space proposed by Adobe Systems in 1998. The color reproduction range (color gamut) is broader than sRGB, and is highly adaptable to such fields as printing etc.

Color Space

YUV and RGB, etc. are available. YUV expresses the color by using the luminance (Y), the color difference of Blue (U), and the color difference of Red (V). RGB does this by using the gradation of the 3 colors, Red (R), Green (G), and Blue (B).

DCI (Digital Cinema Initiatives)

The company was founded by an association of U.S. film studios, and this company decides the specifications for digital cinema.

DisplayPort

This is the interface standard for image signals standardized in accordance with VESA. It was developed with the aim of replacing the conventional DVI and analog interfaces, and it can transmit high resolution signals and sound signals, which DVI does not support. The standard size and mini size connectors have been standardized.

DVI (Digital Visual Interface)

DVI is a digital interface standard. DVI allows direct transmission of the PC's digital data without loss.

This adopts the TMDS transmission system and DVI connectors. There are two types of DVI connectors. One is a DVI-D connector for digital signal input only. The other is a DVI-I connector for both digital and analog signal inputs.

EBU (European Broadcasting Union)

The organization also includes broadcasting offices from Europe and North Africa, and its role is to decide various technical standards etc.

Gain

This is used to adjust each color parameter for red, green and blue. An LCD monitor displays the color by the light passing through the panel color filter. Red, green and blue are the three primary colors. All the colors on the screen are displayed by combining these three colors. The color tone can be changed by adjusting the light intensity (volume) passing through each color's filter.

Gamma

Generally, the monitor brightness varies nonlinearly with the input signal level, which is called "Gamma Characteristic". When the gamma value is low, the middle tone area is displayed brighter, and darker when high. Changes to the gamma value will not affect contrast. A gamma value appropriate for the display content should be selected.

HDCP (High-bandwidth Digital Content Protection)

Digital signal coding system developed to copy-protect the digital contents, such as video, music, etc.

This helps to transmit the digital contents safely by coding the digital contents sent via the DVI or HDMI connector on the output side and decoding them on the input side.

Any digital contents cannot be reproduced if both of the equipments on the output and input sides are not applicable to HDCP system.

HDMI (High-Definition Multimedia Interface)

HDMI is a digital interface standard, developed for consumer electrical appliance or AV device. This standard is issued on the basis of the DVI standard which is one of an interface specification for the connection between a PC and a monitor. The projected image, sound and control signal without compressed enable to be transmitted with one cable.

REC709, REC2020

Digital broadcasting (HDTV, UHDTV) standards defined by the ITU-R (International Telecommunication Union Radio Communication Sector).

REC1886

Standards for the input/output characteristics of flat panel displays used in studio production for digital broadcasting (HDTV) specified by the ITU-R based on CRT characteristics.

Resolution

The LCD panel consists of numerous pixels of specified size, which are illuminated to form images. This monitor consists of horizontal 4096 pixels and 2160 vertical pixels. At a resolution of 4096 × 2160, all pixels are illuminated as a full screen (1:1).

SMPTE-C

One of the standards provided by the SMPTE (Society of Motion Picture and Television Engineers).

sRGB (Standard RGB)

International standard for color reproduction and color space among peripheral devices (such as monitors, printers, digital cameras, scanners). As a form of simple color matching for the Internet, colors can be displayed using tones close to those of the transmission and reception devices.

Temperature

Color temperature is a method to measure the white color tone, generally indicated in degrees Kelvin. The screen becomes reddish at a low temperature, and bluish at a high temperature, like the flame temperature.

5000 K: Slightly reddish white

6500 K: White referred to as daylight-balanced color

9300 K: Slightly bluish white
