## Chapter 1

# *Introduction*

---

The Video and Embedded Evaluation Kit - Multi-touch (VEEK-MT) is a comprehensive design environment with everything embedded developers need to create processing-based systems. VEEK-MT delivers an integrated platform that includes hardware, design tools, intellectual property (IP) and reference designs for developing embedded software and hardware platform in a wide range of applications. The fully integrated kit allows developers to rapidly customize their processor and IP to best suit their specific application. The VEEK-MT features the DE2-115 development board targeting the Cyclone IV E FPGA, as well as a capacitive LCD multimedia color touch panel which natively supports multi-touch gestures. A 5-megapixel digital image sensor, ambient light sensor, and 3-axis accelerometer make up the rich feature-set.

The VEEK-MT is preconfigured with an FPGA hardware reference design including several ready-to-run demonstration applications stored on the provided SD card. Software developers can use these reference designs as their platform to quickly architect, develop and build complex embedded systems. By simply scrolling through the demos of your choice on the LCD touch panel, you can evaluate numerous processor system designs.

The all-in-one embedded solution offered on the VEEK-MT, in combination of the LCD touch panel and digital image module, provides embedded developers the ideal platform for multimedia applications with unparalleled processing performance. Developers can benefit from the use of FPGA-based embedded processing system such as mitigating design risk and obsolescence, design reuse, reducing bill of material (BOM) costs by integrating powerful graphics engines within the FPGA, and lower cost.

**Figure 1-1** shows a photograph of VEEK-MT.

**Figure 1-1 Video and Embedded Development Kit – Multi-touch**

The key features of the board are listed below:

## ■ DE2-115 Development Board

- Cyclone IV EP4CE115 FPGA
  - 114,480 LEs
  - 432 M9K memory blocks
  - 3,888 Kb embedded memory
  - 4 PLLs
- Configuration
  - On-board USB-Blaster circuitry
  - JTAG and AS mode configuration supported
  - EPCS64 serial configuration device
- Memory Devices
  - 128MB SDRAM
  - 2MB SRAM
  - 8MB Flash with 8-bit mode
  - 32Kb EEPROM
- Switches and Indicators
  - 18 switches and 4 push-buttons
  - 18 red and 9 green LEDs
  - Eight 7-segment displays
- Audio
  - 24-bit encoder/decoder (CODEC)
  - 3.5mm line-in, line-out, and microphone-in jacks

- Character Display
  - 16x2 LCD module
- On-board Clocking Circuitry
  - Three 50MHz oscillator clock inputs
  - SMA connectors (external clock input/output)
- SD Card Socket
  - Provides SPI and 4-bit SD mode for SD Card access
- Two Gigabit Ethernet Ports
  - Integrated 10/100/1000 Ethernet
- High Speed Mezzanine Card (HSMC)
  - Configurable I/O standards (voltage levels: 3.3/2.5/1.8/1.5V)
- USB Type A and B
  - Provides host and device controller compliant with USB 2.0
  - Supports data transfer at full-speed and low-speed
  - PC driver available
- 40-pin Expansion Port
  - Configurable I/O standards (voltage levels: 3.3/2.5/1.8/1.5V)
- VGA-out Connector
  - VGA DAC (high speed triple DACs)
- DB9 Serial Connector
  - RS232 port with flow control
- PS/2 Connector
  - PS/2 connector for connecting a PS2 mouse or keyboard
- TV-in Connector
  - TV decoder (NTSC/PAL/SECAM)
- Remote Control
  - Infrared receiver module
- Power
  - 12V DC input
  - Switching and step-down regulators LM3150MH

## ■ Capacitive LCD Touch Screen

- Equipped with an 7-inch amorphous-TFT-LCD (Thin Film Transistor Liquid Crystal Display) module
- Module composed of LED backlight
- Supports 24-bit parallel RGB interface
- Converting the X/Y touch coordinates to corresponding digital data via Touch controller.

**Table 1-1** shows the general physical specifications of the touch screen (Note\*).

**Table 1-1 General Physical Specifications of the LCD**

<i>Item</i>	<i>Specification</i>	<i>Unit</i>
LCD size	7-inch (Diagonal)	-
Resolution	800 x3(RGB) x 480	dot
Dot pitch	0.1926(H) x0.1790 (V)	mm
Active area	154.08 (H) x 85.92 (V)	mm
Module size	164.9(H) x 100.0(V) x 5.7(D)	mm
Surface treatment	Glare	-
Color arrangement	RGB-stripe	-
Interface	Digital	-

## ■ 5-Megapixel Digital Image Sensor

- Superior low-light performance
- High frame rate
- Low dark current
- Global reset release, which starts the exposure of all rows simultaneously
- Bulb exposure mode, for arbitrary exposure times
- Snapshot-mode to take frames on demand
- Horizontal and vertical mirror image
- Column and row skip modes to reduce image size without reducing field-of-view
- Column and row binning modes to improve image quality when resizing
- Simple two-wire serial interface
- Programmable controls: gain, frame rate, frame size, exposure

**Table 1-2** shows the key parameters of the CMOS sensor (Note\*).

**Table 1-2 Key Performance Parameters of the CMOS sensor**

<i>Parameter</i>	<i>Value</i>	
Active Pixels	2592Hx1944V	
Pixel size	2.2umx2.2um	
Color filter array	RGB Bayer pattern	
Shutter type	Global reset release(GRR)	
Maximum data rate/master clock	96Mp/s at 96MHz	
Frame rate	Full resolution	Programmable up to 15 fps
	VGA mode	Programmable up to 70 fps
ADC resolution	12-bit	
Responsivity	1.4V/lux-sec(550nm)	

Pixel dynamic range		70.1dB
SNRMAX		38.1dB
Supply Voltage	Power	3.3V
	I/O	1.7V~3.1V

## ■ Digital Accelerometer

- Up to 13-bit resolution at +/- 16g
- SPI (3- and 4-wire) digital interface
- Flexible interrupts modes

## ■ Ambient Light Sensor

- Approximates human-eye response
- Precise luminance measurement under diverse lighting conditions
- Programmable interrupt function with user-defined upper and lower threshold settings
- 16-bit digital output with I<sup>2</sup>C fast-mode at 400 kHz
- Programmable analog gain and integration time
- 50/60-Hz lighting ripple rejection

*Note: for more detailed information of the LCD touch panel and CMOS sensor module, please refer to their datasheets respectively.*

## 1.1 About the Kit

The kit includes everything users need to run the demonstrations and develop custom designs, as shown in **Figure 1-2**.

The system CD contains technical documents of the VEEK-MT which includes component datasheets, demonstrations, schematic, and user manual.

Figure 1-2 VEEK-MT kit package contents

## 1.2 Setup License for Terasic Multi-Touch IP

To utilize the multi-touch panel in a Quartus II project, the Terasic Multi-Touch IP is required for operation. Error messages will be displayed if the license file for the Multi-Touch IP is not added before compiling projects. The license file is located at:

VEEK-MT System CD\License\license\_multi\_touch.dat

There are two ways to install the license. The first one is to add the license file (license\_multi\_touch.dat) to the “License file” listed in Quartus II, as shown in **Figure 1-3**. In order to reach this window, please navigate through to Quartus II → Tools → License Setup.

Figure 1-3 License Setup

The second way is to add license content to the existing license file. The procedures are listed below:

Use Notepad or other text editing software to open the file license\_multi\_touch.dat.

1. The license contains the FEATURE lines required to license the IP Cores as shown in **Figure 1-4**.

```

license_multi_touch.dat
0 10 20 30 40 50 60 70
1 FEATURE 535C 0018 alterad 9999.12 12-jan-9999 uncounted 3F15022F111E \
2  VENDOR_STRING="142c2k297gj7hoTVotLcny9Bti7hPsnSaeyATv8c8V5OsL3yQqoc1DdCIZ.
3  HOSTID=ANY TS_OK SIGN="1177 818B 8DA8 A068 5C33 BE57 9139 77D8 \
4  C855 3B4B 6582 721C 9B62 CD64 A358 0B19 40C2 15C8 B6C8 CA5B \
5  B5A9 C994 C296 D8FD E93C 9ADE 3D83 8952 EDCF 0843"

```

**Figure 1-4 Content of license\_multi\_touch.dat**

2. Open your Quartus II license.dat file in a text editor.
3. Copy everything under license\_multi\_touch.dat and paste it at the end of your Quartus II license file. (Note: Do not delete any FEATURE lines from the Quartus II license file. Doing so will result in an unusable license file.) .
4. Save the Quartus II license file.

## 1.3 Getting Help

Here is information of how to get help if you encounter any problem:

- Terasic Technologies
- Tel: +886-3-550-8800
- Email: [support@terasic.com](mailto:support@terasic.com)

## Chapter 2

# Architecture

This chapter describes the architecture of the Video and Embedded Evaluation Kit – Multi-touch (VEEK-MT) including block diagram and components.

### 2.1 Layout and Components

The picture of the VEEK-MT is shown in **Figure 2-1** and **Figure 2-2**. It depicts the layout of the board and indicates the locations of the connectors and key components.

**Figure 2-1 VEEK-MT PCB and Component Diagram (Top)**

Figure 2-2 VEEK-MT PCB and Component Diagram (Bottom)

## 2.2 Block Diagram of the VEEK-MT

Figure 2-3 gives the block diagram of the VEEK-MT board. To provide maximum flexibility for the user, all connections are made through the Cyclone IV E FPGA device. Thus, the user can configure the FPGA to implement any system design.

Figure 2-3 Block Diagram of VEEK-MT

## Chapter 3

# Using VEEK-MT

---

This section describes the detailed information of the components, connectors, and pin assignments of the VEEK-MT.

### 3.1 Configuring the Cyclone IV E FPGA

The Video and Embedded Evaluation Kit (VEEK-MT) contains a serial configuration device that stores configuration data for the Cyclone IV E FPGA. This configuration data is automatically loaded from the configuration device into the FPGA every time while power is applied to the board. Using the Quartus II software, it is possible to reconfigure the FPGA at any time, and it is also possible to change the non-volatile data that is stored in the serial configuration device. Both types of programming methods are described below.

1. **JTAG programming:** In this method of programming, named after the IEEE standards Joint Test Action Group, the configuration bit stream is downloaded directly into the Cyclone IV E FPGA. The FPGA will retain this configuration as long as power is applied to the board; the configuration information will be lost when the power is turned off.
2. **AS programming:** In this method, called Active Serial programming, the configuration bit stream is downloaded into the Altera EPCS64 serial configuration device. It provides non-volatile storage of the bit stream, so that the information is retained even when the power supply to the VEEK-MT is turned off. When the board's power is turned on, the configuration data in the EPCS64 device is automatically loaded into the Cyclone IV E FPGA.

#### ■ JTAG Chain on VEEK-MT

To use the JTAG interface for configuring FPGA device, the JTAG chain on the VEEK-MT must form a closed loop that allows Quartus II programmer to detect the FPGA device. **Figure 3-1** illustrates the JTAG chain on the VEEK-MT. Shorting pin1 and pin2 on JP3 can disable the JTAG signals on the HSMC connector that will form a close JTAG loopback on DE2-115 (See **Figure 3-2**). Thus, only the on-board FPGA device (Cyclone IV E) will be detected by Quartus II programmer. By default, a jumper is placed on pin1 and pin2 of JP3. To prevent any changes to the bus controller (Max II EPM240) described in later sections, users should not adjust the jumper on JP3.

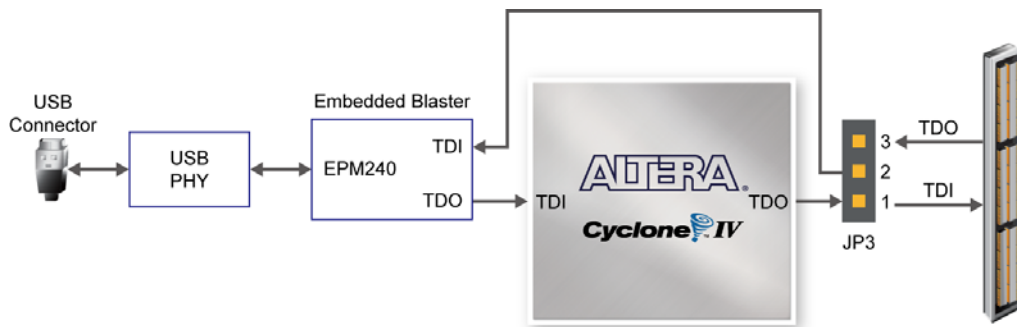

Figure 3-1 JTAG Chain

Figure 3-2 JTAG Chain Configuration Header

## ■ Configuring the FPGA in JTAG Mode

Figure 3-3 illustrates the JTAG configuration setup. To download a configuration bit stream into the Cyclone IV E FPGA, perform the following steps:

- Ensure that power is applied to the VEEK-MT
- Configure the JTAG programming circuit by setting the RUN/PROG slide switch (SW19) to the RUN position (See Figure 3-4)
- Connect the supplied USB cable to the USB-Blaster port on the VEEK-MT
- The FPGA can now be programmed by using the Quartus II Programmer module to select a configuration bit stream file with the .sof filename extension

**Figure 3-3 JTAG Chain Configuration Scheme**

**Figure 3-4 The RUN/PROG Switch (SW19) Set to JTAG Mode**

## ■ Configuring the EPCS64 in AS Mode

**Figure 3-5** illustrates the AS configuration set up. To download a configuration bit stream into the EPCS64 serial configuration device, perform the following steps:

- Ensure that power is applied to the VEEK-MT
- Connect the supplied USB cable to the USB-Blaster port on the VEEK-MT
- Configure the JTAG programming circuit by setting the RUN/PROG slide switch (SW19) to the PROG position
- The EPCS64 chip can now be programmed by using the Quartus II Programmer module to select a configuration bit stream file with the .pof filename extension
- Once the programming operation is finished, set the RUN/PROG slide switch back to the RUN position and then reset the board by turning the power switch off and back on; this action causes the new configuration data in the EPCS64 device to be loaded into the FPGA chip

Figure 3-5 The AS Configuration Scheme

## 3.2 Bus Controller

The VEEK-MT comes with a bus controller using the Max II EPM240 that allows user to access the touch screen module through the HSMC connector. This section describes its structure in block diagram-form and its capabilities.

### ■ Bus Controller Introduction

The bus controller provides level shifting functionality from 2.5V (HSMC) to 3.3V domains.

### ■ Block Diagram of the Bus Controller

Figure 3-6 gives the block diagram of the connection setup from the HSMC connector to the bus controller on the Max II EPM240 to the touch screen module. To provide maximum flexibility for the user, all connections are established through the HSMC connector. Thus, the user can configure the Cyclone IV E FPGA on the VEEK-MT to implement any system design.

Figure 3-6 Block Diagram of the Bus Controller

### 3.3 Using the 7" LCD Capacitive Touch Screen

The VEEK-MT features a 7-inch capacitive amorphous TFT-LCD panel. The LCD touch screen offers resolution of (800x480) to provide users the best display quality for developing applications. The LCD panel supports 24-bit parallel RGB data interface.

The VEEK-MT is also equipped with a Touch controller, which can read the coordinates of the touch points through a serial port interface.

To display images on the LCD panel correctly, the RGB color data along with the data enable and clock signals must act according to the timing specification of the LCD touch panel as shown in **Table 3-1**.

**Table 3-2** gives the pin assignment information of the LCD touch panel.

**Table 3-1 LCD timing specifications**

ITEM		SYMBOL	MIN.	TYP.	MAX.	UNIT	NOTE

TOUCH_INT_n	R23	touch interrupt	2.5V

### 3.4 Using 5 Megapixel Digital Image Sensor

The VEEK-MT is equipped with a 5 megapixel digital image sensor that provides an active imaging array of 2,592H x 1,944V. It features low-noise CMOS imaging technology that achieves CCD image quality. In addition, it incorporates sophisticated camera functions on-chip such as windowing, column and row skip mode, and snapshot mode.

The sensor can be operated in its default mode or programmed by the user through a simple two-wire serial interface for frame size, exposure, gain settings, and other parameters. **Table 3-3** contains the pin names and descriptions of the image sensor module.

**Table 3-3 Pin Assignment of the CMOS Sensor**

<i>Signal Name</i>	<i>FPGA Pin No.</i>	<i>Description</i>	<i>I/O Standard</i>
CAMERA_PIXCLK	J27	Pixel clock	2.5V
CAMERA_D0	F24	Pixel data bit 0	2.5V
CAMERA_D1	F25	Pixel data bit 1	2.5V
CAMERA_D2	D26	Pixel data bit 2	2.5V
CAMERA_D3	C27	Pixel data bit 3	2.5V
CAMERA_D4	F26	Pixel data bit 4	2.5V

CAMERA_LVAL	D28	Line valid	2.5V
CAMERA_FVAL	D27	Frame valid	2.5V
CAMERA_RESET_n	F27	Image sensor reset	2.5V
CAMERA_SCLK	AE26	Serial clock	2.5V
CAMERA_TRIGGER	E28	Snapshot trigger	2.5V
CAMERA_SDATA	AE27	Serial data	2.5V
CAMERA_XCLKIN	G23	External input clock	2.5V

## 3.5 Using the Digital Accelerometer

The VEEK-MT is equipped with a digital accelerometer sensor module. The ADXL345 is a small, thin, ultralow power assumption 3-axis accelerometer with high resolution measurement. Digitalized output is formatted as 16-bit twos complement and can be accessed either using SPI interface or I2C interface. This chip uses the 3.3V CMOS signaling standard. Main applications include medical instrumentation, industrial instrumentation, personal electronic aid and hard disk drive protection etc. Some of the key features of this device are listed below. For more detailed information of better using this chip, please refer to its datasheet which is available on manufacturer's website or under the /datasheet folder of the system CD.

**Table 3-4 Pin Names and Descriptions of the GSENSOR Module**

<i>Signal Name</i>	<i>FPGA Pin No.</i>	<i>Description</i>	<i>I/O Standard</i>
<b>GSENSOR_INT1</b>	<b>G27</b>	<b>Interrupt 1 output</b>	<b>2.5V</b>
<b>GSENSOR_INT2</b>	<b>G28</b>	<b>Interrupt 2 output</b>	<b>2.5V</b>
<b>GSENSOR_CS_n</b>	<b>F28</b>	<b>Chip Select</b>	<b>2.5V</b>
<b>GSENSOR_ALT_ADDR</b>	<b>K27</b>	<b>I2C Address Select</b>	<b>2.5V</b>
<b>GSENSOR_SDA_SDI_SDIO</b>	<b>K28</b>	<b>Serial Data</b>	<b>2.5V</b>
<b>GSENSOR_SCL_SCLK</b>	<b>M27</b>	<b>Serial Communications Clock</b>	<b>2.5V</b>

## 3.6 Using the Ambient Light Sensor

The APDS-9300 is a low-voltage digital ambient light sensor that converts light intensity to digital signal output capable of direct I2C communication. Each device consists of one broadband photodiode (visible plus infrared) and one infrared photodiode. Two integrating ADCs convert the photodiode currents to a digital output that represents the irradiance measured on each channel. This digital output can be input to a microprocessor where illuminance (ambient light level) in lux is derived using an empirical formula to approximate the human-eye response. For more detailed information of better using this chip, please refer to its datasheet which is available on manufacturer's website or under the /datasheet folder of the system CD.

**Table 3-5 Pin names and Descriptions of Ambient Light Sensor Module**

<i>Signal Name</i>	<i>FPGA Pin No.</i>	<i>Description</i>	<i>I/O Standard</i>
<b>LSENSOR_ADDR_SEL</b>	<b>J25</b>	<b>Chip select</b>	<b>2.5V</b>
<b>LSENSOR_INT</b>	<b>L28</b>	<b>Interrupt output</b>	<b>2.5V</b>
<b>LSENSOR_SCL</b>	<b>J26</b>	<b>Serial Communications Clock</b>	<b>2.5V</b>
<b>LSENSOR_SDA</b>	<b>L27</b>	<b>Serial Data</b>	<b>2.5V</b>

### 3.7 Using Terasic Multi-Touch IP

Terasic Multi-Touch IP is provided for developers to retrieve user inputs, including multi-touch gestures and single-touch. The file name of this IP is **i2c\_touch\_config** and it is encrypted. To compile projects with the IP, users need to install the IP license first. For license installation, please refer to section **1.2 Setup License for Terasic Multi-Touch IP** in this document. The license file is located at:

VEEK-MT System CD\License\license\_multi\_touch.dat

The IP decodes I2C information and outputs coordinate and gesture information. The IP interface is shown below:

```

module i2c_touch_config (
    // Host Side
    iCLK,
    iRSTN,
    iTRIG,
    oREADY,
    oREG_X1,
    oREG_Y1,
    oREG_X2,
    oREG_Y2,
    oREG_TOUCH_COUNT,
    oREG_GESTURE,
    // I2C Side
    I2C_SCLK,
    I2C_SDAT
);

```

The signal purpose of the IP is described in **Table 3-6**. The IP requires a 50MHz signal as a reference clock to the **iCLK** pin and system reset signal to **iRSTN**. **iTRIG**, **I2C\_SCLK**, and **IC2\_SDAT** pins should be connected of the TOUCH\_INT\_n, TOUCH\_I2C\_SCL, and TOUCH\_I2C\_SDA signals in the 2x20 GPIO header respectively. When **oREADY** rises, it means there is touch activity, and associated information is given in the **oREG\_X1**, **oREG\_Y1**, **oREG\_X2**, **oREG\_Y2**, **oREG\_TOUCH\_COUNT**, and **oREG\_GESTURE** pins.

For the control application, when touch activity occurs, it should check whether the value of **oREG\_GESTURE** matched a pre-defined gesture ID defined in **Table 3-7**. If it is not a gesture, it means a single-touch has occurred and the relative X/Y coordinates can be derived from **oREG\_X1** and **oREG\_Y1**.

**Table 3-6 Interface Definitions of Terasic Multi-touch IP**

<i>Pin Name</i>	<i>Direction</i>	<i>Description</i>
<b>iCLK</b>	<b>Input</b>	<b>Connect to 50MHz Clock</b>
<b>iRSTN</b>	<b>Input</b>	<b>Connect to system reset signal</b>
<b>iTRIG</b>	<b>Input</b>	<b>Connect to Interrupt Pin of Touch IC</b>
<b>oREADY</b>	<b>Output</b>	<b>Rising Trigger when following six output data is valid</b>
<b>oREG_X1</b>	<b>Output</b>	<b>10-bits X coordinate of first touch point</b>
<b>oREG_Y1</b>	<b>Output</b>	<b>9-bits Y coordinate of first touch point</b>
<b>oREG_X2</b>	<b>Output</b>	<b>10-bits X coordinate of second touch point</b>

<b>oREG_Y2</b>	<b>Output</b>	<b>9-bits Y coordinate of second touch point</b>
<b>oREG_TOUCH_COUNT</b>	<b>Output</b>	<b>2-bits touch count. Valid value is 0, 1, or 2.</b>
<b>oREG_GESTURE</b>	<b>Output</b>	<b>8-bits gesture ID (See <a href="#">Table 3-7</a>)</b>
<b>I2C_SCLK</b>	<b>Output</b>	<b>Connect to I2C Clock Pin of Touch IC</b>
<b>I2C_SDAT</b>	<b>Inout</b>	<b>Connect to I2C Data Pin of Touch IC</b>

The supported gestures and IDs are shown in [Table 3-7](#).

Note: The Terasic Multi-Touch IP can also be found under the \IP folder in the system CD as well as the \IP folder in the reference designs.

## Chapter 4

# *VEEK-MT Demonstrations*

This chapter gives detailed description of the provided bundles of exclusive demonstrations implemented on VEEK-MT. These demonstrations are particularly designed (or ported) for VEEK-MT, with the goal of showing the potential capabilities of the kit and showcase the unique benefits of FPGA-based SOPC systems such as reducing BOM costs by integrating powerful graphics and video processing circuits within the FPGA.

### 4.1 System Requirements

To run and recompile the demonstrations, you should:

- Install Altera Quartus II 11.0 and NIOS II EDS 11.0 or later edition on the host computer
- Install the USB-Blaster driver software. You can find instructions in the tutorial “Getting Started with Altera’s DE2-115 Board” (tut\_initialDE2-115.pdf) which is available on the DE2-115 system CD
- Copy the entire demonstrations folder from the VEEK-MT system CD to your host computer

### 4.2 Factory Configuration

The VEEK-MT development kit comes preconfigured with a default utility that boots up on power on and allows users to quickly select, load, and run different Ready-to-Run demonstrations stored on an SD card using the VEEK-MT touch panel. **Figure 4-1** gives a snapshot of the default application selector interface (Note\*). Every demonstration consists of an FPGA hardware image and an application software image. When you select a demonstration the application selector copies the hardware image to EPCS device and software image to flash memory and reconfigures the FPGA with your selection. For more comprehensive information of the application selector factory configuration, please refer to chapter 5.

Figure 4-1 Application Selector Interface

*Note: Please insert the supplied SD card from this demonstration.*

## 4.3 Painter Demonstration

This chapter shows how to control LCD and touch controller to establish a paint demo based on SOPC Builder and Altera VIP Suite. The demonstration shows how multi-touch gestures and single-touch coordinates operate.

**Figure 4-2** shows the hardware system block diagram of this demonstration. For LCD display processing, the reference design is developed based on the Altera Video and Image Processing Suite (VIP). The Frame Reader VIP is used for reading display content from the associated video memory, and VIP Video Out is used to display the display content. The display content is filled by NIOS II processor according to users' input.

For multi-touch processing, a Terasic Memory-Mapped IP is used to retrieve the user input, including multi-touch gesture and single-touch coordinates. Note, the IP is encrypted, so the license should be installed before compiling the Quartus II project. For IP--usage details please refer to the section **3.7 Using Terasic Multi-Touch IP** in this document.

Figure 4-2 Block Diagram of the Painter Demonstration

## ■ Demonstration Source Code

- Project directory: Painter
- Bit stream used: Painter.sof
- Nios II Workspace: Painter \Software

## ■ Demonstration Batch File

Demo Batch File Folder: Painter \demo\_batch

The demo batch file includes the following files:

- Batch File: test.bat, test\_bashrc
- FPGA Configuration File: Painter.sof
- Nios II Program: Painter.elf

## ■ Demonstration Setup

1. Make sure Quartus II and Nios II are installed on your PC
  2. Power on the DE2-115 board
  3. Connect USB-Blaster to the DE2-115 board and install USB-Blaster driver if necessary
  4. Execute the demo batch file “test.bat” under the batch file folder, Painter \demo\_batch
  5. After Nios II program is downloaded and executed successfully, you will see a painter GUI in the LCD. **Figure 4-3** shows the GUI of the Painter Demo.
- The GUI is classified into three areas: Palette, Canvas, and Gesture. Users can select pen color from the color palette and start painting in the Canvas area. If gesture is detected, the associated gesture symbol is shown in the gesture area. To clear canvas content, press the “Clear” button.

- **Figure 4-4** shows the photo when users paint in the canvas area. **Figure 4-5** shows the phone when counter-clockwise rotation gesture is detected. **Figure 4-6** shows the photo when zoom-in gesture is detected

Figure 4-3 GUI of Painter Demo

Figure 4-4 Single Touch Painting

Figure 4-5 Counter-clockwise Rotation Gesture

Figure 4-6 Zoom-in Gesture

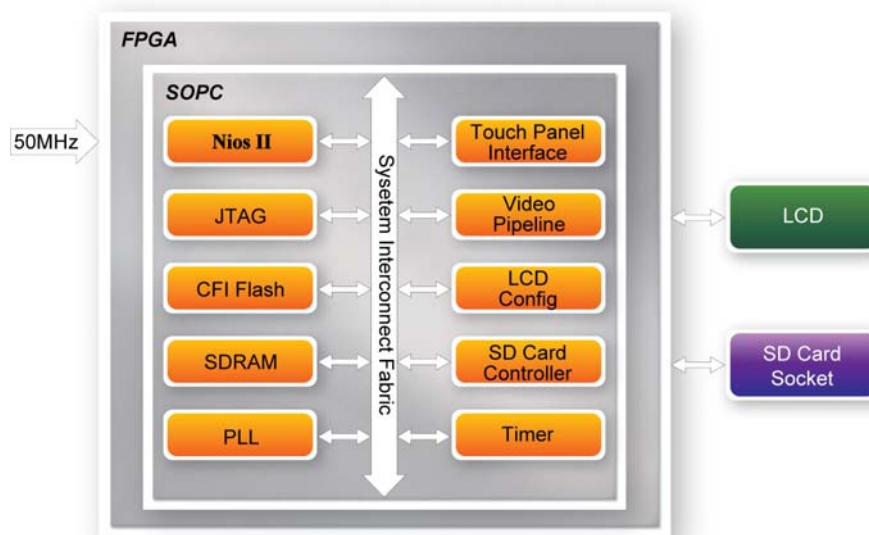

*Note: execute the test.bat under Picture\_Viewer\demo\_batch will automatically download the .sof and .elf file.*

## 4.4 Picture Viewer

This demonstration shows a simple picture viewer implementation using Nios II-based SOPC system. It reads JPEG images stored on the SD card and displays them on the LCD. The Nios II CPU decodes the images and fills the raw result data into frame buffers in SDRAM. The VEEK-MT will show the image the buffer being displayed points to. When users touch the LCD touch panel, it will proceed to display the next buffered image or last buffered image. **Figure 4-7** shows the block diagram of this demonstration.

The Nios II CPU here takes a key role in the demonstration. It is responsible of decoding the JPEG images and coordinates the works of all the peripherals. The touch panel handling program uses the timer as a regular interrupter and periodically updates the sampled coordinates.

**Figure 4-7 Block Diagram of the Picture Viewer Demonstration**

### ■ Demonstration Source Code

- Project directory: Picture\_Viewer
- Bit stream used: Picture\_Viewer.sof
- Nios II Workspace: Picture\_Viewer\Software

### ■ Demonstration Batch File

Demo Batch File Folder: Picture\_Viewer\demo\_batch

The demo batch file includes the following files:

- Batch File: Picture\_Viewer.bat, Picture\_Viewer \_bashrc
- FPGA Configuration File: Picture\_Viewer.sof
- Nios II Program: Picture\_Viewer.elf

## ■ Demonstration Setup

1. Format your SD card into FAT16 format
2. Place the jpg image files to the \jpg subdirectory of the SD card. For best display result, the image should have a resolution of 800x480 or the multiple of that
3. Insert the SD card to the SD card slot on the VEEK-MT
4. Load the bit stream into the FPGA on the VEEK-MT
5. Run the Nios II Software under the workspace Picture\_Viewer\Software (Note\*)
6. After loading the application you will see a slide show of pictures on the SD card.
7. The next image will be displayed after the delay period.
8. You can control the slide show as follows :
  - Press **Forward** () to advance, **Reverse** () to go back to previous image, **Play/Stop** () to play the slide or stop it.
  - On the top corner you will see the delay-period (seconds). You can increase or decrease the delay period by touching the + () or - () buttons.
  - The max delay is 120 seconds, the min delay is 1 second, and the default delay is 10 seconds.
  - You can hide the control buttons by clicking on the Hide button located at the top left corner of the touch screen. Touch anywhere on the screen to resume and to return to menu.

Figure 4-8 Picture Viewer Demonstration

*Note: execute the Picture\_Viewer.bat under Picture\_Viewer\demo\_batch will automatically download the .sof and .elf file.*

## 4.5 Video and Image Processing

The Video and Image Processing (VIP) Example Design demonstrates dynamic scaling and clipping of a standard definition video stream in either National Television System Committee (NTSC) or Phase Alternation Line (PAL) format and picture-in-picture mixing with a background layer. The video stream is output in high resolution (800x480) LCD touch panel.

The example design demonstrates a framework for rapid development of video and image processing systems using the parameterizable MegaCore® functions that are available in the Video and Image Processing Suite. Available functions are listed in **Table 4-1**. This demonstration needs the Quartus II license file includes the VIP suite feature.

**Table 4-1 VIP IP Cores Functions**

<b>IP MegaCore Function</b>	<b>Description</b>
<b>Frame Reader</b>	<b>Reads video from external memory and outputs it as a stream.</b>
<b>Control Synchronizer</b>	<b>Synchronizes the changes made to the video stream in real time between two functions.</b>
<b>Switch</b>	<b>Allows video streams to be switched in real time.</b>
<b>Color Space Converter</b>	<b>Converts image data between a variety of different color spaces such as RGB to YCrCb.</b>
<b>Chroma Resampler</b>	<b>Changes the sampling rate of the chroma data for image frames, for example from 4:2:2 to 4:4:4 or 4:2:2 to 4:2:0.</b>
<b>2D FIR Filter</b>	<b>Implements a 3 x 3, 5 x 5, or 7 x 7 finite impulse response (FIR) filter on an image data stream to smooth or sharpen images.</b>
<b>Alpha Blending Mixer</b>	<b>Mixes and blends multiple image streams—useful for implementing text overlay and picture-in-picture mixing.</b>
<b>Scaler</b>	<b>A sophisticated polyphase scaler that allows custom scaling and real-time updates of both the image sizes and the scaling coefficients.</b>
<b>Deinterlacer</b>	<b>Converts interlaced video formats to progressive video format using a motion adaptive deinterlacing algorithm. Also supports 'bob' and "weave" algorithms</b>
<b>Test Pattern Generator</b>	<b>Generates a video stream that contains still color bars for use as a test pattern.</b>
<b>Clipper</b>	<b>Provides a way to clip video streams and can be configured at compile time or at run time.</b>
<b>Color Plane Sequencer</b>	<b>Changes how color plane samples are transmitted across the Avalon-ST interface. This function can be used to split and join video streams, giving control over the routing of color plane samples.</b>
<b>Frame Buffer</b>	<b>Buffers video frames into external RAM. This core supports double or triple-buffering with a range of options for frame dropping and repeating.</b>
<b>2D Median Filter</b>	<b>Provides a way to apply 3 x 3, 5 x 5, or 7 x 7 pixel median filters to video images.</b>
<b>Gamma Corrector</b>	<b>Allows video streams to be corrected for the physical properties of display devices.</b>
<b>Clocked Video Input/Output</b>	<b>These two cores convert the industry-standard clocked video format (BT-656) to Avalon-ST video and vice versa.</b>

These functions allow you to fully integrate common video functions with video interfaces, processors, and external memory controllers. The example design uses an Altera Cyclone® IV E EP4CE115F29 featured VEEK-MT.

A video source is input through an analog composite port on VEEK-MT which generates a digital output in ITU BT656 format. A number of common video functions are performed on this input stream in the FPGA. These functions include clipping, chroma resampling, motion adaptive deinterlacing, color space conversion, picture-in-picture mixing, and polyphase scaling.

The input and output video interfaces on the VEEK-MT are configured and initialized by software running on a Nios® II processor. Nios II software demonstrates how to control the clocked video input, clocked video output, and mixer functions at run-time is also provided. The video system is implemented using the SOPC Builder system level design tool. This abstracted design tool provides an easy path to system integration of the video processing data path with a NTSC or PAL video input, VGA output, Nios II processor for configuration and control. The Video and Image Processing Suite MegaCore functions have common open Avalon-ST data interfaces and Avalon Memory-Mapped (Avalon-MM) control interfaces to facilitate connection of a chain of video functions and video system modeling. In addition, video data is transmitted between the Video and Image Processing Suite functions using the Avalon-ST Video protocol, which facilitates building run-time controllable systems and error recovery.

Figure 4-9 shows the Video and Image Processing block diagram.

Figure 4-9 VIP Example SOPC Block Diagram (Key Components)

## ■ Demonstration Source Code

- Project directory: VIP
- Bit stream used: VIP.sof
- Nios II Workspace: VIP\Software

## ■ Demonstration Batch File

Demo Batch File Folder: VIP\demo\_batch

The demo batch file includes the following files:

- Batch File: VIP.bat, VIP\_bashrc
- FPGA Configuration File: VIP.sof
- Nios II Program: VIP.elf

## ■ Demonstration Setup

- Connect a DVD player's composite video output (yellow plug) to the Video-IN RCA jack (J12) of the VEEK-MT. The DVD player has to be configured to provide NTSC output or PAL output
- Connect the VGA output of the VEEK-MT to a VGA monitor (both LCD and CRT type of monitors should work)
- Load the bit stream into FPGA (note\*)
- Run the Nios II IDE and choose VIP\Software as the workspace. Click on the Run button (note \*)
- Press the screen of the VEEK-MT and drag the video frame box will result in scaling the playing window to any size, as shown in [Figure 4-10](#)

*Note:*

*(1).Executing VIP\demo\_batch\ VIP.bat will download .sof and .elf files.*

*(2).You may need additional Altera VIP suite Megacore license features to recompile the project.*

**Figure 4-11** illustrates the setup for this demonstration.

Figure 4-10 VIP Demonstration

Figure 4-11 Setup for the VIP Demonstration

## 4.6 Camera Application

This demonstration shows a digital camera reference design using the 5 megapixel CMOS sensor and 7-inch LCD modules on the VEEK-MT. The CMOS sensor module sends the raw image data to FPGA on the DE2-115 board, the FPGA on the board handles image processing part and converts the data to RGB format to display on the LCD module. The I2C Sensor Configuration module is used to configure the CMOS sensor module. **Figure 4-12** shows the block diagram of the demonstration.

As soon as the configuration code is downloaded into the FPGA, the I2C Sensor Configuration block will initial the CMOS sensor via I2C interface. The CMOS sensor is configured as follow:

- Row and Column Size: 800 \* 480
- Exposure time: Adjustable
- Pix clock:  $MCLK * 2 = 25 * 2 = 50\text{MHz}$
- Readout modes: Binning
- Mirror mode: Line mirrored

According to the settings, we can calculate the CMOS sensor output frame rate is about 44.4 **fps**.

After the configuration, The CMOS sensor starts to capture and output image data streams, the CMOS sensor Capture block extracts the valid pix data streams based on the synchronous signals from the CMOS sensor. The data streams are generated in Bayer Color Pattern format. So it's then converted to RGB data streams by the RAW2RGB block.

After that, the Multi-Port SDRAM Controller acquires and writes the RGB data streams to the SDRAM which performs as a frame buffer. The Multi-Port SDRAM Controller has two write ports and read ports also with 16-bit data width each. The writing clock is the same as CMOS sensor pix clock, and the reading clock is provided by the LCD Controller, which is 33MHz.

Finally, the LCD controller fetches the RGB data from the buffer and displays it on the LCD panel continuously. Because the resolution and timing of the LCD is compatible with WVGA@800\*480, the LCD controller generates the same timing and the frame rate can achieve about 25 **fps**.

For the objective of a better visual effect, the CMOS sensor is configured to enable the left right mirror mode. User could disable this functionality by modifying the related register value being written to CMOS controller chip.

Figure 4-12 Block Diagram of the Digital Camera Design

## ■ Demonstration Source Code

- Project directory: Camera
- Bit stream used: Camera.sof

## ■ Demonstration Batch File

Demo Batch File Folder: Camera\demo\_batch

The demo batch file includes the following files:

- Batch File: test.bat
- FPGA Configuration File: Camera.sof

## ■ Demonstration Setup

- Load the bit stream into FPGA by executing the batch file ‘test.bat’ under Camera\demo\_batch\ folder
- The system enters the **FREE RUN** mode automatically. Press **KEY[0]** on the DE2-115 board to reset the circuit
- Press **KEY[2]** to take a shot of the photo; you can press **KEY[3]** again to switch back to **FREE RUN** mode and you should be able to see whatever the camera captures on the LCD display
- User can use the **SW[0]** and **KEY[1]** to set the exposure time for brightness adjustment of the image captured. When **SW[0]** is set to Off, the brightness of image will be increased as **KEY[1]** is pressed longer. If **SW[0]** is set to On, the brightness of image will be decreased as **KEY[1]** is pressed shorter
- User can use **SW[17]** to mirror image of the line. However, remember to press **KEY[0]** after toggle **SW[17]**

*Note: execute the test.bat under Camera\demo\_batch will automatically download the .sof file.*

**Table 4-2** summarizes the functional keys of the digital camera. **Figure 4-13** gives a run-time photograph of the demonstration.

**Table 4-2 The functional keys of the digital camera demonstration**

<b>Component</b>	<b>Function Description</b>
<b>KEY[0]</b>	<b>Reset circuit</b>
<b>KEY[1]</b>	<b>Set the new exposure time (use with SW[0] )</b>
<b>KEY[2]</b>	<b>Trigger the Image Capture (take a shot)</b>
<b>KEY[3]</b>	<b>Switch to Free Run mode</b>
<b>SW[0]</b>	<b>Off: Extend the exposure time</b>

	<b>On: Shorten the exposure time</b>
<b>SW[17]</b>	<b>Mirror mode</b>
<b>HEX[7:0]</b>	<b>Frame counter (Display ONLY)</b>

**Figure 4-13 Screen Shot of the Camera Demonstration**

## 4.7 Video and Image Processing for Camera

The Video and Image Processing (VIP) for Camera Example Design demonstrates dynamic scaling and clipping of a standard definition video stream in RGB format and picture-in-picture mixing with a background layer. The video stream is output in high resolution (800×480) on LCD touch panel.

The example design demonstrates a framework for rapid development of video and image processing systems using the parameterizable MegaCore® functions that are available in the Video and Image Processing Suite. Available functions are listed in Table 4 2. This demonstration needs the Quartus II license file includes the VIP suite feature.

These functions allow you to fully integrate common video functions with video interfaces, processors, and external memory controllers. The example design uses an Altera Cyclone® IV E EP4CE115F29 featured on the VEEK-MT.

A video source is input through the CMOS sensor on VEEK-MT which generates a digital output in RGB format. A number of common video functions are performed on this input stream in the FPGA. These functions include clipping, chroma resampling, motion adaptive deinterlacing, color space conversion, picture-in-picture mixing, and polyphase scaling.

The input and output video interfaces on the VEEK-MT are configured and initialized by software

running on a Nios® II processor. Nios II software demonstrates how to control the clocked video input, clocked video output, and mixer functions at run-time is also provided. The video system is implemented using the SOPC Builder system level design tool. This abstracted design tool provides an easy path to system integration of the video processing data path with a NTSC or PAL video input, VGA output, Nios II processor for configuration and control. The Video and Image Processing Suite MegaCore functions have common open Avalon-ST data interfaces and Avalon Memory-Mapped (Avalon-MM) control interfaces to facilitate connection of a chain of video functions and video system modeling. In addition, video data is transmitted between the Video and Image Processing Suite functions using the Avalon-ST Video protocol, which facilitates building run-time controllable systems and error recovery.

For the objective of a better visual effect, the CMOS sensor is configured to enable the left right mirror mode. User could disable this functionality by modifying the related register value being written to CMOS controller chip.

Figure 4-14 shows the Video and Image Processing block diagram.

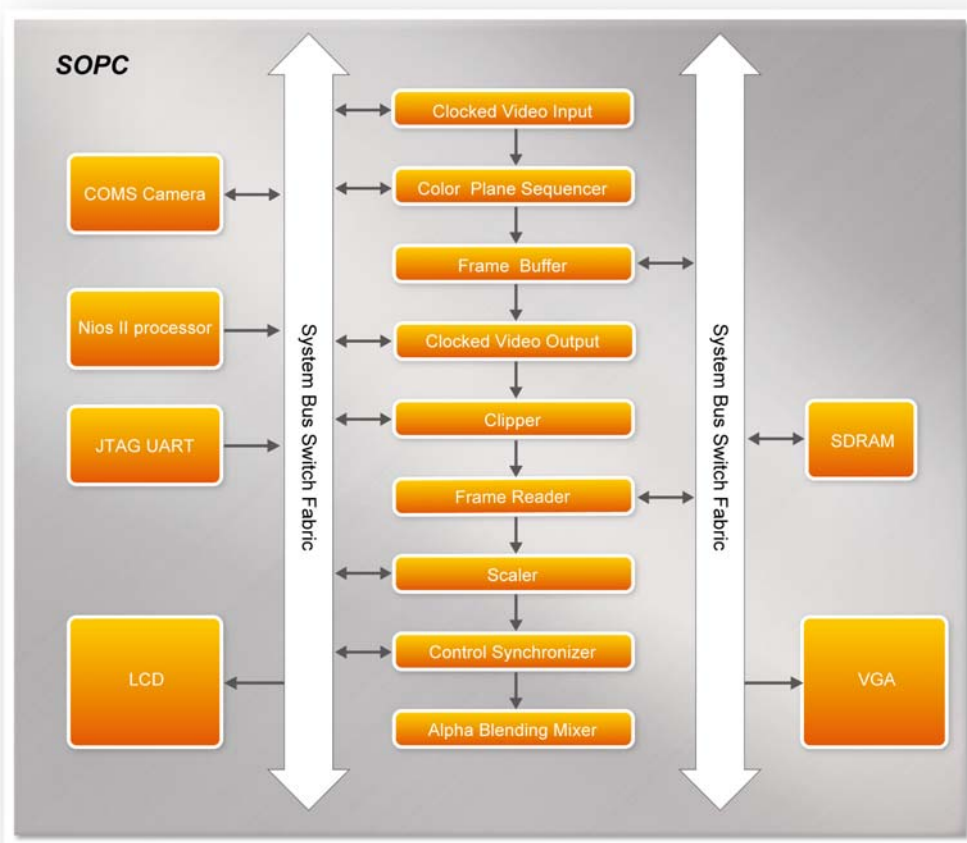

Figure 4-14 VIP Camera Example SOPC Block Diagram (Key Components)

## ■ Demonstration Source Code

- Project directory: VIP\_Camera
- Bit stream used: VIP\_Camera.sof
- Nios II Workspace: VIP\_Camera \Software

## ■ Demonstration Batch File

Demo Batch File Folder: VIP\_Camera\demo\_batch

The demo batch file includes the following files:

- Batch File: VIP\_Camera.bat, VIP\_Camera \_bashrc
- FPGA Configuration File: VIP\_Camera.sof
- Nios II Program: VIP\_Camera.elf

## ■ Demonstration Setup

- Connect the VGA output of the VEEK-MT to a VGA monitor (both LCD and CRT type of monitors should work)
- Load the bit stream into FPGA (note\*)
- Run the Nios II and choose VIP\_Camera\Software as the workspace. Click on the Run button (note \*)
- The system enters the **FREE RUN** mode automatically. Press **KEY[0]** on the DE2-115 board to reset the circuit
- Press **KEY[2]** to stop run; you can press **KEY[3]** again to switch back to **FREE RUN** mode and you should be able to see whatever the camera captures on the VGA display
- User can use **SW[17]** to mirror image of the line. However, remember to press **KEY[0]** after toggle **SW[17]**
- Press and drag the video frame box will result in scaling the playing window to any size, as shown in **Figure 4-10**

*Note:*

*(1).Execute VIP\_Camera\demo\_batch\VIP\_CameraA.bat will download .sof and .elf files.*

*(2).You may need additional Altera VIP suite Megacore license features to recompile the project.*

**Figure 4-15** illustrates the setup for this demonstration.

**Figure 4-15 Setup for the VIP\_Camera demonstration**

## 4.8 Digital Accelerometer Demonstration

This demonstration shows a bubble level implementation based on a digital accelerometer. We use I<sup>2</sup>C protocol to control the ADXL345 digital accelerometer, and the APDS-9300 Miniature Ambient Light Photo Sensor. The LCD displays the interface. When tilting the VEEK-MT, the ADXL345 measures the static acceleration of gravity. In the Nios II software, the change of angle in the x-axis and y-axis is computed, and shown as angle data in the LCD display. The value of light sensor will change as the brightness changes around the light-sensor.

**Figure 4-16** shows the hardware system block diagram of this demonstration. The system is clocked by an external 50MHz oscillator. Through the internal PLL module, the generated 150MHz clock is used for Nios II processor and other components, and there is also 10MHz for low-speed peripherals.

Figure 4-16 Block Diagram of the Digital Accelerometer Demonstration

#### ■ Demonstration Source Code

- Project directory: G\_sensor
- Bit stream used: G\_sensor.sof
- Nios II Workspace: G\_sensor\Software

#### ■ Demonstration Batch File

Demo Batch File Folder: G\_sensor\demo\_batch

The demo batch file includes the following files:

- Batch File: G\_sensor.bat, test\_bashrc
- FPGA Configuration File: G\_sensor.sof
- Nios II Program: G\_sensor.elf

#### ■ Demonstration Setup

- Load the bit stream into the FPGA on the VEEK-MT.
- Run the Nios II software under the workspace *G\_sensor\Software* (Note\*).
- After the Nios II program is downloaded and executed successfully, a prompt message will be displayed in nios2-terminal: “its ADXL345’s ID = e5”.
- Tilt the VEEK-MT to all directions, and you will find that the angle of the accelerometer and value of light sensor will change. When turning the board from  $-80^{\circ}$  to  $-10^{\circ}$  and from  $10^{\circ}$  to  $80^{\circ}$  in Y-axis, or from  $10^{\circ}$  to  $80^{\circ}$  and from  $-80^{\circ}$  to  $-10^{\circ}$  in Y-axis, the image will invert

Figure 4-17 shows the demonstration in action.

Figure 4-17 Digital Accelerometer Demonstration

*Note: Execute `G_sensor \demo_batch\test.bat` to download .sof and .elf files.*

## Chapter 5

# *Application Selector*

The application selector utility is the default code that powers on the FPGA and offers a graphical interface on the LCD, allowing users to select and run different demonstrations that reside on an SD card.

### 5.1 Ready to Run SD Card Demos

You can find several ready-to-run SD card demos in your SD card root directory as well as in the System CD under **Factory\_Recovery\Application\_Selector** folder. **Figure 5-1** shows the photograph of the application selector main interface.

**Figure 5-1 Application selector main interface**

Also, you can easily convert your own applications to be loadable by the application selector. For more information see “**Creating Your Own Loadable Applications**” in section 5.3. If you have lost the contained files in the SD card, you could find them on the VEEK-MT System CD under the **Factory\_Recovery** folder.

## 5.2 Running the Application Selector

- Connect power to the VEEK-MT
- Insert the SD card with applications into the SD card socket of VEEK-MT
- Switch on the power (SW18) (1\*)
- Scroll to select the demonstration to load using the side-bar
- Tap on the **Load** button to load and run a demonstration (2\*)

### *Note:*

*(1) If the board is already powered, the application selector will boot from EPCS, and a splash screen will appear while the application selector searches for applications on the SD card.*

*(2) The application will begin loading, and a window will be displayed showing the progress. Loading will take between 2 and 30 seconds, depending on the size of the application.*

## 5.3 Application Selector Details

This section describes some details about the operation of the application selector utility.

### **SD Card**

The Application Selector uses an SD card for storing applications. The SD card must be formatted with the FAT 16 file system, and can be any capacity up to 2GB. Long file names are supported. The Nios II CPU access the SD card through an SD card SPI controller.

### **Application Files**

Each loadable application consists of two binary files, all stored on the SD card. The first binary file represents the software portion of the example and must be derived from an .ELF file as described in the section of this document titled “Creating Your Own Loadable Applications”. This binary file can be named anything supported by the FAT16 file system, the only restriction being that the name must end with `_SW.bin`. The second binary file represents the hardware portion of the example and must be derived from a .SOF file as described in the section of this document titled “Creating Your Own Loadable Applications”. This file can be named anything supported by the FAT 16 file system, the only restriction being that the name must end with `_HW.bin`.

### **SD Card Directory Structure**

All loadable applications on the SD card must be located in a top-level directory named `Application_Selector`. Under the `Application_Selector` directory, each application is located in its own subdirectory. The name of that subdirectory is important because the application selector utility uses that name as the title of the application when displaying it in the main menu. The subdirectory names can be anything so long as they adhere to the FAT file system long file name rules. Spaces are permitted.

## CFI Flash

CFI flash is used to store the software binary files of applications. All software binary files used by the application selector contain a boot copier which is pre-ended by the Nios2-elf-objcopy utility during file conversion process described in the “Creating Your Own Loadable Applications” section. The boot copier copies the software code to program memory before running it. The Application software binary file is stored in flash at load time to an offset 0x0.

## EPCS Device

EPCS is used to store both the binary file of the Application Selector (both hardware and software image) itself, as well as hardware binary files of applications which are being loaded. The Application Selector binary file is permanently stored in EPCS device at offset 0x0. Hardware binary files for the applications being loaded get written to EPCS at load time to an offset 0x400000.

## Creating Your Own Loadable Applications

It is easy to convert your own Nios II design into an application which is loadable by the Application Selector utility. All you need is a hardware image (a .SOF file) and a software image which runs on that hardware (a Nios II .ELF file).

The only restrictions are:

- The hardware designs must contain a CFI Flash controller (1\*)
- If the .SOF file contains a Nios II CPU, then its reset address should be set to CFI Flash at offset 0x0
- Before compiling the software, make sure you have set your software’s program memory (.text section) in Flash memory under the System Library Properties (Nios II IDE) page or through BSP Editor (Nios II SBT for Eclipse) utility (2\*)

Once you have your working .SOF and .ELF file pair, perform the following steps to convert them to a loadable application selector compatible application.

- Copy both the .SOF and .ELF files into a common directory relying on your choice. This directory is where you will convert the files
- On your host PC, launch a Nios II Command Shell from **Start ->Programs -> Altera -> Nios II <version #> EDS -> Nios II Command Shell**
- From the command shell navigate to where your SOF file is located and create your hardware binary file using the following commands
- Convert .sof file into .flash file
- `sof2flash --epcs --input="your example.sof" --output="your example_HW.flash"(3*)`
- Convert .flash file into .binary file
- `nios2-elf-objcopy -I srec -O binary "your example_HW.flash" "your example_HW.bin"`
- From the command shell navigate to where your ELF file is located and create your software binary file using the following command

- `nios2-elf-objcopy -O binary "your example.elf" "your example_SW.bin "(4,5*)`
- Create a new subdirectory and name it what you would like the title of your application to be shown as in the application selector
- Using an SD card reader, copy the directory onto an SD card into a directory named "Application\_Selector". The directory structure on the SD card should look like this: Application\_Selector\- Place the SD card in the VEEK-MT, and switch on the power. The Application Selector will start up, and you will now see your application appear as one of the selections

**Note:**

(1).You may not need a CFI Flash controller when your design does not contain a Nios II processor or you store your software code within the on-chip memory and use the .hex initialization file.

(2).If you would like to use other memories such as SRAM or SDRAM as the program memory, you may need to perform two steps to convert your .elf file into .bin file to make the software properly run on VEEK-MT. The commands seem to look like this:

```
elf2flash --base=flash_base_address --end=flash_end_address --reset=flash_base_address
--input="<your software name>.elf" --output="<your software name>.flash"
--boot="$SOPC_KIT_NIOS2/components/altera_nios2/boot_loader_cfi.srec"
```

```
nios2-elf-objcopy -I srec -O binary <your software name>.flash <your software name>_SW.bin
```

(3).You may pad a --compress option for saving binary image space because the Cyclone IV E series support the decompress feature while loading hardware image from EPCS device.

(4).The command will use the default HAL boot loader and link it to the .text section.

(5).You can also use the tool 'bin\_demo\_batch' to convert your sof and elf to bin. Copy "your example.sof" and "your example.elf" to the bin\_demo\_batch folder, rename them to test.sof, test.elf, execute the test.bat, then the final test\_HW.bin and test\_SW.bin are your target files.

## 5.4 Restoring the Factory Image

This section describes some details about the operation of restoring the Application Selector factory image.

### Combining factory recovery binary files

In the factory settings, you need to program Application Selector binary files to EPCS. Before programming, you should combine application selector software binary file and hardware binary file together by executing the instructions below:

- Copy both the Selector.sof and Selector.elf files into a common directory relying on your choice. This directory is where you will convert the files
- On your host PC, launch a Nios II Command Shell from **Start ->Programs -> Altera -> Nios II <version #> EDS -> Nios II Command Shell**
- From the command shell navigate to where your SOF file is located and create your hardware binary file using the following command commands listed below

- Convert Selector.sof file into Selector\_HW.flash file
- `sof2flash --epcs --input= Selector.sof --output= Selector_HW.flash`
- Convert .flash file into .bin file
- `nios2-elf-objcopy -I srec -O binary Selector_HW.flash Selector_HW.bin`
- From the command shell navigate to where your ELF file is located and create your software bin image using the following command commands listed below
- Convert Selector.elf into Selector\_SW.flash
- `elf2flash --epcs --after=Selector_HW.flash --input=Selector.elf --output= Selector_SW.flash`
- Convert Selector\_SW.flash into Selector\_SW.bin
- `nios2-elf-objcopy -I srec -O binary Selector_SW.flash Selector_SW.bin`
- Combine Selector\_HW.bin and Selector\_SW.bin using the following command
- `cat Selector_HW.bin Selector_SW.bin > Selector.bin`
- The generated Selector.bin is our target binary file

### Restoring the original binary file

To restore the original contents of the Application Selector, perform the following steps:

- Copy Selector project into a local directory of your choice. The Selector project is placed in **Demonstrations\Selector**
- Power on the VEEK-MT, with the USB cable connected to the USB Blaster port
- Download the Selector.sof to the board by using either JTAG or AS programming
- Run the Nios II and choose **Selector\Software** as the workspace
- Choose **Tools > Flash Programmer** to open the flash programmer
- Choose Program a file into memory, choose your Selector.bin file. See **Figure 5-2**
- Click Program Flash to start program Selector.bin to EPCS in the board
- When the programming finishes, power on again

*Note: You can also use 'Selector\_batch' to generate selector.bin and restore the original binary file by executing the Selector.bat under the Factory\_Recovery\Selector\_batch folder.*
