Certification

FCC CE

FCC Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

To assure continued compliance, any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment. (Example- use only shielded interface cables when connecting to computer or peripheral devices)

FCC Radiation Exposure Statement

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

This equipment complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference, and
- (2) This device must accept any interference received, including interference that may cause undesired operation.

Caution!

The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user authority to operate the equipment

Package Contents

The following items should be found in your package:

- WF-2409
- Power adapter
- Quick Installation Guide
- CD-Rom
- Ethernet cable

Make sure that the package contains above items. If any of the above items is missing or damaged, please contact the store you bought this product from.

--------------------------	----

1. Introduction

1.1. Product Overview

WF-2409 Wireless-N Router is dedicated to Small Office/Home Office (SOHO) Wireless network solution. It is 4 in 1 network device, which combines wireless access point, firewall, 4-port Switch and the NAT-Router. It provides up to 300Mbps data transmission rate in 2.4GHz frequency, complies with IEEE 802.11n, IEEE 802.11g and IEEE802.11b and backwards compatible with all IEEE 802.11n/g/b devices. It has 3 detachable antenna which bring powerful ability of Receiving signal. And the router also supports wireless LAN up to 128-bit WEP, WPA/WPA2 encryption security. The 300Mbps Wireless-N Router also provides WEB and Remote Management and system log so that network administrators can manage and monitor the network in real time.

WF-2409 Wireless-N Router also provides a hardware WPS (Wi-Fi protected setup) button, which helps you setup a secure wireless network in a snap. The button lets you activate the wireless protection easily

1.2. Main Features

- Comply with IEEE802.11n/g/b, IEEE802.3 10Base-T, IEEE802.3u 100Base-TX standards
- Support MIMO technology with 3 transmit and 3 receive, up to 300Mbps wireless LAN data transfer rates
- Support DHCP Client, PPPoE Client, Static IP, L2TP, PPTP
- Support multi-wireless mode: AP, WDS, AP+WDS, repeater, client, etc.
- Support static ARP, MAC filtering, IP access control, DNS filter
- Support FTP, PPTP and L2TP pass through
- Support UPNP (universal plug and play)
- Upgradeable firmware for future functions
- WPS button can easily setup a secure network
- Support WMM
- Support data encryption mode: WEP, WPA, WPA2
- Support DMZ

1.3. Supporting Standard and Protocol

- IEEE 802.11b/g/n
- IEEE 802.11e
- IEEE 802.11h
- IEEE 802.11k
- IEEE 802.11i
- IEEE 802.3 10Base-T
- IEEE 802.3u 100Base-TX
- IEEE802.3ab 1000 Base-T

1.4. Working Environment

Temperature

- 0° to 40° C (operating)
- -40° to 70° C (storage)

Humidity

- 10% to 90 % non-condensing (operating)
- 5% to 90% non-condensing (storage)

Power

- DC 9V

2. Hardware Installation

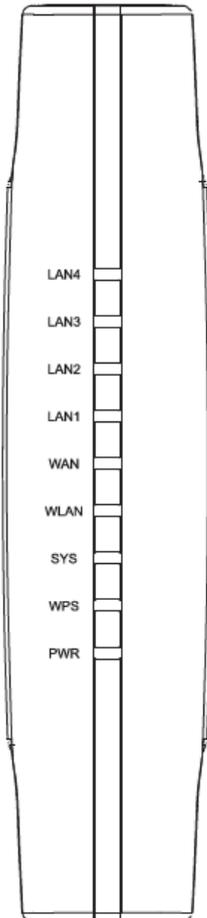

2.1. System Requirement

Minimum Requirements:

- Broadband (DSL/Cable) modem and service with Ethernet port
- 802.11n b/g/n wireless adapter or Ethernet adapter and cable for each computer
- Internet Explorer® 5.0, Firefox® 2.0 or Safari® 1.4 or higher

2.2. Panel

Front panel

LED	Function		Figure2-1

Rear panel

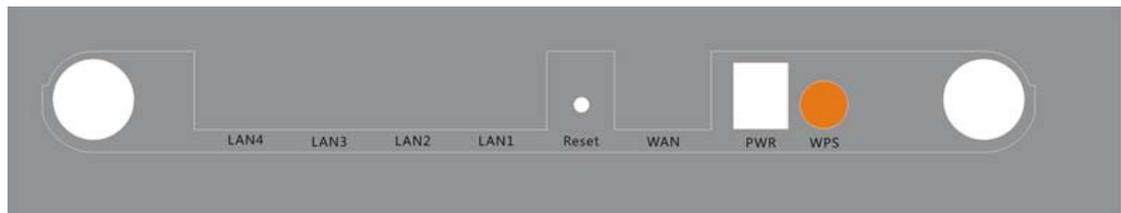

Figure 2-1

Description	Function
PWR	Connect to Power adapter, please don't use the unknown power adapter, otherwise your device may be damaged.
LAN	Connect with computer NIC or Ethernet device
WAN	Internet access
Reset	Restore settings
WPS	WPS settings

2.3. Restore to factory configuration

If the router ever freezes in a setting change process or if you can't access it because you can't remember the IP you have given it or other problem, you may have to utilize the reset button on the back of the router to put it back to factory settings. You have to press and hold this button for a few seconds (2-6s) with a pencil when it is working, then release and it will restore settings to the factory configuration.

The other way to restore factory settings is through the same user interface used in setup. Click on 'System management' - 'Restore', and click on the 'Restore' button.

2.4. Hardware Installation Procedures

The procedures to install the 300Mbps Wireless-N Router please refers to the following picture

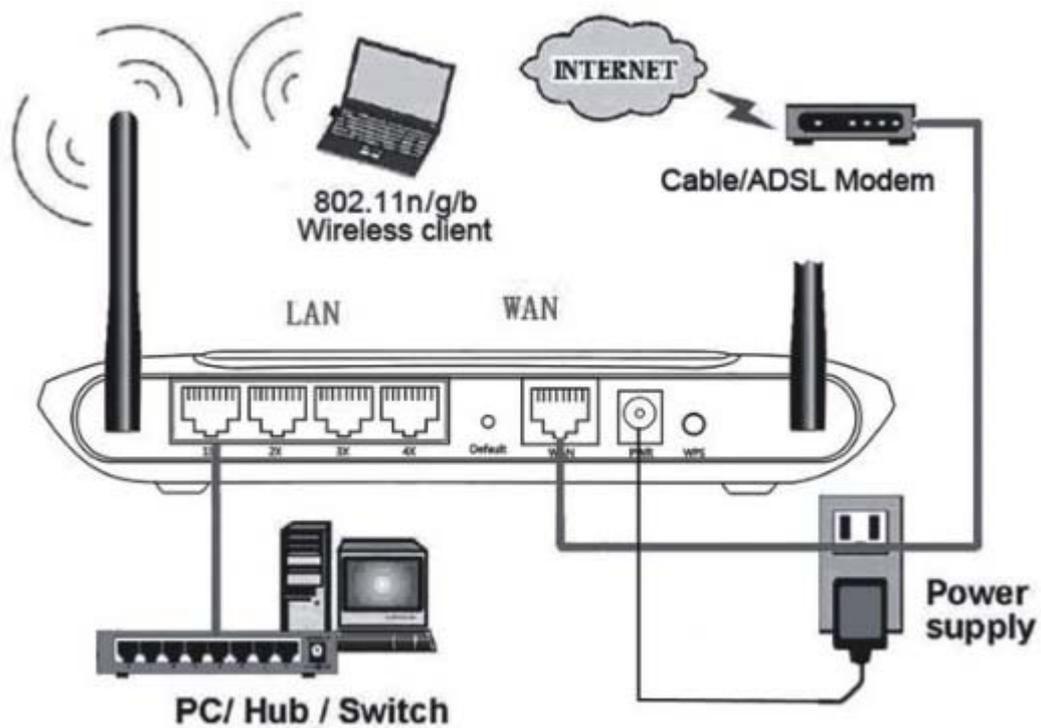

Figure 2-2

- Attach one end of an Ethernet cable to your computer's Ethernet port, and the other end to one of the LAN ports of your router.
- Connect another Ethernet cable from your Cable/DSL modem to the WAN port of your router.
- Connect the single DC output connector of the power adapter to the power jack on the back of the router and plug the Power Adapter into an AC outlet.

3. Login

You can manage WF-2409 Wireless-N Router through the Web browser-based configuration utility. To configure the device via Web browser, at least one properly configured computer must be connected to the device via Ethernet or wireless network. The 300Mbps Wireless-N Router is configured with the **default IP address of 192.168.1.1** and **subnet mask of 255.255.255.0** and its **DHCP server is enabled by default**. Before setting up the Router, make sure your PCs are configured to obtain an IP address automatically from the Router by the steps below.

3.1. Configure computer

3.1.1. Windows 98/Me

1. Go to Start → Settings → Control Panel.
2. Find and double-click the Network icon. The Network dialog box appears.
3. Click the Configuration label and ensure that you have network card.
4. Select TCP/IP. If TCP/IP appears more than once, please select the item that has an arrow “→” pointing to the network card installed on your computer. DO NOT choose the instance of TCP/IP with the words “Dial Up Adapter” beside it.
5. Click Properties. The TCP/IP Properties dialog box appears.
6. Ensure the Obtain IP Address Automatically is checked.
7. From the WINS Configuration dialog box, Ensure that Disable WINS Resolution is checked.
8. From the Gateway dialog box, remove all entries from the Installed gateways by selecting them and clicking Remove.
9. From the DNS Configuration dialog box, remove all entries from the DNS Server Search Order box by selecting them and clicking Remove. Remove all entries from the Domain Suffix Search Order box by selecting them and clicking Remove. Click Disable DNS.
10. Click OK, back to Network Configuration dialog box
11. Click OK, if prompted to restart, click YES.

3.1.2. Windows 2000

Please follow the steps below to setup your computer:

1. Go to Start → Settings → Control Panel

Figure 3-1

2. Double click the icon Network and Dial-up Connections
3. Highlight the icon Local Area Connection, right click your mouse, and click Properties

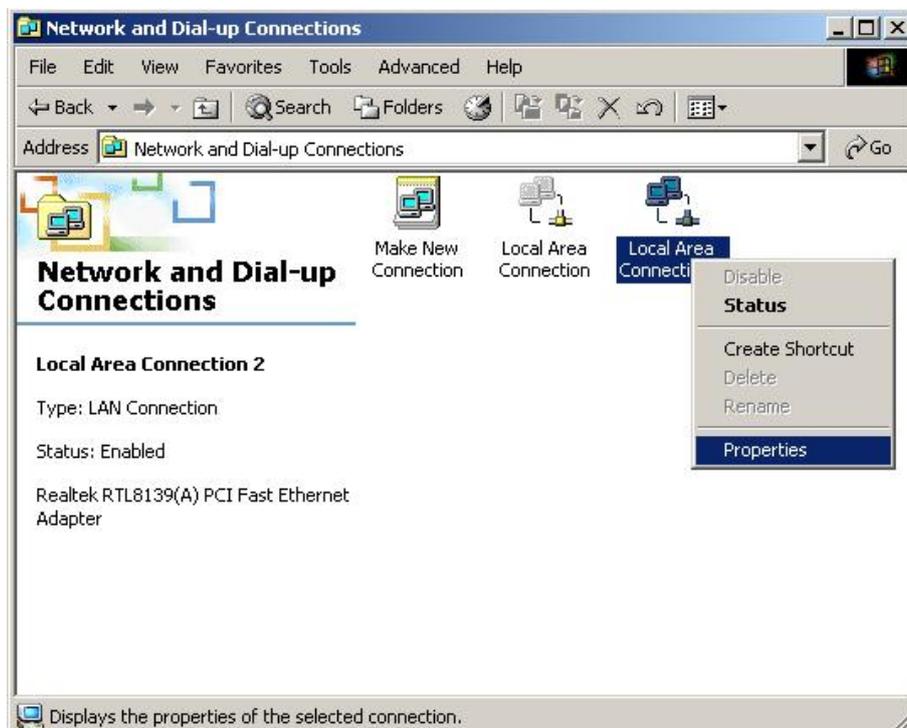

Figure 3-2

4. Highlight Internet Protocol (TCP/IP), and then press Properties button

Figure 3-3

5. Choose Obtain an IP address automatically and Obtain DNS server address automatically, and then press OK to close the Internet Protocol (TCP/IP) Properties window

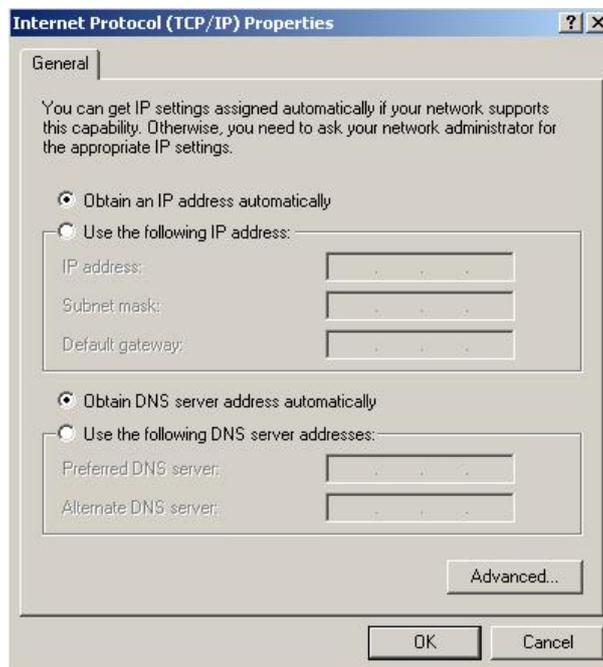

Figure 3-4

6. Press OK to close the Local Area Connection Properties window

Figure 3-5

3.1.3. Windows XP

Please follow the steps below to setup your computer:

1. Go to Start → Settings → Control Panel
2. Click Network and Internet Connections

Figure 3-6

3. Click Network Connections

Figure 3-7

4. Highlight the icon Local Area Connection, right click your mouse, and click Properties

Figure 3-8

5. Highlight Internet Protocol (TCP/IP), and then press Properties button

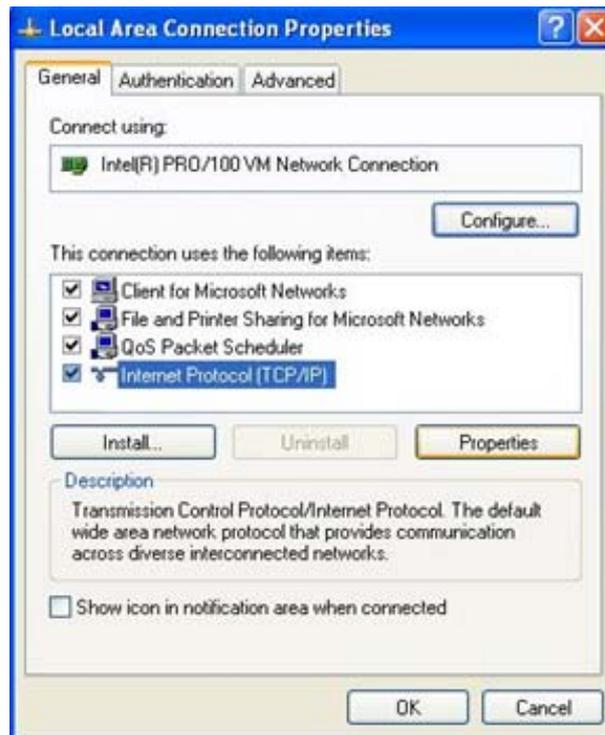

Figure 3-9

6. Choose Obtain an IP address automatically and Obtain DNS server address automatically, and then press OK to close the Internet Protocol (TCP/IP) Properties window

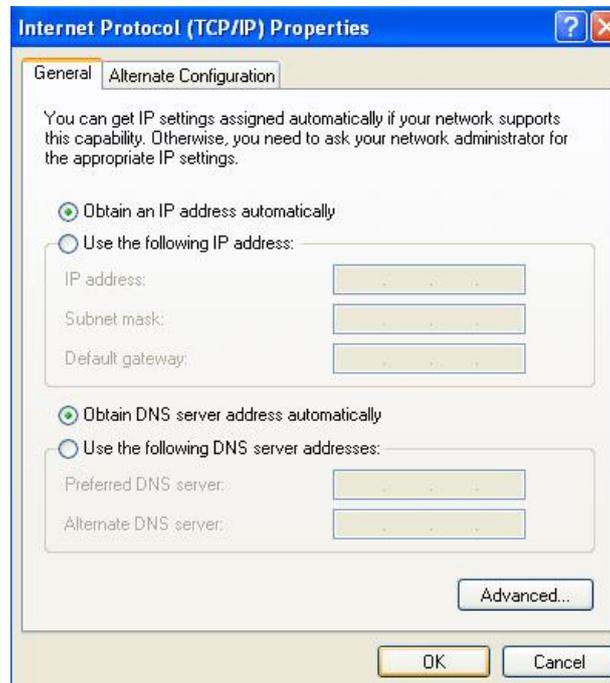

Figure 3-10

7. Press OK to close the Local Area Connection Properties window

Figure 3-11

3.1.4. Windows Vista

Please follow the steps below to setup your computer:

1. Go to Start → Settings → Control Panel
2. Click Network and Sharing Center

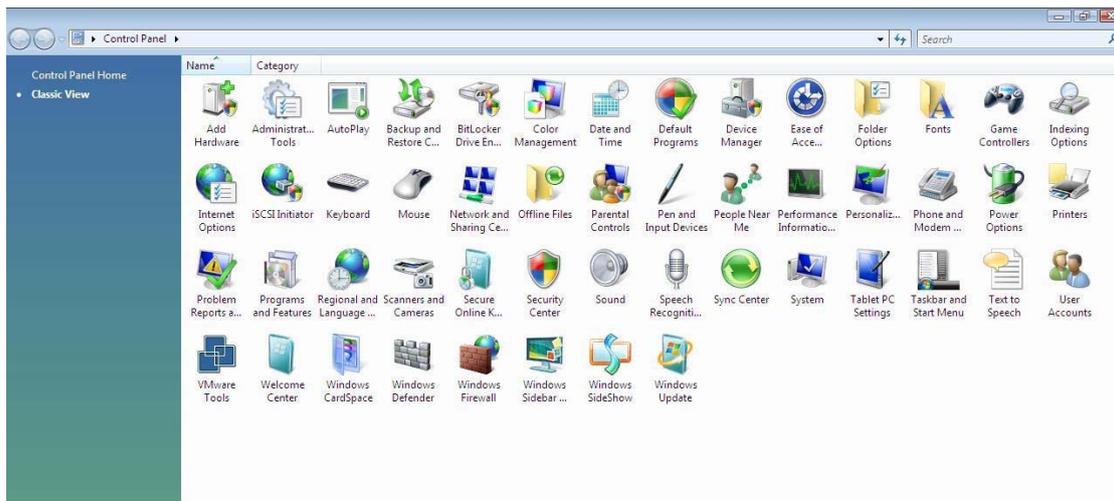

Figure 3-12

3. Click Manage Network Connections

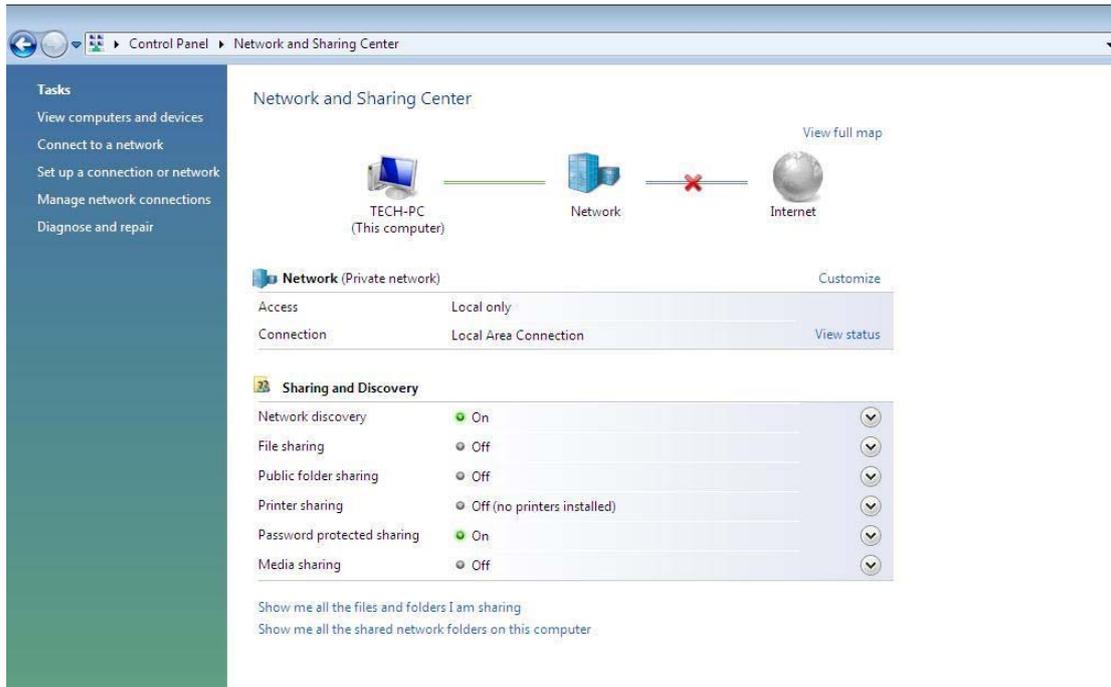

Figure 3-13

4. Highlight the icon Local Area Connection, right click your mouse, and click Properties

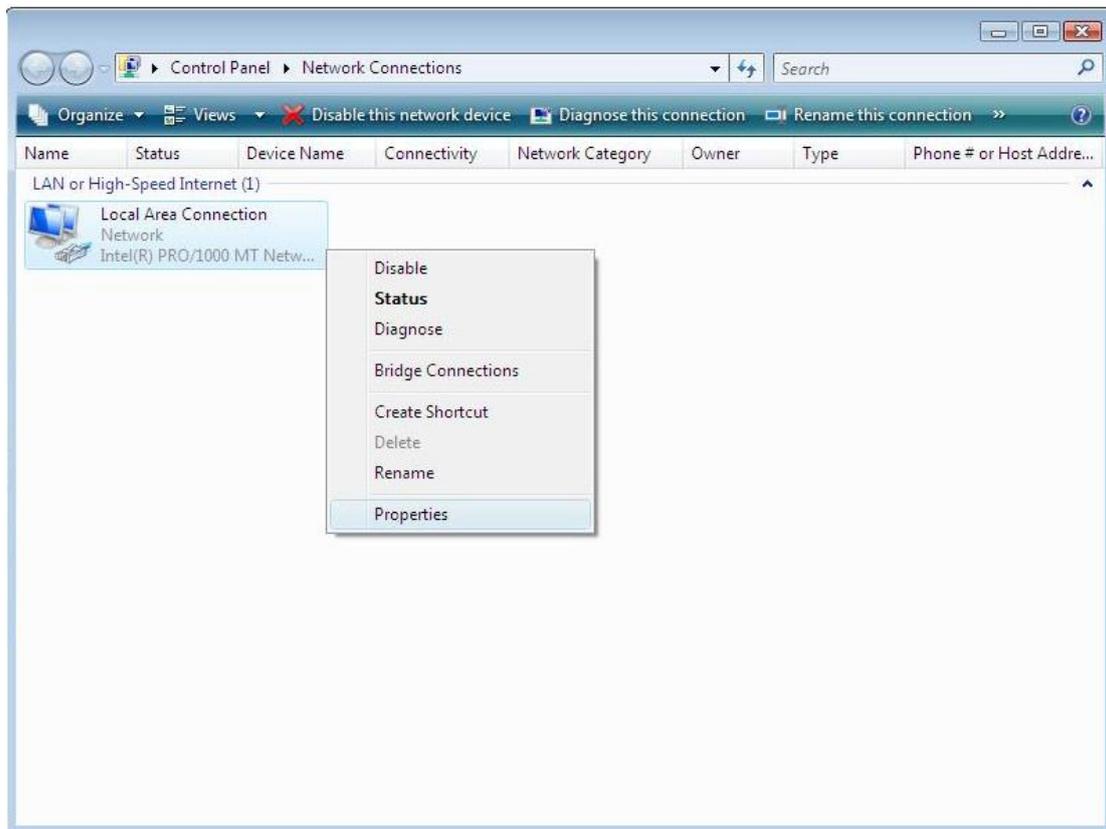

Figure 3-14

5. Highlight Internet Protocol Version 4 (TCP/IP) and then press Properties button

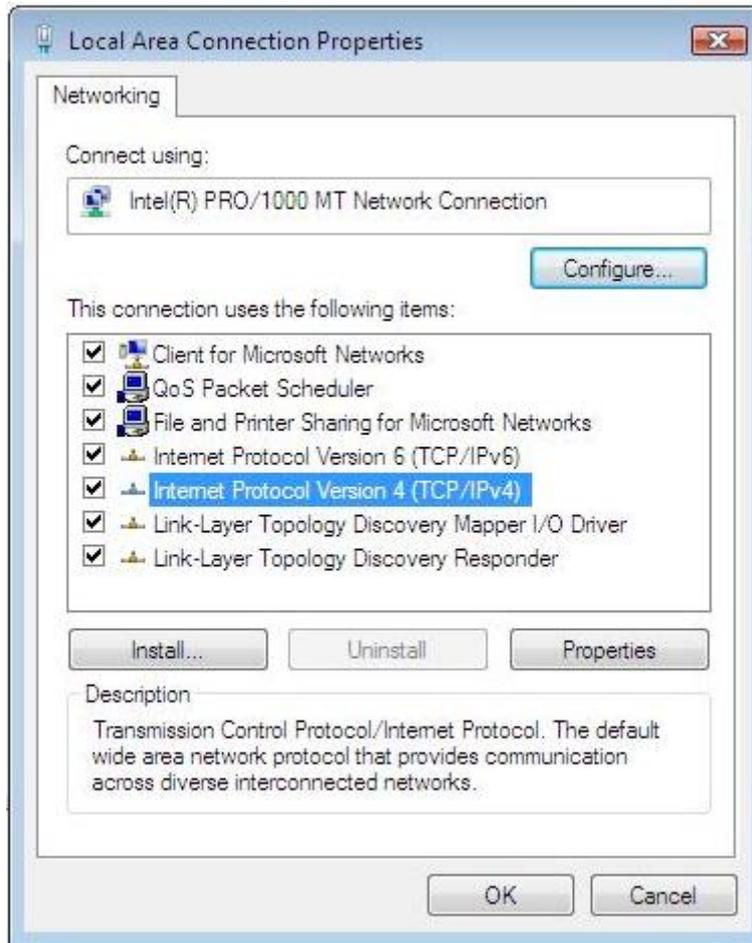

Figure 3-15

6. Choose Obtain an IP address automatically and Obtain DNS server address automatically, and then press OK to close the Internet Protocol (TCP/IP) Properties window

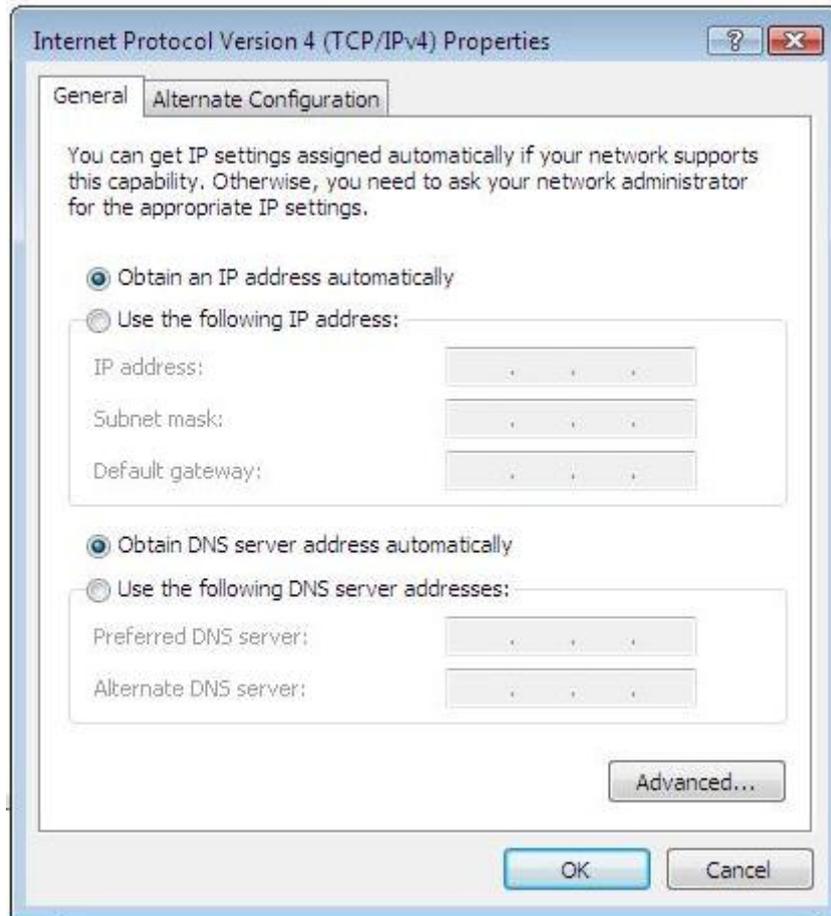

Figure 3-16

7. Press OK to close the Local Area Connection Properties window.

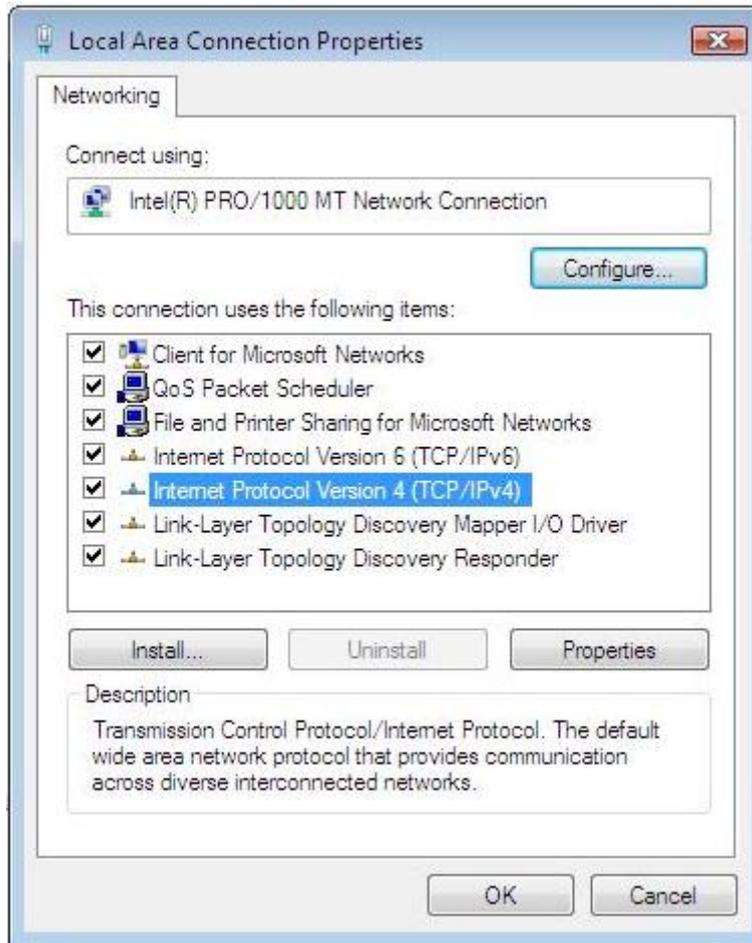

Figure 3-17

3.1.5. Windows 7

Please follow the steps blow to setup your computer :

1. Go to Start→ Control Panel→ Network and Internet.
2. Click Network and Sharing Center→ Change adapter settings.
3. Highlight the icon Local Area Connection, right click your mouse, and click Properties.
Highlight Internet Protocol version 4 (TCP/IPv4).

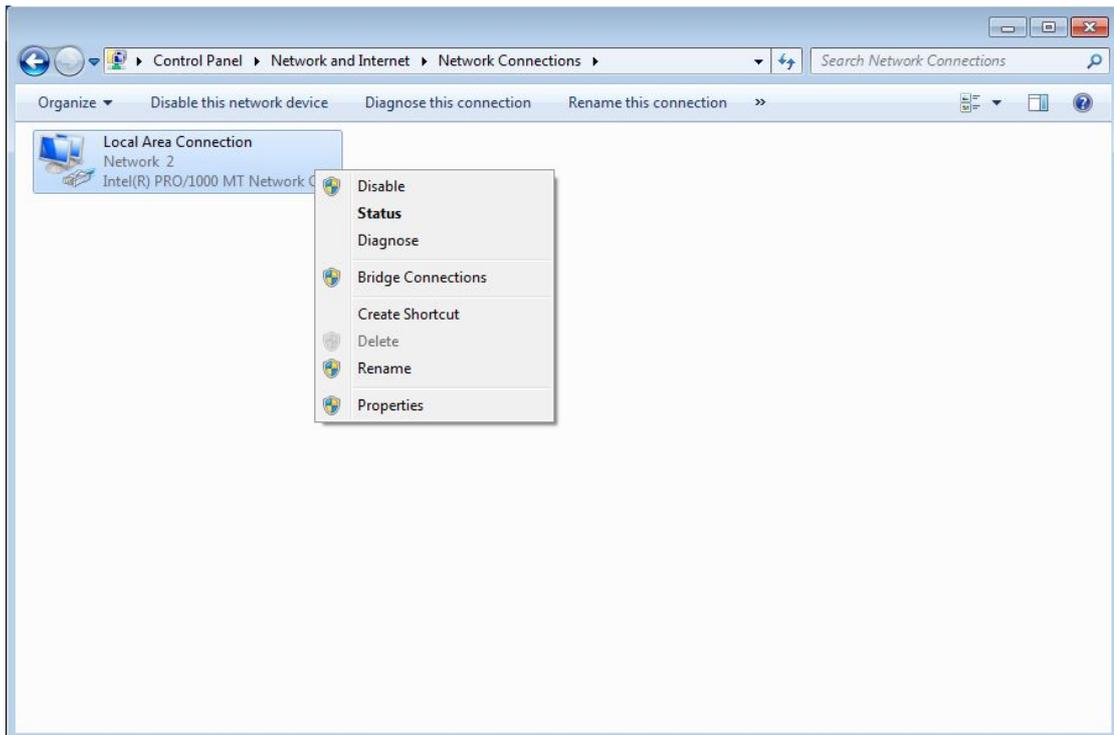

Figure 3-18

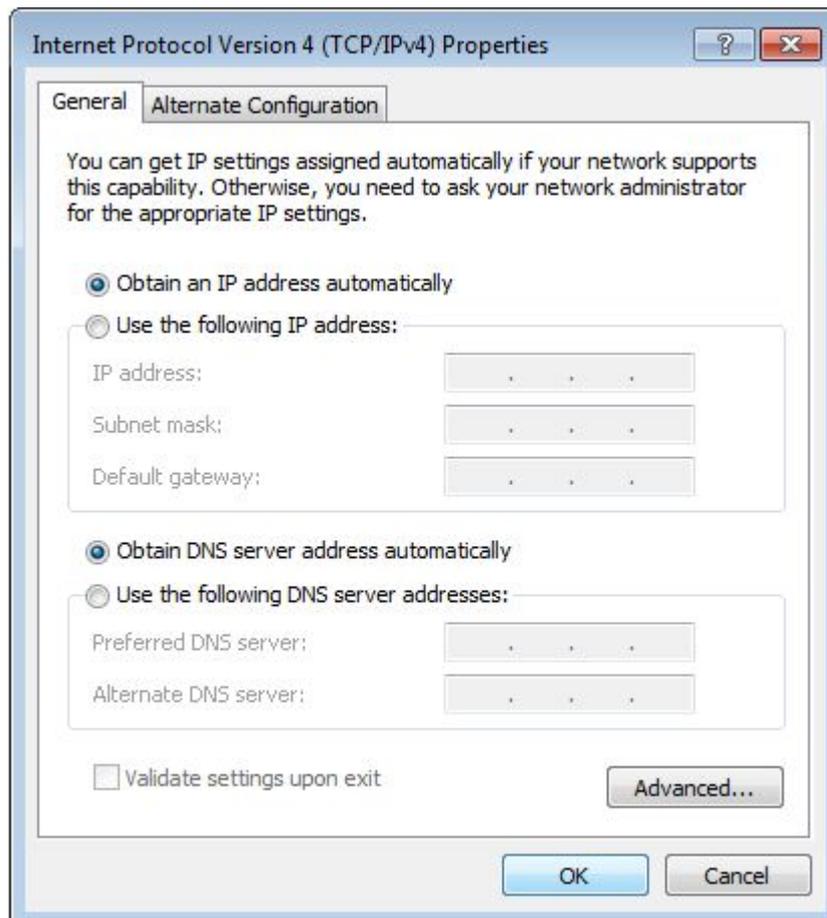

Figure 3-19

4. Choose Obtain an IP address automatically and Obtain DNS server address automatically,

and then press the OK to close the window.

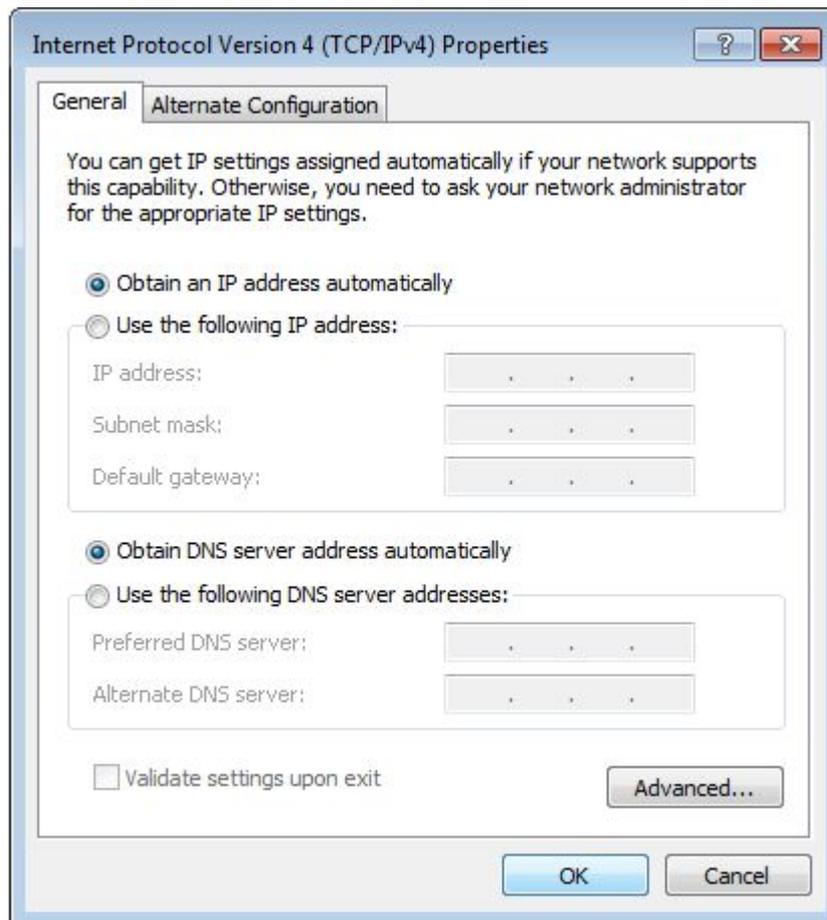

Figure 3-20

5. Press OK to close the Local Area Connection Properties window.

3.1.6. MAC OS

Please follow the steps blow to setup your computer:

1. Go to Start→ System preference Settings→ Network.

Figure 3-21

2. Click Network, Select Use DHCP at the Configuration bar, the system will get the IP address automatically.

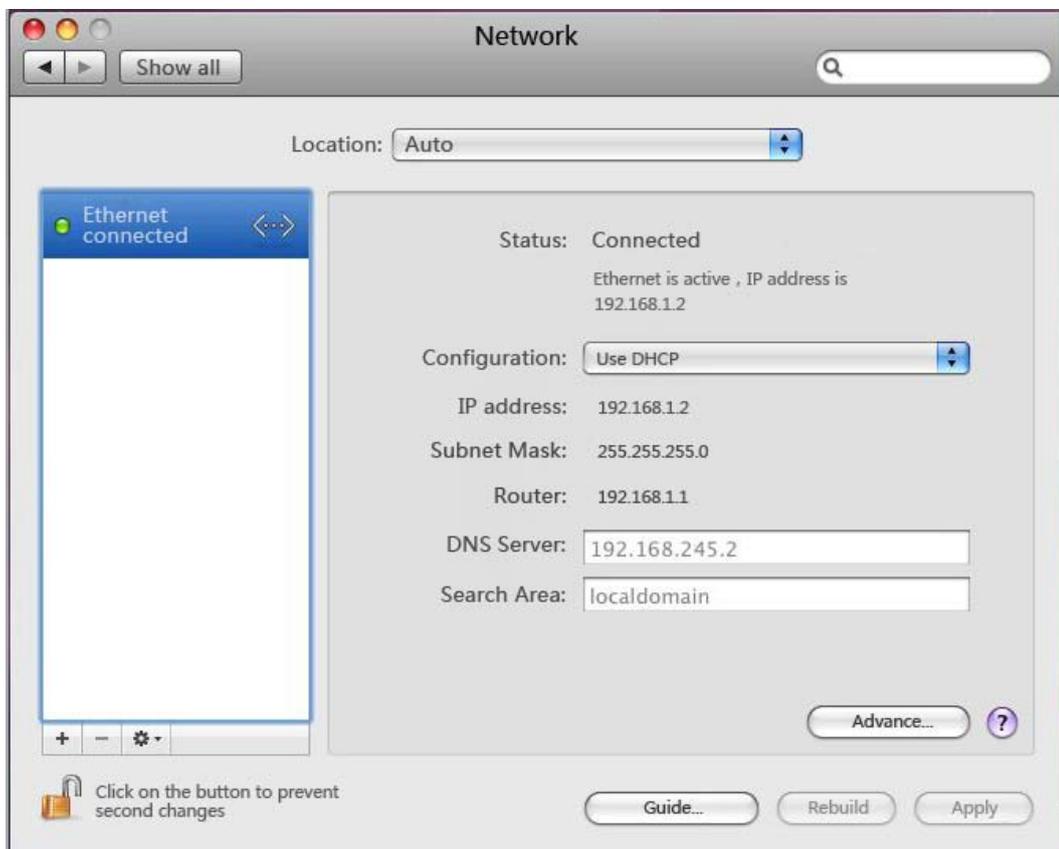

Figure 3-22

3. Press Apply to complete this operation and close the window.

3.2. Checking Connection with the Router

After configuring the TCP/IP protocol, use the ping command to verify if the computer can communicate with the Router. To execute the ping command, open the DOS window and Ping the IP address of the 300Mbps Wireless-N Router at the DOS prompt:

- For Windows 98/Me: Start → Run. Type command and click OK.
- For Windows 2000/XP: Start → Run. Type cmd and click OK.
- For Windows Vista/7: Start → Type cmd at the start search bar and press the Enter.
- For MAC OS → The system will complete this operation automatically.

At the DOS prompt, type the following command:

If the Command window returns something similar to the following:

```
C:\Documents and Settings\admin>ping 192.168.1.1

Pinging 192.168.1.1 with 32 bytes of data:

Reply from 192.168.1.1: bytes=32 time=1ms TTL=64

Ping statistics for 192.168.1.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 1ms, Maximum = 1ms, Average = 1ms
```

Then the connection between the router and your computer has been successfully established.

If the computer fails to connect to the router, the Command window will return the following:

```
C:\Documents and Settings\admin>ping 192.168.1.1

Pinging 192.168.1.1 with 32 bytes of data:
```

```
Request timed out.  
Request timed out.  
Request timed out.  
Request timed out.  
  
Ping statistics for 192.168.1.1:  
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

Verify your computer's network settings are correct and check the cable connection between the router and the computer.

In order to make the whole network operate successfully, it is necessary to configure the 300Mbps Wireless-N Router through your computer has a WEB browser installed. Please follow up the steps listed below.

3.3. Login

- Open a web browser (Safari, Internet Explorer, etc.) on the computer you have just connected to the router, type `http://192.168.1.1` in the address bar, and press enter

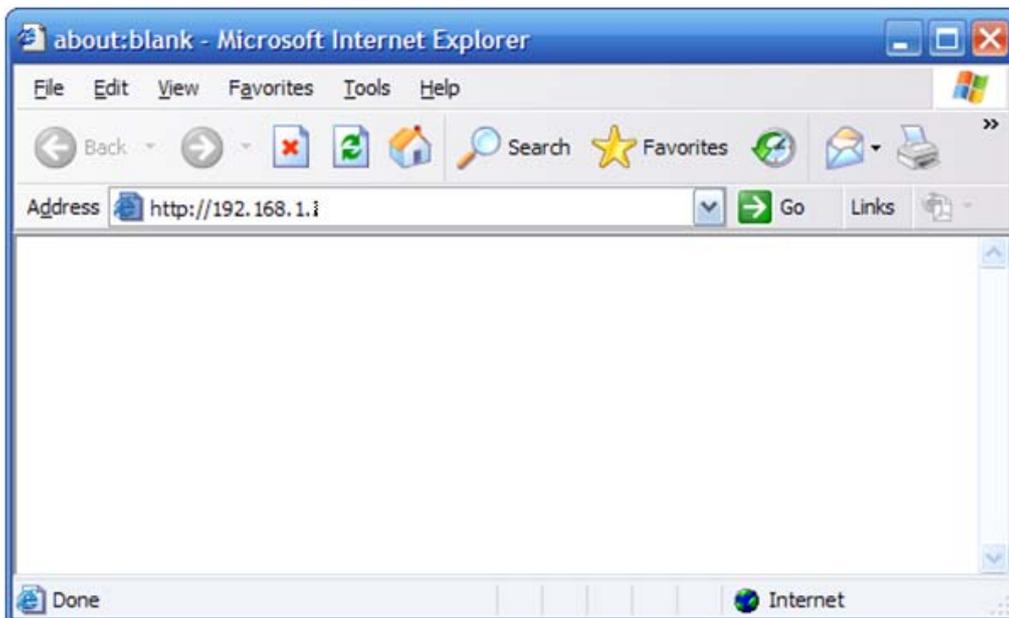

Figure 3-18

- In the pop-up window, enter the user name **guest** and password **guest** and then click OK

Figure 3-19

- After you have logged in, the router's user interface will be displayed. The left menu shows the main options to configure the system, and the right screen is the summary information for viewing and adjusting the configurations.

Figure 3-20

4. Router Setup

4.1. System Information

This feature provides running status information and detailed information about router.

4.1.1. System Info

Show current running information of System.

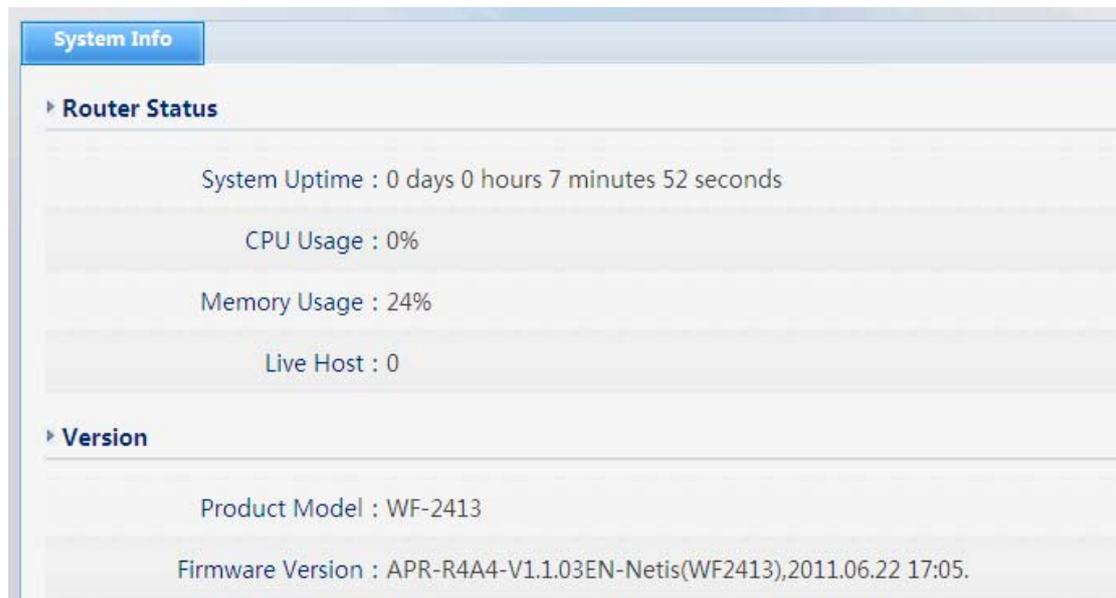

Figure 4-1

4.1.2. WAN

This feature provides running status information of the WAN port (the port connect to the Internet)

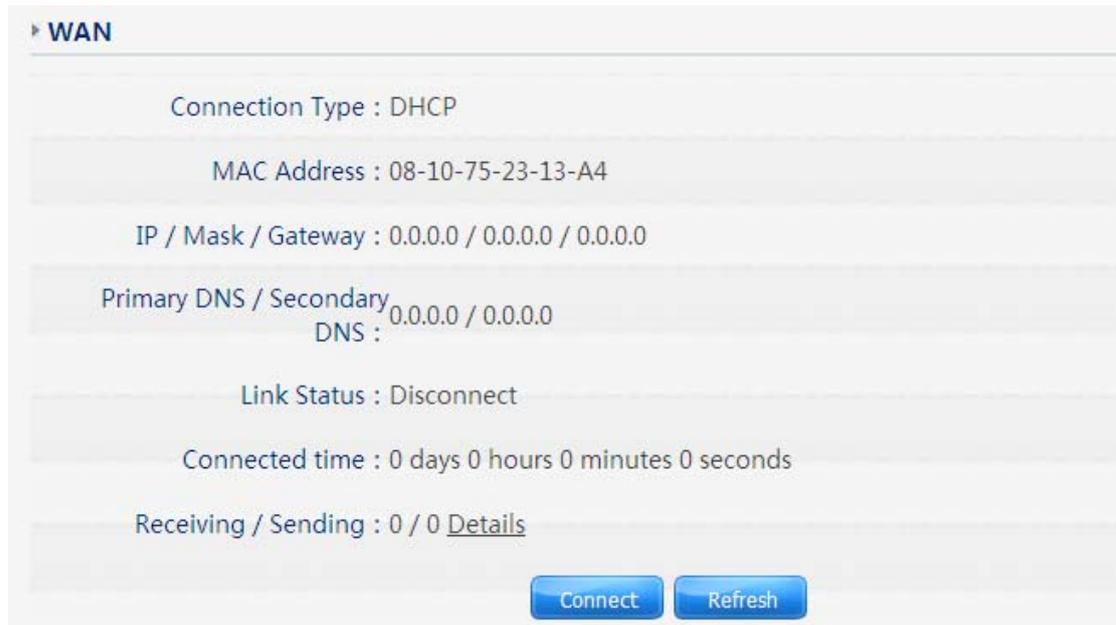

Figure 4-2

- Connection Type: Display router's current connection type, It should be one of "PPPoE", "DHCP", "Static IP", depending on what kind of connection type your ISP provides.
- MAC Address: The physical address of WAN port, this is a unique address assigned by manufacturer.
- IP Address: The IP address you obtained after connect to the Internet, if you haven't connected to the Internet yet, this field is 0.0.0.0.
- Mask: The Subnet mask you obtained after connect to the Internet, if you haven't connected to Internet yet, this field is 0.0.0.0
- Gateway: The IP address of Default gateway you obtained after connect to the Internet, if you haven't connected to Internet yet, this field is 0.0.0.0.
- Primary DNS: The DNS server translates domain or website names into IP address, input the most common DNS server address you used or provided by your ISP.
- Secondary DNS: Input IP address of a backup DNS server or you can leave this field blank
- Link Status: Display router's current connection Status
- Connected time: Display the time since router have connected to the Internet

4.1.3. LAN Info

This item provides information about router's LAN port, display LAN port's physical address, IP address and current data status about receiving and sending

Figure 4-3

4.1.4. Wireless

This item provides current running information of wireless.

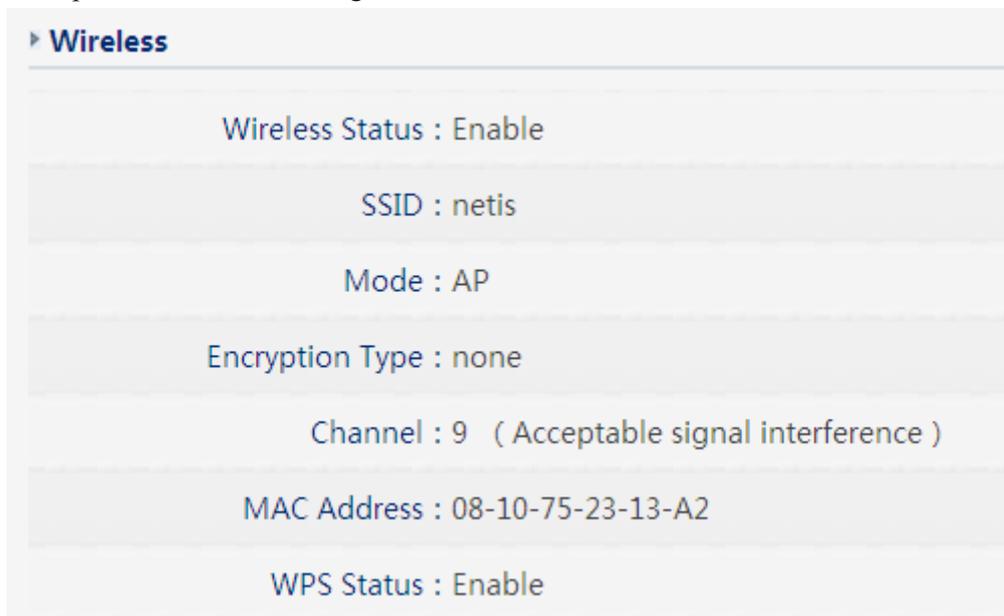

Figure 4-4

- Wireless status: Display wireless interface status is enabled or not
- SSID: SSID (Service Set Identifier) is your wireless network's name shared among all points in a wireless network.
- Mode: Current wireless mode of wireless router
- Channel: Display current channel of your wireless router.
- MAC Address: The MAC address is used for wireless communication
- WPS Status: Display WPS (Wi-Fi Protected Setup) status is enabled or not.

4.1.5. Host Monitoring

This item provides current running information of Host

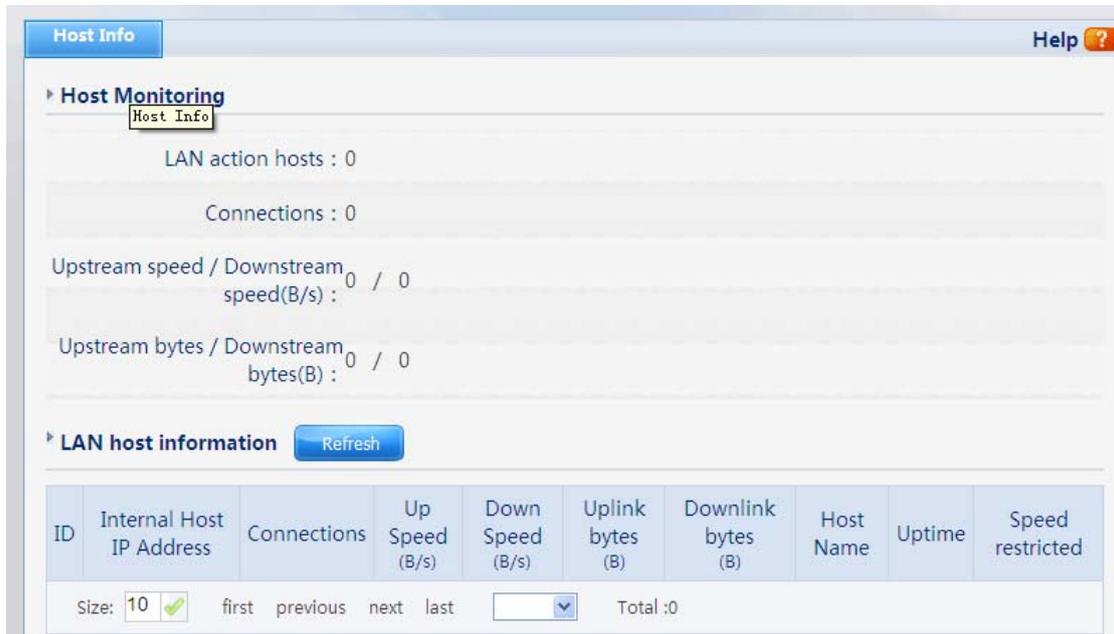

Figure 4-5

4.1.6. Traffic Statistics

This item provides statistics information about the bits router sends and received.

Traffic Statistics					
Type	NAT	Forward			
		Receiving Packets	Receiving data (KBytes)	Sending Packets	Sending data(KBytes)
TCP	37	23,531	2.39MB	47,016	5.36MB
UDP	3	206	18.06KB	1,102	115.99KB
ICMP	0	6	288B	10,366	1.22MB
Other	0	2	80B	178	4.19KB
Total	40	23,745	2.4MB	58,662	6.7MB

Figure 4-6

4.1.7. Statistics

This item provides statistics information about System log

Figure 4-7

4.2. Quick Setup

Providing you the convenient and simplest method for configure the router, the purpose of this item is to provide an easy way for you to use it and configure your router to access the Internet quickly; including ‘DHCP (dynamic)’, ‘PPPoE’, ‘Static’ and ‘Wireless Configuration’. This is the most convenient tool for you to configure router.

4.2.1. DHCP (dynamic)

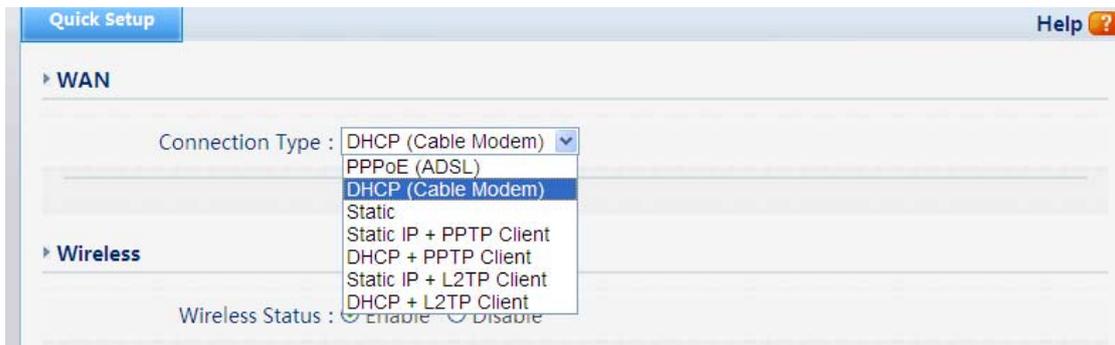

Figure 4-8

After select this item, you will obtain an IP address from your ISP automatically, those ISP who supply Cable modem always use DHCP technology.

4.2.2. PPPoE

The screenshot shows the 'Quick Setup' window with the 'WAN' section expanded. The 'Connection Type' dropdown menu is set to 'PPPoE (ADSL)'. Below this, there are two text input fields for 'PPPoE Username' and 'PPPoE Password'. At the bottom, there are three radio button options: 'Connect to Internet automatically (Default)' (which is selected), 'Auto disconnect when idle, time out, After 15 (1-30) minutes, if no found the access request then auto-break off!', and 'Connect to Internet manually'.

Figure 4-9

If your ISP provides you the PPPoE service (all ISP with DSL transaction will supply this service, such as the most popular ADSL technique), please select this item. In the “Convenient configuration” You can input your PPPoE username and password to access the Internet.

- PPPoE Username: Input PPPoE username provided by ISP
- PPPoE Password: Input PPPoE password provided by ISP.

4.2.3. Static User

The screenshot shows the 'Quick Setup' window with the 'WAN' section expanded. The 'Connection Type' dropdown menu is set to 'Static'. Below this, there are five text input fields for 'IP Address', 'Subnet Mask', 'Default Gateway', 'Primary DNS', and 'Secondary DNS'.

Figure 4-10

This item should only be used when users use a static IP address to access Internet, you should input your “IP address”, ”subnet mask”,” default gateway” and “DNS server (domain name

server)” according to the information provided by your ISP. And every IP address should be input in appropriate IP field, a IP address only divided into four IP octets by sign“.” is acceptable.

- IP address: The IP address that your Internet access into
- Subnet mask: Specify a Subnet Mask for your WAN segment
- Default gateway: It is provided by your ISP
- Primary DNS: DNS server is used for resolve domain name. Your ISP will provides you with at least one DNS IP address, input IP address of your DNS server in this field
- Secondary DNS: Input IP address of backup DNS server, or you can leave this field blank.

4.2.4. Static IP + PPTP Client

The screenshot displays the WAN configuration page with the following fields and options:

- WAN** (Section Header)
- Connection Type :** Static IP + PPTP Client (Selected)
- IP Address :** [Empty text box]
- Subnet Mask :** [Empty text box]
- Default Gateway :** [Empty text box]
- MAc Address :** 08-10-75-23-13-A4 (with **Clone MAC Ad** and **Restore Factor** buttons)
- MTU :** 1500 (576-1440)
- Primary DNS :** [Empty text box]
- Secondary DNS :** [Empty text box]
- Server :** Domain (Selected) [Empty text box]
- Remote Default Gateway :**
- Data encryption :** Enable 128 - bit data encryption
- User Name :** [Empty text box]
- Password :** [Empty text box]

Figure 4-11

If your ISP provides you the Static PPTP service, please select this item. In the “Convenient

configuration” You can input your PPTP Server, username and password to access the Internet.

- Server

The Server IP address that your Internet access into

- IP Address

The Local IP address that your Internet access into Subnet mask

- Subnet mask

Specify a Subnet Mask for your WAN segment

- Primary DNS

DNS server is used for resolve domain name. Your ISP will provides you with at least one DNS IP address, input IP address of your DNS server in this field

- Secondary DNS

Input IP address of backup DNS server, or you can leave this field blank

- Default gateway

It is provided by your ISP

- User Name

Input User name your ISP provides

- Password

It is provided by your ISP

4.2.5. Static IP + L2TP Client

Convenient Setup	
<input type="radio"/>	DHCP user (Cable Modem)
<input type="radio"/>	PPPoE user (ADSL)
<input type="radio"/>	Static User
<input type="radio"/>	PPTP Client + Static IP
<input type="radio"/>	PPTP Client + DHCP
<input checked="" type="radio"/>	L2TP Client + Static IP
<input type="radio"/>	L2TP Client + DHCP
L2TP Client + Static IP	
Server	<input type="text"/>
Local IP	<input type="text" value="0.0.0.0"/>
Subnet Mask	<input type="text" value="0.0.0.0"/>
Gateway	<input type="text" value="0.0.0.0"/>
Using the default gateway of VPN on remote network	<input type="checkbox"/>
User ID	<input type="text"/>
Password	<input type="text"/>

Figure 4-12

If your ISP provides you the Static L2TP service, please select this item. In the “Convenient configuration” You can input your L2TP Server, username and password to access the Internet.

- Server

The Server IP address that your Internet access into

- IP Address

The Local IP address that your Internet access into Subnet mask

- Subnet mask

Specify a Subnet Mask for your WAN segment

- Default gateway

It is provided by your ISP

- Primary DNS

DNS server is used for resolve domain name. Your ISP will provides you with at least one DNS IP address, input IP address of your DNS server in this field

- Secondary DNS

Input IP address of backup DNS server, or you can leave this field blank

- User Name

Iput User name your ISP provides

- Password

It is provided by your ISP

4.2.6. Wireless Configuration

You can choose “Enable” or “Disable” to enable or disable the wireless function. The default setting is “enable”. If you chose the “Disable” status, the router will become a wired router without wireless function, so be careful when you choose this status.

Wireless

Wireless Status : Enable Disable

SSID :

Security : Disable WPS
 WPA-PSK/WPA2-PSK AES (To ensure wireless safty,it is strongly recommended)
 Password : (please enter any 8-63 charcters (ASCII charcters:A-Z,a-z,0-9))
 Do not modify WPS configurations

Save

Figure 4-13

You can choose “Enable” or “Disable” to enable or disable the wireless function. The default setting is ”enable”. If you chose the “Disable” status, the router will become a wired broadband router without wireless function, so be careful when you choose this status.

- SSID

SSID (Service Set Identifier) is your wireless network's name shared among all points in a wireless network. The SSID must be identical for all devices in the wireless network. It is case-sensitive and must not exceed 32 characters. Make sure all points in the wireless network have the same SSID. For added security, you should change the default SSID to a unique name

- Security

The item allows you to encrypt your wireless communication, and you can also protect your wireless network from unauthorized user access. It supplies “None”, “WEP”, “WPA-PSK”, “WPA2-PSK” and “WPA/WPA2-PSK” five different encryption modes. And you can also use WPS function and then it will be encrypted to WPA2-AES mode automatically

4.3. WPS Settings

Wi-Fi Protect Setup (WPS) function can let you create a safety network easily. You can through ‘PIN Input Config (PIN)’ or ‘Push Button (PBC)’ to encrypt your network. This router also provides WPS button, you only need to push the WPS button in this router and the wireless network card that support WPS function, then the router will be encrypted to WPA2-AES mode automatically

Note:

If you have configured encryption mode in your router, then when you use this WPS function, please configure the authentication type to none, and then it will be encrypted to WPA2-AES mode automatically. If you don’t want to change your authentication type, then when you use this function, the router will be encrypted to the mode that you have configured.

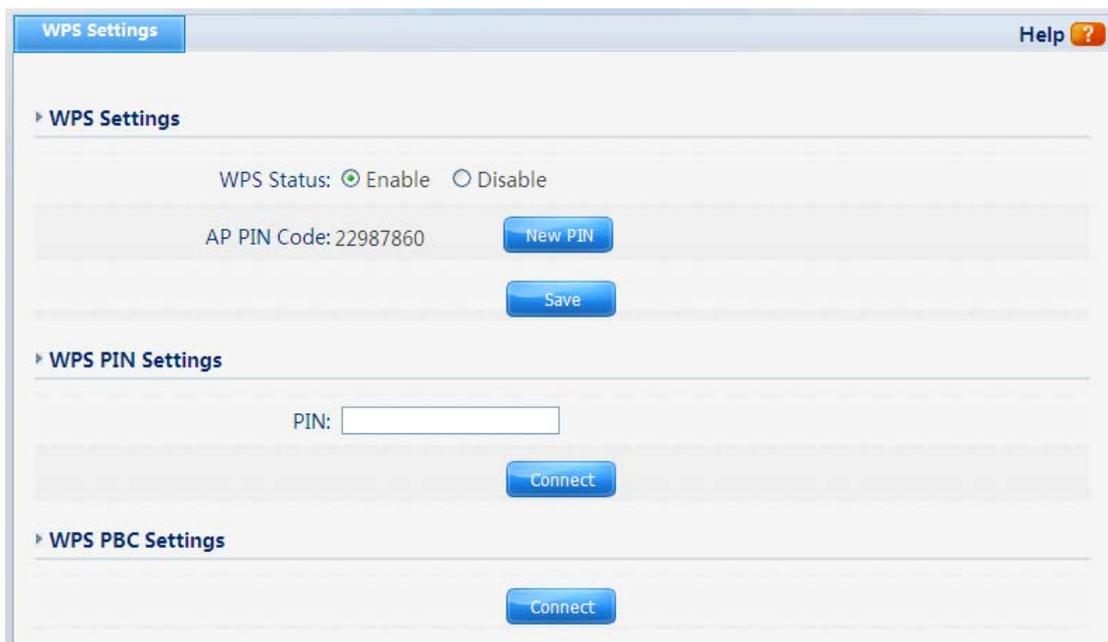

Figure 4-14

- WPS Status: you can use this function to setup the wireless connection between this router and wireless network card. The default is disable.
- AP PIN Code: this code can mark a wireless product
- Wireless Host PIN Code: input the PIN of wireless network card that support WPS function. Click connect, when it connect successfully, it will be encrypted to WPA2-PSK
- WPS PBC settings: Click connect, when it connect successfully, it will be encrypted to WPA2-PSK

- WPS Configuration: display the encryption information

WPS can connect the wireless adapter and the router in a safe way. If you have a wireless network card which has WPS button, you may set up a safe network via the following methods

Method 1:

1. Push the WPS button in the Router until the LED is flashing
2. Push the WPS button in the wireless network card until the following window appears

Figure 4-15

3. The next is the safe connection between the adapter and the router, please wait
4. The connect between the adapter and the router is success

Method 2:

1. Push the WPS button in the Router until the LED is flashing
2. Push the 'Push button Config (PBC)' in the Wi-Fi protect setup of the adapter until the following picture appears

Figure 4-16

3. The next is the safe connection between the adapter and the router, please wait
4. The connect between the adapter and the router is success

Method 3:

1. Input the PIN code of the adapter's WPS page into the router's WPS configure page, then click 'connect'

Figure 4-1

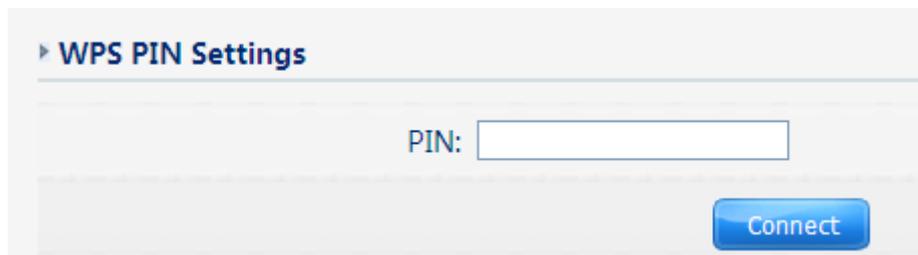

Figure 4-17

2. Push the 'PIN Input Config (PIN)' in the Wi-Fi protect setup of the adapter

Figure 4-18

3. Select this router in the pop-up window, then click 'Select'

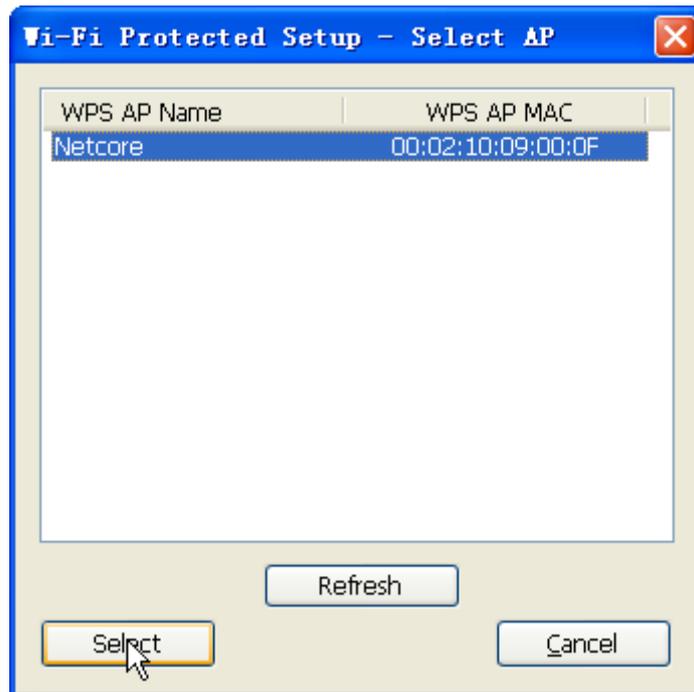

Figure 4-19

4. Please wait until the following window appears, the connect between the adapter and the router will connect automatically

Figure 4-20

Method 4:

1. Click 'connect' in the router's WPS PBC configure page

Figure 4-21

2. Push the 'Push button Config (PBC)' in the Wi-Fi protect setup of the adapter until the

following picture appears

Figure 4-22

3. The next is the safe connection between the adapter and the router, please wait

4. The connect between the adapter and the router is success

Method 5:

1. Select 'Input PIN from AP' in WI-FI protect setup page, input PIN of the router, then click 'PIN Input Config (PIN)'

Figure 4-23

2. Select this router in the pop-up window, then click 'Select'

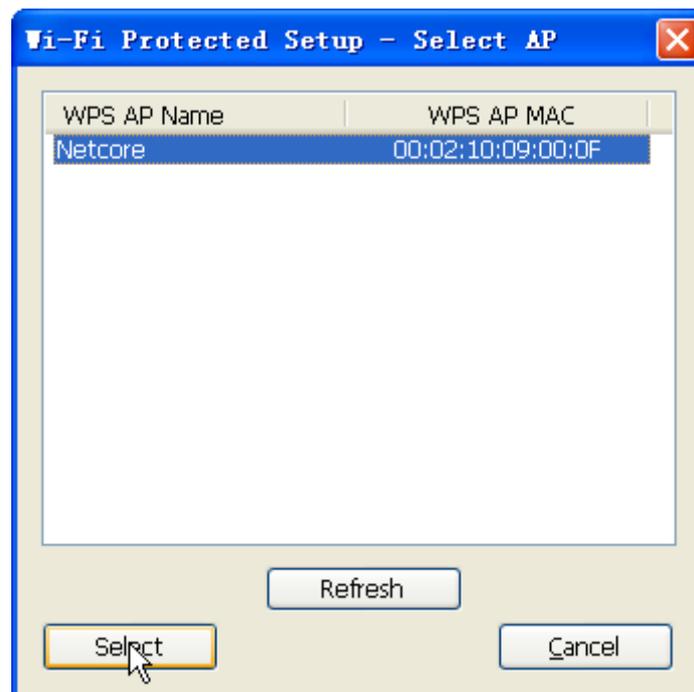

Figure 4-24

3. Please wait until the following window appears, the connect between the adapter and the router will connect automatically

Figure 4-25

Remark

If there is more than one AP in the PBC mode when you use the method 1/2/4, there will be session overlap. Please using method 3/5 or wait for a while push the button again.

4.4. Network

4.4.1. WAN

This item provides two access types for you to configure the WAN parameters.

Figure 4-26

- IP address: The IP address you obtained after connect to the Internet, if you haven't connected to the Internet yet, this field is 0.0.0.0.
- Subnet Mask: The Subnet mask you obtained after connect to the Internet, if you haven't connected to Internet yet, this field is 0.0.0.0.
- Default Gateway: The IP address of Default gateway you obtained after connect to the Internet, if you haven't connected to Internet yet, this field is 0.0.0.0.
- MTU: The MTU (Maximum Transmission Unit) setting specifies the largest packet size permitted for network transmission. Most DSL users should use the value 1492. You can set MTU manually, and you should leave this value in the 1200 to 1500 range. If the value you set is not in accord with the value ISP provide, it may causes some problems, such as fail to send Email, or fail to browse website. So if that happen, you can contact your ISP for more information and correct your router's MTU value.
- Primary DNS: The DNS server translates domain or website names into IP address, input the most common DNS server address you used or provided by your ISP.
- Secondary DNS: Input IP address of a backup DNS server or you can leave this field blank.

4.4.2. LAN

The IP address of LAN port is used for access router itself by computers that connect to the router directly; here you can set IP address you need. The IP address format is like `***.***.***.***`, and default IP address is 192.168.1.1, the default subnet mask is 255.255.255.0.

The screenshot shows a web-based configuration interface for LAN settings. At the top, there is a blue tab labeled 'LAN'. Below it, there are two expandable sections. The first section, 'LAN MAC', contains a text input field for 'MAC Address' with the value '08-10-75-23-13-A2' and a blue 'Save' button to its right. The second section, 'LAN IP', contains two text input fields: 'IP Address' with the value '192.168.1.1' and 'Subnet Mask' with the value '255.255.255.0', followed by another blue 'Save' button.

Figure 4-27

4.4.3. DHCP

The screenshot shows a web-based configuration interface for DHCP settings. At the top, there are three tabs: 'DHCP Setup' (active), 'Address Reservation', and 'DHCP Info'. Below the tabs, there is an expandable section 'DHCP Settings'. Inside this section, there is a 'DHCP Server Status' field with two radio buttons: 'Enable' (selected) and 'Disable'. Below this, there is an 'IP Address Pool' field with two text input boxes containing '192.168.1.2' and '192.168.1.254', separated by a hyphen. A blue 'Save' button is located at the bottom right of the section.

Figure 4-28

➤ **DHCP Server Status**

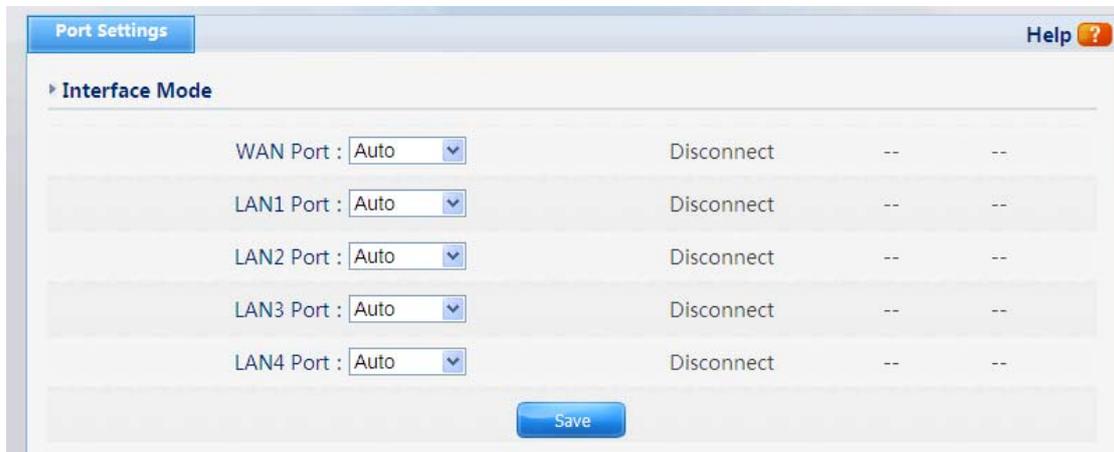

Keep the default setting “Enable”, so router is able to use DHCP function. If a DHCP server has already existed in the network, please select “Disable”.

➤ **IP Address Pool**

The IP Address pool is used for allocate IP address by DHCP server; The IP Address pool range is also changeable

4.4.4. Port settings

Show current running information of Interface Mode, Default settings is auto.

The screenshot displays the 'Port Settings' configuration window. At the top, there is a 'Port Settings' tab and a 'Help' icon. Below the tab, the 'Interface Mode' section is expanded, showing a table of port configurations. Each row represents a port type (WAN, LAN1, LAN2, LAN3, LAN4) with a dropdown menu set to 'Auto', a status of 'Disconnect', and two empty fields. A 'Save' button is located at the bottom center of the configuration area.

Port Type	Mode	Status	Field 1	Field 2
WAN Port	Auto	Disconnect	--	--
LAN1 Port	Auto	Disconnect	--	--
LAN2 Port	Auto	Disconnect	--	--
LAN3 Port	Auto	Disconnect	--	--
LAN4 Port	Auto	Disconnect	--	--

Figure 4-29

4.5. Wireless

4.5.1. Wireless Basic

Providing basic configuration items for wireless router users, including “wireless network status”, “SSID”, “Radio Band”, “Radio Mode”, “MAC”, “SSID broadcasting”, “Channel width”, “Channel sideband”, “Region” and “Channel” several basic configuration items.

Wireless Base

▶ **Wireless Settings**

Wireless Status : Enable Disable

SSID :

Radio Band :

Radio Mode :

MAC :

SSID Broadcast : Enable Disable

WLAN Partition : Enable Disable

Channel Width : 20M 20/40M

Control Sideband : Lower Upper

Region :

Channel :

Save

Figure 4-30

- Wireless status: You can choose “enable” or “disable” to enable or disable the “Wireless Network Status”, if what you choose is “Disable”, the AP function of wireless router will be turned off.
- SSID: The default is trst1.
- Radio band: You can select the wireless standards running on your network, if you have Wireless-N, and Wireless-B/G devices in your network, keep the default setting, 802.11b+g+n
- Radio mode: You can select radio mode of wireless router, it contains Access Point, Client, AP+WDS and WDS. The default setting is AP mode.
- MAC: Wireless router’s physical address.
- SSID Broadcasting: You can select “enable” or “disable” to enable or disable the broadcast SSID function, If the setting of this field is disable, wireless client can’t obtain this SSID to login in, then user have to input the SSID value manually.
- Channel width: This switch allows you to set Router's wireless bandwidth. 20MHz: In this mode you can get low bandwidth, little interference and slow rate. 40MHz: In this mode you can get high bandwidth, high interference and rapid rate. Use only when you have a

- pure router, draft 802.11n wireless network.
- Channel sideband: It controls your wireless router use higher or lower channel when working on 40MHz.
 - Region: please select the region where you live in.
 - Channel: In 20MHz, you can select one channel from 1 to 13 manually, and in 40MHz, you can select one channel from 1 to 9 or 5 to 13, which provides a choice of avoiding interference.

4.5.2. Wireless Security

The item allows you to encrypt your wireless communication, and you can also protect your wireless network from unauthorized user access. It supplies “None”, “WEP”, “WPA-PSK”, “WPA2-PSK” and “WPA/WPA2-PSK” five different encryption modes.

4.5.2.1. None

“None” means do not encrypt wireless data.

Figure 4-31

4.5.2.2. WEP

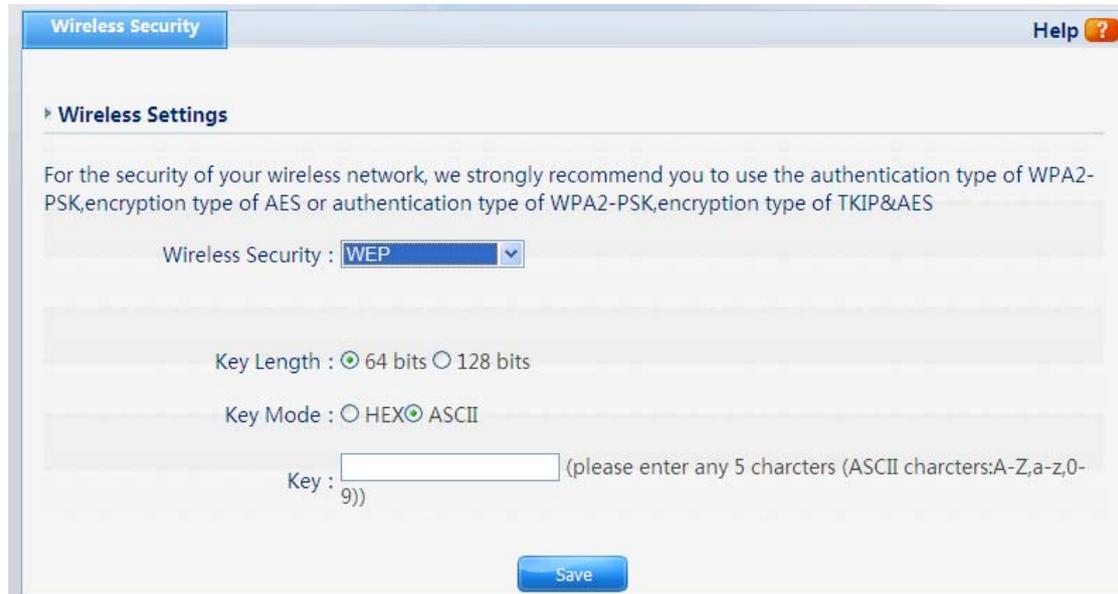

Figure 4-32

- **Key Length:** There are two basic levels of WEP encryption, 64 bits and 128 bits, the more bits password have, the better security wireless network is, at the same time the speed of wireless is more slower.
- **Key Mode:** If you select WEP to encrypt your data, choose the bits of password, it should be 64 bits or 128 bits. Then choose the format of password; it should be HEX or ASCII. The valid character for HEX format should be numbers from 0 to 9 and letters from A to F. HEX support mixed letter and number mode. And ASCII supports all characters that in keyboard.
- **Key Length description:** when you select 64bits, you need to input 10 chars for HEX and 5 chars for ASCII, and when you select 128bits, you need to input 26 chars for HEX and 13 chars for ASCII.

Note: when the WPS is enabled, please not use WEP.

4.5.2.3. WPA-PSK

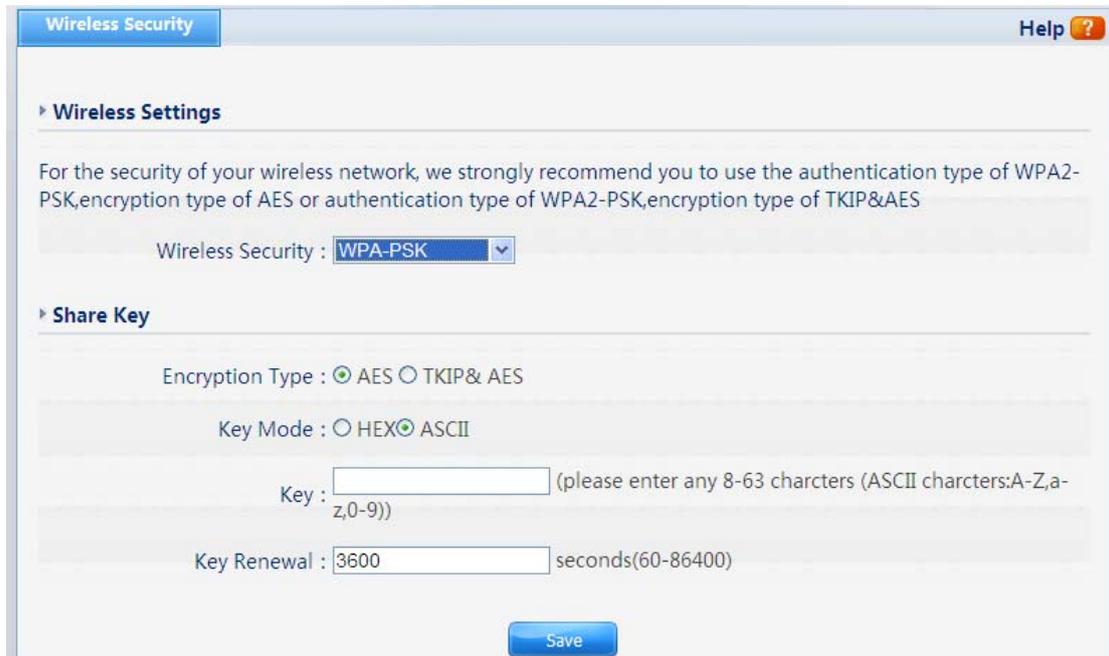

Figure 4-33

- Encryption type: You can select the algorithm you want to use, TKIP, AES or TKIP&AES. TKIP means “Temporal Key Integrity Protocol”, which incorporates Message Integrity Code (MIC) to provide protection against hackers. AES, means “Advanced Encryption System”, which utilizes a symmetric 128-Bit block data.
- Key Renewal: you can configure the renewal time between 60 to 86400 seconds.
- Key Length description: you need to input 8 to 63 ASCII characters no matter which type you select.

4.5.2.4. WPA2-PSK

The WPA2-PSK is similar to WPA-PSK and with stronger encryption method than WPA-PSK, using WPA2-PSK; you should input password (leave this value in the range of 8 to 63 characters) and key renewal time (leave this value in the range of 60 to 86400 seconds).

Figure 4-34

4.5.2.5. WPA/WPA2-PSK

This item mixed WPA-PSK and WPA2-PSK mode, which provides higher security level; you can configure it according with WPA-PSK or WPA2-PSK.

Wireless Security Help ?

▶ **Wireless Settings**

For the security of your wireless network, we strongly recommend you to use the authentication type of WPA2-PSK, encryption type of AES or authentication type of WPA2-PSK, encryption type of TKIP&AES

Wireless Security : **WPA/WPA2-PSK**

▶ **Share Key**

Encryption Type : AES TKIP& AES

Key Mode : HEX ASCII

Key : (please enter any 8-63 characters (ASCII characters: A-Z, a-z, 0-9))

Key Renewal : seconds (60-86400)

Save

Figure 4-35

4.5.3. Wireless MAC Filter

Wireless MAC Filtering Help ?

▶ **Wireless MAC Address Filtering**

Access Control Status : Enable Disable

Access Control Rule : Permit wireless connection for MAC address listed (others are Denied)
 Deny wireless connection for MAC address listed (others are Permitted)

Save

▶ **Rule Description**

MAC Address :

Add

▶ **Wireless MAC Filter List**

ID	MAC Address	Operate
Size: 10 <input checked="" type="checkbox"/>	first previous next last	<input type="text"/> Total : 0

Figure 4-36

- Access Control Status: the default is disable. You can filter wireless users by enabling this function; thus unauthorized users can not access the network.
- Rule: you can select permit or deny. The default is permit.
- MAC address: input the MAC address that you want to control. The default format is

__**_**_**_** (e.g.: 00-22-33-da-cc-bb) .

Follow the following steps to set Wireless Access Control:

1. Enable Wireless MAC Address Filter, then select save.
2. Add MAC address you want to control in the “MAC address” field (the format is *_**_**_**_**_**), then click “Add” button, and you will see the MAC address has displayed in the MAC list.
3. There are two items supplied, “Permit wireless connection for MAC address listed (others are Denied)” and “Deny wireless connection for MAC address listed (others are Permitted)”, Select the item you want, and click “Save” button.

4.5.4. WDS Settings

If you have selected WDS or AP+WDS mode in Wireless Basic-Radio Mode, please do the following configurations.

Figure 4-37

- WDS Name: Give a description of your wireless bridge to tell apart.
- WDS MAC Address: If the current working mode is “WDS” or “AP+WDS”, then you need to configure wireless bridge configuration. Enter MAC address of remote access point, at the same time the remote access point also need to configure to “WDS” or ”AP+WDS” mode.
- Encryption Type: select AES or TKIP as the Encryption Type
- Key Mode: choose the format of password; it should be HEX or ASCII. The valid character for HEX format should be numbers from 0 to 9 and letters from A to F. HEX support mixed letter and number mode. And ASCII supports all characters that in

keyboard.

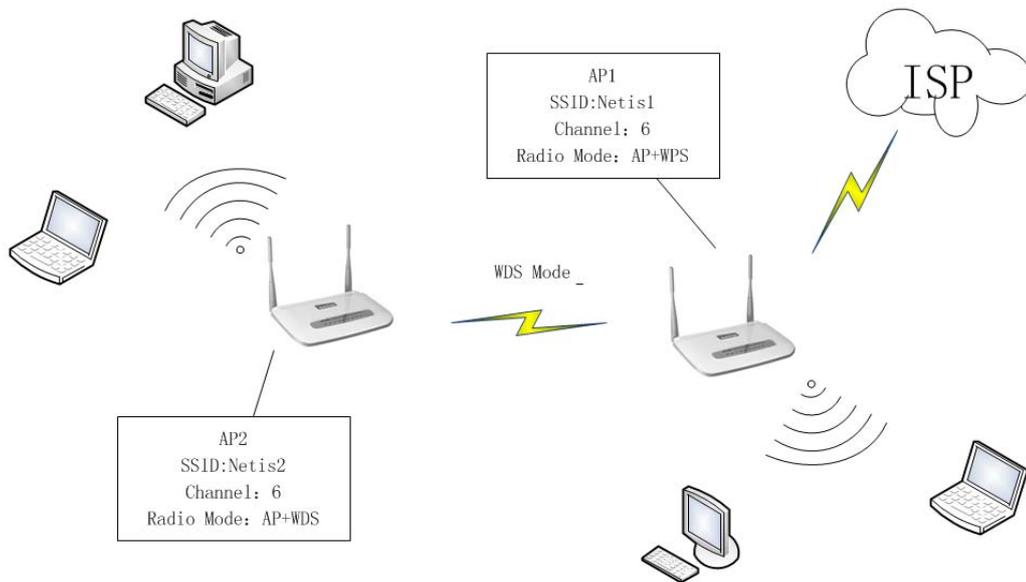

Figure 4-38

AP1:

- Select radio mode is WDS or AP+WDS in wireless base of AP1.
- Click on 'Wireless'- 'Wireless Security' and select and save None as authentication type.
- Click on 'Wireless'- 'WDS Settings' ,input WDS name (e.g.: default), input MAC address of AP2 (00-22-4f-bc-af-5d), click add, then the record named default will appears in WDS list.
- Click on 'Wireless'- 'WDS Settings' and select the same WDS authentication type and password with AP2's Settings and save.
- Select Channel is 'Channel 6'in wireless base of AP2.

AP2:

- Select radio mode is WDS or AP+WDS in wireless management-basic of AP2.
- The IP address of AP2 should be 192.168.1.x (1<x<255,e.g.: x=8).
- Select 'Network'- 'DHCP' ,select disable DHCP server.
- Click on 'Wireless'- 'WDS Settings', Input WDS name (e.g.: Default), input MAC address of AP1 (00-22-4f-cc-ae-f5), click add, then the record named Default will appears in WDS list.
- Select Channel is 'Channel 6'in wireless base of AP2.

Note: Before you setup WDS connection, please make sure that AP1 and AP2 is in the same network, that is if the IP address of AP1 is 192.168.1.1, then the IP address of AP2 should be 192.168.1.x (1<x<255,e.g.: x=8).

4.5.5. Repeater Settings

Wireless Repeater mode, is used to relay the wireless signal from a relay point to the next point, relay and amplify the signals and form a new wireless coverage area.

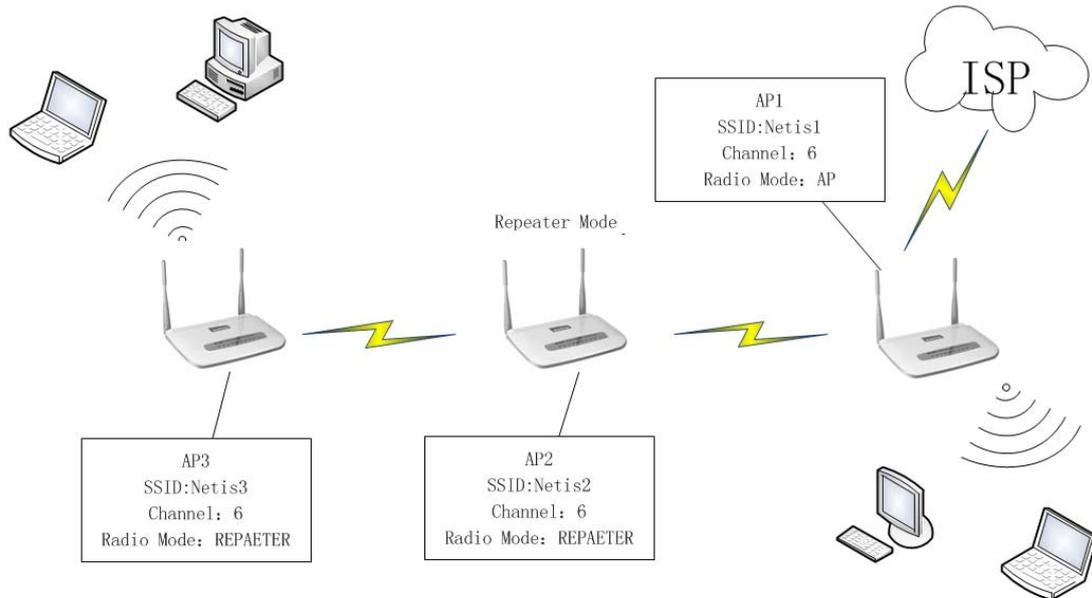

Figure 4-39

AP1:

- Select radio mode is 'Access Point' in wireless base of AP1.
- Select Channel is 'Channel 6' in wireless base of AP1.

The screenshot displays the 'Wireless Base' configuration window. At the top, there is a 'Wireless Base' tab and a 'Help' icon. Below the tab, the 'Wireless Settings' section is expanded. The settings are as follows:

- Wireless Status: Enable Disable
- SSID:
- Radio Band:
- Radio Mode:
- MAC:
- SSID Broadcast: Enable Disable
- WLAN Partition: Enable Disable
- Channel Width: 20M 20/40M
- Control Sideband: Lower Upper
- Region:
- Channel:

A 'Save' button is located at the bottom center of the configuration area.

Figure 4-40

AP2:

- Select radio mode is 'REPEATER' in wireless base of AP2.
- Click 'AP Scan' in wireless base of AP2, and select 'Netis1' and Connect, then the 'Repeater SSID' and 'Channel' become same as AP1.
- The IP address of AP2 should be 192.168.1.x ($1 < x < 255$, e.g.: x=8).
- Select 'Network'-'DHCP', select disable DHCP server.

▶ **Wireless Settings**

Wireless Status : Enable Disable

SSID :

Radio Band :

Radio Mode :

MAC :

SSID Broadcast : Enable Disable

WLAN Partition : Enable Disable

Repeater SSID :

Channel Width : 20M 20/40M

Control Sideband : Lower Upper

Region :

Channel :

Figure 4-41

AP3:

- Select radio mode is 'REPEATER' in wireless base of AP3.
- Click 'AP Scan' in wireless base of AP3 ,and select 'Netis1' and Connect , then the 'Repeater SSID' and 'Channel' become same as AP2.
- The IP address of AP3 should be 192.168.1.x (1<x<255),but different from AP2.
- Select 'Network'-'DHCP' ,select disable DHCP server.

4.5.6. Wireless Advanced

These settings are only for more technically advanced users who have a sufficient knowledge about wireless LAN. These settings should not be changed unless you know what effect the change will have on your AP.

▶ **Wireless Advanced**

Authentication Type : ▼

Beacon Interval : (Extent:20-1000,Default:100)

RTS Threshold : (Extent:256-2347,Default:2347)

Aggregation : ▼

Fragmentation Threshold : (Extent:256-2346,Default:2346)

Transmission Rate : ▼

Protection : Enable Disable

Preamble Type : Long Short

RF Output Power : 100% 70% 50% 35% 15%

WMM : Enable Disable

Figure 4-42

- Authentications type: The default is set to “Auto”, which allows “Open System” or “Shared Key” authentication to be used. Select “Shared Key” if you only want to use “Shared Key” authentication (the sender and recipient use a WEP key for authentication).
- Beacon Interval: The interval time of this 300Mbps Wireless-N Router broadcast a beacon. Beacon is used to synchronize the wireless network. The valid interval is 20-1000, the default is 100.
- RTS Threshold: You can set RTS Threshold value in this field, the valid range should be 256-2347 and default value is 2347. If a network packet is smaller than the preset RTS threshold size, the RTS/CTS mechanism will not be enabled.
- Aggregation: You can accelerate the wireless transmission speed by enabling the aggregation function. The default is AMPDU+AMSDU.
- Fragmentation Threshold: It specifies the maximum size of packet during the fragmentation of data to be transmitted.
- Transmission Rate: Transmit rate indicates the transmission speed of wireless LAN access. The default setting is “Auto” and you can set this value between 1-54Mbps range.
- Protection: Using 802.11b and 802.11g mixed mode may result in poor network performance. By enabling 802.11 protection, it will ameliorate performance of 802.11g devices in your wireless network.

- Preamble Type: "Short Preamble" is suitable for heavy traffic wireless network. "Long Preamble" provides much communication reliability; the default setting is "Long Preamble".

4.5.7. Multiple AP Settings

The default status of secondary AP is disabled, you can select enable to enable the secondary AP. Please refer to "Quick Setup" and "Wireless Security" for details.

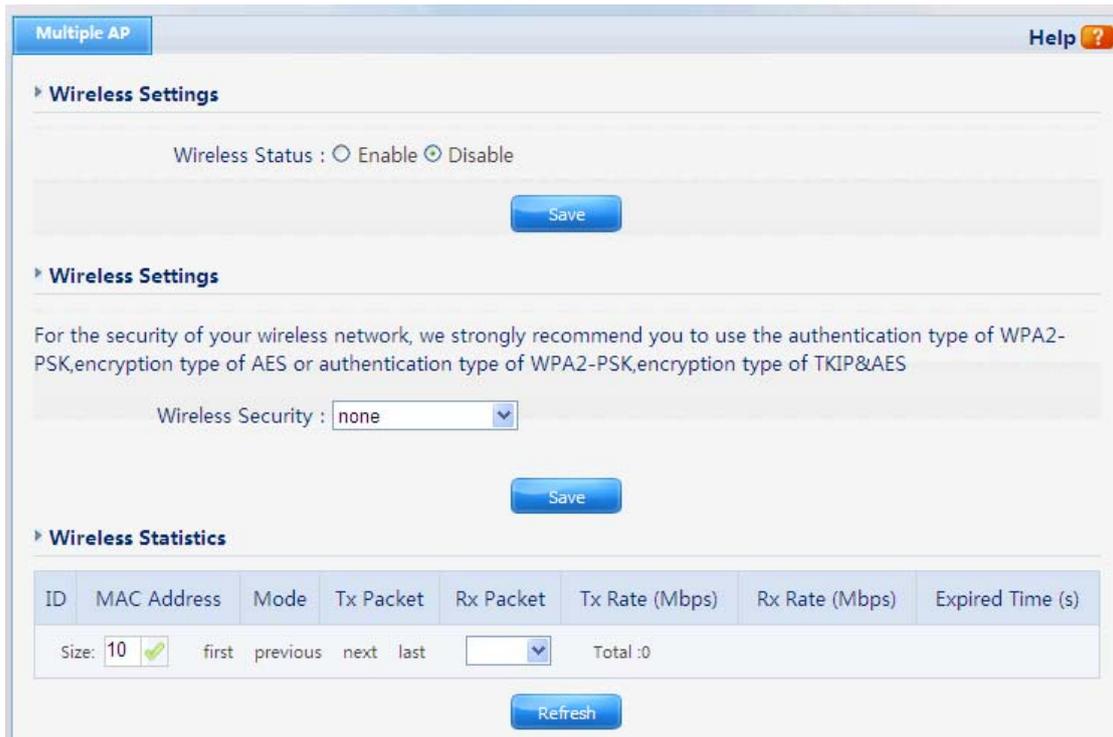

Figure 4-43

4.6. QoS

4.6.1. QoS Settings

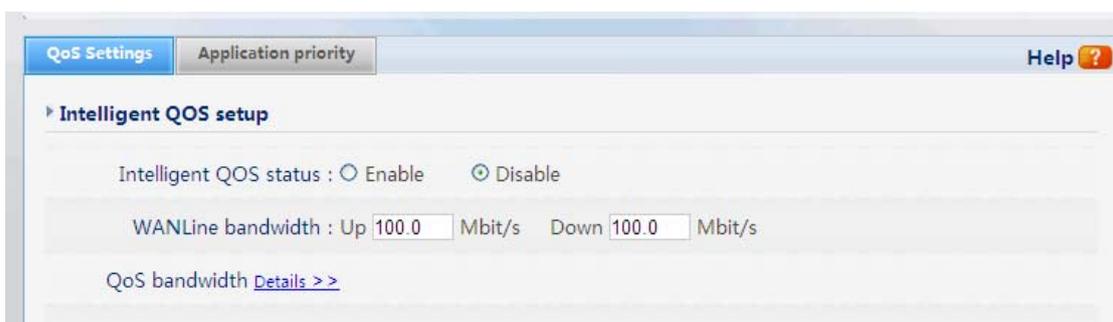

Figure 4-44

QoS Settings **Application priority**

▸ **Application priority setup**

Status :

Priority : (The smaller number has higher priority)

Rule Name :

Priority query : (The smaller number has higher priority)

LAN host :

WAN host :

Templates :

Protocol and Port : -

Time Paragraph : All Day Time Slot

▸ **Application priority List**

Figure 4-45

- Intelligent QoS Status: QoS switch.
- WAN line bandwidth: WAN bandwidth control
- Status: Application priority setup control.
- Priority: use a number to define the application priority, The smaller number has higher priority
- LAN host: Set the LAN host IP, you can define “all Host”, “Specific Host”, “Host subnet” or “HOST IP section”
- WAN host: Set the LAN host IP, the same setting as LAN Host
- Templates: define a application setup Templates

4.6.2. Host Bandwidth control

The screenshot displays two configuration sections. The first section, 'Host bandwidth control', includes three input fields: 'Uplink Speed' (0 KB/s), 'Downlink Speed' (0 KB/s), and 'Maximum connection numbers' (0). A 'Save' button is located below these fields. The second section, 'QoS Rule Setting', includes a 'Comment' field, a 'Priority' field (with a note that smaller numbers have higher priority), an 'IP Address' range field, 'Uplink Speed' and 'Downlink Speed' fields, and 'Maximum connection numbers' field. At the bottom, there are radio buttons for 'Time Paragraph' (set to 'All Day') and 'Time Slot', followed by an 'Add' button.

Figure 4-46

- Uplink Speed: set host uplink bandwidth
- Downlink Speed: set host downlink bandwidth
- Maximum connection numbers: set the Maximum connection numbers
- IP Address: Set the IP address range for restricted hosts.

4.7. Forwarding

4.7.1. Virtual Servers

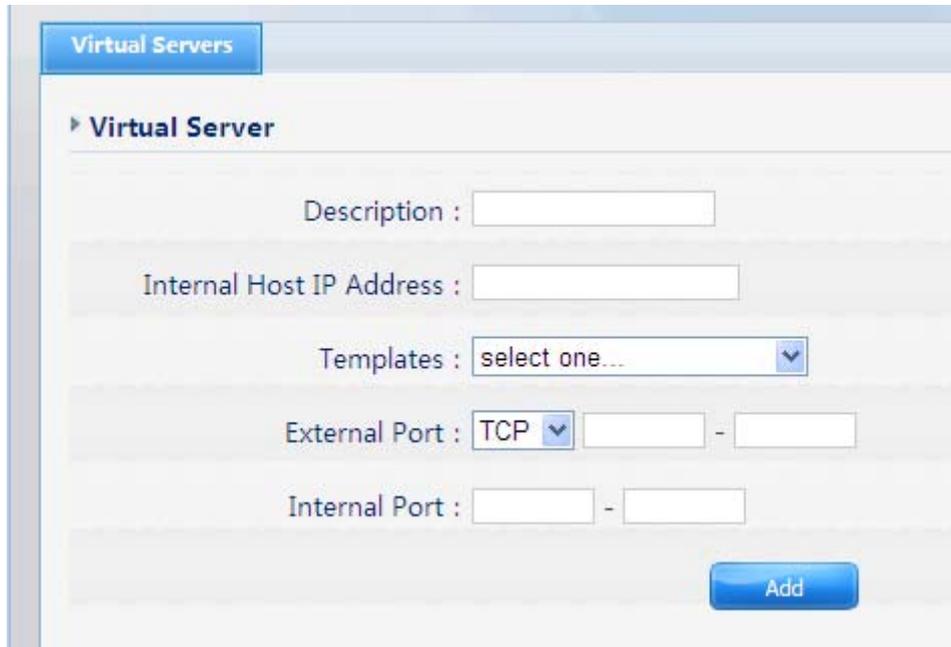

Figure 4-47

- Description: Describe current virtual server item
- Internal Host IP Address: The “Internal Host IP Address” indicates IP address of the internal host using virtual server.
- Templates: The templates item supplies several protocols. For example, if you have web server within LAN, you can select the HTTP template then the router will input port number 80 automatically.
- External Port: Input an extranet port number (the users in Internet can see these ports).
- Internal Port: Input an intranet port number.

4.7.2. FTP

This item set the FTP application port.

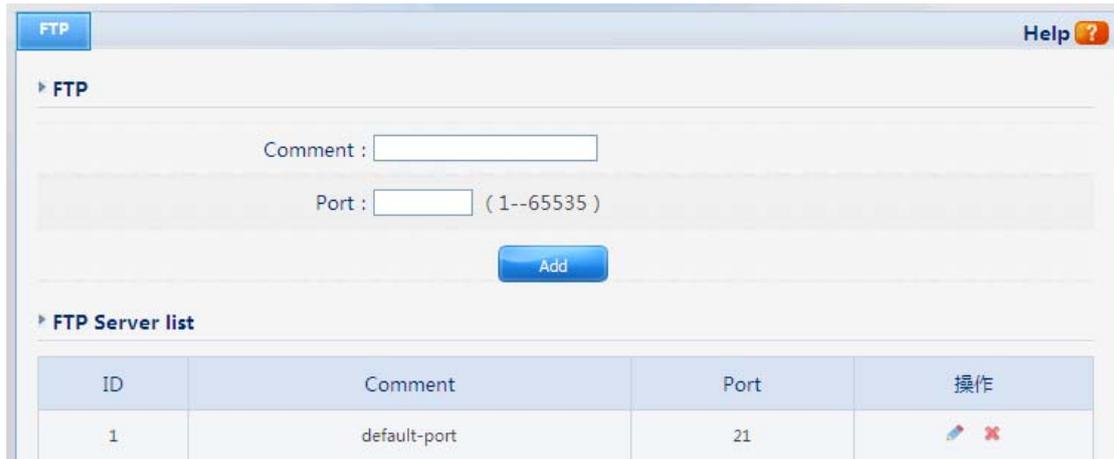

Figure 4-48

4.7.3. DMZ

DMZ opens all the ports of one computer, exposing the computer to the Internet. So it should only be used for some special-purpose, especial for Internet online games. Using this function you can select “DMZ” item and input IP address of DMZ host, then click “Save”. For the purpose of security, we suggested that using “Virtual server” instead of “DMZ”.

Figure 4-49

4.7.4. UPnP

The UPnP function supports load Application’s port forward record automatically. Select

“Enable” to enable this function.

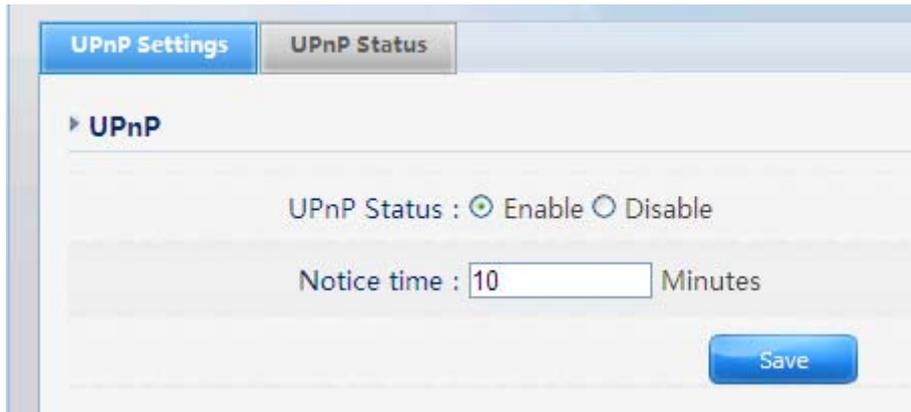

Figure 4-50

4.8. Security Setup

4.8.1. IP/MAC bind

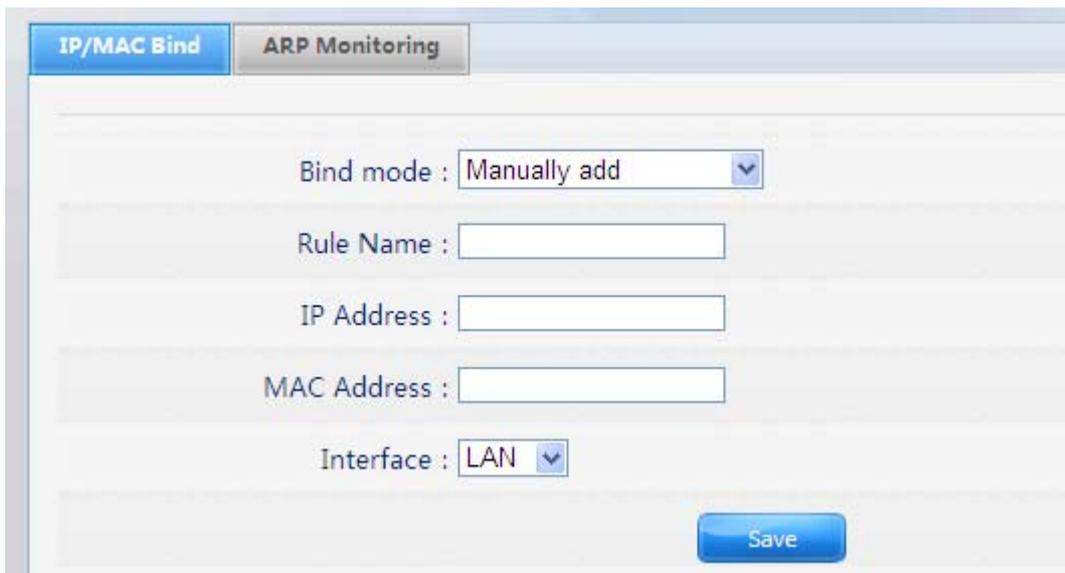

Figure 4-51

- Bind mode: define the bind mode ,you can select manually add, auto binding or export/import TXT file of ARP.
- Rule Name: define name for this rule
- IP Address: define the address of binded IP
- MAC Address: define the address of binded MAC
- Interface: Select the binded Interface from LAN and WAN

4.8.2. IP Filtering

The screenshot shows two main sections for IP filtering configuration:

- IP Address Filtering:**
 - Status: Enable Disable
 - Filtering Rules:
 - Permit through the router for IP address listed, others are denied
 - Deny through the router for IP address listed, others are permitted
 - Save button
- IP Filter List Management:**
 - Rule:
 - Description:
 - Priority: (The smaller number has higher priority)
 - Source Host:
 - Destination Host:
 - Templates:
 - Protocol And Port: -
 - Time Paragraph: All Day Time Slot
 - Add button

Figure 4-52

- Status: the default is disable. The rules of “Internet access control” based on source IP, port number and protocol.
- Description: describe IP Firewall list to tell from different IP Firewall lists.
- Rule: you can select permit or deny. The default is permit.
- Source Host: input the source IP address that you want to control. you can select “all Host”, “Specific Host”, “Host subnet” or “HOST IP section”
- Destination Host: input the Destination IP address that you want to control. you can select “all Host”, “Specific Host”, “Host subnet” or “HOST IP section”
- Templates: The templates item supplies several protocols. For example, if you have web server within LAN, you can select the HTTP template then the router will input port number 80 automatically
- Protocol and Port: If the rule has already existed in “Protocol Template”. You can select appropriate item and apply it. Or you can input protocol type and port number manually, click “add” button, then the item will displayed in the list.

Follow the following steps to set Internet Access Control:

1. You can select “enable” and click “Save” to enable “IP Address Filtering” function. This is only the first step, you should continued to create appropriate rules for “IP Address Filtering”.
2. Input description information for current access control rule in the “Description” field. Input IP address of host you want to restrict.
3. There are two items supplied, “Permit through the router for IP address listed, others are denied” and “Deny through the router for IP address listed, others are permitted”, Select the item you want, and click “Save” button.
4. If you want to delete certain item on the list, select appropriate item on the list, click “delete” to delete it.

4.8.3. MAC Filtering

Figure 4-53

- Status: the default is disable. You can filter wired users by enabling this function; thus unauthorized users can not access the network.
- MAC address add mode: You can select Manual add or Import IP/MAC bind list
- Rule name: describe MAC Filter list to tell from different MAC Filter lists
- Rule: you can select permit or deny. The default is permit
- MAC address: input the MAC address that you want to control. The default format is

__**_**_**_** (e.g.: 00-22-33-da-cc-bb)

Follow the following steps to set MAC filter:

1. Enable MAC Filter, then select save.
2. Add MAC address you want to control in the “MAC address” field (the format is *_**_**_**_**_**), then click “Add” button, and you will see the MAC address has displayed in the MAC list. Or you can import IP/MAC bind list.
3. There are two items supplied, “Permit through the router for MAC address listed, others are denied” and “Deny through the router for MAC address listed, others are permitted”, Select the item you want, and click “Save” button.

4.8.4. Domain Filtering

Figure 4-54

- Status: the default is disable. “Domain filter” is able to filter certain domain name such as www.sina.com.
- Rule: you can select permit or deny. The default is permit.
- Source Host: input the source IP address that you want to control. you can select “all Host”, “Specific Host”, “Host subnet” or “HOST IP section”
- Priority: define the priority of this Rule
- DNS Filter Key words: Input website name or Domain name in the “DNS Key Words”

field, such as www.163.com.

Follow these steps to set Domain filter:

1. You can select “enable” and click “Save” to enable “Domain Filter” function. This is only the first step, you should continued to create appropriate rules for “Domain Filter”.
2. Input DNS Filter Key words.
3. There are two items supplied, “Permit through the router for DNS Key words listed, others are denied” and “Deny through the router for DNS Key words listed, others are permitted”, Select the item you want, and click “Save” button.
4. If you want to delete certain item on the list, select appropriate item on the list, click “delete” to delete it.

4.9. Advance

4.9.1. Static Routing

Most of router and wireless router are using NAT mode, so this feature is designed for most common network environment.

Figure 4-55

- IP Address: Specify a certain IP address which static route forward to.
- Subnet Mask: Subnet mask is used for distinguish Network portion and Host portion for an IP address.
- Next-hop IP Address: This is an IP address of the next-hop device (and also is the gateway

address for local host) that allows forwarding data between router and remote network or host.

Routing Table: You can check out all current route items, click “delete” button to delete an route item existed in routing table.

4.9.2. Dynamic DNS

The DDNS feature allows you using domain name (not IP address) to access Internet. Before you can use this feature, you need to register an account for DDNS service at DDNS service providers, such as “roay.cn”, ”TZO.com”, ”DynDNS”. For more information, you can visit <http://www.oray.net/Help>.

The screenshot shows a web interface for configuring Dynamic DNS (DDNS). At the top, there is a 'WAN' tab. Below it, the 'DDNS' section is expanded. The 'DDNS Status' is currently set to 'Disable' (indicated by a selected radio button). The 'DDNS Server Provider' is set to 'dyndns', with a link to 'www.dyndns.com'. There are two input fields: 'Username' and 'Password', both of which are currently empty. Below these fields is a 'Status' label. At the bottom right of the configuration area, there are two buttons: 'Apply' and 'Refresh'.

Figure 4-56

- DDNS Status: Current status of DDNS server.
- DDNS Server Provider: For example, if you want to use service of “roay.cn”, you have to first register and accounts for it. Other DDNS service providers as the same.
- Username, Password: After register an DDNS account from DDNS service providers, you will get “User Name”, “Password”, Input information in appropriate field.

4.9.3. Time Settings

You can choose the time server and the time zone for the system time

Figure 4-57

4.9.4. Port Triggering

Port trigger module dynamically registers virtual server rules when any IP host generates the packet from the specified trigger protocol and port. Port trigger module use forward protocol type and port number and use the IP address of host that generates the trigger packet when it registers a rule.

Figure 4-58

- Predefined Trigger Rules: select one of the Predefined Rules.
- Name: describe one Predefined Trigger that you will configure.
- Trigger Protocol: you can select TCP/UDP.

- Trigger Port: you can select a part of ports.
- Forward Protocol: you can select TCP/UDP.
- Forward Port: you can select a part of ports.

4.9.5. VPN Settings

VPN is commonly used for encapsulate and encrypt data across the public network. For VPN tunnel, the router supports IPSEC pass-through, PPTP pass-through and L2TP pass-through.

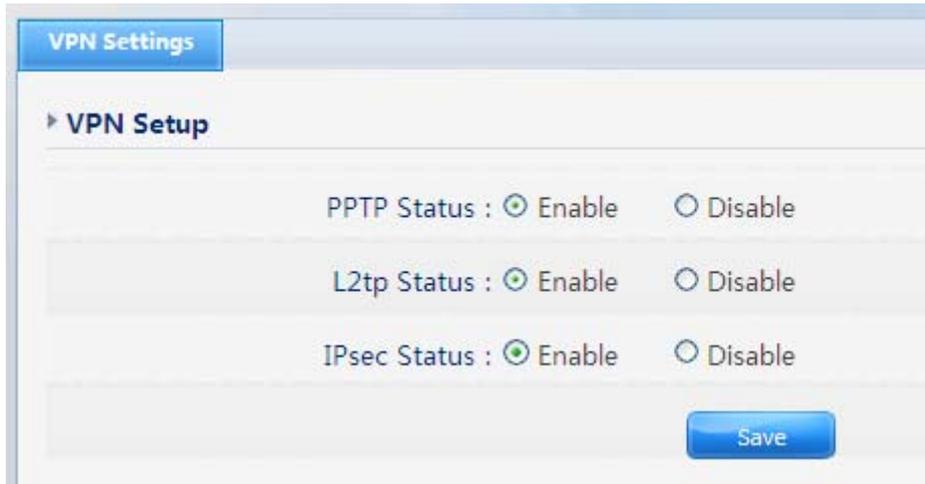

Figure 4-59

4.9.6. IGMP Proxy

Here you can set the IGMP Proxy 'Enabled' and 'Disabled'.

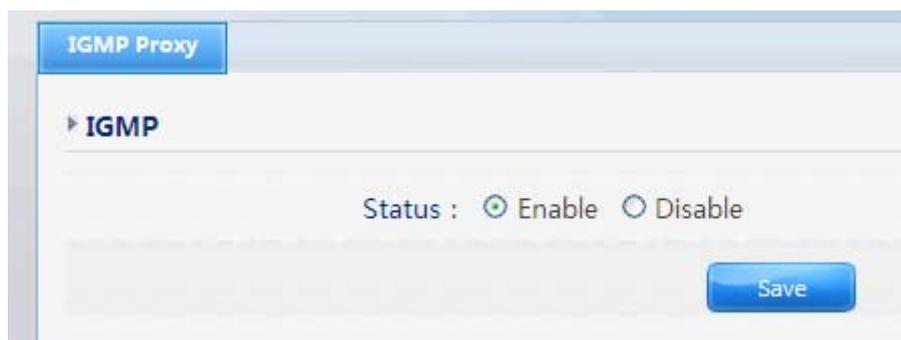

Figure 4-60

4.10. System Tools

System management includes password setup, Firmware, reboot, Remote Management , Factory Defaults, and Parameters backup

4.10.1. Firmware

Click "Browse..." button and select a File to upgrade, after you have selected the appropriate file, click "Upgrade" button to execute upgrade procedure. Do not cut off the power supply during the process of upgrading.

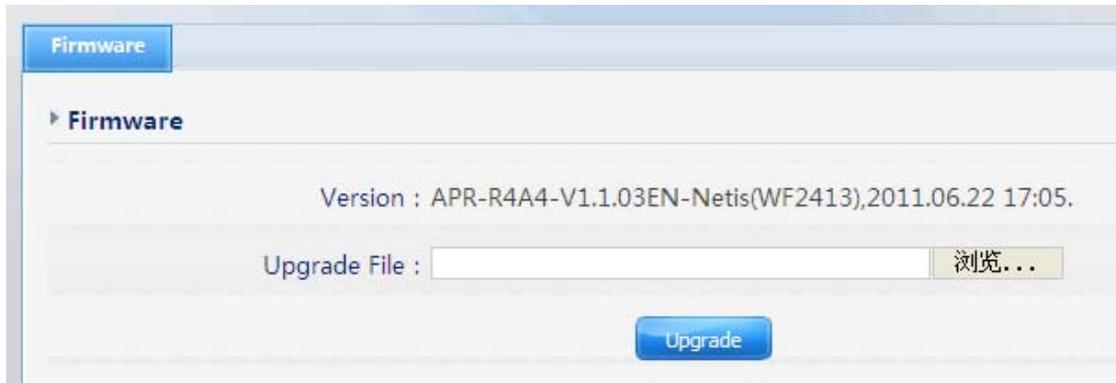

Figure 4-61

4.10.2. Password

The default username/password is guest/guest. To ensure the Router's security, it is suggested that you change the default password to one of your choice, here enter a new password and then Re-enter it again to confirm your new password. Click "Save" button to save settings.

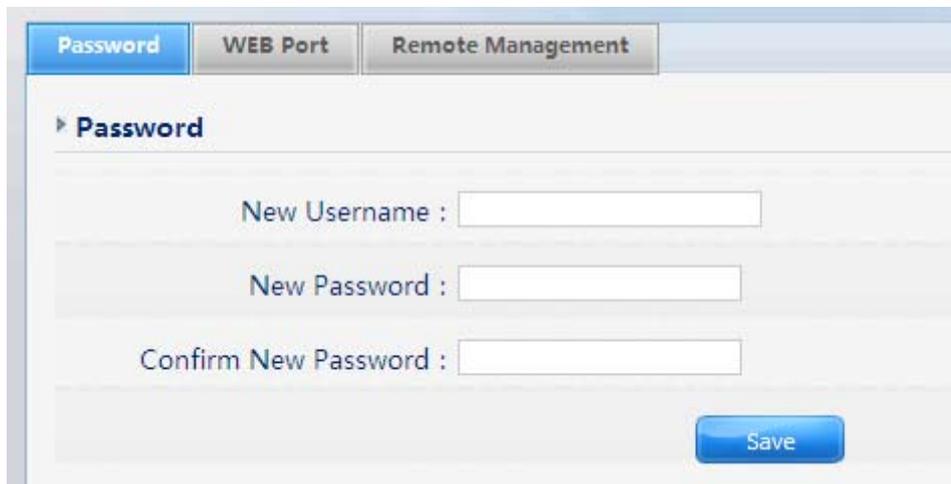

Figure 4-62

4.10.3. Parameters Backup

Here you can Backup and Recovery system Configuration Parameter

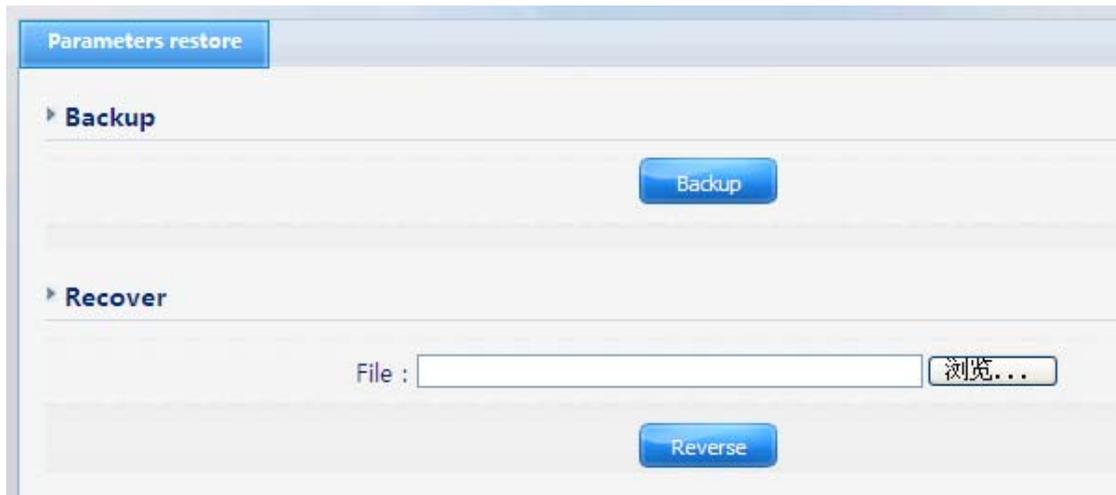

Figure 4-63

4.10.4. Remote Management

WEB Management Status: the default is disable. Router can be accessed on the remote site using “Web setup”. Check the “Management Port” and enter the port number and then press “save” button to enable web management.

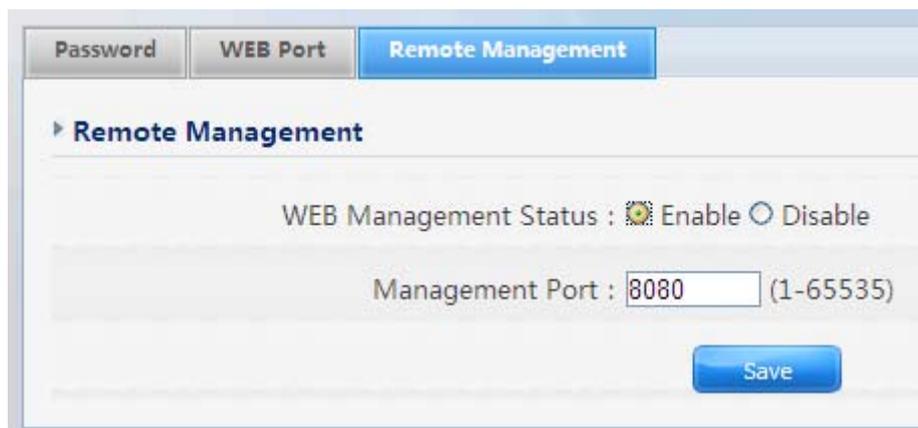

Figure 4-64

4.10.5. Factory Defaults

Click "Restore default parameters" button, the Router will erase all of your settings and replace them with the factory defaults, make sure you have backup current settings before click this button.

Figure 4-65

4.10.6. Reboot

Click “Reboot” button to restart the router.

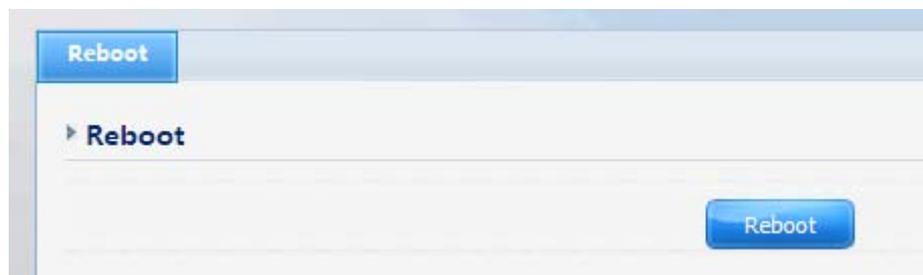

Figure 4-66

5. Troubleshooting

1. I cannot access the Web-based Configuration Utility from the Ethernet computer used to configure the router.

- Check that the LAN LED is on. If the LED is not on, verify that the cable for the LAN connection is firmly connected.
- Check whether the computer resides on the same subnet with the router’s LAN IP address.
- If the computer acts as a DHCP client, check whether the computer has been assigned an IP address from the DHCP server. If not, you will need to renew the IP address.
- Use the ping command to ping the router’s LAN IP address to verify the connection.
- Make sure your browser is not configured to use a proxy server.
- Check that the IP address you entered is correct. If the router’s LAN IP address has been changed, you should enter the reassigned IP address instead.

2. I forget Password (Reset the Router without Login)

- Use a pencil to press the button for about 2-6 seconds when it is working, then leave your hands, it will restore settings to the factory configuration. The default password is **guest**.

3. I have some problems related to Connection with Cable Modem

Please follow the following steps to check the problems:

- Check whether the DSL modem works well or the signal is stable. Normally there will be some indicator lights on the modem, users can check whether the signal is ok or the modem works well from those lights. If not, please contact the ISP.
- Check the front panel of the Router, there are also some indicator lights there. When the physical connection is correct, the Power light and the CPU light should be solid; the WAN light should be blinking. If you use your computer, the corresponding LAN port light should be blinking too. If not, please check whether the cables work or not.
- Repeat the steps in **WAN Setup** Connect with Internet through DSL Modem.

4. I can browse the router's Web-based Configuration Utility but cannot access the Internet.

- Check if the WAN LED is ON. If not, verify that the physical connection between the router and the DSL/Cable modem is firmly connected. Also ensure the DSL/Cable modem is working properly.
- If WAN LED is ON, open the System Overview page of the Web configuration utility and check the status group to see if the router's WAN port has successfully obtained an IP address.
- Make sure you are using the correction method (Dynamic IP Address, PPPoE, or Static IP) as required by the ISP. Also ensure you have entered the correct settings provided by the ISP.
- For cable users, if your ISP requires a registered Ethernet card MAC address, make sure you have cloned the network adapter's MAC address to the WAN port of the router. (See the **MAC Address** field in **WAN Setup**.)

5. My wireless client cannot communicate with another Ethernet computer.

- Ensure the wireless adapter functions properly. You may open the Device Manager in Windows to see if the adapter is properly installed.
- Make sure the wireless client uses the same SSID and security settings (if enabled) as the 300Mbps Wireless-N Router.
- Ensure that the wireless adapter's TCP/IP settings are correct as required by your network administrator.
- If you are using a 802.11b wireless adapter, and check that the **802.11G** Mode item in **Wireless Basic Setting** page, is not configured to use 802.11G Performance.
- Use the ping command to verify that the wireless client is able to communicate with the router's LAN port and with the remote computer. If the wireless client can successfully ping the router's LAN port but fails to ping the remote computer, then verify the TCP/IP

settings of the remote computer.
