

Save these instructions for future use!

DESCRIPTION

The 16E09-101 is a single stage electronic temperature control, with a Nema 1 rated enclosure, and can be used for most applications within the temperature control range of -40° to 220°F, (-40° to 104°C). The control has an SPDT (Single Pole Double Throw) output load relay.

The control has user options to control differential, anti-short cycle delay, set back, offset, alarms and more. It includes an NTC (Negative Temperature Coefficient) thermistor temperature sensor, and can be used with certain other NTC or PTC (Positive Temperature Coefficient) thermistors that meet the specified resistance vs. temperature specifications. See the tables on page 7.

The control can fit many applications, which range from refrigeration to heating due to the wide temperature range of the control stated above. Typical applications include walk-in freezers, beverage coolers, supermarket display cases for flowers, produce, meats, convenience store refrigerated cases, food warmers, boiler control, and certain industrial applications.

PRECAUTIONS

! WARNING

- Failure to read and follow all instructions carefully before installing or operating this control could cause personal injury and/or property damage.
- To prevent electrical shock, personal injury and/or equipment damage, disconnect electric power to system at main fuse or circuit breaker box prior to installation or service.
- To prevent scald injury, do not use this control to heat water for bathing, washing, hot tub or similar applications.
- Where failure of this control may result in personal injury and/or property damage, additional alarms or limit controls must be installed.
- This control is a temperature control and is not to be used as a temperature limit control.

INSTALLATION

- ⚠ To prevent electrical shock and/or equipment damage, disconnect electric power to system at main fuse or circuit breaker box prior to installation or service.**
- ⚠ Where failure of this control may result in personal injury and/or property damage, additional alarms or limit controls must be installed.**
- ⚠ This control is a temperature control and is not to be used as a temperature limit control.**

Fig. 1 Control Front View and Description

NOTE:

Green Status Indicator LED and display backlight operation

It may be observed from time to time that the green status indicator LED and display back-light will briefly turn off during a call for heating or cooling. During this time, the control is performing a self-check lasting up to 15 seconds. This is normal operation of the control and the load power will be maintained.

Fig. 2 Control Dimensions and Mounting Information

The control has a user selection for changing the setpoint to be either the Cut In or the Cut Out setting. The user must be careful to understand how this effects the "range" in which the control will operate when the differential value is entered. If entered values are incorrect, the control could operate outside the user's intended settings due to set-up error. See section titled "Operation".

Switch SW1 must be set for system mode as shown:

	SW1
Refrigeration	Cool
Heating	Heat

WIRING

Wiring Instruction Notes

Switch Settings

Switch SW2 must be set for applications as shown:

	SW2
Line Voltage (Power Stealing)	PS
Line Voltage (Non Power Stealing)	Non PS
24 VAC (Non Power Stealing)	Non PS

Power Stealing

Power Stealing is an electronic design within the control that can eliminate the need to connect a neutral line to power the control. The control receives power from the unit it is controlling. Power Stealing saves time and money by often eliminating the labor to run a neutral wire to the control for power. See compatibility chart below for certain limitations.

Power Stealing Compatibility Chart

Application	Power Stealing	Non-Power Stealing
Line Voltage, replacing existing control that has a common wire	Yes	Yes
Line Voltage, with load greater than 2.5 amps, without Defrost timer or other power interruption circuit, with or without alarm	Yes	Yes
Line Voltage, with load greater than 2.5 amps, with Defrost timer or other power interruption circuit, no alarm	See Note 1	Yes
Line Voltage with load greater than 2.5 amps, with Defrost timer or other power Interruption circuit, with alarm	No	Yes
Line Voltage with load less than 2.5 amps	No	Yes
24 VAC Application	No	Yes

NOTE 1: During defrost or time when load circuit is broke, display will be blank because power has been interrupted to the control. All menu settings and setpoint will be restored when power is returned.

Fig. 3 Line Voltage Application (Power Stealing)

Fig. 4 Line Voltage Application (Non-Power Stealing)

Fig. 5 24 VAC Applications (Non-Power Stealing)

* NTC – Negative Temperature Coefficient
PTC – Positive Temperature Coefficient

NOTE: Only one sensor (PTC or NTC) may be connected. Sensor must meet specific temperature vs. resistance specifications.

USER MENU

USER MENU OPERATION SETTINGS:

The control has user Menu settings that will determine how the control operates. The unit is shipped with factory default settings. The user must change any of the settings as required for the application. To reset all settings to factory defaults, press and hold all 3 buttons simultaneously (**MENU**, **+**, and **=** buttons) for approximately 5 seconds.

To view Menu items, press and hold **MENU** for 5 seconds.

The unit will display the first Menu item on the left side of the display. The right side of the display indicates the Menu item settings. To change the setting, momentarily press the **+** or **=** key.

A momentary press of the **MENU** key advances the display to the next Menu item, and continues, till the last menu item is displayed. Pressing the key one more time with the **last** menu item, (aL) displayed returns the control to the operating mode.

Each press of **MENU** results in forward movement to the next Menu item. If you need to change an item "passed", you must repeatedly press **MENU**, return to the operating mode, then press and hold **MENU** for 5 seconds to re-enter the Menu mode. Then repeatedly, momentarily press **MENU** until the desired Menu item is again displayed.

To store any changes made to any Menu items, the Menu must be exited by pressing **MENU** when the last item is displayed. If no buttons are pressed for ten minutes while in the menu, the control will return to operating mode and any changes that were made will be lost.

The following table shows the menu items, default settings and optional settings.

NOTE: The Heat/ Cool switch (SW1) MUST be in the proper position BEFORE setting options.

Menu Item	Description	Factory Default	Options Press + or = to select	Comments
CF	Temperature Scale	F	C or F	Selects temperature display in Fahrenheit or Celsius
dFF	Differential	5	1 to 30	Selects the range between Cut In and Cut Out.
SP	Set Point Mode Cool Heat	CI CO	CO or CI CI or CO	Selects how the set point temperature will operate the load terminal. CI indicates the setpoint temperature will be the Cut In temperature. CO indicates the temperature will be the Cut Out temperature. See Operation section.
SOF	Sensor Operation Failure Cool Heat	1 0	0 or 1 None	Cooling - Selects the operation of the Control Load relay in the event of a sensor failure in Cool mode. 1 (default) will cause the load contacts of the relay to close and remain closed if the sensor either opens or shorts. 0 causes the load contacts of the relay to open and remain open. Heating has no optional selection. Sensor failure in Heating will result in the relay contacts opening.
dL	Display Light	Off	On or Off	Selects the LCD display light Off or On. With this selected Off, the display light will illuminate any time a keypad button is pressed to provide better viewing in low lighting conditions, and go off after 10 seconds. If On is selected, the display light will be On continuously.
ASd	Anti Short-Cycle Delay	Cool 1 Heat 0	0 to 12	Selects the minimum time (in minutes) that the load contacts will remain open after a cycle before closing again. This will prevent the compressor or other load from being damaged by cycling too soon. A blinking Snowflake or Flame icon indicates that the control has a demand to energize the load, but is waiting for the delay time to elapse. A setting of 0 indicates no time and the feature is disabled. SW1 must be set to the proper position before checking this setting.
LP	Lock Front Panel Keypad	Off	On or Off	When selected Off, the keypad can be used as normal. When selected On, prevents unauthorized access to the control settings by locking out all keys. To unlock the control when it is locked, press and hold the Menu key for 5 seconds.
OFS	Ambient Temperature Offset	0	-4, -3, -2, -1, 0, 1, 2, 3, 4	This control is calibrated at the factory, but the "sensed" temperature may read different because of mounting/installation, or other factors. This item allows the displayed temperature to be shifted the number of degrees set to compensate for this difference

USER MENU

Menu Item	Description	Factory Default	Options Press + or = to select	Comments
bIn	Binary Input	Off	On or Off	The default setting of Off will have no affect on the operation of the thermostat. When set to On, it allows an external binary input (switch or relay) to start a temperature set back. See Set Back (Sb).
Sb	Set Back	0	0 to 50	Selects the number of degrees the thermostat will change the setpoint temperature when the external binary input signal is received. 0 will cause no temperature change to occur. See Binary Input (bin).
AL	Alarm	0	0 to 99	Selects the time delay (in minutes) before a Temperature Out of Range alarm output is sent. A setting of 0 disables the alarm relay.

OPERATION

⚠ This control is a temperature control and is not to be used as a temperature limit control.

⚠ To prevent scald injury, do not use this control to heat water for bathing, washing, hot tub or similar applications.

The factory default setpoint for this control is 45°F (7°C) for Cool and 120°F (49°C) for Heat. Setpoint temperature can be adjusted using the + or = keys. A power loss does not lose the settings. All menu item selections and setpoint setting are stored in a permanent memory.

The user determines the temperature operating range. To determine the temperature range, the user must select the Set Point (SP) as the Cut Out or Cut In temperature, Differential (dFF) and enter a set point temperature. Cut out is when the load is turned off and cut in is when the load is turned on.

NOTE: The Heat/ Cool switch (SW1) MUST be in the proper position BEFORE setting options.

COOL/REFRIGERATION

To use as a Cooling control, SW1 must be set to Cool. The snowflake (*) icon will display.

If control is in Cool mode, and Set Point is selected as the Cut In:

Temperature

$$\text{Operating Range} = \text{Setpoint Temperature} - \text{Differential}$$

Example:

SW1 = Cool
Set Point (SP) = Cut In
Differential = 5
Setpoint temperature = 40°

If control is in Cool mode, and Set Point is selected as the Cut Out:

$$\text{Temperature Operating Range} = \text{Setpoint Temperature} + \text{Differential}$$

Example:

SW1 = Cool
Set Point (SP) = Cut Out
Differential = 5
Setpoint temperature = 40°

HEAT

To use as a Heating control, SW1 must be set to Heat. The flame (flame) icon will display.

If control is in Heat mode, and Set Point is selected as the Cut Out:

$$\text{Temperature Operating Range} = \text{Setpoint Temperature} - \text{Differential}$$

Example:

SW1 = Heat
Set Point (SP) = Cut Out
Differential = 5
Setpoint temperature = 100°

If control is in Heat mode, and Set Point is selected as the Cut In:

$$\text{Temperature Operating Range} = \text{Setpoint Temperature} + \text{Differential}$$

Example:

SW1 = Heat
Set Point (SP) = Cut In
Differential = 5
Setpoint temperature = 100°

OPERATION

Lock Panel (LP)

The keypad can be locked to prevent unwanted tampering with the control settings. In the User Menu, change the menu item LP selection to On. When the menu is exited and settings are stored, the \oplus or $=$, and **MENU** keys will be disabled from normal use.

To unlock the keypad, press and hold **MENU** for 5 seconds. The display will change to show LP On. Momentarily press \oplus or $=$ to change to Off and then momentarily press **MENU**. The control will return to normal operation and the keypad will be unlocked.

Binary Input (bln) and Set Back (Sb)

Binary Input is an option to allow the setpoint temperature to set back to conserve energy or for other reasons as determined by the user. Set Back determines the number of degrees the setpoint temperature will be changed.

An external switch or N.O. relay can be connected to the BIN and GND terminals of the control. With bln set to On, when the switch is closed, the control will change the setpoint temperature by the number of degrees set in Sb. In Heat mode, setpoint temperature will change lower or cooler. In Cool mode, setpoint temperature will change higher or warmer.

During the time that the switch is closed, bln will appear in the lower left corner of the display. If an alarm is connected be sure that the alarm delay time is set long enough to allow for the temperature change to avoid a "false" alarm.

Alarm (AL)

SPECIAL NOTE

Using the Alarm Output and power stealing in combination –

When using power stealing mode and the alarm output, it is

important for the installer to review the wiring circuit of the installation to insure no device is present that could interrupt electrical power to the temperature control. Such a device could be a defrost timer, as one example, that may be used in some refrigeration applications.

If a device is in the system wiring that can periodically disrupt power to the load and the temperature control, the power stealing mode of the control cannot be used. A neutral wire must be connected to the control and select the non power stealing mode for the control. This keeps power to the control during power interruptions to the load and avoids a "false" alarm output.

This control has an alarm relay that will provide an output to alert of a malfunction. The alarm relay output must be connected to an external light, audible alarm or other device as needed by the user. If AL is set to 0, the alarm relay will not provide any alarm output. If AL is set to a value greater than 0, the alarm relay output provides indication of three error conditions: Temperature Out of Range, Power Loss and Sensor Operation Failure. Although AL must be set to a value greater than 0 for any alarm output to be provided, the value selected is the time delay, in minutes, before a Temperature Out of Range alarm is set. The alarm time delay does not apply to Power Loss or Sensor Operation Failure.

Temperature out of range – If the temperature is more than 5° from the setpoint, continuously for the length of time set in AL, the alarm relay output will close. The delay should be set to allow for conditions that will cause the temperature to vary, such as defrost cycle, opening door for stock removal or replacement or Set Back changes. When setting the AL time, consideration should be given to these events to prevent a false alarm.

If the control set back feature is used to change the setpoint, the delay period set in AL should consider the time it takes for the system to reach the set back temperature to avoid a false alarm.

Power Loss – If the temperature control experiences an input power failure, the control will close the alarm relay before total power of the control is lost. The delay time is not used in this event, and the alarm relay will close within seconds of a power failure. In addition, the load relay contact change state per the Sensor Operation Failure (SOF) setting.

When power returns, the alarm contacts will open. The load relay will remain in the SOF position the length of time set in Anti Short-Cycle Delay (ASd) after power resumption. The display will blink the flame or snowflake icon for this time to indicate the load is "locked" out. This is to help protect the user's equipment from damage by short cycle switching.

Sensor Operation Failure (SOF) – If in operation, the sensor wiring should become open or shorted, the temperature control will begin blinking SOF with SH for shorted or SO for sensor open. However, the control will wait approximately 1 minute before closing the alarm output relay - indicating sensor operation failure. If during the 1 minute, the sensor "resumes" normal operation, the time is reset and the control returns to normal display. The load relay will operate as selected in sensor operation failure (SOF).

Multiple Sensors

The 16E09 is normally operated with one sensor. If an average temperature of an area is required, 4 sensors may be used and wired in the method shown below. If 4 sensors are used, they must all be of the same model.

NOTE: When using multiple sensors, 4 sensors must be used. The control will not operate with 2 or 3 sensors.

SPECIFICATIONS

Load Output Relay:

	Ratings (Maximum):		
	120VAC	208VAC	240VAC
Full Load Amps NC & Load	16 A	9.2 A	8 A
Locked Rotor Amps NC & Load	96 A	55.2 A	48 A
Non-Inductive Amps NC & Load	16 A	16 A	16 A
Horsepower NC & Load	1 hp	1 hp	1 hp
24 VAC NC & Load	100 VA, 30 VAC Max (Class 2)		
Pilot Duty NC & Load	125 VA, 24 to 240 VAC		
	<ul style="list-style-type: none"> • Minimum Load Rating: 1 Amp @ 24 VAC • Note: the above minimum current/voltage is specified to assure proper operation. 		

NOTE: For use on single phase circuits only.

Alarm Relay Ratings (Maximum):

N.O. contact: 1 Amp, 5 to 24 V, AC or DC

Temperature Probes:

NTC

The control is shipped with an NTC (Negative Temperature Coefficient) sensor, with a cable length of 7½ feet. Cable length can be extended up to 400 feet by appropriately splicing and adding additional cable (22 AWG or larger diameter)

Operating Ambient Ratings (Control Enclosure):

Operating Temperature: -29°F to 140°F (-34° to 60°C)

Storage Shipping Ambient Ratings:

Storage Temperature: -40°F to 185°F (-40° to 85°C)

Operating Humidity: 0 to 95% Relative Humidity, Non-Condensing

Maximum Dew Point: 85°F (29°C)

Temperature Set-Point Range:

Set-Point Range: -40° to 220°F (-40° to 104°C)

Differential Range: 1 to 30 (Degrees F or Degrees C)

Case:

NEMA 1 Enclosure, Flammability Rating: UL94VO

as needed – polarity is not important. When extending cable length, verify temperature accuracy and use the menu Ambient Temperature Offset (OFS) settings to compensate accordingly if required.

PTC

The control may be connected to an existing PTC (Positive Temperature Coefficient) sensor. Make sure the PTC sensor meets the specifications tables below. Failure to do so will result in temperature inaccuracies. The PTC input may not be

extended more than 50 feet, and the wire gauge should be 18 AWG wire or larger diameter. Be sure the probe attached matches the resistance vs. temperature tables or temperature inaccuracies may occur.

TROUBLESHOOTING

LCD display, display back-light and green status indicator LED turn off in Power Stealing mode:

This "off" condition is normal for the control in power stealing mode when wired with a defrost timer or other device that interrupts electrical power to the control.

No control settings will be lost during this time, however, the installer must ensure that applications requiring power stealing are suitable for the control to be off during these periods.

Please note: if the built-in alarm feature of the control is to be used on systems that may interrupt power to the control, the control must be wired with a neutral wire and set in non-power stealing mode. This will keep the control continuously powered unless there is an actual power interruption or loss. In this case, the control will be able to signal an alarm for system power loss.

Display indicates "CaL" on power up.

Control was not calibrated. Return control for replacement.

Unit does not turn on, (LCD does not display anything):

- Check that wiring is correct.
- Make sure power is turned on.
- Check that wiring is under terminal blocks correctly.
- Make sure both switches inside control are set to proper position.
- If in Power Steal mode,
 - Make sure the load draws a minimum of 2.5 amp AC. If not, wire per the Non-Power Stealing diagram.
 - Make sure nothing "breaks/opens the load line, such as a defrost timer or any other device, with the alarm feature enabled. This would cause a false alarm. If the alarm function is enabled, wire per the Non-Power Stealing diagram.

Temperature differential is wider than set:

- Temperature change of customer's unit is fast, and the Anti Short Cycle delay setting may be overriding the "call" to activate the heat or cool. Solution – lower Anti Short Cycle delay.

Installation and Power Up:

False alarm sounds, temperature has not yet reached set-point setting. CUSTOMER must disable alarm (AL = 0), until setpoint temperature is reached, then set alarm delay time.

Customer Changes Setpoint Temperature:

False alarm sounds. CUSTOMER must disable alarm (AL = 0), while unit is adjusting to new temperature. CUSTOMER must then set the alarm delay time when temperature is reached.

Bin/Set Back

False alarm sounds. CUSTOMER must set the delay time with sufficient delay time to assure the Set Back temperature is reached before the alarm delay time has expired.

Note: If the Set Back temperature cannot be reached within 99 minutes (the maximum Alarm delay time), change the Set Back value to a lower number of degrees. If a lower set back can not be used, you may not be able to use the alarm feature.

Alarm Sounds, Reason Unknown:

CUSTOMER should make sure the Alarm (AL) delay time is great enough to cover other conditions when the unit temperature may not be able to stay within 5 degrees.

- Loading or unloading of stock and the doors are open. (Add sufficient delay time to the alarm delay).
- Power is lost to the control if the line is broken/open by a defrost timer or other device. (Wire control per the Non Power Stealing line voltage schematic and connect/add a neutral line connection).

LÍNEA DE SOPORTE TÉCNICO: 1-888-725-9797

- Se interrumpe la alimentación al control si la línea demora de la alarma.)
- Apertura de las puertas para colocar agregar o remover dispositivos. (Agregue suficiente tiempo de demora de la alarma.)
- Unaida y secciónes en las que es posible que la temperatura no pueda permanecer dentro de los 5 grados Celsius (AL) sea lo suficientemente amplio para almacenar, causas descontroladas:

BIN/Reducción de la temperatura Sigue una fala de alarma. El CLINETE debe ajustar el tiempo de demora a un valor suficiente que permita alcanzar la temperatura reducida antes de que haya transcurrido la demora de la alarma. Nota: si no es posible alcanzar la temperatura reducida dentro de los 99 minutos (el tiempo de demora de la alarma máxima), cambie el valor de la temperatura reducida a una cantidad menor. Si no se puede usar clida a una cantidad de grados menor que no pueda utilizar la temperatura inferior, es posible que no pueda utilizar la función de alarma.

EL CLIENTE CAMBIARÁ LA TEMPERATURA DE REFERENCIAS: Sigue una racha de alarma. El CLIENTE debe desacribar la alarma ($AL = 0$), mientras la unidad se adapta a la nueva temperatura. Luego el CLIENTE debe ajustar el tiempo de demora de la alarma cuando se alcance la temperatura.

Suena una falsa alarma, la temperatura aun no ha llegado a la temperatura de referencia. El CLINET debe desactivar la alarma ($AL = 0$), hasta alcanzar la temperatura de referencia y luego ajustar el tiempo de demora de la alarma.

- El diferencial de temperatura es más amplio que el susitado: El cambio de temperatura de la unidad del cliente es rápido y ajuste de demora anti-cílico corto para activar la calificación de inflamable.
- Solución: reduzca la demora anti-cílico corto.

- Verifiqué que las conexiones se hayan realizado correctamente.
- Assegúrese de que la alimentación esté encendida.
- Verifique que las conexiones pasen correctamente por debajo de los bloques de terminales.
- Assegúrese de que la conexión de alimentación esté encendida.
- Si lo utiliza en el modo Power Steal:
 - Assegúrese de que ambos interruptores que se encuentran dentro del control estén ajustados en la posición adecuada.
- Assegúrese de que la carcasa sirviera un mínimo de 2.5 amperios CA. De lo contrario, conecte según el diagrama Non-Power Stealing.
- Assegúrese de que nadie interrumpe o abra la línea de carga, como un temporizador de descongelación o cuando otra disposición, con la función de alarma activada. Esto produciría una falsa alarma. Si la función de alarma está activada, conecte según el diagrama Non-Power Stealing.

Almacenamiento: Si la configuración de sistema microprocesada del control debe usarse en sistemas que pueden interrumpir la alimentación al control, este debe conectarse con un cable alimentación al control. Este neutro y configurarse en el modo Non-Power Stealthing. Esto mantenrá el control continuamente encendido a menos que se produzca una interrupción o perdida de alimentación. En este caso, el control podrá activar una alarma de pérdida de alimentación del sistema.

Pantalla LCD, luz de fondo de pantalla e indicador verde de estado LED se apaga en el modo Power Stealing: La condición de apagado es normal para el control en el modo Power Stealing cuando se conecta con un reloj de descongelamiento u otro dispositivo que interrumpe el suministro eléctrico al control.

No se perderá ningún ajuste del control durante este tiempo. No obstante, el instalador deberá asegurarse de que las aplicaciones que requieren Power Stealing sean adecuadas para el control se apague durante estos períodos.

SOLUCIÓN DE PROBLEMAS

Temperatura (°F)	Resistencia (°C)						
-40	40	50	10	924	1323	140	60

TABLAS DE TEMPERATURA VS. RESISTENCIA PTG

El control podrá concentrarse en un sensor PTC (coeficiente de temperatura positivo) existente. Asegúrese de que el sensor PTC cumpla con las especificaciones de los tablas incluidas en la continuación. De lo contrario, podrán producirse impresiones de temperatura. La entrada PTC no podrá extenderse más allá de la resistencia vs. temperatura, ya que de lo contrario podrían producirse impresiones de temperatura.

TABLAS DE TEMPERATURA VS. RESISTENCIA NTC

El control incluye un sensor NTC (coeficiente de temperatura negativo), con un cable de $7\frac{1}{2}$ pies de longitud. La longitud del cable puede extenderse hasta 400 pies empalmados y agregando cable adicional (22 AWG o un diámetro mayor) según sea necesario. La polaridad no es importante. Si ex- tiene la longitud del cable, verifique que la temperatura sea precisa y utilice los ajustes de compensación de temperatura ambientante (OFs) del menú para compensarla en caso de que sea necesaria.

NOTA: cuando se usan varios sensores, deben usarse 4. El control no funcionará con 2 o con 3 sensores.

Normalmente, el 1609 opera con un sensor. Si se requiere una
emperatiria promedio de un área, pueden usarse 4 sensores
conectados de una manera como se muestra a continuación. Si se
toman 4 sensores, todos deberán ser del mismo modelo.

Varios sensores

Falla de funcionalamiento del sensor (SOF) - Si durante su funcionamiento se gign el ajuste seleccionado en Falla de funcionamiento segun el control que se ha establecido en el sensor (SOF).
 La falla de SOF se produce cuando el sensor no detecta un objeto en la trayectoria de su campo de visión. El sensor emite una señal de salida que indica si hay un objeto en su campo de visión o no. Si el sensor no detecta ningún objeto, la señal de salida permanece en el nivel de alta. Si detecta un objeto, la señal de salida cambia al nivel de baja. Si el sensor no detecta ningún objeto durante un período de tiempo establecido, se considera que el sensor ha detectado un objeto y se activa la señal de salida. Si el sensor detecta un objeto durante un período de tiempo establecido, se considera que el sensor no ha detectado un objeto y se desactiva la señal de salida.

Cuando se restablece la alimentación, los contactos de la alarma se activan. El relé de carga permanecerá en la posición SOF por un tiempo específico en Demora anti-ciclo controlada (ASd) después de que se restablezca la alimentación. La pantalla muestra un icono intermitente con forma de llama o de copo de nieve durante ese tiempo para indicar que la carga está "funcionando". Volver el equipo del sistema contra posibles daños por la conexión en ciclos cortos.

interrupcion de la alimentacion - Si el control de temperatura experimenta una falla en la alimentacion de entrada, el control cerrara el relé de alimentacion al controlar la temperatura la alimentacion de la falla. En este caso no se interrumpe totalmente la alimentacion al control. Ademas, el contacto del rele producira una falla en el suministro. Ademas, el contacto del rele de carga cambia de estado segun el ajuste de Falla en el uniconamiento del sensor (SOF).

Si se utiliza la función de reducción de la temperatura del control para cambiar la temperatura de referencia, el periodo de demora ajustado en AL debe tener en cuenta el tiempo que tarda el sistema en alcanzar la temperatura reducida para evitar falsas alarmas.

Temperatura fija de rango - Si la temperatura difiere de la temperatura de referencia en más de 5° en forma continua durante el tiempo definido en AL, la silla del reloj de alarma se cerrará. La memoria deberá ajustarse de modo tal de que contemple situaciones que suceden que la temperatura varíe, como el ciclo de descongelación, la apertura de la puerta para retirar o reposicionar artículos o cambios en la educación de la temperatura. Cuando se ajusta el tiempo AL, deben entenderse en cuenta estas situaciones para evitar falsas alarmas.

Este control cuenta con un relé de alarma que alerta a través de una falla. La salida del relé de alarma debe conectarse a una luz extrema, siempre audible o visible a dispositivos, según las necesidades del usuario. Si AL se ajusta en 0, el relé de alarma no proyectaría ninguna señal de alarma. Si AL se ajusta a un valor mayor que 0, la salida del relé de alarma indicaría tres condiciones de error:

- Temperatura fuera de rango, interrupción de alimentación y falla de funcionamiento del sensor.
- Va a ser necesario ajustar AL de acuerdo a las necesidades de cada sistema.

La función de alarma es útil para proteger el sistema de daños. Una vez que se activa la alarma, el sistema debe detenerse y no volver a operar hasta que se resuelva la falla. La alarma se activa cuando la temperatura es menor que el límite inferior establecido o mayor que el límite superior establecido. La alarma se desactiva cuando la temperatura vuelve a estar dentro del rango establecido.

USO COMBINADO DE SALIDA DE ALARMA Y Power Stealing - Cuando se utilice el modo Power Stealing y la salida de alarma, es importante que el instalador revise el circuito de cablesado de la instalación para asegurarse de que no haya presentes ningún dispositivo que pudiera interrumpir el suministro eléctrico al control de temperatura. Dicho dispositivo podría ser un relé de desacoplamiento, por ejemplo, como el que se utiliza en algunas aplicaciones de enfermería.

Si hay algo en el cableado del sistema que pude interrumpir periódicamente la alimentación al control de temperatura, no podrá usar el modo Power Stealing del selector. Es necesario conectar un cable neutro al control de temperatura, o bien interrumpir periódicamente la alimentación al selector para evitar una "falsa" alarma.

NOTA

ESPECIAL

Alarma (AL)

Puede conectarle un interruptor externo o relé N/O a las terminales BIN Y GND del control. Cuando la opción bin sea ajustada en On, al cerrar el interruptor, el control cambiará la temperatura de referencia a la cantidad de grados indicada en Sb. En el modo Calor, la temperatura de referencia se reducirá a ser más fría. En el modo Frio, la temperatura de referencia aumentará a ser más caliente.

Mientras el interruptor esté cerrado, aparecerá la leyenda "bin" en el display interior izquierdo de la pantalla. Si la alarma está conectada, se activará la alarma para evitar una "falsa" alarma.

Bloquear Panel (LP)

El tecaldo puede bloquearse para impedir la modificación indeizada de los ajustes de control. En el menú del sistema, cambie la opción de menu LP a On. Al salir del menú, cuando se guarden los ajustes, las teclas o en el tecaldo, y **MENU** quedarán desactivadas del uso normal.

Para desbloquear el tecaldo, presione **MENU** y mantenga la tecla durante 5 segundos. La pantalla cambiará mostará LP On. Presione o por un momento para cambiar el ajuste a Off y luego presione **MENU** durante algunas instantes. El control volverá a su funcionamiento normal y el tecaldo quedará desbloqueado.

Entrada binaria (bin) Y Reducción de la temperatura (Sb)

FUNCIONAMIENTO DEL USUARIO

Opción del menú	Descripción	Opciones para selecciónar	Observaciones
bIn	Entrada binaria	Off On u Off	El ajuste predeterminado de Off no tendrá efecto en el funcionamiento del termostato. Cuando se ajusta en On, permite una mitad del termostato. Una vez que se ajusta en On, permite una mitad del termostato. Una vez que se ajusta en On, permite una mitad del termostato. Una vez que se ajusta en On, permite una mitad del termostato.
Sb	Reducción de la temperatura	0 0 a 50	Selecciona la cantidad de grados que el termostato modificará la temperatura de referencia cuando se reciba la señal de entrada binaria extrema. Si se selecciona 0, no se producirá ningún cambio en la temperatura. Ver Reducción de la temperatura (Sb).
AL	Alarma	0 0 a 99	Selecciona la demora (en minutos) antes de que se envíe una señal de alarma de Temperatura Futura de rancho. Un ajuste de 0 desactiva el reloj de alarma.

Fig. 2 Dimensiones del control e información para el montaje

NOTA: LED verde indicador de estado y funciónamiento de la luz de fondo de pantalla

OCASIONALMENTE PUEDE OBSERVARSE QUE EL LED VERDE INDICADOR DE ESTADO Y LA LUZ DE FONDO DE LA PANTALLA SE APAGAN POR ALGUNOS INSTANTES DURANTE UNA LLAMADA DE CALIFICACIÓN O ENFIAMIENTO. DURANTE ESTE TIEMPO, EL CONTROL REALIZANDO UNA AUTOCOMPRAVACIÓN DURA HASTA 15 SEGUNDOS. ESTE FUNCIONAMIENTO DEL CONTROL ES NORMAL Y SE MANTENDRÁ LA POTENCIA DE CARGA.

Calor	Heat
Enfriamiento	Cool
SW1	

El interruptor SW1 debe ajustarse para el modo de funcionamiento del sistema como muestra la figura:

Fig. 1 Vista frontal del control y descripción

Este control es un control de temperatura y no debe usarse como control de límite de temperatura.

En los casos en que una falla del control de temperatura se deba producir instalar alarmas o controles de límites de operación.

En los casos en que una falla del control de temperatura se deba producir instalar alarmas o controles de límites de operación.

Para evitar descargas eléctricas y/o daños al equipo, proceder a la instalación o reparación del equipo.

La caja de fusibles o disyuntores principales deben desconectarse la alimentación eléctrica al sistema en desconnection. El usuario debe asegurarse de entender de que maneja esto afecta el "rango" dentro del cual funcio-

na el control al ingresar el valor diferencial. Si los valores de los valores deseados son incorrectos, el control podrá functionar fuera de los valores deseados por el usuario debido a un error de configuración. Vea la sección titulada "Operación".

Algunas fallas de control pueden ser causadas por el uso de materiales que producen lesiones personales y/o daños materiales,

debieran instalar alarmas o controles de límites de operación.

Algunas fallas de control pueden ser causadas por el uso de materiales que producen lesiones personales y/o daños materiales,

debieran instalar alarmas o controles de límites de operación.

CONTENIDOS

- Este control es un control de límite de temperatura y no debe usarse como control de límite de temperatura.
- Para evitar quemaduras, no utilice este control para proceder a la instalación o reparación del equipo.
- Para evitar descargas eléctricas, lesiones personales y/o daños al equipo, desconecte la alimentación eléctrica al sistema en la caja de fusibles o disyuntores principales antes de proceder a la instalación o reparación del equipo.
- En los casos en que una falla del control pueda producir lesiones personales y/o daños materiales, debieran instalarse alarmas o controles de límites adicionales.
- Lea y siga con atención todas las instrucciones antes de instalar o utilizar este control para evitar lesiones personales y/o daños materiales.

ADVERTENCIA!
