Ninja Traders
User Manual

Introduction

My Trade Analyzer was primarily designed to monitor and analyze your **actual trades executed** each day. You can copy your actual trades taken daily from your Ninja Trader Platform, **"Control Center"** and export to an Excel worksheet, and paste directly into this program thus saving time and minimizing input errors. This program does not need to distinguish between trades of different instruments – it can calculate for Stocks, ETF's, Futures, and Emini's.

This analyzer was designed using Microsoft's 2007 Excel Edition with file format .xlsm. If you have the previous Excel 2003 version, *My* Trade Analyzer is available in .xls format. **Please make sure you select the proper format when you download the analyzer. Do not try to "convert" from 2003 to 2007 or vice versa. Microsoft Excel has some *inherent compatibility issues* that could make the program function improperly.**

Remember … This is a macro enabled file. If you are using Excel 2007, you must save it as a "Macro Enabled Workbook". If you are using Excel 2003, save it as an "Excel 97-2003 Workbook"

Due to the vast amount of information *My* Trade Analyzer creates for you, the ideal set up would be a four-monitor system (stacked) which would allow full view access to your worksheet. If you are using a one-monitor or two-monitor system (side by side), scrolling will be required. However, we have created a Hot button ***"Toggle View"*** in the upper portion of your monthly sheet to allow a collapsed view of your data for ease of posting your codes.

If your Analyzer does not fit into the width of your monitors, for example the 19" size or the setting of monitor resolution, you can go to "View" then "Zoom" then "Custom Zoom" and set for 92%. This should set your layout for full view. If not, you can adjust your zoom appropriately.

Please read the following instructions first to fully grasp how to use this system prior to creating your first workbook. A better understanding of its proper use will save you a lot of time and minimize errors.

Do not try to "think" for the program. Get in a habit of maintaining a sequence of steps of using the "Hot Buttons" and let the program do the work for you. There are hidden features in each of these buttons.

There are five basic parts to this analyzer.

"Template" This is the main data analyzer designed to allow you to redefine and input *your* style of trading *according to your plan*. You can actually go into the sheet and change parameters to fit your individual types of Setups that you take, the Timeframe you take your trades on, Source of your trades, the Time of day you took your trades, and the types of errors you commonly make.

"Totals" This sheet automatically accumulates your daily results while keeping track of your performance on a daily, weekly, monthly and annual basis. It also calculates which day of the week you perform your best or your worst.

"Daily Trade Log" This sheet is linked to the Template sheet, so when you redefine your trading style and change the parameters, it will automatically update. This sheet is ideal to use as a "cheat sheet" that you can print out and keep on your desk to jot down the what, when, where, and why you took that trade while *"in the moment".* You will find it makes for easier and faster coding at the end of the day.

"Monthly Sheet" You create this sheet each month and this is where you actually copy and paste your trade information. Once you have redefined your Template and "*saved it*", you merely copy your template onto a new sheet and *rename* the sheet for the month you are working with.

"P & L / BA / Sharpe" This sheet graphs and maintains your progress in these three areas and calculates an 8 period SMA of your *trend*.

Now Let's Get Started

Setting up your Program

Once you have downloaded your program onto your desktop, take a moment and think about how you trade now or may trade in the future. If you have several broker accounts where you trade futures and maybe stocks or ETF's across the Ninja platform, you may want to copy *My* Trade Analyzer onto your desktop and rename it so you can analyze the different instruments you trade *(most people have different trading styles for trading different instruments).* Or if you are using a simulated account, you may want to set up a copy to track how your simulated trading is doing.

Creating a copy of your program on your desktop
See back of manual for the procedures, you can make as many copies of the program as you wish.

Never rename the saved ORIGINAL SHEETS as "These must be Kept as is" for *My* Trade Analyzer to function properly.

Step 1: Setup your Template with User Definitions: The Templates are designed to allow you to modify or change most of the coding to fit your style of trading. For example, in your style of trading, let's say you do not take "Break out or break down" plays but you do take "123 Continuation" plays or "Gap" plays. You can go to the descriptions (white cells) of the "Setup, type, timeframe, source, and time of day" section and modify to suit your needs and even change the code. You can also change the description of errors on all but error codes 1, 2, and 7, (those have linked formulas to them). All other error codes in the "Demon" section can be changed to suit your needs and as often as you wish. Also in cell (U3) account size, you can set the value of your account. Remember next month to change accordingly as your account value will vary from month to month. In Col D Rows 16 & 17, we have default values set there. Define your values and change accordingly. In cells A11 and A12 you can change your brokers name as well as the commission costs they charge you. Most brokers have varying rates based on the size of your account and your volume of shares/contracts you trade. Now you are ready to "**save**" your changes and create a new monthly worksheet.

Step # 2: To Create a New Months Worksheet:
Simply "**right-click**" on your "**saved Template"**, select **"Move or Copy",** highlight **"Template",** check **"Create a Copy",** and click **"OK".** This will create a new **Template (2) sheet.**   Right-click on this tab, select **"Rename"** and rename your new sheet the appropriate new month.

<p style="text-align:center;color:red;">Now We Are Ready to Start Posting …</p>

Level 1 and Level 2 Users:

With your Ninja **Control Center** open, select the **Account Performance** tab, set the Mode for **Currency,** select the date range you want to post, and select the **Trades** tab. Now right click in the body of the report and select **Export to Excel.**

Step #3: Copy Report
This will create an Excel sheet of your days trades, with your analyzer open, just select all the rows of trades you did that day, use the **Ctrl + C (to copy)** and open up the analyzer to the **EOD trades sheet**; click on the cell in upper left cell **A7**, click on it and use **Ctrl V (to paste)** the trades.

Step #4: Consolidate and Post
Now click on the **Consolidate and Post** Hot button. It will ask you which sheet you want to post to. Select your monthly sheet you are working on and **click OK.** You will now see your trades on the monthly sheet. You will also notice the trades have "filtered out" your partial fills at the same trade price.

Note: If you get behind and decide to generate a report for multiple days, make sure at this point, you manually go in and "insert" a blank row between each of the trade dates. Otherwise the program will consider all the days of trading as one day.

Step #5: "Process Day's Trade"
Click on any cell within your days trade range to tell the analyzer which trades you want to analyze. **Click on the Hot Button "Process Day's Trade"** If you get a default *"This date is not in the date range"...*Click OK. It is looking to see that you have not duplicated same trade dates. *My* Trade Analyzer will determine whether it is a Long or a Short trade and insert the "yellow coding cells" for you. (Tip: When coding the *Yellow cells*, you must put your coding on the same row as your P&L which is the same row as your Long or Short.)

You will notice a warning message "pop up" reminding you to fill in the Step #6 prior to using the "Post all" button. It will give you a message if you forget or type in your code on the wrong line.

Step #6: Column R - Win/Loss/Scratch/Break Even/Stop Out
Go to Column R and look in Column I (your P&L), determine whether your trade was a Win, Loss, Scratch, Break Even or a Stop Out. If the P&L is greater than your scratch amount, place a **"W"** in the cell. If greater than your Scratch amount and a loss, then place an **"L"**. If a win, but less than your scratch amount place an **"X"**. If a loss, but less than your scratch amount, place an **"X"**. If you were stopped out of the trade, then place an **"SO"**. If a Break Even ($0.00), then place a **"BE"**. Space down to our next trade exit and repeat the process. Once done, continue to Step #7.

Step #7: Click on the Hot Button "Post All Data"
At this point, *My* Trade Analyzer calculates and posts your "*Today's Results*" in row 9 and automatically inserts that information on to your Totals Summary. It also posts the data to your P&L, BA, and Sharpe line charts.

Now, you will notice *My* Trade Analyzer updating automatically.

(Tip: If you would like to go back and see a previous day's results, simply click in cell A9 (the date), select the date you would like to review from the drop-down menu and it will repopulate the results for that date.)

You will notice your Batting Average (BA) and Sharpe Ratio has calculated for the day. And while Adding up the commission cost for your trades, the commission's percentage of your daily P & L has calculated.

(Note: Take a quick glance at your BA and Sharpe for the day. Most traders strive for a BA above 60% and a Sharpe above 1.5. If you can maintain that, then *you're making money*.

There appears to be a lot of steps up to this point, but after a few days, you will be getting this far in less than 5 minutes.

Level 1 Users
You have now completed your daily trade analysis. You have also created a cumulating daily, weekly, monthly and annual summary report and graphs *"of the trend"* of your P&L, Batting Average and Sharpe Ratio.

Level 2 Users

Chart Analysis

Tip: This is where I have a specific platform workspace set up which I call "Print Chart" with a full view (full workspace) chart selected with my normal timeframes in which I take trades, with the necessary Moving Averages, volume, and any other indicators I normally use. I also have "Open Order Lines" enabled for quick reference to the trades I took that day. I scroll the chart over to put the first trade of the day to the far right of my chart. This keeps me from looking at the future action after taking the trade to keep from determining any bias as to "why I took that trade and managed in that way". So now I can toggle between my chart and *My* Trade Analyzer and post the appropriate codes. And, obviously, change the chart for the symbol I am analyzing.

Step #8: Column S, Setup: Go to Column S; review your chart for that trade to determine the Setup. Post the code, space over and repeat the process.

    Column T, Type of trade you managed: Go to Column T; review your chart for that trade to determine the management style. Post the code, space over and repeat the process.

    Column U, Timeframe: Go to Column U; review your chart for that trade to determine the timeframe. Post the code, space over and repeat the process.

    Column V, Source: Go to Column V; define whether it was your call, a newsletter, chat room recommendation and who called the trade. Post the code, space over, and repeat the process.

    Column W, Time of Day: Go to Column W; define the time of day you took the trade. Post the code.

At this point, you can now see a great deal of information from this coding. You will see your number of wins and losses, dollar amount and average wins and losses, your Batting Average and Sharpe ratio for that specific code. You will also have what time of day, the timeframe, and management criteria of your wins and losses, as well as your Batting Average and Sharpe of your Longs vs. Shorts.

Basically the when, where, and how you make your money.

Trade Errors and Demons
There are four rows where you can evaluate your trade and determine what mistakes you are consistently making – **"The Demons"**. Any more than two to three errors and you might think about paper trading. Here is where the chart analysis really tells you important information and

summarizes which are your most crucial demons and to what degree they are affecting your trading.

In the first row, Row Y, it is of the greatest importance to place the appropriate code that *caused the major error in the trade to ultimately fail*. The other three rows of errors can be changed as you see fit. The reason for this is the $Dollar total and average loss on these trade errors is determined from this Row Y error code. Although you may have also made other errors in this trade, it does total the number of errors you are making and calculates the percentage of the errors made. **Your greatest percentage in the "Demon" column is the biggest demon *YOU* need to get under control.**

<p align="center">**Interpreting Your Cumulative Trading Worksheet**</p>

Now let's evaluate your trades and see what it tells you. (Tip: As you accumulate more trades for the month, valuable information starts to "pop out" at you.)

The upper section for your total Wins vs. Losses calculates your Batting Average and Sharpe ratio for each type of trade. Obviously you want to keep the highest Batting Average on your wins and the Lowest Batting Averages as possible on your Losses, Scratches and Stop Outs. Your objective is to keep less than 10% on each of your losses which affords you no more than 30% Batting Average on your losses. Again, most traders strive to keep their win Batting Average above 70%, and their goal for the Sharpe 1.6 or better.

The Totals Summary sheet keeps a cumulative summary as you progress through your weeks, months and even makes an annual summary. It also allows you to select which month you would like to print. (Tip: you may have to adjust your printer scaling to accommodate a full print function.)

If any of the criteria starts to vary, you become aware of issues arising in that particular area and what you need to do to address it. *My* **Trade Analyzer** calls attention to how you are doing on your longs vs. shorts.

My **Trade Analyzer** examines how you are doing on your setups - which ones make you money and which ones don't.

My **Trade Analyzer** prompts you on how you are doing in your management styles and what needs to be addressed.

My **Trade Analyzer** cautions you on which timeframes, source, and time of day you are not making money and guides you on which timeframes, source and time of day you are

My **Trade Analyzer** posts the Total Commissions and fees in Column P daily, keeps a running total of your expenses (cell Z5) as well as automatically calculates your Commission's percentage against your P&L.

End of Year ….. Creating Next Year's Totals Sheet

Due to the fact each year does not maintain the same day of the week/date relationship, we have created a function that will automatically recalculate next years Totals Sheet.

After the last trading day for the year, click the Hot Button "**New Year"** on the Totals Sheet, select the next year, and press "OK". This will create a copy of Totals of the present year and also creates a new Totals Sheet for your next year. Click **"Save"**, now click **"Save As"** and save your workbook as "IB 2009 Stocks" or "IB Futures". Go back to your present workbook and delete all your monthly sheets that you created for last year. (Tip: you can keep your Totals for 2009 if you would like to compare last years trading with the upcoming year's trading.) Re-evaluate and make any End of Year corrections to your Template Sheet and save the file. You should be ready to start the New Year off Fresh.

Creating a copy of your program
You can create as many copies of the program for as many accounts you may have…However, keep in mind, *My Trade Analyzer is specifically designed for the broker you downloaded*. It will not work for any other broker. Please contact sales@mytradeanalyzer.com to obtain a second broker license.
Once you have downloaded the program
Go to My Trade Analyzer Folder on your Desktop… double-click
Then you should see the program file with a params files and uninstall file.

Right click on the program file...and select Copy...then right click, and Paste
Now you will see a copy of the program file.
If you want to analyze different instruments, then create another copy, so go back and repeat...
Right click on the program file. And select Copy …then right-click, and Paste
Now you will see a 2nd copy of the program file.
Select one of the copies…Right click and rename….
Right click again, "create a shortcut" and drag the new file onto your desktop
Then go to the other copy. Right click and re-name the other file..
Right click again, "create a shortcut" and drag the new file onto your desktop

This will keep your original intact in your main My Trade Analyzer folder
Now you have two copies of the program on your desktop and the saved original
Now check to make sure the renamed copies appear on your desktop for easy identification.

You've read the Instructions. It's time to put *My Trade Analyzer* to work.
Analyze what you are doing right and what you are doing wrong. **Overcome your Demons.**
