## 1. Safety

### 1.1. Risks involved in operating the oily water separator (OWS)

The OWS has been safety and certification tested. Incorrect operation or misuse involves risks to:

- life and limb of service personnel
- the OWS and other shipboard plant and
- the efficient functioning of the OWS.

All staff involved in commissioning, operating, servicing and maintaining the OWS must:

- be properly qualified and
- adhere to this User Information closely.

It could save your life!

### 1.2. Safety information and tips

The following symbols are used in this user manual:

**Danger**

Indicates a direct potential danger. Failure to observe this warning can result in death or severe injury.

Voltage

Hand injuries

Tipping over

Hot surface

**Attention**

Indicates a possibly dangerous situation. A failure to observe this warning can result in damage to health, injury and/or damage to the oily water separator.

**Important**

Indicates important information and necessary action. A failure to observe can result in damage to, or malfunction of, the oily water separator.

**Information**

Indicates tips for use or other useful information.

### 1.3. Proper use

The OWS is intended to be used for the separation of bilge water consisting of dispersed oil-water mixtures and emulsified hydrocarbons in accordance with IMO requirements.

**Important**

The plant (or pump) may not be used to discharge oily sludge.

**Ecologically dangerous!**

### 1.4. Emissions

The oily water system has a continuous noise level below 70 dB(A).

## 1.5. Sources of risk

**Danger**

Electric voltage > 42 V

Direct contact with live parts may cause serious injury or death.

Fixed connection to onboard mains should only be done by qualified staff (electricians)

Disconnect the power supply before working on electrical installations (switch off at the main switch, remove or switch off fuses).

**Attention**

The OWS works with an eccentric screw pump. Do not touch the gear casing / stuffing box packing on the rotating shaft! Doing so risks severe injuries to the fingers.

**Attention**

The flushing water entry valve (Fig. 4, Pos. 4, 5 and 15) is closed by a tensed spring. Disassemble very carefully to avoid having the spring jump out and cause injury.

**Attention**

The OWS can be heated (either electrically or, e.g., by steam). Temperatures up to around 50°C can then obtain in the upper part, which could cause burns if touched.

## 2. Important technical notes

- An ows must be operated and maintained according to this Information if it is to operate reliably.
- We are not liable for any damage arising from improper use, or installing or the disregarding of this Information.
- The electrical connection values clearly displayed on the automatic-control box must be adhered to.
- The ows is designed for a water mixture temperature between min. +2 and max. 45 C.

**Important**

The ows pump is designed for a maximum temperature of + 45 C. Temperatures above this lead to excessive motor starting torque due to material expansion in the rotating parts which could cause major damage to the motor.

- The pump rotates to the right when viewed from the motor.

**Important**

During initial operation. incorrect rotation direction leads to the pump running dry and overheating can then destroy the stator after just a few revs

- Compressed air (6 - 8 bar) and backwash water (1 bar, max. 1.5 bar) are needed to operate the ows. Water flow pressure should not be less than 0.5 bar.
- The plant is to be kept free of solids.
- Avoid emulsions! If absolutely unavoidable, use only separator-friendly cleaners recommended by RWO.
- If the site is subject to frost, the plant must be completely emptied after every use or kept warm at all times.
- Clean all pipelines and bilges before starting up for the first time.

- Use only original RWO spares in order to guarantee operating and functional safety (this is a pre-requisite of the **IOPP Certificate**, see Fig. 3.2).
- Ensure safe, environment-friendly disposal in conformity with all applicable laws of all residues and waste after repair work.!

## **IMPORTANT!**

Always state the ows plant number (see front page)

### 3. General

The IMO Resolution MEPC.107(49) has been adopted on 18<sup>th</sup> July 2004 and applies to all oily water separators and 15ppm alarm devices to be installed onboard ships on or after 1<sup>st</sup> January 2005.

The IMO Resolution MEPC.107(49) describes in detail the type approval procedures for oily water separators and 15ppm oil content alarm devices. The main difference between the former MEPC.60(33) rule and the new MEPC.107(49) one, is the required performance compliance involving an oil-in-water emulsion. The emulsion is created by mixing the different test oils with a specified emulsifying chemical and a powder of iron oxide under controlled conditions for one hour by means of a high speed centrifugal pump. The oily water separator must then be able to breakdown the emulsion and extract the oily residues.

An emulsion is a mixture of two or more components. In this application it involves oil and water. In this mixture the oil particle is still present, but does not form droplets and larger agglomerations. It requires mechanical energy to make an emulsion i.e. a high pressure water jet, high speed centrifugal pumps, all of which are transforming the oil droplets into very small particles. This type of mechanical emulsion can easily be handled by an efficient coalescer, but in the presence of an emulsifying chemical the oil particle becomes hydrophob by ionic and anionic tensides on the oil particle surface. The same micro electric load of all particles in a stable chemical emulsion makes the agglomeration impossible.

Mechanical emulsions can normally be separated by mechanical coalescers, however stable chemical emulsions can not be handled by a coalescer because the surface active compounds on the coalescer surface prevent the coalescing effects of the coalescer material. Stable chemical emulsions can be split by means of:

- heat treatment i.e. evaporation
- chemically, by using adequate flocculents
- membrane – ultrafiltration, which retains the oil molecules
- Absorption by suitable materials

#### 3.1. Extract of IMO Resolution MEPC.107(49)

Revised Guidelines and Specification for Pollution Prevention Equipment for Machinery Space Bilges of Ships:

#### 3.2. Marpol 73/78 Annex I

*The requirements of Annex I of the International Convention for Prevention of Pollution from Ships MARPOL 73/78 relating to pollution prevention equipment for ships are set out in regulation 16, which stipulates that ships of 400 gross tonnage and above should be installed with approved equipment.*

#### 3.3. Regulation 16(5)

*Regulation 16(5) stipulates that the oil content of the from 15 ppm Bilge Separators should not exceed 15 ppm. The 15 ppm Bilge Alarm shall activate to indicate when this level cannot be maintained, and initiate automatic stop of overboard discharge of oily mixtures where applicable.*

- 3.3.1 15 ppm Bilge Separator
- 3.3.2 15 ppm Bilge Alarm
- 3.3.3 Automatic stopping device

### **3.4. The Resolution MEPC.107(49)**

*The Resolution MEPC.107(49) supersedes the recommendations contained in Resolution MEPC.60 (33).*

### **3.5. Equipment requirements**

#### **3.5.1 Bilge The Resolution MEPC.107(49) separator**

*15 ppm Bilge Separators are considered to be applicable for use in conjunction with oily bilge-water and ballast water from fuel oil tanks, as these are of a low or medium capacity, and are conditioned by the need to avoid discharging oil mixtures with an oil content more than 15 ppm of the mixture. It should be understood that a 15 ppm Bilge Separator must be capable of handling any oily mixtures from the machinery space bilges and be expected to be effective over the complete range of oils which might be carried on board ship, and deal satisfactorily with oil of very high relative density, or with a mixture presented to it as an emulsion. Cleansing agents, emulsifiers, solvents or surfactants used for cleaning purposes may cause the bilge water to emulsify. Proper measures should be taken to minimize the presence of these substances in the bilges of a ship. With the possibility of emulsified bilge water always present the 15 ppm Bilge Separator must be capable of separating the oil from the emulsion to produce an effluent with an oil content not exceeding 15 ppm.*

#### **3.5.2 Bilge Alarm**

*The 15 ppm Bilge Alarm should record date, time and alarm status, and operating status of the 15 ppm Bilge Separator. The recording device should also store data for at least eighteen months and should be able to display or print a protocol for official inspections as required. In the event the 15 ppm Bilge Alarm is replaced, means should be provided to ensure the data recorded remains available on board for 18 months (computer unit).*

*To avoid wilful manipulation of 15 ppm Bilge Alarms, the following items should be included:*

- 1. every access of the 15 ppm Bilge Alarm beyond the essential requirements of paragraph 4.2.8 requires the breaking of a seal; and*
- 2. the 15 ppm Bilge Alarm should be so constructed that the alarm is always activated whenever clean water is used for cleaning or zeroing purposes.*

#### **3.5.3 Automatic Stopping Device**

*The automatic stopping device is a device used, where applicable, to automatically stop any discharge overboard of oily mixture when the oil content of the effluent exceeds 15 ppm. The automatic stopping device should consist of a valve arrangement installed in the effluent outlet line of the 15 ppm Bilge Separator which automatically diverts the effluent mixture from being discharged overboard back to the ship's bilges or bilge tank when the oil content of the effluent exceeds 15 ppm.*

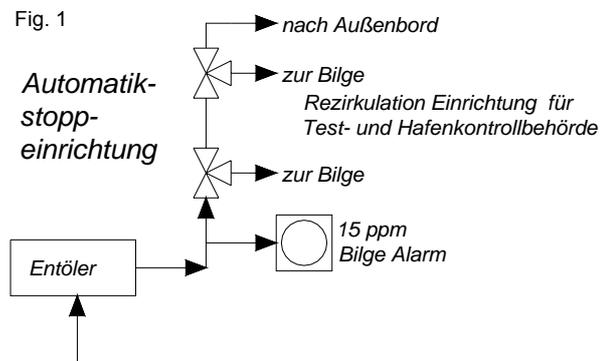

*The accuracy of the 15 ppm Bilge Alarms should be checked at IOPP (International Oil Pollution Prevention) Certificate renewal surveys according to the manufacturers instructions. Alternatively the unit (measuring block) may be replaced by a calibrated 15 ppm Bilge Alarm. The calibration certificate for the 15 ppm Bilge Alarm, certifying date of last calibration check, should be retained onboard for inspection purposes. The accuracy checks can only be done by the manufacturer or persons authorized by the manufacturer*

### 3.6. Installation requirements

#### 15 ppm Bilge Separator

For future inspection purposes on board ship, a sampling point should be provided in a vertical section of the water effluent piping as close as is practicable to the 15 ppm Bilge Separator outlet. Re-circulating facilities (manual 3 way valve) should be provided, after and adjacent to the overboard outlet of the stopping device to enable the 15 ppm Bilge Separator system, including the 15 ppm Bilge Alarm and the automatic stopping device, to be tested with the overboard discharge closed (see Fig. 1).

The re-circulating facility should be so configured as to prevent under all operating conditions any by-pass of the oily-water-separator. 15 ppm Bilge Separator should be based in a non-hazardous area.

### 3.7. Instructions

A vessel fitted with a 15 ppm Bilge Separator should, at all times, have onboard a copy of the Operating and Maintenance manuals.

All routine and repair maintenance to be recorded, see section 12. "Routine and repair maintenance record".

### 3.8. Training

Ship staff training should include familiarization in the operation and maintenance of the equipment.

### 3.9. Applicability

These guidelines and specifications apply:

- to installations fitted to ships, the keel of which are laid or which are at a similar stage of construction on or after 1 January 2005 and
- to new installations fitted on or after 1 January 2005 to ships, the keel of which were laid or which were at a similar stage construction before 1 January 2005 in so far as is reasonable and practicable

### 3.10. Separator-friendly detergents/cleaners

Detergents often transform oil-water mixtures into stable emulsions not separable by gravity and coalescence. We have performed exhaustive detergent tests on our plant under field conditions. Several of the multitude of products available on the market were tested, and those listed below proved relatively good when used on our plant:

1. Drewclean 2000, Drew Ameroid Marine Division Ashland Chemical, Inc
2. Tegeral Des Flüssig, Tegee-Chemie GmbH
3. Tegeral Forte, Tegee-Chemie GmbH
4. Carclin Außenreiniger F, Henkel KGaA
5. Carclin Veri, Henkel KGaA

### 3.11. Type approval

The type approval for the 15 ppm bilge separator and for the 15 ppm bilge alarm with automatic stopping device has been carried out satisfactory accordance with the Annex of the Resolution MEPC 107.(49).

Part 1 - Test and performance specifications for type approval of 15 ppm bilge separators

Part 2 - Test and performance specifications for type approval of 15 ppm bilge alarms

Part 3 - Specifications for environmental testing for type approval of pollution prevention equipment

*Part 4 - Method for the determination of the oil content*

*Part 5 - Documentation of approval*

*APPENDIX 1 – Certificate of type approval for 15 ppm bilge separator*

*APPENDIX 2 – Certificate of type approval for 15 ppm bilge alarm*

The following type approval certificates are available:

	<b>Entöler SKIT/S DEB 0,1.....10 m<sup>3</sup>/h</b>	<b>Bilge Alarm OMD-2005</b>
EC-conformity acc. to Marine Equipment Directive MED 96/ 98/ EC as amended by Directive 2002/75/EC	 Module B Module D Production Quality Assurance	 Module B Module F
National Certificate Germany	SBG	SBG
National Certificate USA		USCG
National Certificate Canada		CCG
National Certificate Russia	RMRS	RMRS
Acceptance Confirmation USA	USCG	USCG

Table 1 type approval certificates

#### 4. Process description RWO oily water separator SKIT/S-DEB

The RWO oily water separation system type SKIT/S-DEB complies with the recent IMO Resolution MEPC.107(49), using the combination of a highly effective open porous coalescer, the well known RWO oily water separator SKIT/S, together with a second stage newly developed emulsion breaking oil and hydrocarbon absorber.

##### 4.1. Oil Water Separation

The oily water is drawn from the bilge through the separator by an eccentric helical rotor pump, so that an additional mixture of oil and water is avoided. As a result of the excellent homogeneous fluid mechanics in the oily water separator and the difference of density between oil and water the rough separation of oil takes place immediately by gravity flowing through the built-in modern coalescer which is a very open-porous type, smallest oil droplets are separated by the extremely oleophilic surface. This system features the outstanding efficiency of the SKIT/S oily water separator.

##### 4.2. Description of the Adsorber operation mode

The operation mode is controlled by the Bilge Alarm Monitor OMD 2005 (P&ID 514 00 005, see enclosure).

The oil collection capacity of the Adsorber elements is limited by the collected oil quantity. To protect the Adsorber elements and extend the lifetime, the Adsorber is fitted with an upstream 3-way bypass valve (Pos. 58) which makes it possible that the water, purified by the OWS, showing an oil content of less than 14ppm will bypass the Adsorber and will be discharged overboard.

The demulsifier has a certain absorption capacity. The Adsorber elements remove all kind of hydrocarbons from the water. The Adsorption capacity is mainly limited by the quantity of hydrocarbons solved or emulsified in the water, but also dirt particles in large quantities might clog the Adsorber. To prolong the lifetime of the Adsorber, heavy emulsions with high oil percentage should be avoided by using quick separating cleaners in the engine room. Cleaning emulsion of the aircoolers or purifier sludge should be avoided in the bilge.

Only if the oil content in the treated water, after the first stage OWS / before the Adsorber (sample point  $\alpha$ ) is showing an oil content higher or equal than 14ppm, the water will flow through the Adsorber and the oil content in the effluent will be measured at a second measuring point (sample point  $\beta$ ) after the Adsorber. If the oil content is below 15ppm the water will be discharged overboard.

To investigate the performance of the first stage OWS continuously and to protect the Adsorber, every 5 minutes a sample is taken from sample point  $\alpha$  for 4 seconds to check the actual oil content.

If the oil content will be below 14ppm again, the 3-way bypass valve (Pos. 58) will change to Adsorber bypass. If the oil content after the OWS is still higher or equal than 14ppm the water flow remains via the Adsorber for the next 5 minutes.

During this short investigation procedure (4 seconds) the 3-way diverting valve (Pos. 23) will change to recirculation to the bilgewater tank. If the oil content even after the Adsorber will be higher than 15ppm the water will be recirculated by the 3-way diverting valve (Pos. 23) to the bilgewater tank.

The limiting values of the oil content in the effluent water after the first stage OWS and after the Adsorber might be adjusted to each value between 0 - 15ppm. Ex factory the limiting values are 14ppm at sample point  $\alpha$  and 15ppm at sample point  $\beta$ . Only if the oil content of 15ppm after the Adsorber is exceeded for at least 3 seconds an alarm to the control room will be activated. The Alarm 2 (sample point  $\alpha$ ) must be lower than Alarm 1 (sample point  $\beta$ ).

Basically three different signals conditions can occur on the control panel:

Both limiting values are undershoot (sample point  $\alpha$  under 14ppm and sample point  $\beta$  under 15ppm). **OPERATION MODE ADSORBER BYPASS** LED lights green at the control panel on the switching box.

The 3-way bypass valve (Pos. 58) (solenoid valve energised) bypassed the water at the Adsorber and convey it directly to the 3-way diverting valve (Pos. 23). The 3-way sample valve (Pos. 57) convey the sample water at the sample point  $\beta$  to the Bilge Alarm Monitor OMD 2005 (solenoid valve energised). The 3-way diverting valve (Pos. 23) convey the water overboard (solenoid valve energised).

Limiting value Alarm 2 is exceeded (sample point  $\alpha$  over or equal 14ppm) and limiting value Alarm 1 is undershoot (sample point  $\beta$  under 15ppm).

**OPERATION MODE VIA ADSORBER** LED lights green at the control panel on the switching box.

The 3-way bypass valve (Pos. 58) (solenoid valve energised) convey the water through the Adsorber. The 3-way sample valve (Pos. 57) convey the sample water at the sample point  $\beta$  to the Bilge Alarm Monitor OMD 2005 (solenoid valve de-energised). The 3-way diverting valve (Pos. 23) convey the water overboard (solenoid valve energised).

In this situation mode, every 5 minutes the concentration of residual oil will be measured before of the Adsorber (at the sample point  $\alpha$ ) for 4 seconds. The 3-way sample valve (Pos. 57) will be switched temporary to the sample point  $\alpha$ . During this short measuring period the 3-way diverting valve (Pos. 23) will be switched to recirculation (solenoid valve de-energised).

If the measurement result a concentration of residual oil below the first limiting value, the condition **b**) will switched on.

Both limiting values are exceeded.

**OPERATION MODE VIA ADSORBER** LED lights green at the control panel on the switching box.

The 3-way bypass valve (Pos. 58) convey the water through the Adsorber (solenoid valve de-energised). The 3-way sample valve (Pos. 57) in the measuring pipe convey the sample water at the sample point  $\alpha$  to the Bilge Alarm Monitor OMD 2005 (solenoid valve de-energised). The 3-way diverting valve (Pos. 23) convey the water back to the bilgewater tank (solenoid valve de-energised). The alarm signal in the switching box is activated.

Overview of the valves and their operation mode during the process

Signal mode of the Bilge Alarm Monitor OMD 2005	Valve Pos.	Description	Valve Position / Function	Solenoid valve
a) Oil content below 14ppm after OWS (sample point $\alpha$ ).	57	3-way sample valve	Sample point $\alpha$ (before of the Adsorber)	Energised
	23	3-way diverting valve	To overboard	Energised
	58	3-way bypass valve	Adsorber bypass	Energised
b) Sample point $\alpha$ (ex factory set 14ppm) exceeded but sample point $\beta$ is below 15ppm.	57	3-way sample valve	Sample point $\beta$ (after the Adsorber)	De-energised
	23	3-way diverting valve	To overboard	Energised
	58	3-way bypass valve	Via the Adsorber	De-energised
During the situation mode b), the system is checking periodically every 5 minutes the oil content at sample point $\alpha$ . This procedure takes only few seconds.	57	3-way sample valve	Sample point $\alpha$ (before of the Adsorber)	Energised
	23	3-way diverting valve	Back to the bilge water tank	De-energised
	58	3-way bypass valve	Via the Adsorber	De-energised
c) Both limiting values are exceeded.	57	3-way sample valve	Sample point $\beta$ (after the Adsorber)	De-energised
	23	3-way diverting valve	Back to the bilge water tank	De-energised
	58	3-way bypass valve	Via the Adsorber	De-energised

Table 2 Overview of the valves and their operation mode during the process

### 4.3. Flushing

The separated oil flows upwards and is collected on the surface. A powerful electric heating supports the separation. The oil-level is detected by the RWO-sensor unit.

Immediately after discharging the oil the time-controlled flushing is started. Clean water is used for flushing. The coalescer is cleaned from oil and dirt by periodical flushing. The mixture of oil sludge and water is drained off to the bilge. The fully automatic oil discharge- and flushing-cycle is a special feature of the SKIT/S oily water separator. The periodic flowreverse enables continuous operation without clogging of the coalescer which cleans itself while operating.

#### 4.4. Bilge Alarm Monitor OMD 2005

The oily water separating system is equipped with the 15ppm oil content alarm device OMD 2005, type tested and approved in accordance with IMO Resolution MEPC.107(49). The new resolution requires:

The 15 ppm Bilge Alarm should record date, time alarm status and operating status of the 15 ppm Bilge Separator. The recording device should also store data for at least eighteen months and should be able to display or print a protocol for official inspections as required. In the event that the 15 ppm Bilge Alarm is replaced, procedures should be put in place to ensure the recorded data remain accessible on board for 18 months.

To prevent tampering with the 15 ppm Bilge Alarms, the following precautions should be taken:

- *Every access of the 15ppm Bilge Alarm beyond the essential requirements of paragraph 4.2.8 of the MEPC.107(49), requires the breaking of a seal.*
- *The 15 ppm Bilge Alarm should be so constructed that the alarm is always activated whenever clean water is used for cleaning or zeroing purposes.*

The Bilge Alarm Monitor OMD 2005 complies with the above rules. The measuring cell can be removed for calibration while the control device remains on the oily water separator to keep the recorded data on board for at least 18 months.

According to IMO Resolution MEPC.107(49) a 3-way valve must be installed downstream of the oily water separator in the overboard line to recirculate the water to the bilge during "port" state control procedure.

As automatic stopping device a 3-way diverting valve is installed downstream and if the oil content in the effluent exceeds 15ppm the 3-way diverting valve will change over to recirculation and the alarm to the engine room control system is activated.

## 5. Operating the OWS SKIT/S-DEB

### 5.1. Before first commissioning

- 5.1.1 Check electrical connections

**Danger**

Electrical voltage > 42 V

Direct contact with live parts may lead to severe injury or death.

Fixed connections to the onboard mains may only be installed by qualified staff (electricians).

**Risk of explosion. Standard plant may not be operated in hazardous areas.**

**Danger**

- 5.1.2 Service pipe and all flange connections

Compressed-air connections, backwash water connections and all flange connections must be checked for tightness. Tighten both of OWS cover if necessary.

Pressurised piping is dangerous.

Release the pressure completely before working on them.

**Attention****Important**

The oily water separator SKIT/S-DEB is a suction type. Ensure that the OWS does not suck air via leaks in the suction piping and/or flange connections the OWS. Sucking air initiates endless periodical discharge and flushing, which means the OWS cannot suck wastewater and therefore cannot separate water and oil as required.

- 5.1.3 Check if bilge water is available

**Important**

The "LEVEL" LED is a visual display of availability of bilge water.

The OWS is equipped ex works with two bridges between the clamps X2-4 and X2-5 as well as X2-6 and X2-7 in the control panel. The OWS can only be started when bridged or if connected to two level switches (high and low level) in the bilge water tank for automatic operation.

We recommend to replace these bridges by two level switches ( 1pc high level and 1pc low level switch) in the bilge or in the bilge water tank and to control the plant by the level switches depending to the bilge water level. Therefore both level switches must work with closing contacts. The plant only starts if the water level rise and the contacts of both level switches are closed. The plant stops if the water level falls and the contacts of both level switches are open.

**5.2. Before every commissioning**

- 5.2.1 Check if bilge water is available.

**Important**

The "LEVEL" LED is a visual display of availability of bilge water. See a detailed description under point 5.1.3

- 5.2.2 Guarantee compressed-air and backwash water.
- 5.2.3 Open all valves in the sucking line.
- 5.2.4 Open all valves in the suction and discharge pipes.

**Important**

This is a positive displacement pump. Do not run the pump against a closed valve

### 5.3. Start up OWS SKIT/S-DEB

**Danger**

Electric voltage > 42 V

Direct contact with live parts may cause serious injury or death.

Fixed connection to onboard mains should only be done by qualified staff (electricians)

Disconnect the power supply before working on electrical installations (switch off at the main switch, remove or switch off fuses).

Fig. 2

By 4 LED's in the control box door the basic functions are shown. The OWS can be started with a main switch and the operating mode can be chosen with a switch "hand-0-auto"

Clamps for two level switches in the bilge are available to start or stop the OWS in the automatic operation mode by level switch.

The terminals of the swimmer switches are ex works bridged.

Fig. 2 shows the control panel:

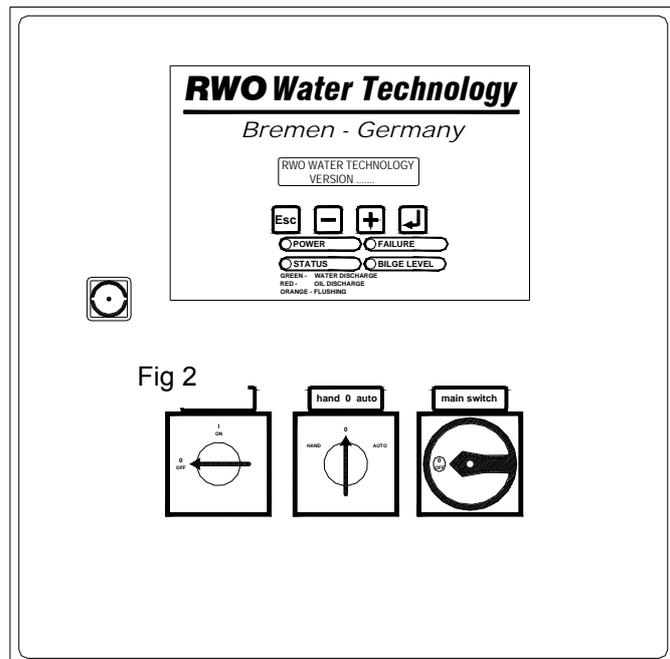

Fig 2

- Make the decision whether to work in the manual or automatic mode.

**Information**

In the manual mode the plant will work independent of the signals from the bilge water level switches. A level dependent stop of the plant isn't carried out. Therefore this operating mode should be selected only under permanent supervision.

- Switch on the main switch.
- The status LED is red illuminated (oil discharge to collecting tank), because the sensor electrode reports air like oil (both are non conducting mediums). The pneumatic piston valves at the flushing water inlet (pos. 15) and at the oil outlet (pos. 4) are open (both solenoid valves are energised) and the plant is simultaneously filled with flushing water and vented automatically. At this procedure the pump is shut down.
- If the water level reach the sensor electrode (pos. 9) (conductive medium is regonized), the status LED is orange illuminated (flushing). The pneumatic piston valve (pos. 5) is open (the solenoid valve is energised) and with a time delay the oil outlet valve (pos. 4) is closing (the solenoid valve is not energised).
- If the system is filled up, both piston valves (pos. 5 and 15) are closed (both solenoid valves are not energised). The status LED is green illuminated (water discharge). Now the pump starts and sucks from the bilge. **The plant is now ready for operation.**
- Now the heating can be switched on by the switch "heater".

#### 5.4. Information of the control LED´s of the OWS control panel, Table 3

Description	Colour	Condition	Meaning / cause
<b>POWER</b>	white	Main switch "On"	The power supply is enable the plant is energised
<b>FAILURE</b>	red	One or more alerts are online	The alarm cause is shown on the display as a text
<b>BILGE LEVEL</b>	green	The level switches in the bilge or bilge water tank signals "bilge water are available"	Indication of bilge water level! If no level switches attached to the corresponding terminals the terminals must be bridged otherwise the plant cannot start in the automatic mode. See chapter 5.1.3 Check if bilge water is available.
<b>STATUS</b> GREEN WATER-DISCHARGE	green	OWS in operation The display points WATER DIS- CHARGE	Cleaned water is pumped out
RED-OIL-DISCHARGE	red	OWS in operation The display points OIL DISCHARGE	Oil or air is discharged to the oil collecting tank The pump and the heater are switched off Valve 4 and 15 are open
ORANGE-FLUSHING	orange	OWS in operation The display points FLUSHING	The back flushing procedure is running The pump and the heater are switched off Valve 4 and 15 are open

Table 3 Information of the control LED´s of the OWS control panel

In the chapter 9. you find a detailed description of the OWS control box with microprocessor

You find on the following two sides a check list for commissioning and start up  
Follow this list point for point.

### 5.5. Check list for commissioning and start up

Table 4 Check list for commissioning and start up

Test Procedure	Remarks
Open valves for compressed air supply.	Air pressure 6-8 bar.
Open valves for flushing water supply.	Water pressure 1,0 bar.
Open valves in the suction line from bilge tank.	Ensure that the OWS does not suck air via leaks in the pipe system.
Open valves in the overboard discharge line.	CAUTION: Never operate against close valve.
Check rotation direction of the pump (see arrow mark, clock wise seen from the motor end).	CAUTION: Wrong rotating direction will damage the stator.
Vent valve for Adsorber open.	Ventilation
Cut the plastic nipples from all pressure gauges.	
Check that the ventilation hole of the filling screw of the gear is open (elec.-motor gear).	
Ensure that bilge water is available	
Make the decision whether to work in the manual or automatic mode.	In the manual mode there is no automatic stop if the bilge is empty.
Switch on <b>POWER 1Q1</b>	
<b>a)</b> The bilge level LED is only green illuminated if the bilge level has reached the upper level switch	It is a precondition for a plant start in the automatic mode
<b>b)</b> The status LED is red illuminated (oil discharge to collecting tank), because the sensor electrode reports air like oil (both are non conducting mediums). The pneumatic piston valves at the flushing water inlet (pos. 15) and at the oil outlet (pos. 4) are open (both solenoid valves are energised) and the plant is simultaneously filled with flushing water and vented automatically. At this procedure the pump is shut down.	The plant is filled up with water. The pump and the heater are now shut down. display indication in automatic mode OPERATION AUTO OIL DISCHARGE display indication in manual mode OPERATION HAND OIL DISCHARGE
<b>c)</b> If the water level reach the sensor electrode (pos. 9) (conductive medium is regonized), the status LED is orange illuminated (flushing). The pneumatic piston valve (pos. 5) is open (the solenoid valve is energised) and with a time delay the oil outlet valve (pos. 4) is closing (the solenoid valve is not energised).	The back flushing procedure starts (8 up to 50 seconds) The pump and the heater are now shut down. display indication in automatic mode OPERATION AUTO FLUSHING display indication in manual mode OPERATION HAND FLUSHING
<b>d)</b> If the system is filled up, both piston valves (pos. 5 and 15) are closed (both solenoid valves are not energised). The status LED is green illuminated (water discharge). Now the pump starts and sucks from the bilge.	The 1 <sup>st</sup> part is now ready for operation. The pump and the heater are now switched on. Precondition is that you have set the heater switch to "on". display indication automatic mode OPERATION AUTO WATER DISCHARGE display indication manual mode OPERATION HAND WATER DISCHARGE
The water is guided by the by-pass valve (pos. 58) to the 2 <sup>nd</sup> part (adsorber)	The solenoid valve is not energised
The water is guided by the measuring valve (pos. 57) from the measuring point behind the 2 <sup>nd</sup> part to the bilge alarm monitor.	The solenoid valve is not energised
Monitor OMD 2005 alarm 1 is red "On"	Air is in the measuring cell
Monitor OMD 2005 alarm 2 is red "On"	Air is in the measuring cell

Test Procedure	Remarks
Monitor OMD 2005 system is red.	The monitor reacts to air with an alarm.
The water is routed by the re-circulation valve (pos. 23) back to the bilge.	The solenoid valve is not energised
<b>The 2<sup>nd</sup> part (adsorber) is filled up</b>	
Close the venting valve at the adsorber cover.	
<b>During the first 5 minutes:</b>	
The water is routed by the by-pass valve (pos. 58) to the 2 <sup>nd</sup> part (adsorber).	The solenoid valve is not energised
The water is routed from the measuring point behind the adsorber to the monitor by the measuring valve (pos. 57).	The solenoid valve is not energised
Monitor OMD 2005 alarm 1 is green "off".	Clean water is in the measuring cell
Monitor OMD 2005 alarm 2 is green "off".	Clean water is in the measuring cell
Monitor OMD 2005 system is green.	The monitor signals "no alarm"
The cleaned water is routed to overboard by the re-circulation valve (pos. 23).	The solenoid valve is energised
<b>After the first 5 minutes:</b>	
<b>a) If the measurement underrun 14ppm at the measuring point before the adsorber.</b>	
The water is routed by the by-pass valve (pos. 58) to pass the adsorber.	The solenoid valve is energised
The water is routed from measuring point before the adsorber to the monitor by the measuring valve (pos. 57).	The solenoid valve is energised
Monitor OMD 2005 alarm 1 is green "off".	Clean water is in the measuring cell
Monitor OMD 2005 alarm 2 is green "off".	Clean water is in the measuring cell
Monitor OMD 2005 system is green.	The monitor signals "no alarm"
The cleaned water is routed to overboard by the re-circulation valve (pos. 23).	The solenoid valve is energised
<b>b) If the measurement exceed 14ppm at the measuring point before the adsorber.</b>	
Monitor OMD 2005 alarm 1 is red "on".	Water with more then 14ppm is in the measuring cell
The measuring valve (pos. 57) is switched over. Now the water is routed from the measuring point after the adsorber to the monitor.	The solenoid valve is not energised
The by-pass valve (pos. 58) is switched over. The water is now routed through the adsorber.	The solenoid valve is not energised
Monitor OMD 2005 alarm 1 is green "off".	Clean water is in the measuring cell
Monitor OMD 2005 alarm 2 is green "off".	Clean water is in the measuring cell
Monitor OMD 2005 system is green.	The monitor signals "no alarm"
The cleaned water is routed to overboard by the re-circulation valve (pos. 23).	The solenoid valve is energised
<b>c) If the measurement exceed 15ppm at the measuring point after the adsorber.</b>	<b>Alarm</b>
Monitor OMD 2005 alarm 1 is red "on".	The adsorber elements are exhausted
Monitor OMD 2005 alarm 2 is red "on".	Water with more then 15ppm is in the measuring cell
Monitor OMD 2005 system is red "alarm".	Water with more then 15ppm is in the measuring cell
The water is routed from the measuring point after the adsorber to the monitor by the measuring valve (pos. 57).	The solenoid valve is not energised
The water is routed through adsorber by the by-pass valve (pos. 58).	The solenoid valve is not energised
The not sufficient cleaned water is routed back to the bilge by the re-circulation valve (pos. 23).	The solenoid valve is not energised

Table 4 Check list for commissioning and start up

## 6. Maintenance

### 6.1. Regular checks

- Check difference pressure before and after the coalescer (pressure gauges Pos. 7 and Pos. 54). Max. difference pressure 0,2 bar.
  - back flushing the coalescer

#### Information

Werden die Tasten (+) und (-) gleichzeitig für mind. 2 Sekunden gedrückt, wird eine Ölsimulation gestartet. Nach dem die Tasten los gelassen werden startet die Spülung.

- If this doesn't lead the desired success, the coalescer must be changed.
- Check difference pressure before and after the Adsorber (pressure gauges Pos. 7 and Pos. 54). Max. difference pressure 3,0 bar.
  - exchange the Adsorber elements
- Check stuffing box packing of the pump shaft.
  - Slight leakage welcome
  - intensive leakage => tighten the stuffing box  
=> exchange the stuffing box packing
- Check the difference pressure at the pump suction pressure side (pressure gauge Pos. 8 and Pos. 54)
  - Check the motor and stator
  - Replace worn elements

### 6.2. Every 6 months

- Check the zinc anodes
- Lubricating oil of the pump's gear motor => if necessary refill

### 6.3. Every year

- Open the handhole, open the OWS and the Adsorber
- Check if there is sedimented sludge => remove and clean
- Check the inside coating => repaint if necessary
- Check gaskets of the piston valves
- Electrode: Clean the electrode if there is any damage => replace
- Heating coil: Check the function

## 7. Optional Alarms and Indications

- see detailed instruction of OWS microprocessor controller

## 8. Troubleshooting

### 8.1. Warnings

**Danger**

Electric voltage > 42 V. Direct contact with live parts may cause serious injury or death.

Work on live parts should only be carried out by qualified electricians.

**Attention**

Pressurised piping is dangerous. Check and make sure that pipes are unpressurised before working on them.

**Attention**

The OWS uses an eccentric screw pump. Do not touch the gearing casing or stuffing box packing whilst the shaft is turning as this may cause serious injury to the fingers.

**Attention**

The flushing inlet valve is spring-loaded. Disassemble very carefully to avoid injury from the spring.

**Attention**

The OWS can be heated (electrically, by steam or by thermal oil). This leads to temperatures up to 60 C in the upper part, which should not be touched to avoid burns.

### 8.2. Fault table

Table 5 Fault table

Fault	Cause	Remedy
Constant rapid repetition of the backwashing process.	OWS is sucking air from empty bilge. Level switch doesn't initiate shutdown.	Shut off the OWS, check level switches.
Constant repetition of backwashing process and vacuum manometer shows too low a suction height proportionate to the installation level	Plant is sucking air through leaks in the suction piping or at the OWS (covers, flanges, valves).	Pressure-test of the ows and suction piping, tighten all flanges.
Low pumping performance at high vacuum reading	Suction piping or inlet basket filter clogged.	Clean or both.
	Valves in suction piping closed	Open them
Low pumping performance, several meters pressure difference between pump vacuum manometer and ditto on OWS cover.	Coalescer packing clogged.	Thoroughly manual flush by using the "simulation" button. If unsuccessful, replace coalescer.
Motor protection switch trips	Motor burned	Replace
	Short-circuit, motor or power supply wiring	Check both
	Protection switch maladjusted	Correct setting

<b>Fault</b>	<b>Cause</b>	<b>Remedy</b>
	Pump rotor stuck	Find cause. Replace stator and/or rotor.
	Pump shaft stuck	Loosen stuffing box
Piston valves not functioning	No compressed air supply	Check compressed air supply
	Control voltage not available	Check automatic control panel
	Piston ring defective	Replace cylinder
	Dirt in solenoid valve	Clean
	Defective solenoid valve	Check by turning main switch ON and OFF. (Function can be felt and heard)
	Pistons stuck	Loosen them
Plant flushes constantly or unusually slowly	Inlet non-return inlet valve not closing	Check, remove and clean if necessary
	Oil outlet clogged	Check and clean
	Backwash water pressure inadequate	Check water flow pressure. Min. is 0.5 bar, max. is 1 bar.
Plant recognises oil but discharges water via the oil discharge	Wiring from switchbox to electrode interrupted	Check and renew if needed
	Electrode insulated	Clean contact surfaces
	PC Board defective	Bridge clamps X2-3 , if water is not recognised LED GREEN WATER illuminates green if PC-board is OK. Change PC-board if not.
Plant recognises oil but does not discharge	Oil outlet to oil collecting tank blocked	Check piping to collector tank and clean if needed
	Backwash water supply interrupted	Check water supply
		Check piston valve Pos. 15
Piston valve (Pos. 4 or 15) doesn't work		Check connection voltage in automatic-control box; should be 24 V between clamps X1-9/10 and X1-11/12. If not, change PC-board.
Plant doesn't flush	Backwash water outlet to bilge (Pos. 5) blocked	Remove blockage
	Piston valves (Pos. 5) and (Pos. 15) don't work	Check connection voltage in automatic-control box; should be 24 V between clamps X1-9/10 and X1-11/12. If not, change board.
Plant doesn't recognise oil	Wiring between sensor electrode and control box	Check wiring
	PC-board defect	Check PC-board by removing the plug from the electrode (Pos. 9); if no oil recognition follows, replace

<b>Fault</b>	<b>Cause</b>	<b>Remedy</b>
		the PC-board.
<b>Fault</b>	<b>Cause</b>	<b>Remedy</b>
	Electrical conductivity in the oil phase too high or emulsions	Avoid emulsions. Contact RWO Service dept.
	Oil binds water	Contact RWO Service dept.
No heating	Heating element defect	Replace
	Wiring connection interrupted	Check and renew if needed
	Thermal sensor maladjusted or defective	Adjust to 45° C or replace
	Heating fuse U/S	Replace
Control voltage not available	Transformer fuse if 24 V AC are not available between clamps X1-7/8	Change fuse/s; if no cure, find cause.
	Wiring connection interrupted	Renew wiring
	Board U/S	Check; 24 V must be available between clamps X2-9/10 and X2-13/14 when „RED-OIL-DISCHARGE“ illuminated

## 9. Operating Instructions For Oily Water Separator Control Unit

### 9.1. Generally:

The OWS control unit will be operated by 4 push buttons. The LCD display has 2 back-lighted lines of text each with 20 alphanumeric digits. Basic functions are indicated by 4 LED's.

### 9.2. Operating Devices Of The Control Unit

#### a) On – Off – Main Switch

Enable / disable the power supply of the oily water separator.

#### b) Hand – 0 – Automatic Selector Switch

Switches the oily water separator from manual over stop to the automatic operation mode.

#### c) Position Manual Operation

The oily water separator operates independent of the bilge water level.

#### d) Position 0 (Zero)

The oily water separator is active but doesn't work.

#### e) Position Automatic

Does the bilge water reach the switching point of the upper level sensor the oily water separator will start his operation automatically and will stop his operation when the bilge water level reaches the switching point of the lower level sensor.

#### f) On – Off – Switch Electrical Heating (Optional)

Turns the electrical heating on or off. Only if the oily water separator is equipped with an electrical heating.

### 9.3. LED-Indication

The control unit has 4 LED's for the permanent indication of the operating states. One of the 4 LED's is a multi-color type.

#### a) White LED (Power)

Indicates the ready status. This LED is illuminated as soon as the control unit is under power and ready for operation.

#### b) Red LED (Failure)

This LED is illuminated in case of a failure. The LCD display will show the reason of the failure.

#### c) Red/Orange/Green LED (Status)

This LED shows the operating states of the oily water separator. Green – water discharge. Red – oil discharge. Orange - flushing.

#### d) Green LED (Bilge Level)

It is shown with the green LED that the level is high in the bilge tank and the oily water separator can start the operation.

### 9.4. Push Buttons

The control unit has 4 push buttons. With these push buttons all commands and queries during the operation of the oily water separator can be made.

#### a) ESC-Button

This button is in function under all operating states. With this button the step carried out can be taken back. Pressing the ESC button in the menu tree causes to left the actual menu level and return to the previous menu level. All adjustments carried out remain unchanged. After repeated operation you reach at the end the top level in the menu, the operating states display.

**b) – Button, + Button**

With this buttons settings can be changed. This buttons are only active in menus where settings can be changed. This is visible through the flashing of words or numbers. If a word is flashing you can choose with the –button the left word. Accordingly to this you can choose with the +button the right word. If a number is flashing you can change the number by using the -/+ button. You can jump from digit to digit by using the Enter button (see below).

** Note!**

As a special feature it is possible to use the -/+ buttons for an oil simulation. An oil simulation will start if you press both buttons simultaneously for not less than 2 seconds. The system feigns the PLC an interruption on both electrodes.

**c) Enter-Button**

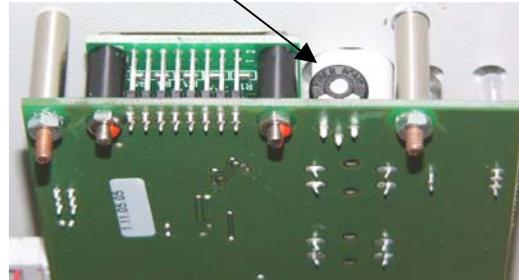

The Enter-button is the „jump-“, or „confirmation button“. In the menu tree you reach the next menu level by pressing the Enter-button or confirm a choice selected before by the -/+ button.

**9.5. LCD-Display**

The 20-digit, 2 line LCD display will show the operating states or the menus alternatively in German or English. At the start the display shows the message: RWO Water Technology and the number of the installed software version.

At the PCB of the display is a potentiometer to adapt the contrast of the LCD display to the lighting conditions.

## 9.6. Menu Tree

### a) Start Message

When switching on the control unit, at first a start message is carried out. This message shows the version of the installed control software

RWO Water Technology Version Nr	RWO Water Technology Version No
------------------------------------	------------------------------------

### b) Operating Indication

After 3 seconds the start message will change automatically to the operating indication modus. The operation indication will inform about the status of the control unit.

Normally the operating indication will show only the status message of the oily water separator. If there are special reports they will be displayed cyclically (e.g. MOTOR FAILURE OVER CURRENT). The displays shows then alternating for approx. 5 seconds the operating indication and then for approx. 3 seconds the special report.

Status Indication:

The status of the oily water separator will be displayed in two lines. The 1<sup>st</sup> line displayed accordingly to the position of the selector switch HAND, STOP or AUTO. The 2<sup>nd</sup> line displayed the function of oily water separator STAND BY, WATER DISCHARGE, OIL DISCHARGE or FLUSHING.

**Display indication at position „0“ of the selector switch:**

BETRIEB STOP STAND BY	OPERATION STOP STAND BY
--------------------------	----------------------------

At the position „STOP“ the oily water separator will pause in the function STAND BY.

**Possible display indications at position „HAND“ of the selector switch:**

BETRIEB HAND STAND BY	OPERATION HAND STAND BY
--------------------------	----------------------------

*If the oily water separator switched to manual operation and the display indicates STAND-BY then must be a special event. This display indication is published only with the corresponding alternating message (see **Display indications of alternating messages**)*

**Further display indication in manual operation mode:**

BETRIEB HAND ENTOELEN	OPERATION HAND WATER DISCHARGE
--------------------------	-----------------------------------

BETRIEB HAND ABSTEUERN	OPERATION HAND OIL DISCHARGE
---------------------------	---------------------------------

BETRIEB HAND SPUELEN	OPERATION HAND FLUSHING
-------------------------	----------------------------

Indication only by separating with adsorber

BETRIEB HAND ENTOELT MIT ADSORBER	OPERATION HAND WATER PASS ADSORBER
--------------------------------------	---------------------------------------

**Possible display indication at position „AUTOMATIC“ of the selector switch:**

BETRIEB AUTO	OPERATION AUTO
STAND BY	STAND BY

*If the oily water separator switched to automatic operation and the display indicates STAND-BY then must be a special event. This display indication is published only with the corresponding alternating message (see **Display indications of alternating messages**)*

**Further display indications in automatic operation mode:**

BETRIEB AUTO	OPERATION AUTO
ENTOELN	WATER DISCHARGE

BETRIEB AUTO	OPERATION AUTO
ABSTEUERN	OIL DISCHARGE

BETRIEB AUTO	OPERATION AUTO
SPUELEN	FLUSHING

**Indication only by separating with adsorber**

BETRIEB HAND	OPERATION HAND
ENTOELT MIT ADSORBER	WATER PASS ADSORBER

**Display indications of alternating messages**

! LANGZEIT-	! LONG TIME
! BETRIEBSALARM !	! RUNNING ALARM !

! FEHLER	! FAILURE

**c) Display Indication Aroused By Menu Operations**

As described, switching on the control unit will published the start message and change after 3 seconds to the operation indication. By the menu control further menus can be called now to see values or to change parameters. The menu control will be controlled by the Enter-button. If you use only the Enter-button you will see all main topics one after the other. After the last main topic you jump back to the operation indication. You can go through this menu structure as often as you want by the Enter-button. If you use inside main topics the ESC-button you will jump directly back to the operation indication:

**d) Language selection**

The language English is selected in the display language selection with the + button and with the – button the German language is chosen. The selection is taken with the Enter-button and branches to the next main topic of the menu. With ESC the language selection can be stopped without changing.

**e) Input:**

EING: 48. 0. 0. 65	IN: 48. 0. 0. 65
0110.1011.0001.1001	0110.1011.0001.1001

In the first line are 4 by points separate numbers. The range of values of every number lies between 0 and 102. The first two numbers are part of the two analogous inputs of the sensor electrodes and reflecting the proportional swelling value of the input quantity to the maximum rejection, e.g. for a 0-10V input means the value 48 approx. 4,8V. The resistances measured by the sensor electrode inputs are reflected by the 3<sup>rd</sup> and 4<sup>th</sup> number. 0 means no or low resistance (water). High numbers (e.g. 65) mean more highly resistance (oil).

**Important Note!**

The swelling value of the sensor electrodes is ex works predefined to normal bilge waters and oils and normally don't need to be adapted. If in special cases an adaptation on board is necessary to divergent conditions, contact at first the RWO Service department.

In the second line the on/off conditions of the inputs are displayed by 0 and 1. Altogether 16 inputs are represented. The 16 inputs are subdivided for a better overview by points into blocks of 4 numbers. 14 of 16 condition informations come from the inputs 1 to 14. The two last condition informations are derived from the sensor electrodes. Exceeds the measured resistance the threshold for oil detection the input would be represented by „1“. Underrun the measured resistance the threshold value for water detection the input would be represented by „0“.

**f) Output:**

AUSGANG:	OUT:
1000.0111.00	1000.0111.00

The condition of the 10 output relays are in the display represented. „0“ mean the relay is turned off. „1“ mean the relay is turned on. The 10 outputs are subdivided for a better overview by points into blocks of 4 numbers.

**g) Branch To The Customer Parameters**

In the branching to customer parameters the values can be seen and changed. To this at first you must branch to this level. This happens by activating the YES-field at the main topic with the + button.

**Display main topic, after pressing the + button („YES“ flashes)**

KUNDENPARAMETER				USER SETTINGS	
AENDERN?	NEIN	<b>JA</b>		MODIFY?	NO <b>YES</b>

press Enter:

**Customer password query (PIN = 7963)**

KUNDENPASSWORT :		USER PASSWORD
0000		0000

At first the first digit of the password is activated (flashes). With the -/+ buttons the number can be adjust now. If the digit is adjusted as desired, the next digit can be activate with the Enter-button. If the Enter-button activate the 4<sup>th</sup> digit, the password is checked. Is the password wrong appear:

PASSWORT FALSCH!	WRONG PASSWORD!
BITTE NEU EINGEBEN!	PLEASE RETYPE PASSWD

Is the password correct, you reaches to the customer parameter level and to be more precise to the query whether you would like to change the first parameter. At first „No“ is selected as the answer. So you reaches the next parameter after pressing the Enter-button automatically. At first the answer is also predefined with „No„. So you can reach fast the parameter with the Enter-button which is to change.

*(If you have the desired parameter inadvertently skipped, then you can press the ESC button 1x, as long as you are still in the customer parameter level. With that you will step one menu level back and comes to the question once more whether you would like to change the customer parameter. If this question is answered with “YES“, you are at the beginning of the customer parameters again)*

See **Important Note 9.6.e**

OEL-ERKENNUNG > %		OIL IDENT > %
AENDERN? <b>NEIN</b> JA		MODIFY? <b>NO</b> YES

See **Important Note 9.6.e**

WASSER-ERKENNUNG < %		WATER IDENT < %
AENDERN? <b>NEIN</b> JA		MODIFY? <b>NO</b> YES

SPUELZEIT SEK.		FLUSHING TIME SEC.
AENDERN? <b>NEIN</b> JA		MODIFY? <b>NO</b> YES

LANGZEIT ALARM MIN.		LONG TIME ALARM MIN.
AENDERN? <b>NEIN</b> JA		MODIFY? <b>NO</b> YES

WERKSEINSTELL. HOLEN		RESTORE DEFAULTS
<b>NEIN</b> JA		<b>NO</b> YES

After the last customer parameter you leaves the customer parameter level and reaches the menu structure of the main level again. Then follows the question about change of the factory parameters in the main level.

**h) Changing The Customer Parameter**

You branched to the customer parameter as described above, the question then must be answered for the change of a single parameter with „YES“ (+ button). In the case of the oil recognition threshold means this:

**ATTENTION!**

**The values for oil and water recognition shouldn't be changed without consultation with the RWO Service Department!**

Wrong settings lead to serious malfunctions!

see **Important Note 9.6.e**

OEL-ERKENNUNG > %	OIL IDENT > %
AENDERN? NEIN <b>JA</b>	MODIFY? NO <b>YES</b>

The actual set point and the possible range of values are displayed after pressing the Enter button. The procedure is analogous to the input instructions of the password.

OEL-ERKENNUNG > %	OIL IDENT > %
WERT :010 (000..100)	VALUE:010 (000..100)

After the last digit was entered by pressing the Enter button, the system asked once again whether the new value shall be stored or not.

OEL-ERKENNUNG > %	OIL IDENT > %
SPEICHERN? <b>NEIN</b> JA	STORE? <b>NO</b> YES

With the +button can now switched over to „YES“. With pressing the Enter button the new value is taken over (if the entered value outside of the permitted area, the entered value is put on the limiting value automatically). Changing this parameter is left with that and the next customer parameter is asked for change.

Changes of the customer parameter can be broken off without change of the values every time by pressing the ESC button. The menu then steps back to the previous menu level.

SPUELZEIT SEK.	FLUSHING TIME SEC.
AENDERN? <b>NEIN</b> JA	MODIFY? <b>NO</b> YES

The flushing time is dependent from the separator performance, factory settings are:

SKIT	0,1	0,25	0,5	1,0	1,5	2,5	5,0	10,0
sec.	8	12	15	20	25	30	40	50

LANGZEIT ALARM MIN.	LONG TIME ALARM MIN.
AENDERN? <b>NEIN</b> JA	MODIFY? <b>NO</b> YES

The setting value arises from the maximum bilge water volume on board and is calculate by the formula: minutes = maximum bilge water volume (m³) divided by pump performance (m³/h) \* 60 plus 15%. If the oily water separator shouldn't have worked off the bilge water after this time, the LONG TIME alarm is aroused.

The cause should be located, e.g. a leakage in the suction line. The oily water separator then would draw in air permanently.

There are display indication for changing, setting and storage of values for every customer parameter.

Exception is the point restore defaults.

WERKSEINSTELL. HOLEN.	RESTORE DEFAULTS.
AENDERN? <b>NEIN</b> JA	MODIFY? <b>NO</b> YES

If you answer the point restore defaults with „YES“, there isn't any submenu for the setting of the values but all parameter are reset to the general set points and the control unit is newly started.

### **Important Note!**

If you have restored the defaults, then you must set the value for FLUSHING TIME to the plant specific set point. If you have set the value LONG TIME ALARM individually, you must reset this value also to your earlier individual value.

#### **Generally:**

If customer parameters are changed, the control unit must newly start for the take over of the changes by switching the plant off and on.

## 9.7. Control Functions

### a) Oil Recognition and Oil Discharge

The oil is collected in the upper zone of the oily water separator. The RWO-Level-Automatic system measures the collected oil level with the two stick sensor electrode (pos. 9). During the oil collecting phase the status LED is green illuminated.

As soon as a predefined quantity of oil is collected, the oil discharge valve (Pos. 4) and flushing water inlet valve (pos. 15) will be open by the RWO-Level-Automatic (pos. 3), so the collected oil can be discharge to the oil collecting tank by the flashing water pressure. During the oil discharge phase the status LED is red illuminated.

Then starts the back flushing procedure. With clean water the high performance coalescer is cleaned, by the fact that the flushing water inlet valve (pos. 15) as well as the flushing water outlet valve (pos. 5) are open. During this time the status LED is orange illuminated.

If the RWO-Level-Automatic states an illogical signal input, e.g. the short stick electrode recognizes a conducting medium (water) while the long stick electrode recognizes a non conducting medium (oil), the plant switches to the stand-by modus and activates the alarm.

Separating interval and flushing cycle are co-ordinated so that the SKIT aquaclean "S-DEB" works largely free of maintenance and supervision.

The pump (pos. 14) and the optional electric heating (pos. 10) are automatically shut down during the oil discharge and flushing procedure!

### b) Additional Control Functions

#### b) 1 Bilge Or Bilge Water Tank Level Recognition

The terminals X2-1 and X2-2 as well as X2-3 and X2-4 are connected together ex works. For the bilge level indication two level switches should be provided by the customer to the terminals instead of the bridges. The oily water separator starts and the green LED (bilge level) is illuminated if the bilge water level reache the upper level switch. The oily water separator stops and the LED (bilge level) is off if the bilge water level reache the lower level switch.

If the control unit states an illogical signal input, e.g. upper level available and lower level not available, the plant switches to the stand-by mode and activates the alarm.

**b) 2 Separator Remote Control**

The terminals X2-5 and X2-6 are connected together ex works. A remotely placed „On/Off-“ or „Emergency Switch“ can be connected to the terminals by the customer. About this switch the plant can be switched to the stand-by mode.

**b) 3 Oil Tank Overflow**

The terminals X2-7 and X2-8 are connected together ex works. A level switch can be connected to the terminals by the customer. At an oil tank overflow, the plant switches to the stand-by mode and activates the alarm.

**b) 4 Capacitive Transmitter For Separator Oil Alarm**

The terminals X2-9 and X2-10 are connected together ex works. A capacitive transmitter can optionally be attached and installed to the separator. If the 2 stick sensor electrode don't recognize a special oil in the bilge water (e.g. hygroscope oil), the separator fills slowly with oil. If the oil reaches the capacitive transmitter, the plant switches to the stand-by mode and activates the alarm.

**b) 5 Difference Pressure Switch**

The terminals X2-11 and X2-12 are connected together ex works. A difference pressure switch can be connected to the terminals by the customer. If the difference pressure reaches the allowed maximum e.g. between the measuring points before and after the adsorber, the plant switches to the stand-by mode and activates the alarm.

**b) 6 Dry Run Protection**

The terminals X2-13 and X2-14 are connected together ex works. A dry run protection for the oily water separator pump can be connected to the terminals by the customer. If the dry run protection respond, the plant switches to the stand-by mode and activates the alarm.

**b) 7 Bilge Alarm Monitor**

Ex work the limit value 1 (set point 14 ppm ex work) is connected to the terminals X2-15 and X2-16 and the limit value 2 (set point 15 ppm ex work) is connected to the terminals X2-17 and X2-18.

Both signals are for the control of the recirculation valve (pos. 23) and the valves (pos. 57 and 58) for the adsorber bypass.

- At underrun of the limit value 1 and limit value 2  
The sample valve (pos. 57) is switched so that the water is routed to the monitor from the measuring point before adsorber.  
The bypass valve (pos. 58) is switched so that the water is routed to pass the adsorber after the oily water separator.  
The recirculation valve (pos. 23) is switched so that the cleaned water is routed to over board.
- At exceed of the limit value 1 and underrun limit value 2  
The sample valve (pos. 57) is switched so that the water is routed to the monitor from the measuring point after adsorber.  
The bypass valve (pos. 58) is switched so that the water is routed to flow after the oily water separator to the adsorber.  
The recirculation valve (pos. 23) is switched so that the cleaned water is routed to over board.
- At exceed of the limit value 1 and limit value 2  
The sample valve (pos. 57) is switched so that the water is routed to the monitor from the measuring point after adsorber.  
The bypass valve (pos. 58) is switched so that the water is routed to flow after the oily water separator to the adsorber.  
The recirculation valve (pos. 23) is switched so that the cleaned water is routed back to the bilge.

**c) Alarms**

All alerts activate a common alarm relay. The different alarms are indicated as a message in the display. Potential free change-over contacts X1-14; X1-15 and X1-16 can be used for an alarm signal.

**d) In Service Indication**

Are the following conditions fulfilled „oily water separator switched on“ and „hand – 0 – automatic selector switch is not in position zero“ and „bilge water level is high“ and „alerts (except for 15 ppm – alarm) aren't existing“, two relays are activated.

- A remotely placed „in service“ indication lamp can be connected by the customer.
- Terminal X1-20 and X1-21 delivers, internally cabled by RWO, a in service signal to the bilge alarm monitor, which will take the operating log.

**10. Copyright regulations**

This manual including all appendices contains proprietary information protected under the Copyright Act. All rights reserved.

Installation and operating manual including the appendices are intended for the use by operating and maintenance personnel.

The manual is subject to the condition that it shall not, by way of trade or otherwise, be lent, re-sold, hired out or otherwise circulated without prior consent of the company RWO Marine Water Technology GmbH.

## 11. Spare parts

The spare part position numbers are listed in the following tables.

**Note: All spare parts are optional and not in the standard scope of supply.**

### Important

Please specify with your spare part order always the serial number, capacity and RWO order no of the OWS.

See attached drawings to identify the position numbers

### Information

**All here listed spare parts are optional. They aren't contained in the standard extent of supply.**

**See: 2.1 Important contact numbers:**

### 11.1. Part list (see the attached drawings for Pos. no.)

#### 11.1.1 Coalescer stage and integrated pipe work up to Adsorber vessel:

Pos	Description:	Table
1	Non-return valve	9
4	Pneumatic piston valve, complete (oil discharge valve)	9
4.1	Pneumatic piston valve, body	9
4.2	Pneumatic piston valve, cylinder	9
4.3	Solenoid valve	9

Table 11 Ident numbers of the Adsorber

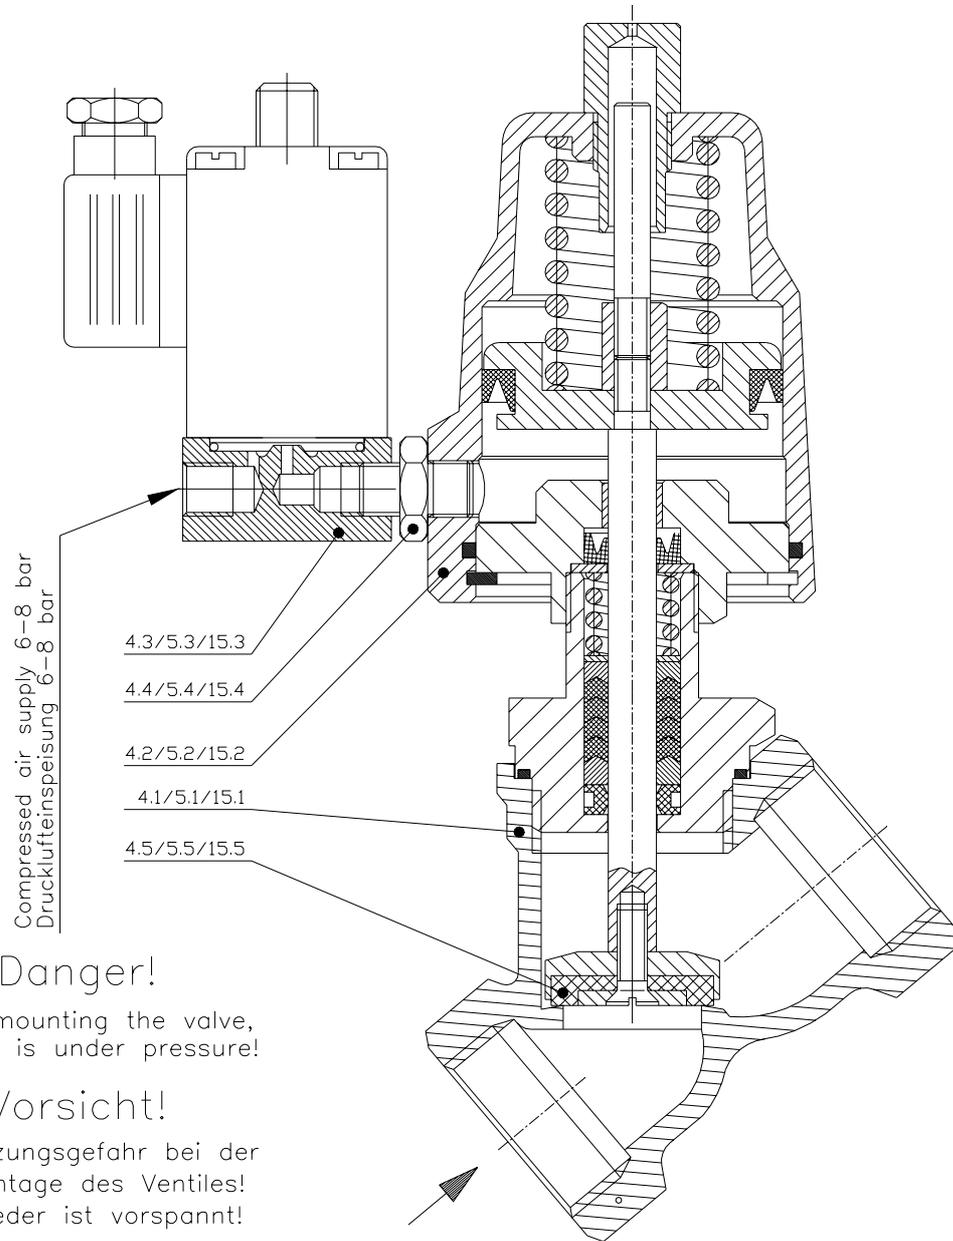

## 12. Drawings

### 12.1. Adsorber (second stage)

**12.2. Valve Pos. 4; Pos. 5 + Pos. 15 with SKIT S DEB 0.1 ... 5.0 m<sup>3</sup>/**

Kolbenventil Größe R1/2" – R1"  
 pneumatic piston valve size R1/2" – R1"

Under spring pressure the valve is closed  
 Under compressed air pressure the valve is open  
 Durch Federkraft ist das Ventil geschlossen  
 Durch Druckluft ist das Ventil geöffnet

Benennung:	Oily water separator SKIT/S Entölersystem	Blatt:
	Pneumatic piston valve pos. 4, 5 and 15 Kolbenventil Pos. 4, 5 und 15	
Zeichnung Nr.:	920060	

**12.3. Valve Pos. 4 / Pos. 5 only with SKIT S DEB 10 m<sup>3</sup>/h**

Kolbenventil Größe DN32 – DN40  
 pneumatic piston valve size DN32 – DN40

**Danger!**  
 If dismantling the valve,  
 The spring is under pressure!

**Vorsicht!**  
 Verletzungsgefahr bei  
 Demontage des Ventiles!  
 Die Feder ist vorgespannt!

Compressed air supply 6-8 bar  
 Druckluftspeisung 6-8 bar

Compressed air supply 6-8 bar  
 Druckluftspeisung 6-8 bar

4.1 / 5.1, 4.2, 4.3, 4.4, 4.5 / 5.5, 5.2, 5.3, 5.4

Under spring pressure the valve is open  
 Under compressed air pressure the valve  
 is closed  
 Durch Federkraft ist das Ventil geöffnet  
 Durch Druckluft ist das Ventil geschlossen

**12.4. Sensor Electrode (Pos. 9)**

R1''

As soon as the rods are in water there will be a conductivity between electrodes. The min. conductivity of the water must be 5 µS (micro Siemens).

Sobald Wasser die Elektroden benetzt, entsteht eine leitende Verbindung zwischen den Elektroden. Die Mindestleitfähigkeit des Wassers muß 5 µS (Mikro Siemens) betragen.
