Input Switches	Input Switches (cont.)					
 Most basic binary input devices The switch output is high or low, depending 	Vcc					

- The switch output is high or low, depending on the switch position.
- Pull-up resistors are necessary in each switch to provide a high logic level when the switch is open.
- Problem with switches:
 - Switch bounce.
 - When a switch makes contact, its mechanical springiness will cause the contact to bounce, or contact and break, for a few milliseconds (typically 5 to 10 ms).

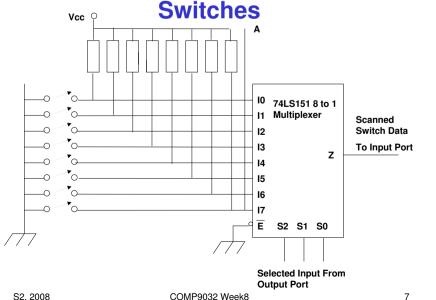

S2, 2008

3

Software Debouncing NAND Latch Debouncer Basic idea: wait until the switch is stable • For example: Vcc - Wait and see: • If the software detects a low logic level, indicating that switch has closed, it simply waits for some time, say 20 to 100ms, and then test if the switch is still low. Logic high with switch up - Counter-based approach: • Initialize a counter to 10. Logic low with switch down Poll the switch every millisecond until the counter is either 0 or 20. If the switch output is low, decrease the counter; otherwise, increment the counter. If the counter is 0, we know that switch output has been low (closed) for at least 10 ms. If, on the other hand, the counter reaches 20, we know that the switch has been open for at least 10 ms. S2. 2008 COMP9032 Week8 5 S2. 2008 COMP9032 Week8 6

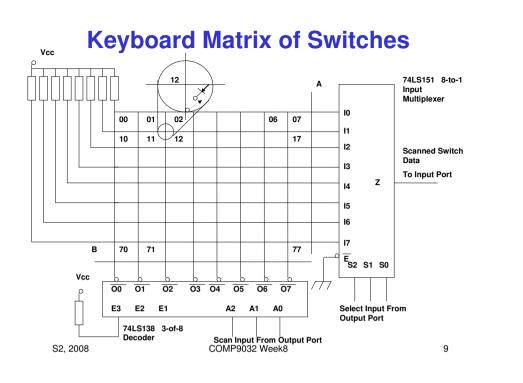

One-Dimensional Array of

One-Dimensional Array of Switches

- Switch bouncing problem must be solved
 - Either using software or hardware
- The array of switches must be scanned to find out which switches are closed or open.
 - Software is required to scan the array. As the software outputs a 3-bit sequence from 000 to 111, the multiplexer selects each of the switch inputs.
 - The output of switch array could be interfaced directly to an eight-bit port at point A.

S2. 2008

Keyboard Matrix of Switches (cont.)

- A keyboard is an array of switches arranged in a two-dimensional matrix.
- A switch is connected at each intersection of vertical and horizontal lines.
- Closing the switch connects the horizontal line to the vertical line.
- 8*8 keyboard can be interfaced directly into 8-bit output and input ports at point A and B.

S2, 2008

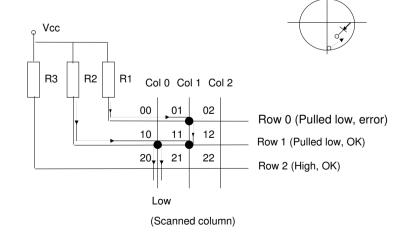

COMP9032 Week8

10

Keyboard Matrix of Switches (cont.)

- Software can scan the key board by outputting a three-bit code to the decoder and then scanning the multiplexer to find the closed switch or switches.
 - The combination of the two 3-bit scan codes (A2A1A0 and S2S1S0) identifies which switch is closed. For example, the code 000000 scan switch 00 in the upper left-hand corner.
- The diode prevents a problem called ghosting.

Ghosting (cont.)

- Ghosting occurs when several keys are pushed at once.
- Consider the case shown in the figure where three switches 01, 10 and 11 are all closed. Column 0 is selected with a logic low and assume that the circuit does not contain the diodes. As the rows are scanned, a low is sensed on Row 1, which is acceptable because switch 10 is closed. In addition, Row 0 is seen to be low, indicating switch 00 is closed, which is NOT true. The diodes in the switches eliminate this problem by preventing current flow from R1 through switches 01 and 11. Thus Row 0 will not be low when it is scanned.

S2, 2008 COMP9032 Week8 13 S2, 2008 COMP9032 Week8 14

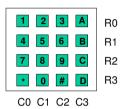

Example (solution)

Algorithm

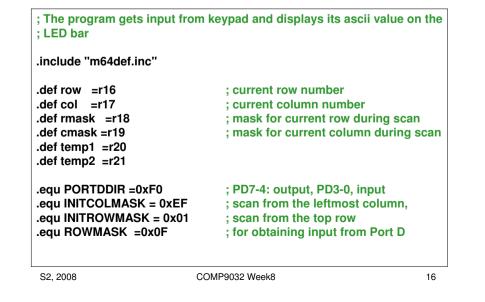

Scan columns from left to right for each column, scan rows from top to bottom for each key being scanned if it is pressed display wait endif endfor Repeat the scan process

- A column is selected, its related Cx value is set to 0.
- A mask is used to read one row at a time.

Get an input from 4*4 keypad

Code Implementation

Dot Matrix LCD

- Characters are displayed using a dot matrix.
 - 5x7, 5x8, and 5x11
- A controller is used for communication between the LCD and other devices, e.g. MPU
- The controller has an internal character generator ROM. All display functions are controllable by instructions.

26

Operations

- MPU communicates with LCD through two registers
 - Instruction Register (IR)
 - To store instruction code like Display clear or Cursor Shift as well as addresses for the Display Data RAM (DD RAM) or the Character Generator RAM (CG RAM)
 - Data Register (DR)
 - To temporarily store data to be read/written to/from the DD RAM of the display controller.

Operations (cont.)

 The register select (RS) signal determines which of these two register is selected.

RS	R/W	Operation
0	0	IR write, internal operation (Display Clear etc.)
0	1	Busy flag (DB ₇) and Address Counter (DB ₀ \sim DB ₆) read
1	0	DR Write, Internal Operation (DR ~ DD RAM or CG RAM)
1	1	DR Read, Internal Operation (DD RAM or CG RAM)

LCD Instructions **Operations (cont.)** • When the busy flag is high or "1", the LCD · A list of binary instructions are available for LCD operations module is busy with internal operation. • The next instruction must not be written until · Some typical ones are explained in the next slides. the busy flag is low or "0". · For details, refer to the LCD USER'S MANUAL. S2. 2008 S2. 2008 30 COMP9032 Week8 29 COMP9032 Week8 Instructions Instructions Clear Display

- RS R/W DB7 DB6 DB5 BD4 DB3 DB2 DB1 DB0 Code 0 0 0 0 0 0 0 0 0 1
 - The display clears and the cursor or blink moves to the upper left edge of the display.
 - The execution of clear display instruction sets entry mode to increment mode.

Return Home

	RS	R/W	DB7	DB6	DB5	BD4	DB3	DB2	DB1	DB0	
Code	0	0	0	0	0	0	0	0	1	х	

- The cursor or the blink moves to the upper left edge of the display. Text on the display remains unchanged.

Instructions

Entry Mode Set

	RS	R/W	DB7	DB6	DB5	BD4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	0	1	I/D	S

- Sets the Increment/Decrement and Shift modes to the desired settings.
 - I/D: Increments (I/D = 1) or decrements (ID = 0) the DD RAM address by 1 when a character code is written into or read from the DD RAM.
 - The cursor or blink moves to the right when incremented by +1.
 - The same applies to writing and reading the CG RAM.
 - S: Shifts the entire display either to the right or to the left when S = 1; shift to the left when I/D = 1 and to the right when I/D = 0.

S2, 2008 COMP9032 Week8 33 S2, 2008 COMP9032 Week8 34

Instructions

• Cursor or Display Shift

	RS	R/W	DB7	DB6	DB5	BD4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	1	S/C	R/L	Х	Х

 Shifts the cursor position or display to the right or left without writing or reading display data.

- 0 0 Shifts cursor position to the left (AC is decremented by one)
- 0 1 Shifts cursor position to the right (AC is incremented by one)
- 1 0 Shifts the entire display to the left. The cursor follows the display shift.
- 1 1 Shifts the entire display to the right. The cursor follows the display shift.

Instructions

Instructions

RS R/W DB7 DB6 DB5 BD4 DB3 DB2 DB1 DB0

0

1

0

• D: The display is ON when D = 1 and OFF when D = 0.

• C: The cursor displays when C = 1 and does not display

• B: The character indicated by the cursor blinks when B =

С

D

В

Display ON/OFF Control

0

when C = 0.

1

0

0

- Controls the display ON/OFF status, Cursor

ON/OFF and Cursor Blink function.

Code 0

Function Set

	RS	R/W	DB7	DB6	DB5	BD4	DB3	DB2	DB1	DB0
Code	0	0	0	0	1	DL	Ν	F	х	х

- Sets the interface data length, the number of lines, and character font.
 - DL = "1", 8 -bits; otherwise 4 bits
 - N: Sets the number of lines
 - N = "0" : 1 line display
 - N = "1" : 2 line display
 - F: Sets character font.
 - F = "1" : 5 x 10 dots
 - F = "0" : 5 x 7 dots

Instructions

Read Busy Flag and Address

	RS	R/W	DB7	DB6	DB5	BD4	DB3	DB2	DB1	DB0
Code	0	1	BF	Α	А	А	А	А	А	А

Reads the busy flag (BF) and value of the address counter (AC). BF = 1 indicates that on internal operation is in progress and the next instruction will not be accepted until BF is set to "0". If the display is written while BF = 1, abnormal operation will occur.

Instructions

Write Data to CG or DD RAM

	RS	R/W	DB7	DB6	DB5	BD4	I DB3	B DB2	DB1	DB0
Code	1	0	D	D	D	D	D	D	D	D

- Writes binary 8-bit data DDDDDDD to the CG or DD RAM.
- The previous designation determines whether the CG or DD RAM is to be written (CG RAM address set or DD RAM address set). After a write the entry mode will automatically increase or decrease the address by 1. Display shift will also follow the entry mode.

Examples

· Send a command to LCD

; Register data stores value to ; Port D is output and connects ; Assume all other labels are p	s to LCD; Port A controls the LCD.
.MACRO lcd write com	
out PORTD, data clr temp	; set the data port's value up
out PORTA, temp	; RS = 0, RW = 0 for a command write
nop	; delay to meet timing (Set up time)
sbi PORTA, LCD_E	; turn on the enable pin
nop	; delay to meet timing (Enable pulse width)
nop	
nop	
cbi PORTA, LCD_E	; turn off the enable pin
nop	; delay to meet timing (Enable cycle time)
nop	
nop	
.ENDMACRO	

Examples

• Send data to display

; comments are same as in prev	ious slide.
.MACRO Icd_write_data	
out PORTD, data	; set the data port's value up
ldi temp, 1 << LCD_RS	
out PORTA, temp	; RS = 1, RW = 0 for a data write
nop	; delay to meet timing (Set up time)
sbi PORTA, LCD_E	; turn on the enable pin
nop	; delay to meet timing (Enable pulse width)
nop	
nop	
cbi PORTA, LCD_E	; turn off the enable pin
nop	; delay to meet timing (Enable cycle time)
nop	
nop	
.ENDMACRO	

Examples

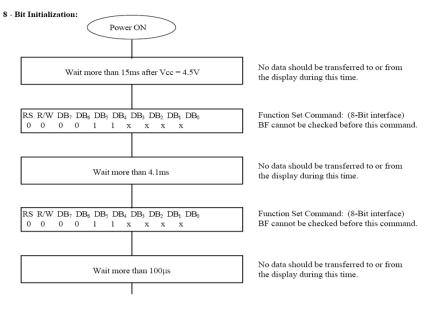

Check LCD and wait until LCD is not busy

; comments are same as in the prev .MACRO lcd_wait_busy	vious slide
cIr temp out DDRD, temp out PORTD, temp Idi temp, 1 << LCD RW	; Make PORTD be an input port for now
out PORTA, temp	; RS = 0, RW = 1 for a command port read
busy_loop:	
nop	; delay to meet set-up time)
sbi PORTA, LCD_E	; turn on the enable pin
nop	; delay to meet timing (Data delay time)
nop	
nop	
in temp, PIND	; read value from LCD
cbi PORTA, LCD E	turn off the enable pin
sbrc temp, LCD_BF	; if the busy flag is set
rimp busy loop	repeat command read
clr temp	else
out PORTA, temp	; turn off read mode,
ser temp	
out DDRD, temp	, make PORTD an output port again
.ENDMACRO	,

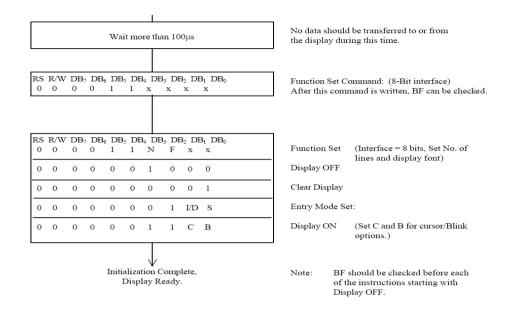

LCD Initialization

- · LCD should be initialized before use
- Internal Reset Circuit can be used, but it is related to power supply loading, may not work properly.
- Therefore, software initialization is recommended.

Software Initialization

Software Initialization
