Developing DSP56364 Software Using the DSP56362 EVM

by Miguel Moreno

This application note is intended for programmers that wish to develop DSP56364 software on a DSP56362EVM. The DSP56362EVM can be used to develop both DSP56364 RAM based solutions and custom mask ROM codes. This application note addresses the many functions, I/O, and memory map differences to ease the development of DSP56364 software.

This document summarizes from several existing documents including the *DSP56362 User's Manual* (DSP56362UM/D), the *DSP56364 User's Manual* (DSP56364UM/D), and the *56300 Family Manual* (DSP56300FM/AD). For a complete understanding of how to design your DSP56364 software on a DSP56362EVM please refer to the docements listed above.

1 Key Points

- DO NOT USE the 3X Timers, DAX (SP/DIF), HDI08 (unless for GPIO emulation) on the DSP56362.
- DO NOT USE the DSP56362 pins that don't exist on the DSP56364.
- DO NOT USE external data bus pins 8-23.
- DO NOT USE memory on the DSP56362 that cannot be supported on the DSP56364.

Information in this document is provided solely to enable system and software implementers to use Freescale Semiconductor products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document. Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.

2 Hardware Peripheral Differences

The DSP56362 has many peripherals that should not be used when developing DSP56364 software. In Figure 1., we have highlighted the peripherals that should not be accessed on a DSP56362 because they do not exist on a DSP56364.

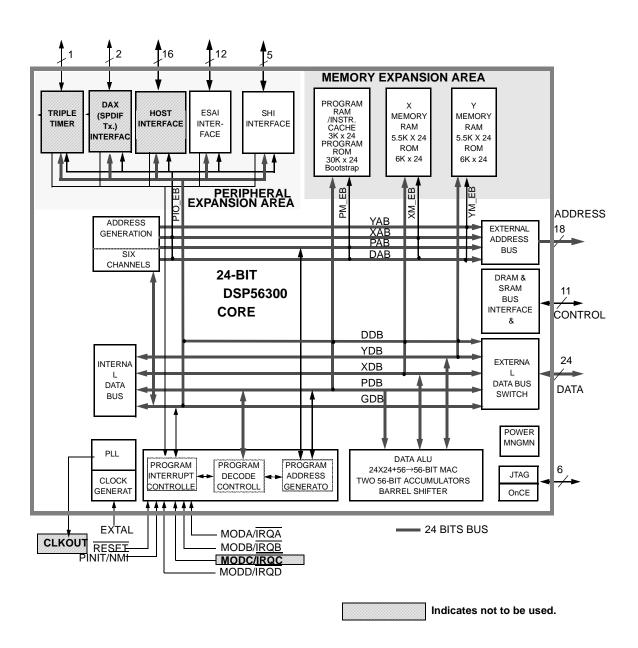

Figure 1. DSP56362 and DSP56364 Differences Diagram.

Triple Timers and DAX (SP/DIF) are core peripherals that should not be addressed. Other peripherals on the DSP56362 can be used to emulate the features of the DSP56364. For example, the DSP56362 HDI08 can be used to emulate the DSP56364 GPIO.

2.1 Emulating the DSP56364 GPIO on a DSP56362EVM

Users can emulate the GPIO peripheral of the DSP56364 using the HDI08 Host Interface peripheral of the DSP56362. To convert the HDI08 interface to GPIO, set the HPCR 16-bit read/write control register on the DSP56362. The Host port control register on the (HPCR)(X:\$FFFFC4) on the DSP56362 can be set to many different formats, please refer to Section 6.5.6 in the DSP56362 User's Manual.

To configure the HDI08 for input or output, set the Host Data Direction Register (HDDR) (X: \$FFFFC8) on the DSP56362 (section 6.5.7 DSP56362 user's manual). In addition, the Host Data Register (HDR) (X: \$FFFFC9) holds the GPIO data value (section 6.5.8 DSP56362 user's manual).

When emulating the DSP56364 GPIO on a DSP56362 EVM remember to only use the four least significant bits of the GPIO since this is the limitation of DSP56364 GPIO.

Slight modifications of the software developed on the DSP56362 emulated GPIO will be needed when using DSP56364 hardware, please note the following register differences.

	DSP56364	DSP56362
GPIO Control Register	PCRB X:\$FFFFCF	HPCR (X: \$FFFFC4)
GPIO Direction Register	PRRB X:\$FFFFCE	HDDR (X: \$FFFFC8)
Data Register	PDRB X:\$FFFFCD	HDR (X: \$FFFFC9)

Refer to Section 6.5.6 in the *DSP56362 User's Manual* for additional information on the configuration of the HDI08 Host Port Control Register and Section 5 in the DSP56364 User's manual. The following section will explain the differences in I/O on core peripherals.

2.2 I/O Pin Differences

When creating software for the DSP56364, be aware of the extra I/Os and I/O differences on the DSP56362EVM.

2.2.1 PLL- Do not use the following:

Signal Name	Туре	
CLKOUT	Output	

2.2.2 Program interrupt controller - Do not access the following:

Signal Name	Туре	
MODC/ĪRQC	Input	

2.2.3 JTAG - Do not access the following:

Signal Name	Туре
TRST	Input
DE	input/output

3 EXTERNAL DATA BUS SWITCH

For external memory access, the DSP56364 uses an eight-bit data bus instead of the 24-bit data bus on the DSP56362. Use only the lowest eight significant bits of the 24 bit data bus to properly represent a DSP56364 data bus (DATA0-7).

3.1 DRAM/SRAM Bus Interface & I-Cache Control - Do not use the following:

Signal Name	Туре
AA2-AA3	Output
RAS2-RAS3	Output
BR	Output
BG	Output
BB	input/output

Further information on the Signal/Connection Descriptions can be found in Section 2 of the *DSP56364 User's Manual* and the *DSP56362 User's Manual*.

4 Software Memory Map Differences

When programming for a DSP56364, pay careful attention to the memory map differences of the DSP56362. The DSP56362 memory is a superset of the DSP56364 memory, so when developing your software, you should be aware of the boundaries of the DSP56364 memory map. Use the following DSP56364 memory map as a guideline for your development. The DSP56362 memory map has also been included for reference.

4.1 DSP56364 Memory Maps

	PROGRAM		X DATA	Y DATA
