

Visualizing Palaeontology

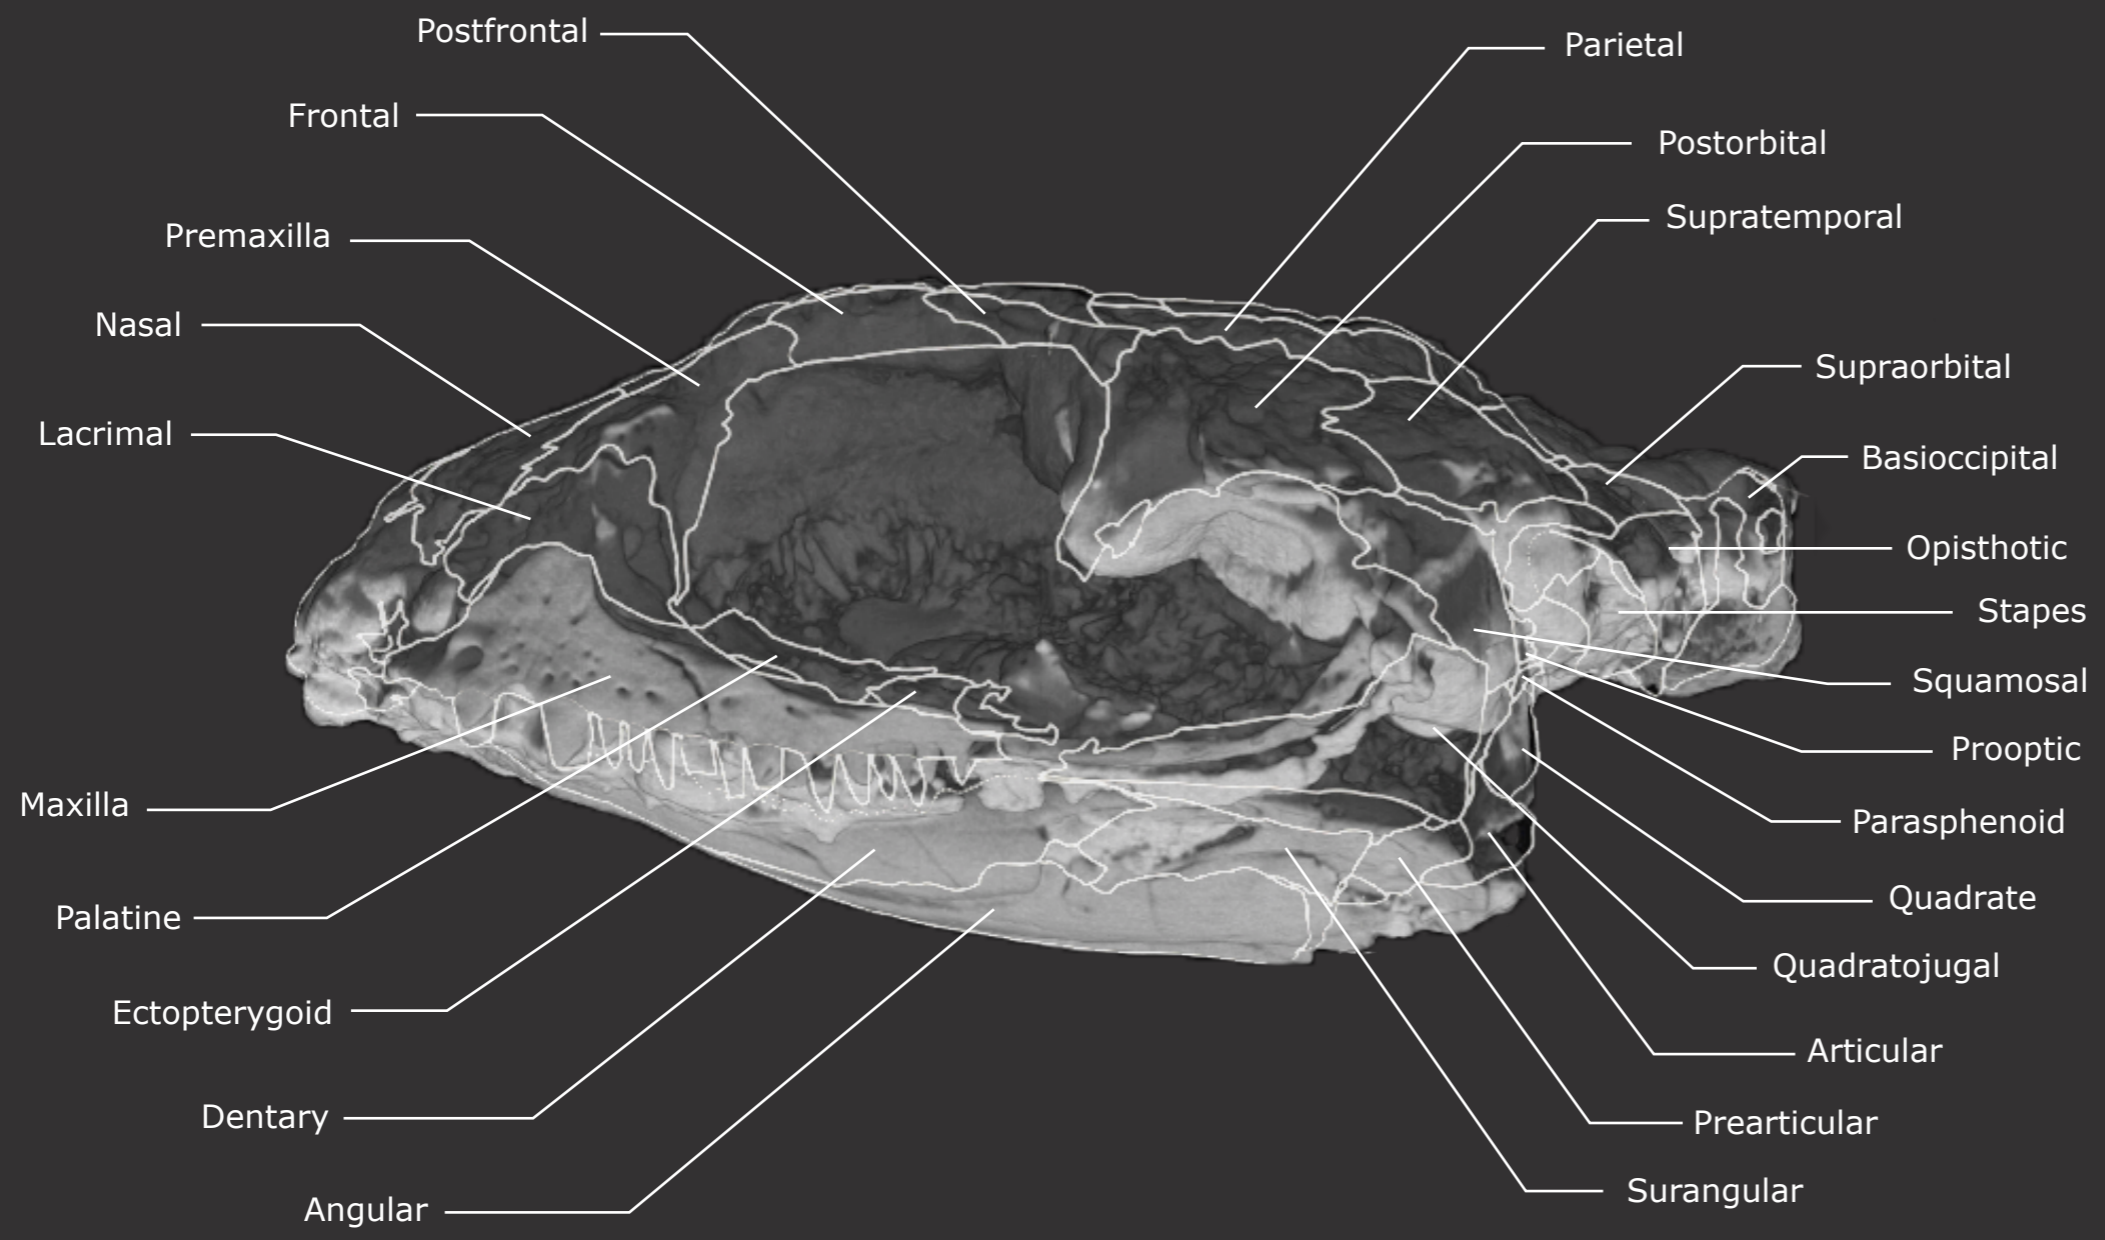

3D reconstruction of a vertebrate fossil cranium using CT data and the development of a model-viewing user interface for vertebrate palaeontologists

“PaleoScope”
Graphical User Interface

11 December 2012

When a label is "on", it will appear in the viewport only when the labelled component is visible.

The orientation cube matches the orbit position of the model. The user may rotate the model by click-dragging the model or the cube

When the model is zoomed in/out, the scale icon does not change in size, but the number adjusts accordingly

UI panel with search and preset controls:

 - Occiput 100%
 - Lower Jaw 100%

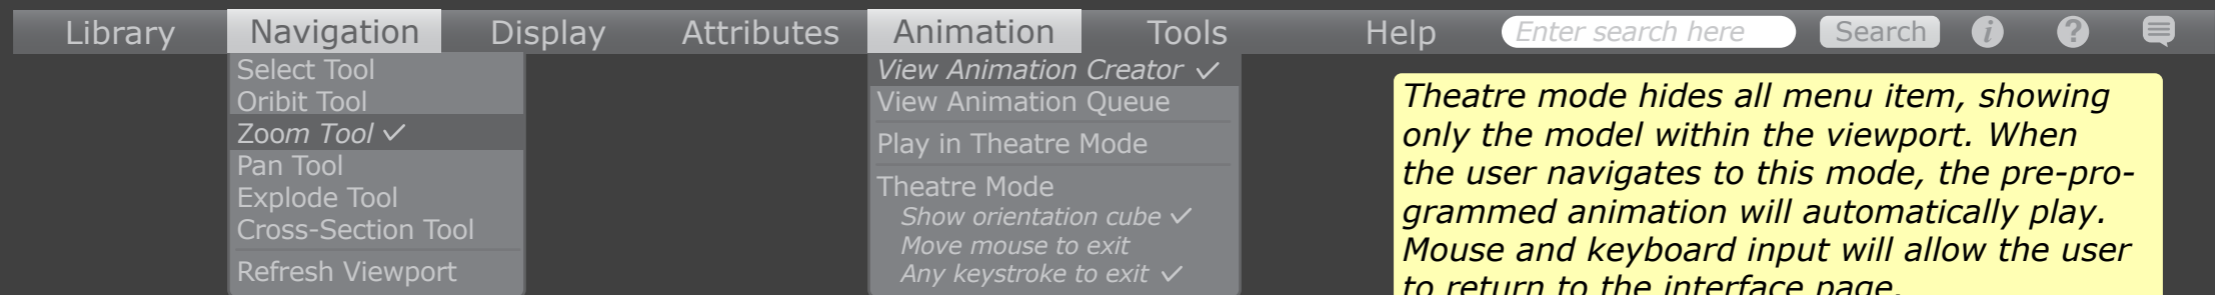

Animation Creator and Queue panel:

- Animation Creator
- Animation Queue
- New animation dropdown
- Animation type dropdown
- Timing: 5 sec dropdown
- Option... dropdown
- Edit option dropdown
- Save to queue button

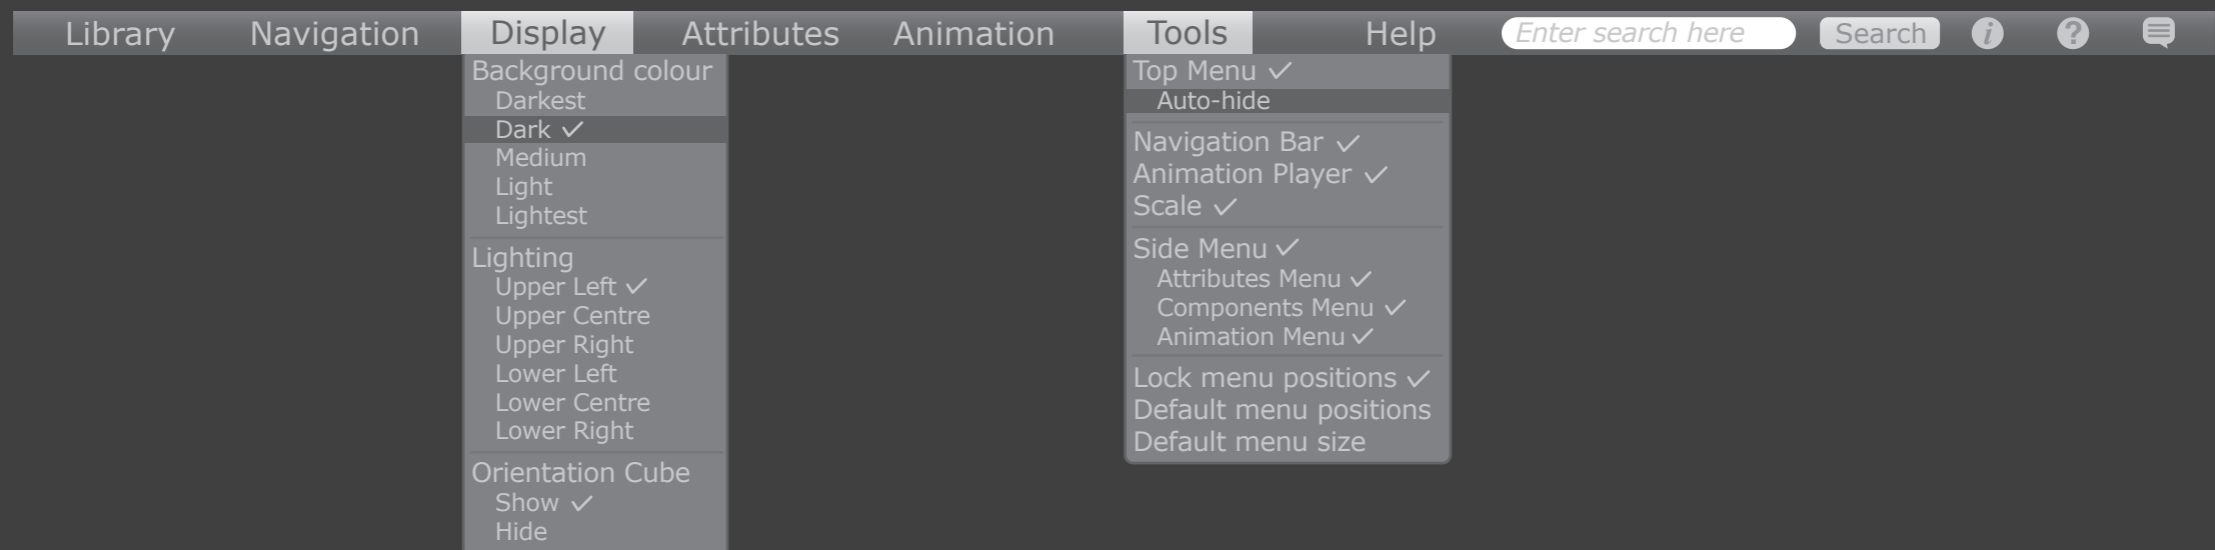

Top Drop-Down Menu

Clicking on any of the Help menu options will navigate away from the interface application page to the appropriate support page. A warning will appear, and the user must confirm to proceed.

Theatre mode hides all menu item, showing only the model within the viewport. When the user navigates to this mode, the pre-programmed animation will automatically play. Mouse and keyboard input will allow the user to return to the interface page.

Components Menu

The screenshot shows a window with two tabs: "Components" and "Info". The "Components" tab is active, displaying a hierarchical tree for "F. Oklahomensis". The tree includes a "Cheek" group with sub-components like Premaxilla, Maxilla, Lacrimal, Prefrontal, Postfrontal, Postorbital, Jugal, Squamosal, and Quadrojugal. Below this is a "Skull table" group with sub-components Nasal, Frontal, and Parietal. Other components include Palate, Occiput, and Lower Jaw. Each component has a percentage tag (e.g., 100%) and a slider control. A menu icon in the top right corner is closed.

Menu options closed

Tags indicate the attributes that are associated with a component.

Faded tags at lower hierarchical components indicate that all components of a group have the same attributes.

No tags at higher hierarchical group indicates that the components it contains have different attributes.

This screenshot is identical to the one on the left, but the menu icon in the top right corner is expanded, showing a list of options: "Expand groups", "Expand components", "Expand all", "Collapse all", "Show tags ✓", "Hide tags", "Increase text size", "Decrease text size", and "Default text size".

Components Info

Specimen
Feeserpeton oklahomensis
(OMNH 73541, holotype)

Taxonomy
Family: Lanthanosuchoidea
Order: Parareptilia
Class: Reptilia
Phylum: Chordata
Kingdom: Animalia

Model
Submitted by: Agnes Chan,
University of Toronto
CT Scan: 623 slices,
0.04528mm, University of Texas
Model: [format], University of
Toronto

Publications
Macdougall M. J., and Reisz, R.
(2012). A new parareptile
(Parareptilia, Lanthanosuchoi-
dae) from the Early Permian of
Oklahoma. *Journal of Palaeon-*
tology, 32:5, 1018-1026.

Menu options closed

Options for this menu are for the user to jump to the indicated section of the information panel.

When possible, publications will be externally linked to downloadable online versions

Animation Menu

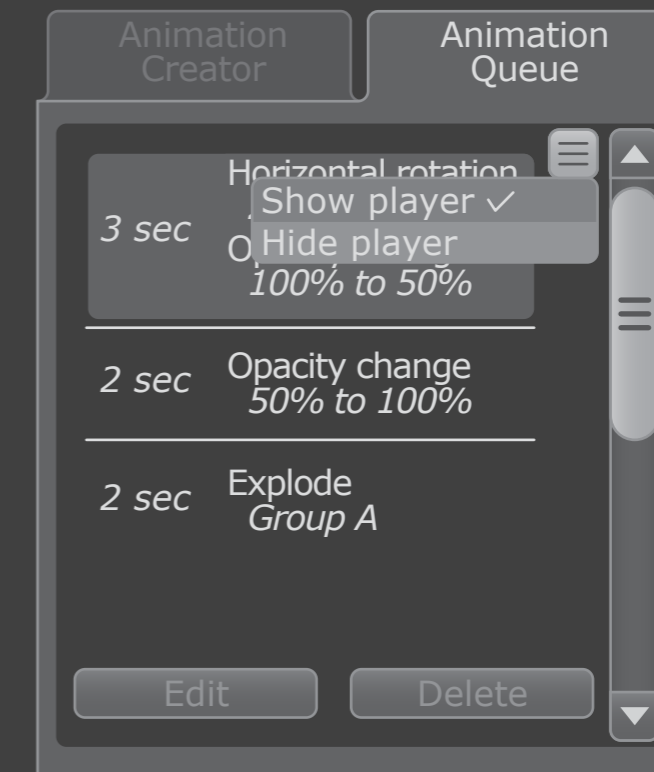

The user sets up individual animation using the Animation Creator menu. The customized animation is saved to the animation queue.

At the Animation Queue menu, the user can determine the order of the individual animations. Animations may play sequentially or at the same time as another animation, with exceptions (for example, the model cannot simultaneously orbit in two directions on the same plane).

Using the Animation Queue menu, the user may also delete individual animations, or edit them. Clicking on the edit button will navigate back to the Animation Creator menu, where the top drop-down menu will indicate that an animation is being edited rather than having a new one created.

(OMNH 73541)

The Library is linked, separate page to the the interface. Here, the user can select models currently uploaded to the site. Mutiple sort options will be available.

The search engine will recognize tagged terms associated with the model, including taxonomic names, specimen identification numbers, and authors of linked publications.

A login option will be available to allow advanced users to upload and store their own models. When logged in, the user will have access to their personal library along with the public one. The user may opt to allow their models to be publicly available, or only accessible via their personal account.
