Safety notices

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a warning triangle; notices that relate to material damage only have no warning triangle. The notices shown below are graded according to the level of danger (from most to least hazardous):

Danger

Indicates that death or serious injury **will** result if proper precautions are not taken.

Alarm

Indicates that death or serious injury **may** result if proper precautions are not taken.

Caution

With a warning triangle, indicates that minor injury **may** result if proper precautions are not taken.

Caution

Without a warning triangle, indicates that material damage may result if proper precautions are not taken.

Notice

Indicates that an undesirable result or state may occur if the corresponding instructions are not observed.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A warning on a warning triangle indicating possible personal injury may also include a warning relating to material damage.

Qualified personnel

The associated device/system may only be installed and operated in conjunction with this documentation. The equipment/system may only be commissioned and operated by **qualified personnel**. For the purpose of the safety information in this documentation, a "qualified person" is someone who is authorized to energize, ground, and tag equipment, systems, and circuits in accordance with established safety procedures.

----- **End of example** -----

The individual pieces of information are described in detail below.

pxxxx[0...n] Parameter number

The parameter number is made up of a "p" or "r", followed by the parameter number and the index or bit array (optional).

Examples of representation in the parameter list:

- p... Adjustable parameter (read and write)
- r... Display parameter (read-only)
- p0918 Adjustable parameter 918
- p2051[0...13] Adjustable parameter 2051, indices 0 to 13
- p1001[0...n] Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944 Display parameter 944
- r2129.0...15 Display parameter 2129 with bit array from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of the notation in the documentation:

- p1070[1] Adjustable parameter 1070, index 1
- p2098[1].3 Adjustable parameter 2098, index 1 bit 3
- p0795.4 Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Setting PROFIBUS telegram (BICO interconnections)
p0922
- Setting component lists
p0230, p0300, p0301, p0400
- Automatic calculation and pre-assignment
p0340, p3900
- Restoring factory settings
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square brackets.

Note:

The parameter list can contain parameters that are not visible in the expert lists of the respective commissioning software (e.g. parameters for trace functions).

BICO technology: Long parameter name / short parameter name

The following abbreviations can appear in front of the BICO parameter name:

- BI: Binector input
This parameter is used for selecting the source of a digital signal.
- BO: Binector output
This parameter is available as a digital signal for interconnection with other parameters.
- CI: Connector input
This parameter is used for selecting the source of an "analog" signal.
- CO: Connector output
This parameter is available as an "analog" signal for interconnection with other parameters.
- CO/BO: Connector/binector output
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

Note:

A BICO input (BI/CI) cannot be interconnected with just any BICO output (BO/CO, signal source).

When interconnecting a BICO input using the commissioning software, only the corresponding possible signal sources are listed.

Function diagrams 1020 ... 1030 explain the symbols for BICO parameters and how to deal with BICO technology.

G120C variants

Specifies for which G120C variants (communication) the parameter is valid is. If no G120C variant is listed, then the parameter is valid for all variants.

The following information relating to "G120C variants" can be displayed under the parameter number:

Table 1-1 Information in the "CU/PM variants" field

CU/PM variants	Meaning
	All G120C variants have this parameter.
G120C_CAN	G120C with CAN interface
G120C_DP	G120C with PROFIBUS interface
G120C_PN	G120C with PROFINET interface
G120C_USS	G120C with USS interface

Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard (not adjustable, included in p0003 = 3)
- 2: Extended (not adjustable, included in p0003 = 3)
- 3: Expert
- 4: Service
Parameters with this access level are password protected.

Note:

Parameter p0003 is CU-specific (available on the Control Unit).

A higher access level will also include the functions of the lower levels.

Calculated

Specifies whether the parameter is influenced by automatic calculations.

p0340 determines which calculations are to be performed:

- p0340 = 1 includes the calculations from p0340 = 2, 3, 4, 5.
- p0340 = 2 calculates the motor parameters (p0350 ... p0360, p0625).
- p0340 = 3 includes the calculations from p0340 = 4, 5.
- p0340 = 4 only calculates the controller parameters.
- p0340 = 5 only calculates the controller limits.

Note:

For p3900 > 0, p0340 = 1 is also called automatically.

After p1900 = 1, 2, p0340 = 3 is also called automatically.

Parameters with a reference to p0340 after "Calculated", depend on the Power Module being used and the motor. In this case, the values at "Factory setting" do not correspond to the actual values because these values are calculated during the commissioning. This also applies to the motor parameters.

Data type

The information on the data type can consist of the following two items (separated by a slash):

- First item
Data type of the parameter.
- Second item (for binector or connector input only)
Data type of the signal source to be interconnected (binector/connector output).

Parameters can have the following data types:

- Integer8 I8 8-bit integer
- Integer16 I16 16-bit integer
- Integer32 I32 32-bit integer
- Unsigned8 U8 8 bits without sign
- Unsigned16 U16 16 bits without sign
- Unsigned32 U32 32 bits without sign
- FloatingPoint32 Float 32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when creating BICO interconnections:

Table 1-2 Possible combinations of BICO interconnections

BICO output parameter	BICO input parameter			
	CI parameter			BI parameter
	Unsigned32 / Integer16	Unsigned32 / Integer32	Unsigned32 / FloatingPoint32	Unsigned32 / Binary

BO: Integer32	–	–	–	x
BO: FloatingPoint32	–	–	–	–
Legend:	x: BICO interconnection permitted –: BICO interconnection not permitted			

Changeable

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. One or more states are possible.

The following states may be specified:

- C(x) Commissioning C: Commissioning

Drive commissioning is in progress (p0010 > 0).

Pulses cannot be enabled.

The parameter can only be changed in the following drive commissioning settings (p0010 > 0):

C: Changeable for all settings p0010 > 0.

C(x): Only changeable when p0010 = x.

A modified parameter value does not take effect until the device commissioning mode is exited with p0010 = 0.

- U Operation U: Run

Pulses are enabled.

- T Ready T: Ready to run
The pulses are not enabled and the status "C(x)" is not active.

Scaling

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2006: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 %

Dyn. index (dynamic index)

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)

Data sets can only be created and deleted when p0010 = 15.

Note:

Information on the data sets can be taken from the following references:

Operating Instructions SINAMICS G120 Frequency Converter G120C.

Unit group and unit selection

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched over, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be changed over.

Example:

Unit group: 7_1, unit selection: p0505

The parameter belongs to unit group 7_1 and the unit can be switched over using p0505.

All the potential unit groups and possible unit selections are listed below.

Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

Description:	Sets the drive unit supply voltage (rms value of the phase-to-phase line supply voltage).		
Dependency:	Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0. The switch-in thresholds of the Vdc_max controller are then directly determined using p0210.

	Min 0.00 [kW]	Max 20000.00 [kW]	Factory setting 0.00 [kW]
Description:	Sets the braking power of the connected braking resistor.		

Dependency: Refer to: p1240, p1280, p1531

Note: When setting a value for the braking power, the following calculations are made:

- p1240, p1280: Vdc_max control is deactivated.
- p1531 = - p0219: the power limit when generating is set (limited to - p1530).
- The minimum ramp-down time is calculated (p1127) as a function of p0341, p0342 and p1082 (not for vector control with speed encoder).

p0230 = 4:
 --> p0290 (power unit overload response) = inhibit pulse frequency reduction
 --> p1802 (modulator modes) = space vector modulation without overcontrol

 --> p0234 (power unit sine-wave filter capacitance) = filter capacitance
 --> p1082 (maximum speed) = Fmax filter / pole pair number

Access level: 3	Calculated: -	Data type: FloatingPoint32
Can be changed: U, T	Scaling: -	Dyn. index: -
Units group: -	Unit selection: -	Func. diagram: -
Min 0 [s]	Max 600 [s]	Factory setting 0 [s]

Description: Sets the fan run-on time after the pulses for the power unit have been canceled.

Note:

- Under certain circumstances, the fan can continue to run for longer than was set (e.g. as a result of the excessively high heat sink temperature).
- For values less than 1 s, a 1 s run on time for the fan is active.
- for a PM230 power unit, sizes D - F the parameter is ineffective.

p0300[0...n] Motor type selection / Mot type sel

Access level: 2	Calculated: -	Data type: Integer16
Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS
Units group: -	Unit selection: -	Func. diagram: 6310
Min 0	Max 100	Factory setting 0

Description: Selecting the motor type.

The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:

1 = Rotating induction motor
2 = Rotating synchronous motor

The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/IOP).

Value:

- 0: No motor
- 1: Induction motor (rotating)
- 2: Synchronous motor (rotating, permanent-magnet)
- 10: 1LE1 standard induction motor series
- 13: 1LG6 standard induction motor series
- 17: 1LA7 standard induction motor series
- 19: 1LA9 standard induction motor series
- 100: 1LE1 standard induction motor

Dependency: When selecting a motor type from the 1LA7 series, parameters of the thermal motor model are pre-assigned as a function of p0307 and p0311.

Note: Once the Control Unit has been powered up for the first time or if the factory settings have been defined accordingly, the motor type is pre-configured to induction motor (p0300 = 1).
If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.

p0301[0...n]	Motor code number selection / Mot code No. sel		
	Access level: 2	Calculated: -	Data type: Unsigned16
	Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS
	Units group: -	Unit selection: -	Func. diagram: -
	Min 0	Max 65535	Factory setting 0
Description:	The parameter is used to select a motor from a motor parameter list. When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists.		
Dependency:	Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. Refer to: p0300		
Note:	The motor code number can only be changed if the matching catalog motor was first selected in p0300. When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected.		
p0304[0...n]	Rated motor voltage / Mot U_{rated}

	Units group: -	Unit selection: -	Func. diagram: 6300, 6724
	Min 0 [Vrms]	Max 20000 [Vrms]	Factory setting 0 [Vrms]
Description:	Sets the rated motor voltage (rating plate).		
Caution:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	When the parameter value is entered the connection type of the motor (star-delta) must be taken into account. Once the Control Unit has booted for the first time or if the factory settings have been restored, the parameter is pre-assigned to match the power unit.		
p0305[0...n]	Rated motor current / Mot I_{rated}		
	Access level: 1	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS
	Units group: -	Unit selection: -	Func. diagram: 6300
	Min 0.00 [Arms]	Max 10000.00 [Arms]	Factory setting 0.00 [Arms]
Description:	Sets the rated motor current (rating plate).		
Caution:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Notice:	If p0305 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly.		
Note:	When the parameter value is entered the connection type of the motor (star-delta) must be taken into account. Once the Control Unit has booted for the first time or if the factory settings have been restored, the parameter is pre-assigned to match the power unit.		
p0306[0...n]	Number of motors connected in parallel / Motor qty		
	Access level: 1	Calculated: -	Data type: Unsigned8
	Can be changed: C(1, 3)	Scaling: -	Dyn. index: MDS
	Units group: -	Unit selection: -	Func. diagram: -
	Min 1	Max 50	Factory setting 1
Description:	Number of motors that can be operated in parallel using one motor data set. Depending on the motor number entered, internally an equivalent motor is calculated.		

The following should be observed in motors connected in parallel:
 The following rating plate data should only be entered for one motor:
 - resistances and inductances: p0350 ... p0360
 - currents: p0305, p0320, p0323
 - power ratings: p0307
 - masses/moments of inertia: p0341, p0344
 All other parameters take into account the replacement motor.

Dependency:

Refer to: r0331, r0382

Caution:

The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)).
 The mounting regulations when connecting motors in parallel must be carefully maintained!
 The number of motors set must correspond to the number of motors that are actually connected in parallel.
 After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1, p3900 > 0).
 For synchronous motors connected in parallel with p1300 >= 20, the following applies:
 - the individual motors must be mechanically coupled with one another and the EMF must be aligned to one another.
 For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies:
 - an individual motor must not be loaded beyond its stall point.

Notice:

If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned.

Note:

Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel.

	Min - [s]	Max - [s]	Factory setting - [s]
Description:	Displays the rated motor starting time. This time corresponds to the time from standstill up to reaching the motor rated speed and the acceleration with motor rated torque.		
Dependency:	Refer to: r0333, p0341, p0342		
p0346[0...n]	Motor excitation build-up time / Mot t_excitation		
	Access level: 3	Calculated: p0340 = 1,3	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
	Units group: -	Unit selection: -	Func. diagram: -
	Min 0.000 [s]	Max 20.000 [s]	Factory setting 0.000 [s]
Description:	Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.		
Caution:	If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note).		
			
Note:	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384). For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.

	Units group: -	Unit selection: -	Func. diagram: -
	Min 0.000 [s]	Max 20.000 [s]	Factory setting 0.000 [s]
Description:	Sets the de-magnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.		
Note:	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). if this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

Description:	Sets the stator resistance of the motor at ambient temperature p0625 (phase value).		
Dependency:	Refer to: p0625		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance (p0352).

	Units group: -	Unit selection: -	Func. diagram: -
	Min 0.00000 [ohm]	Max 120.00000 [ohm]	Factory setting 0.00000 [ohm]
Description:	Resistance of the power cable between the power unit and motor.		
Caution:	The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.		
			
Note:	The parameter influences the temperature adaptation of the stator resistance. The motor identification sets the cable resistance to 20% of the measured total resistance if p0352 is zero at the time that the measurement is made. If p0352 is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance p0350. In this case, p0350 is a minimum of 10% of the measured value. The cable resistance is reset when quick commissioning is exited with p3900 > 0.

Description:	Induction machine: sets the stator leakage inductance of the motor. Synchronous motor: Sets the stator quadrature axis inductance of the motor.		

This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).

Caution: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: If the stator leakage inductance (p0356) for induction motors is changed outside the commissioning phase (p0010 > 0), the magnetizing inductance (p0360) is automatically adapted to the new EMF. You are then advised to repeat the measurement for the saturation characteristic (p1960).

For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is, therefore, ideal for a low current.

Description:	Sets the alarm threshold for monitoring the motor temperature for motor temperature model 2 or KTY. After the alarm threshold is exceeded, alarm A07910 is output and timer (p0606) is started. If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.		
Dependency:	Refer to: p0612 Refer to: F07011, A07910		
Caution:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The hysteresis is 2 K. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

Description:	Sets the threshold for monitoring the motor temperature for motor temperature model 1/2 or KTY. Motor temperature model 1 (p0612.0 = 1): alarm threshold - Alarm A07012 is output after the alarm threshold is exceeded. Motor temperature model 2 (p0612.1 = 1) or KTY: fault threshold - Fault F07011 is output after the fault threshold is exceeded.		
Dependency:	Refer to: p0611, p0612 Refer to: F07011, A07012		
Caution:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Notice:	Motor temperature model 1: p0605 also defines the target temperature of the model for r0034 = 100 %. Therefore, p0605 has no influence on the time up to alarm A07012 being issued. The time is only determined by time constant p0611, the actual current and the reference value p0305.		
Note:	The hysteresis is 2 K. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (p0300).

Description:	Sets the system response when the motor temperature reaches the alarm threshold.		
Value:	0: No response only alarm no reduction of I_max 1: Messages, reduction of I_max 2: Messages, no reduction of I_max 12: Messages, no reduction of I_max, temperature storage		

List of parameters

Dependency: Refer to: p0601, p0604, p0605, p0614, p0615
Refer to: F07011, A07012, A07910

Note: The I_{max} reduction is not executed for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4).
The I_{max} reduction results in a lower output frequency.
If value = 0:
An alarm is output and I_{max} is not reduced.
If value = 1:
An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired.
- for KTY84, the following applies: I_{max} is reduced
- for PTC, the following is valid: I_{max} is not reduced
If value = 2:
An alarm is output and a timer is started. A fault is output if the alarm is still active after this timer has expired.
If value = 12:
Behavior is always the same as for value 2.
For motor temperature monitoring without temperature sensor, when switching off, the model temperature is saved in a non-volatile fashion. When switching on, the same value (reduced by p0614) is taken into account in the model calculation. As a consequence, the UL508C specification is fulfilled.

p0611[0...n] I2t motor model thermal time constant / I2t mot_mod T

Access level: 3	Calculated: -	Data type: FloatingPoint32
Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
Units group: -	Unit selection: -	Func. diagram: 8017
Min 0 [s]	Max 20000 [s]	Factory setting 0 [s]

Description: Sets the winding time constant.
The time constant specifies the warm-up time of the cold stator winding when loaded with the motor standstill current (rated motor current, if the motor standstill current is not parameterized) up until a temperature rise of 63 % of the continuously permissible winding temperature has been reached.

Dependency: This parameter is only used for synchronous motors (p0300 = 2xx).
Refer to: r0034, p0612, p0615
Refer to: F07011, A07012, A07910

Caution: This parameter is automatically pre-set from the motor database for motors from the motor list (p0301).
When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.

Note: When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model.
If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

Note: It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero (p0611 > 0).
 Mot_temp_mod: motor temperature model
 Re bit 00:
 This bit is used to activate/deactivate the motor temperature model for permanent-magnet synchronous motors.

 Refer to: r0034, p0611, p0612
 Refer to: F07011, A07012

Caution: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The hysteresis is 2 K.

p0620[0...n] Thermal adaptation, stator and rotor resistance / Mot therm_adapt R

Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS
Units group: -	Unit selection: -	Func. diagram: -
Min 0	Max 2	Factory setting 1

Description: Sets the thermal adaptation of the stator/primary section resistance and rotor/secondary section resistance according to r0395 and r0396.

Value:
 0: No thermal adaptation of stator and rotor resistances
 1: Resistances adapted to the temperatures of the thermal model
 2: Resistances adapted to the measured stator winding temperature

Note: For p0620 = 1, the following applies:
 The stator resistance is adapted using the temperature in r0035 and the rotor resistance together with the model temperature.
 For p0620 = 2, the following applies:
 The stator resistance is adapted using the temperature in r0035.

p0621[0...n]	Identification stator resistance after restart / Rst_ident Restart		
	Access level: 4	Calculated: -	Data type: Integer16
	Can be changed: C(3), T	Scaling: -	Dyn. index: MDS, p0130
	Units group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0	2	0
Description:	Selects the identification of the stator resistance after booting the Control Unit (only for vector control).		
	The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.		
	p0621 = 1:		
	Identification of the stator resistance only when the drive is powered up for the first time (pulse enable) after booting the Control Unit.		
	p0621 = 2:		
	Identification of the stator resistance every time the drive is powered up (pulse enable).		
Value:	0: No Rs identification		
	1: Rs identification after switching-on again		
	2: Rs identification after switching-on each time		
Dependency:	- perform motor data identification (see p1910) with cold motor.		
	- enter ambient temperature at time of motor data identification in p0625.		
	Refer to: p0622, r0623		
Notice:	The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.		
	Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.		
Note:	The measurement is carried out:		
	- For induction motors		
	- When vector control is active (see p1300)		
	- If a temperature sensor (KTY) has not been connected		
	- When the motor is at a standstill when switched on		
	When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure).		
	If identification is activated, the magnetizing time is determined via p0622 and not via p0346. The speed is enabled after completion of the measurement.		
p0622[0...n]	Motor excitation time for Rs_ident after powering up again / t_excit Rs_id		
	Access level: 4	Calculated: p0340 = 1,3	Data type: FloatingPoint32
	Can be changed: C(3), U, T	Scaling: -	Dyn. index: MDS, p0130
	Units group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	0.000 [s]	20.000 [s]	0.000 [s]
Description:	Sets the excitation time of the motor for the stator resistance identification after powering up again (restart).		
Dependency:	Refer to: p0621, r0623		
Note:	For p0622 < p0346 the following applies:		
	If identification is activated, the magnetizing time is influenced by p0622. The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current.		
	For p0622 >= p0346 the following applies:		
	Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. The entire measurement period (magnetizing plus measurement settling time plus measuring time) will always be greater than p0346.

	Units group: 21_1	Unit selection: p0505	Func. diagram: 8016
	Min -40 [°C]	Max 80 [°C]	Factory setting 20 [°C]
Description:	Defines the ambient temperature of the motor for calculating the motor temperature model.		
Note:	The parameters for stator and rotor resistance (p0350, p0354) refer to this temperature. If the thermal I2t motor model is activated for permanent-magnet synchronous motors (refer to p0611), p0625 is included in the model calculation if a temperature sensor is not being used (see p0601).

p0640[0...n]	Current limit / Current limit		
	Access level: 2	Calculated: p0340 = 1	Data type: FloatingPoint32
	Can be changed: C(1, 3), U, T	Scaling: -	Dyn. index: DDS, p0180
	Units group: -	Unit selection: -	Func. diagram: 5722, 6640
	Min 0.00 [Arms]	Max 10000.00 [Arms]	Factory setting 0.00 [Arms]
Description:	Sets the current limit.		
Dependency:	Refer to: r0209, p0323		
Note:	The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305. The current limit p0640 is limited to r0209. The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the power unit. The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5.		

p0640 is limited to 4.0 x p0305.

p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]).

p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 > 0).

Description:	Sets the type of analog inputs. p0756[0...1] = 0, 1, 4 corresponds to a voltage input (r0752, p0757, p0759 are displayed in V). p0756[0...1] = 2, 3 corresponds to a current input (r0752, p0757, p0759 are displayed in mA). In addition, the associated DIP switch must be set. For the voltage input, DIP switch AI0/1 must be set to "U". For the current input, DIP switch AI0/1 or AI2 must be set to "I".		
Value:	0: Unipolar voltage input (0 V ... +10 V) 1: Unipolar voltage input monitored (+2 V ... +10 V) 2: Unipolar current input (0 mA ... +20 mA) 3: Unipolar current input monitored (+4 mA to +20 mA) 4: Bipolar voltage input (-10 V ... +10 V) 8: No sensor connected		
Index:	[0] = AI0 (T. 3/4) [1] = AI1 (T. 10/11)		
Warning:	The maximum voltage difference between analog input terminals AI+, AI-, and the ground must not exceed 35 V. If the system is operated when the load resistor is switched on (DIP switch set to "I"), the voltage between differential inputs AI+ and AI- must not exceed 10 V or the injected 80 mA current otherwise the input will be damaged.		
			

Note: When changing p0756, the parameters of the scaling characteristic (p0757, p0758, p0759, p0760) are overwritten with the following default values:
 For p0756 = 0, 4, p0757 is set to 0.0 V, p0758 = 0.0 %, p0759 = 10.0 V and p0760 = 100.0 %.
 For p0756 = 1, p0757 is set to 2.0 V, p0758 = 0.0 %, p0759 = 10.0 V and p0760 = 100.0 %.
 For p0756 = 2, p0757 is set to 0.0 mA, p0758 = 0.0 %, p0759 = 20.0 mA and p0760 = 100.0 %.
 For p0756 = 3, p0757 is set to 4.0 mA, p0758 = 0.0 %, p0759 = 20.0 mA and p0760 = 100.0 %.

Notice: The memory card must not be removed while data is being transferred.
 For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory.
 When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM").
 Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:

p0804 = 1001:

The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card.

p0804 = 1002:

The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory.

p0804 = 1003:

No memory card has been inserted.

G120C_PN	Can be changed: T	Scaling: -	Dyn. index: -
	Units group: -	Unit selection: -	Func. diagram: -
	Min 0	Max 1100	Factory setting 0

Description: Sets the transfer direction and start of data transfer between the memory card and non-volatile device memory.

Example 1:

The parameter backup is to be transferred from the device memory to the memory card with setting 0. The parameter backup is to be stored on the memory card with setting 22.

p0802 = 22 (parameter backup stored on memory card as target with setting 22)

p0803 = 0 (parameter backup stored in device memory as source with setting 0)

p0804 = 2 (start data transfer from device memory to memory card)

--> PS000xxx.ACX is transferred from device memory to memory card and stored as PS022xxx.ACX.

Example 2:

The parameter backup is to be transferred from the memory card to the device memory with setting 22. The parameter backup is to be stored in the device memory as setting 0.

p0802 = 22 (parameter backup stored on memory card as source with setting 22)

p0803 = 0 (parameter backup stored in device memory as target with setting 0)

p0804 = 1 (start data transfer from memory card to device memory)

--> PS022xxx.ACX is transferred from memory card to device memory and stored as PS000xxx.ACX.

Example 3 (only supported for PROFIBUS/PROFINET):

The PROFIBUS or PROFINET device master data (GSD) should be transferred from the device memory to the memory card.

p0802 = (not relevant)

p0803 = (not relevant)

p0804 = 12 (start transferring the GSD files to the memory card)

--> The GSD files are transferred from the device memory to the memory card and stored in the /SIEMENS/SINAMICS/DATA/CFG directory.

Value:

0: Inactive
 1: Memory card to device memory
 2: Device memory to memory card
 12: Device memory (GSD files) to memory card

1001: File on memory card cannot be opened
 1002: File in device memory cannot be opened
 1003: Memory card not found
 1100: File cannot be transferred

Dependency:

Refer to: p0802, p0803

Notice:

The memory card must not be removed while data is being transferred.

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note:

If a parameter backup with setting 0 is detected on the memory card when the Control Unit is switched on (PS000xxx.ACX), this is transferred automatically to the device memory.

When the memory card is inserted, a parameter backup with setting 0 (PS000xxx.ACX) is automatically written to the memory card when the parameters are saved in a non-volatile memory (e.g. by means of "Copy RAM to ROM").

Once the data has been successfully transferred, this parameter is automatically reset to 0. If an error occurs, the parameter is set to a value > 1000. Possible fault causes:

p0804 = 1001:

The parameter backup set in p0802 as the source on the memory card does not exist or there is not sufficient memory space available on the memory card.

p0804 = 1002:

The parameter backup set in p0803 as the source in the device memory does not exist or there is not sufficient memory space available in the device memory.

p0804 = 1003:

No memory card has been inserted.

 If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

Description: Displays or sets the PROFIBUS address for PROFIBUS interface on the Control Unit.
The address can be set as follows:
1) Using the DIP switch on the Control Unit.
--> p0918 can then only be read and displays the selected address.
--> A change only becomes effective after a POWER ON.
2) Using p0918
--> Only if all of the DIP switches are set to ON or OFF.
--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".
--> A change only becomes effective after a POWER ON.

Notice: For p0014 = 1, the following applies:
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

For p0014 = 0, the following applies:

Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

Note: Permissible PROFIBUS addresses: 1 ... 126
Address 126 is used for commissioning.
Every PROFIBUS address change only becomes effective after a POWER ON.

At the end of the calculations, p0970 is automatically set to 0.
Parameter reset is completed with p0970 = 0 and r3996[0] = 0.

11: Save in non-volatile memory as setting 11
12: Save in non-volatile memory as setting 12

Dependency: Refer to: p1960, r3996

Caution: If a memory card (optional) is inserted, the following applies:
The parameters are also saved on the card and therefore overwrite any existing data!

Notice: The Control Unit power supply may only be powered down after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).
Writing to parameters is inhibited while saving.
The progress while saving is displayed in r3996.

p0972**Drive unit reset / Drv_unit reset**

Can be changed: U, T	Scaling: -	Dyn. index: -
Units group: -	Unit selection: -	Func. diagram: -
Min	Max	Factory setting
0	3	0

Description: Sets the required procedure to execute a hardware reset for the drive unit.

Value:
0: Inactive
1: Hardware-Reset immediate
2: Hardware reset preparation
3: Hardware reset after cyclic communication has failed

Danger: It must be absolutely ensured that the system is in a safe condition.
The memory card/device memory of the Control Unit must not be accessed.

Note: If value = 1:
Reset is immediately executed and communications interrupted.
After communications have been established, check the reset operation (refer below).
If value = 2:
Help to check the reset operation.
Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.
After communications have been established, check the reset operation (refer below).
If value = 3:
The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.
If cyclic communication is not active, then the reset is immediately executed.
After communications have been established, check the reset operation (refer below).
To check the reset operation:
After the drive unit has been restarted and communications have been established, read p0972 and check the following:
p0972 = 0? --> The reset was successfully executed.
p0972 > 0? --> The reset was not executed.

Dependency: When changing this parameter, the following settings are influenced:

Refer to: p1070, p1071, p1075, p1076

Caution:

If p1000 is selected as the main setpoint of the fieldbus, the following BICO interconnection is set automatically:

p2051[1] = r0063

Caution:

When executing a specific macro, the corresponding programmed settings are made and become active.

Notice:

The parameter is possibly protected as a result of p0922.

For PROFIBUS/PROFINET Control Units, the following applies: The parameter can be freely set by setting p0922 = 999.

03	Save in NVRAM active	Yes	No	-
04	Ramp-function generator always active	Yes	No	-

Notice:

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note:

Re bit 00:

0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.

1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.

Re bit 01:

0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).

1: With ramp-function generator in the automatic mode.

For manual operation, the ramp-function generator is always active.

Re bit 02:

0: Without initial rounding-off

1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).

The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:

$$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$$

The jerk acts up until the maximum acceleration is reached ($a_{max} = p1082 [1/s] / p1047 [s]$), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:

0: Non-volatile data save de-activated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

Re bit 04:

When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.

	Min 0.000 [rpm]	Max 210000.000 [rpm]	Factory setting 0.000 [rpm]
Description:	Sets the bandwidth for the skip speeds/velocities 1 to 4.		
Dependency:	Refer to: p1091, p1092		
Note:	The setpoint (reference) speeds are skipped (suppressed) in the range of the skip speed +/-p1101. Steady-state operation is not possible in the skipped (suppressed) speed range. The skip (suppression) range is skipped. Example: p1091 = 600 and p1101 = 20 --> setpoint speeds between 580 and 620 [rpm] are skipped. For the skip bandwidths, the following hysteresis behavior applies: For a setpoint speed coming from below, the following applies: r1170 < 580 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 580 [rpm] For a setpoint speed coming from above, the following applies: r1170 > 620 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 620 [rpm]

Description:	The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.		
Dependency:	Refer to: p1082		
Note:	The ramp-up time can be scaled via connector input p1138. The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized. For U/f control and sensorless vector control (see p1300), ramp-up times of 0 s are not expedient. The setting should be based on the startup times (r0345) of the motor.

	Min 0.000 [s]	Max 999999.000 [s]	Factory setting 10.000 [s]
Description:	Sets the ramp-down time for the ramp-function generator. The ramp-function generator ramps-down the speed setpoint from the maximum speed (p1082) down to standstill (setpoint = 0) in this time. Further, the ramp-down time is always effective for OFF1.		
Dependency:	Refer to: p1082		
Note:	For U/f control and sensorless vector control (see p1300), ramp-down times of 0 s are not recommended. The setting should be based on the startup times (r0345) of the motor.

	Min 0	Max 1	Factory setting 0
Description:	Sets the smoothed response to the OFF1 command or the reduced setpoint for the extended ramp-function generator.		
Value:	0: Cont. smoothing 1: Discont smoothing		
Dependency:	No effect up to initial rounding-off time (p1130) > 0 s.		
Note:	p1134 = 0 (continuous smoothing) If the setpoint is reduced while ramping-up, initially a final rounding-off is carried out and then the ramp-up completed. During the final rounding-off, the output of the ramp-function generator continues to go in the direction of the previous setpoint (overshoot). After the final rounding-off has been completed, the output goes toward the new setpoint. p1134 = 1 (discontinuous smoothing) If the setpoint is reduced while ramping-up, then the output goes immediately in the direction of the new setpoint. For the setpoint change there is no rounding-off.

Description: Sets the operating mode for flying restart.

The flying restart allows the drive converter to be powered up while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.

Value:

- 0: Flying restart inactive
- 1: Flying restart always active (start in setpoint direction)
- 4: Flying restart always active (start only in setpoint direction)

Dependency: For synchronous motors, flying restart cannot be activated.

Refer to: p1201

Refer to: F07330, F07331

Notice: The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.

Note: When p1200 = 1, 4: Flying restart is active after faults, OFF1, OFF2, OFF3.

When p1200 = 1: The search is made in both directions.

When p1200 = 4: The search is only made in the setpoint direction.

For U/f control (p1300 < 20), the following applies:

The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.

If p1200 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

 The value is referred to the motor magnetizing current.

Dependency: Refer to: r0331

Caution: An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

Note: In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the prevailing search current is set dependent upon the frequency on the basis of voltage inputs.
 Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).

p1203[0...n]	Flying restart search rate factor / FlyRst v_Srch Fact		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
	Units group: -	Unit selection: -	Func. diagram: -
	Min 10 [%]	Max 4000 [%]	Factory setting 100 [%]

Description: Sets the factor for the search speed for flying restart.
 The value influences the rate at which the output frequency is changed during a flying restart. A higher value results in a longer search time.

Caution: An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

For vector control, a value that is too low or too high can cause flying restart to become unstable.

Note: The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart).
 With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203).

p1206[0...9]	Faults without automatic restart / F w/out auto AR

	Can be changed: U, T	Scaling: -	Dyn. index: -
	Units group: -	Unit selection: -	Func. diagram: -
	Min 0	Max 65535	Factory setting 0

Description: Sets faults for which automatic restart should not be effective.

Dependency: The setting is only effective for p1210 = 6, 16.
 Refer to: p1210

p1210 Automatic restart mode / AR mode			
Access level: 2	Calculated: -	Data type: Integer16	
Can be changed: U, T	Scaling: -	Dyn. index: -	
Units group: -	Unit selection: -	Func. diagram: -	
Min 0	Max 26	Factory setting 0	
Description:	Sets the automatic restart mode (AR). The parameters must be saved in the non-volatile memory p0971 = 1 in order that the setting becomes effective.		
Value:	0: Inhibit automatic restart 1: Acknowledge all faults without restarting 4: Restart after line supply failure w/o additional start attempts 6: Restart after fault with additional start attempts 14: Restart after line supply failure following man. acknowledgment 16: Restart after fault following manual acknowledgment 26: Acknowledging all faults and reclosing for an ON command		
Dependency:	The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted. When using an Operator Panel in the LOCAL mode, then there is no automatic start. For p1210 = 14, 16, a manual acknowledgement is required for an automatic restart. Refer to: p0840 Refer to: F30003		
Danger:	If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is present again. This automatic power-up sequence can only be interrupted by withdrawing the ON command.		
			
Caution:	A change is only accepted and made in the state "initialization" and "wait for alarm". When faults are present, therefore, the parameter cannot be changed. For p1210 > 1, the motor is automatically started.		
Note:	Re p1210 = 1: Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts. Re p1210 = 4: An automatic restart is only performed if fault F30003 has occurred on the power unit. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure. Re p1210 = 6: An automatic restart is carried out if any fault has occurred. Re p1210 = 14: As for p1210 = 4. However, faults that are present must be manually acknowledged. Re p1210 = 16: As for p1210 = 6. However, faults that are present must be manually acknowledged. Re p1210 = 26: The same as for p1210 = 6. For this mode, the switch-on command can be entered with a delay. The restart is interrupted with either OFF2 or OFF3.		

p1211 Automatic restart start attempts / AR start attempts			
Access level: 3	Calculated: -	Data type: Unsigned16	
Can be changed: U, T	Scaling: -	Dyn. index: -	
Units group: -	Unit selection: -	Func. diagram: -	
Min 0	Max 10	Factory setting 3	
Description:	Sets the start attempts of the automatic restart function for p1210 = 4, 6, 14, 16, 26.		

Dependency:	Refer to: p1210 Refer to: F07320
Caution:	A change is only accepted and made in the state "initialization" and "wait for alarm".
Notice:	After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.
Note:	A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized (r0056.4 = 1) and an additional delay time of 1 s has expired. As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning. Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available. At least one start attempt is always carried out. After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented. For p1210 = 26, the start counter is decremented if after a successful fault acknowledgement, the on command is present.

Notice:	A change is only accepted and made in the state "initialization" and "wait for alarm".												
Note:	The faults are automatically acknowledged after half of the delay time has expired and the full delay time. If the cause of a fault is not removed in the first half of the delay time, then it is no longer possible to acknowledge in the delay time.

Description:	Sets the monitoring time of the automatic restart (AR).												
Index:	[0] = Restart [1] = Reset start counter												
Dependency:	Refer to: p1210												
Caution:	A change is only accepted and made in the state "initialization" and "wait for alarm".												

Notice: After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.

Note: Re index 0:
The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is de-activated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present).

In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.

Re index 1:

The start counter is only reset to the starting value p1211 if, after successful restart, the time in p1213[1]. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (black-out) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged.

The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

For p1210 = 26, the fault must have been successfully acknowledged and the switch-on command issued within the time in p1213[0]. Otherwise, fault F07320 is generated after the set time.

p1215 Motor holding brake configuration / Brake config

Access level: 2	Calculated: -	Data type: Integer16
Can be changed: T	Scaling: -	Dyn. index: -
Units group: -	Unit selection: -	Func. diagram: 2701
Min 0	Max 3	Factory setting 0

Description: Sets the holding brake configuration.

Value: 0: No motor holding brake available
3: Motor holding brake like sequence control connection via BICO

Dependency: Refer to: p1216, p1217

Caution: For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.

Notice: If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.

Note: If a holding brake integrated in the motor is used, then it is not permissible that p1215 is set to 3.
if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
The parameter can only be set to zero when the pulses are inhibited.

Description: Sets the time to open the motor holding brake.
After the holding brake has been controlled (opened), the speed setpoint remains at zero for this time. After this, the speed setpoint is enabled.

Dependency: Refer to: p1215, p1217

Note: For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

	Units group: -	Unit selection: -	Func. diagram: 2701
	Min 0 [ms]	Max 10000 [ms]	Factory setting 100 [ms]
Description:	Sets the time to apply the motor holding brake. After OFF1 or OFF3 and the controlling (closing) of the holding brake, the drive remains stationary under closed-loop control for this time with a speed setpoint of zero. The pulses are suppressed when the time expires.		
Dependency:	Refer to: p1215, p1216		
Notice:	If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.		
Note:	For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

Description:	Setting to activate DC braking.		
Value:	0: No function 4: DC braking 5: DC braking for OFF1/OFF3 14: DC braking below starting speed		
Dependency:	Refer to: p0300, p1232, p1233, p1234, r1239		
Note:	The function can only be used for induction motors (p0300 = 1). Re p1231 = 4: The function is activated as soon as the activation criterion is fulfilled. - the function can be superseded by an OFF2 response. Activation criterion (one of the following criteria is fulfilled): - binector input p1230 = 1 signal (DC braking activation, depending on the operating mode). - the drive is not in the state "S4: Operation" or in "S5x". - the internal pulse enable is missing (r0046.19 = 0). DC braking can only be withdrawn (p1231 = 0) if it is not being used as a fault response in p2101.		

Re p1231 = 5:

DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely. Flying restart must be activated if the motor is still rotating.

DC braking by means of fault response continues to be possible.

Re p1231 = 14:

In addition to the function for p1231 = 5, binector input p1230 is evaluated.

DC braking is only automatically activated when the speed threshold p1234 is fallen below if at binector input p1230 = 1 signal. This is also the case, if no OFF command is present.

After demagnetization and after the time in p1233 has expired, the drive changes back into normal operation or is switched-off (for OFF1/OFF3).

If a 0 signal is applied to binector input p1230, for OFF1 and OFF3 no DC braking is executed.

	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 10.00 [rpm]
Description:	Sets the lower speed threshold for the Vdc_max controller. When this speed threshold is undershot, the Vdc_max control is switched out and the speed is controlled using the ramp-function generator.

This is supported using a dynamic setting of the speed controller.

Description:	Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.		
Value:	0: Inhib Vdc ctrl 1: Enable Vdc_max controller		
Note:	For high input voltages (see p0210), the following settings can improve the degree of ruggedness of the Vdc_max controller: - Set the input voltage p0210 as low as possible (in so doing avoid A07401). - Set the rounding times (p1130, p1136). - Increase the ramp-down times (p1121). - Reduce the integral time of the controller (p1291) (factor 0.5). - Reduce the rate time of the controller (p1292) (factor 0.5). In this case, we generally recommend to use vector control (p1300 = 20) (Vdc controller, see p1240). The following measures are suitable to improve the Vdc_min controller: - Optimize the Vdc_min controller (see p1287). If a braking resistor is connected to the DC link (p0219 > 0), then the Vdc_max control is automatically deactivated.

Description:	Sets the open and closed-loop control mode of a drive.		

List of parameters

Value:	0: U/f control with linear characteristic 1: U/f control with linear characteristic and FCC 2: U/f control with parabolic characteristic 3: U/f control with parameterizable characteristic 4: U/f control with linear characteristic and ECO 5: U/f control for drives requiring a precise freq. (e.g. textiles) 6: U/f control for drives requiring a precise frequency and FCC 7: U/f control for a parabolic characteristic and ECO 19: U/f control with independent voltage setpoint 20: Speed control (encoderless)
Dependency:	Only operation with U/f characteristic is possible if the rated motor speed is not entered (p0311). Operation with a U/f characteristic is not supported for 1LE4 synchronous motors. Refer to: p0300, p0311, p0500
Notice:	Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%). The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed.
Note:	For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I _{max} frequency controller are switched off internally so that the output frequency can be set precisely. The I _{max} voltage controller remains active. During operation (the pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

	03	Motor holding brake with constant stop frequency	Yes	No	-

p1310[0...n] Voltage boost permanent / U_boost perm

Access level: 2	Calculated: -	Data type: FloatingPoint32
Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
Units group: -	Unit selection: -	Func. diagram: 1690, 6300
Min 0.0 [%]	Max 250.0 [%]	Factory setting 50.0 [%]

Description: Defines the voltage boost as a [%] referred to the rated motor current (p0305).
The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present.
The magnitude of the boost in Volt at a frequency of zero is defined as follows:
Voltage boost [V] = 1.732 x p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1310 (permanent voltage boost [%]) / 100 %
At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following:
- magnetize the induction motor.
- hold the load.
- compensate for losses in the system.
This is the reason that the output voltage can be increased using p1310.
The voltage boost can be used for both linear as well as square-law U/f characteristics.

Dependency: The current limit p0640 limits the boost.
For vector control, the permanent voltage boost (p1310) has no effect as the drive converter automatically sets the optimum operating conditions.
Refer to: p1300, p1311, p1312, r1315

Notice: The voltage boost increases the motor temperature (particularly at zero speed).

Note: The voltage boost is only effective for U/f control (p1300).
The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)).
However, these parameters are assigned the following priorities: p1310 > p1311, p1312

p1311[0...n] Voltage boost at acceleration / U_boost accelerate

Access level: 2	Calculated: -	Data type: FloatingPoint32
Can be changed: U, T	Scaling: -	Dyn. index: DDS, p0180
Units group: -	Unit selection: -	Func. diagram: 1690, 6300
Min 0.0 [%]	Max 250.0 [%]	Factory setting 0.0 [%]

Description: p1311 only results in a voltage boost when accelerating and generates a supplementary torque to accelerate the load.
The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed.
The magnitude of the boost in Volt at a frequency of zero is defined as follows:
Voltage boost [V] = 1.732 * p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1311 (voltage boost when accelerating [%]) / 100 %

Dependency: The current limit p0640 limits the boost.
Refer to: p1300, p1310, p1312, r1315

Notice: The voltage boost results in a higher motor temperature increase.

Note: The voltage boost when accelerating can improve the response to small, positive setpoint changes.
Assigning priorities for the voltage boosts: refer to p1310

Description: Setting for an additional voltage boost when powering-up, however, only for the first acceleration phase.
The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed.

Dependency: The current limit p0640 limits the boost.
Refer to: p1300, p1310, p1311, r1315

Notice: The voltage boost results in a higher motor temperature increase.

Note: The voltage boost when accelerating can improve the response to small, positive setpoint changes.

Units group: -	Unit selection: -	Func. diagram: 1690, 6310

0.0 [%]	600.0 [%]	0.0 [%]	
Description:	Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip). p1335 = 0.0 %: Slip compensation de-activated. p1335 = 100.0 %: The slip is completely compensated.		
Dependency:	Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335. For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.		
Note:	The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors. For synchronous motors, this effect does not occur and the parameter has no effect in this case. For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency. If p1335 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

Description:	Sets the gain for resonance damping for U/f control.		
Dependency:	Refer to: p1300, p1349		
Note:	The resonance damping function dampens active current oscillations that frequency occur under no-load conditions. The resonance damping is active in a range from approximately 6 % of the rated motor frequency (p0310). The shutoff frequency is determined by p1349. For the open-loop control modes p1300 = 5 and 6 (textile sectors), the resonance damping is internally disabled in order that the output frequency can be precisely set.

	Units group: -	Unit selection: -	Func. diagram: 1690
	Min 0.000	Max 0.500	Factory setting 0.000
Description:	Sets the proportional gain of the I_max frequency controller. The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time).		
Dependency:	In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used.		
Notice:	When de-activating the I_max controller, the following must be carefully observed: When the maximum current (r0067) is exceeded, the output current is no longer reduced, however, overcurrent alarm messages are generated. The drive is shut down if the overcurrent limit (r0209) is exceeded.		
Note:	p1341 = 0: I_max frequency controller de-activated and I_max voltage controller activated over the complete speed range.

Description: Sets the scaling for the acceleration pre-control of the speed/velocity controller.

Dependency: Refer to: p0341, p0342

Warning:

The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0).

The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).

Note: The parameter is set to 100% by the rotating measurement (refer to p1960).

The acceleration pre-control may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled.

We also recommend that the pre-control mode is not used if there is gearbox backlash.

Description:	Sets the efficiency optimization. When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load. For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.		
Note:	It only makes sense to activate this function if the dynamic response requirements of the speed controller are low. 	Min -200.0 [%]	Max 200.0 [%]	Factory setting 50.0 [%]
Description:	Sets the static torque setpoint for sensorless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque. For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.		
Notice:	p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur.		
Note:	For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current). For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque. Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors.

Description:	Enters the dynamic torque setpoint for the low-speed range for sensorless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque.		
Note:	When accelerating and braking p1611 is added to p1610 and the resulting total torque is converted into an appropriate current setpoint and controlled. For pure accelerating torques, it is always favorable to use the torque pre-control of the speed controller (p1496).

Description:	Sets the speed activation threshold (referred to the synchronous speed) for pure quadrature branch operation of the closed-loop current control. The d current controller is only effective as P controller for speeds greater than the threshold value.		
Warning:	For settings above 80%, the d current controller is active up to the field weakening limit. When operated at the voltage limit, this can result in an unstable behavior. In order to avoid this, the dynamic voltage reserve p1574 should be increased.

List of parameters

Induction motor (ASM): Rs, Lh, and offset compensation.

Permanent magnet synchronous motor (PEM): kT

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	Select motor model ASM Rs adaptation	Yes	No	-
	02	Select motor model ASM Lh adaptation	Yes	No	-
	03	Select motor model PEM kT adaptation	Yes	No	-
	04	Select motor model offset adaptation	Yes	No	-
	06	Select pole position identification PEM encoderless	Yes	No	-
	07	Select T(valve) with Rs adaptation	Yes	No	-
	10	Filter time combination current like current ctrl integral time	Yes	No	-

Dependency: In U/f characteristic operating mode only bit 7 is relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

Note: ASM: Induction motor

PEM: Permanent magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using bit 0 ... bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered for each different motor.

Description: Sets the pulse frequency for the converter.

This parameter is pre-set to the rated converter value when the drive is first commissioned.

Dependency: Refer to: p0230

Note: The maximum possible pulse frequency is also determined by the power unit being used.
 When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).
 If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter.
 For operation with output reactors, the pulse frequency is limited to 4 kHz (see p0230).
 If p1800 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

Value: 0: Automatic changeover SVM/FLB
 2: Space vector modulation (SVM)
 3: SVM without overcontrol
 4: SVM/FLB without overcontrol
 10: SVM/FLB with modulation depth reduction
Dependency: If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only space vector modulation without overcontrol can be selected as modulation type (p1802 = 3). This does not apply to power units PM260.
 p1802 = 10 can only be set for power units PM230 and PM240 and for r0204.15 = 0.
 Refer to: p0230, p0500
Note: When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 2, 10), the modulation depth must be limited using p1803 (default, p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.

Description:	Sets the motor data identification and speed controller optimization. The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960). p1900 = 0: Function inhibited. p1900 = 1: Sets p1910 = 1 and p1960 = 0, 1 depending on p1300 When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.		

With the following power-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.

p1900 = 2:

Sets p1910 = 1 and p1960 = 0

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

p1900 = 3:

Sets p1960 = 0, 1 depending on p1300

This setting should only be selected if the motor data identification was already carried out at standstill.

When the drive enable signals are present, with the next power-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

Value:

0: Inhibited

 2: Identify motor data at standstill
 3: Identify motor data with motor rotating

Dependency:

Notice:

p1900 = 3:

This setting should only be selected if the motor data identification was already carried out at standstill.

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).

During the rotating measurement it is not possible to save the parameter (p0971).

For p0014 = 1, the following applies:

After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note:

The motor and control parameters are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating).

An appropriate alarm is output when the parameter is set.

The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

Caution:	After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next power-on command: - current flows through the motor and a voltage is present at the drive converter output terminals. - during the identification routine, the motor shaft can rotate through a maximum of half a revolution. - however, no torque is generated.
Notice:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971).
Note:	When setting p1910, the following should be observed: 1. "With acceptance" means: The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting. 2. "Without acceptance" means: The identified parameters are only displayed in the service parameter range. The controller settings remain unchanged.

Description:	Sets the rotating measurement. The rotating measurement is carried out after the next power-on command. The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300). p1300 < 20 (U/f open-loop control): It is not possible to select rotating measurement or speed controller optimization. p1300 = 20, 22 (encoderless operation): Only rotating measurement or speed controller optimization can be selected in the encoderless mode.		
Value:	0: Inhibited 1: Rotating measurement in encoderless operation 3: Speed controller optimization in encoderless operation		
Dependency:	Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done. When selecting the rotating measurement, the drive data set changeover is suppressed. Refer to: p1300, p1900, p1959		
Danger:	For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.		
			
Notice:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971). During the rotating measurement it is not possible to save the parameter (p0971).		
Note:	When the rotating measurement is activated, it is not possible to save the parameters (p0971). Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made. The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.

Description:

All speeds or frequencies specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number)

Dependency:

This parameter is only updated during the automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning was carried out beforehand for drive data set zero. This means that the parameter is not locked against overwriting using p0573 = 1.

Refer to: p2001, p2002, p2003, r2004, r3996

Notice:

When the reference speed / reference frequency is changed, short-term communication interruptions may occur.

Note: If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example 1:

The signal of an analog input (e.g. r0755[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000).

Example 2:

The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

Description:	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). Note: This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.		
Dependency:	p2001 is only updated during automatic calculation (p0340 = 1, p3900 > 0) if motor commissioning has been carried out first for drive data set zero and as a result overwriting of the parameter has not been blocked by setting p0573 = 1. Refer to: r3996		
Notice:	When the reference voltage is changed, short-term communication interruptions may occur.		
Note:	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.

Notice:	If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor must be taken into account. Example: p2002 = 100 A Reference quantity 100 A corresponds to 100 %		

p0305[0] = 100 A
 Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current
 p0305[1] = 50 A
 Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current
 When the reference current is changed, short-term communication interruptions may occur.

Note:

Preassigned value is p0640.
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
 For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage ($p2002 = r0206 / p0210 / 1.73$) is pre-assigned as the reference quantity.
 Example:
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

Closed-loop control: Calculated from torque times speed.

Refer to: p2000, p2001, p2002, p2003

Note:

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

The reference power is calculated as follows:
 - $2 * \text{Pi} * \text{reference speed} / 60 * \text{reference torque (motor)}$
 - $\text{reference voltage} * \text{reference current} * \text{root}(3)$ (infeed)

Re value = 2 (OFF2):
Internal/external pulse inhibit.

Re value = 3 (OFF3):
Braking along the OFF3 down ramp followed by a pulse inhibit.

Re value = 5 (STOP2):

Re value = 6 (armature short-circuit, internal/DC braking):
This value can only be set for all drive data sets when p1231 = 4.

a) DC braking is not possible for synchronous motors.
b) DC braking is possible for induction motors.

Note:

Re bit 03, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present"/"alarm present" has occurred, a change in the buffer was also detected (r0944, r9744).

Re bit 06, 08:

These status bits are used for internal diagnostic purposes only.

Re bit 11, 12:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

	03	Non-volatile data save active for p2230.0 = 1	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-
Dependency:	Refer to: r2231, p2240				
Notice:	For p0014 = 1, the following applies: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.				
Note:	Re bit 00: 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240. 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.				

Re bit 02:

0: Without initial rounding-off

1: With initial rounding-off.

The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).

It is calculated as follows:

$$r = 0.0001 \times \max(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$

The jerk is effective until the maximum acceleration is reached ($a_{\max} = p2237 [\%] / p2247 [s]$ or $a_{\max} = p2238 [\%] / p2248 [s]$), after which the drive continues to run linearly with constant acceleration.

The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:

0: Non-volatile data save de-activated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).

Re bit 04:

When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

Description:	Sets the integral time (I component, integrating time constant) of the technology controller.		
Notice:	The following applies for p2251 = 0: If the output of the technology controller lies within the range of a suppression (skip) bandwidth (p1091 ... p1092, p1101) or below the minimum speed (p1080), the integral component of the controller is held so that the controller temporarily works as a P controller. This is necessary in order to prevent the controller from behaving in an unstable manner, as the ramp-function generator switches to the parameterized up and down ramps (p1120, p1121) at the same time in order to avoid setpoint steps. This state can be exited or avoided by changing the controller setpoint or by using the start speed (= minimum speed).		
Note:	When the controller output reaches the limit, the I component of the controller is held. p2285 = 0: The integral time is disabled and the I component of the controller is reset.

0.00 [%]	200.00 [%]	0.00 [%]	

Description: Sets the start value for the output of the technology controller.

If the drive is switched on and the technology controller is already enabled (see p2200, r0056.3), then its output signal r2294 first goes to the start value p2302, before the controller starts to operate.

Dependency: The starting value is only effective in the mode "technology controller as main speed setpoint" (p2251 = 0).

If the technology controller is first enabled when the drive is switched on, a start speed remains ineffective, and the controller output starts with the actual setpoint speed of the ramp-function generator.

Note: If the technology controller operates on the speed/setpoint channel (p2251 = 0), then the starting value is interpreted as the starting speed and when operation is enabled, is connected to the output of the technology controller (r2294).

If fault F07426 "technology controller actual value limited" occurs while ramping up to the starting value and if the associated reaction has been set to "NONE" (see p2100, p2101), the starting value is kept as the speed setpoint instead of a switch to closed-loop control operation.

	Can be changed: T	Scaling: -	Dyn. index: -

Description:	Setting to invert the fault signal of the technology controller. The setting depends on the type of control loop.		
Value:	0: No inversion 1: Inversion		
Caution:	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!		
			
Note:	The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal (of the technology controller). - if the actual value increases with increasing motor speed, then the inversion should be switched out. - if the actual value decreases with increasing motor speed, then the inversion should be set. If value = 0: The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor). If value = 1: The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

	Can be changed: U, T	Scaling: -	Dyn. index: -

	Min 0	Max 2	Factory setting 0
Description:	Sets the response of the technology controller to the occurrence of fault F07426 (technology controller actual value limited). The fault response is executed if status bit 8 or 9 in the technology controller status word r2349 is set. If both status bits are zero, a switch back to technology controller operation will follow.		
Value:	0: Function inhibited 1: On fault: Changeover to r2344 (or p2302) 2: On fault: Changeover to p2215		

- Dependency:** The parameterized fault response is only effective if the technology controller mode is set to p2251 = 0 (technology controller as main setpoint).
Refer to: p2267, p2268, r2344
Refer to: F07426
- Notice:** Dependent upon the application, the changing over of the setpoint when fault F07426 occurs can lead to the fault condition disappearing and the re-activation of the technology controller. This can repeat itself and cause limit oscillations. In this case, a different fault response or a different fixed setpoint 15 for the fault response p2345 = 2 should be selected.
- Note:** The parameterized fault response can only be achieved if the default fault response of the technology controller fault F07426 is set to "NONE" (see p2100, p2101). If a fault response other than "NONE" is entered in p2101 for F07426, p2345 must be set to zero.
If the fault occurs during ramping up to the starting setpoint p2302, this starting setpoint is retained as the final value (there is no changeover to the fault response setpoint).

	Units group: -	Unit selection: -	Func. diagram: -	
	Min	Max	Factory setting	
	0.00 [%]	250.00 [%]	0.00 [%]	
Description:	Compound braking current is used to define the amount of DC current that is produced on stopping the motor during U/f operation to further increase the DC brake function. Compound braking is a superimposition of the DC brake function with regenerative braking (net braking along the ramp) after OFF1 or OFF3. This permits braking with controlled motor frequency and minimum power input into the motor. Effective braking without using additional hardware components is obtained by optimizing the ramp down time and compound braking.			

- Dependency:** The compound braking current is only activated if the DC link voltage exceeds the threshold value in r1282. Compound braking does not operate:
- when DC braking is active (refer to p1230, r1239)
 - as long as the motor is not magnetized (e.g. for flying restart)
 - for vector control (p1300 >= 20)
 - for synchronous motors (p0300 = 2xx)
- Caution:** Generally, increasing the braking current improves the braking effect when stopping the motor. However, if the value is set too high, then the drive can be tripped (shut down) as a result of overcurrent or ground fault. Recommendation: $p3856 < 100 \% \times (r0209 - r0331) / p0305 / 2$
- Compound braking generates a current in the motor with a ripple manifesting the rotational frequency. The higher the braking current is set, the higher the resulting ripple, especially when the Vdc(max) control is simultaneously active (refer to p1280).
- Note:** The parameter value is entered relative to the rated motor current (p0305). Compound braking is deactivated with $p3856 = 0\%$.

Description: Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning.

p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning.

The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p15 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p15 and p1500 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1.

Value:

- 0: No quick parameterization
- 1: Quick parameterization after parameter reset
- 2: Quick parameterization (only) for BICO and motor parameters
- 3: Quick parameterization for motor parameters (only)

Notice: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

If a catalog motor has not been selected (p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time:

induction motor: p0320, p0352, p0362 ... p0369, p0604, p0605

Re bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

Re bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765 = 1.

Description: Displays the Pre-defined Error Field of the CAN node.

It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history.

The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code.

Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code.

CANopen error code:

0000 hex: No error present

8110 hex: Alarm A08751 present

8120 hex: Alarm A08752 present

8130 hex: Alarm A08700(F) with alarm value = 2 present

1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799)

1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700)

List of parameters

All drive objects are acknowledged by writing the value 0 to the index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

Index:

	Can be changed: T	Scaling: -	Dyn. index: -
	Units group: -	Unit selection: -	Func. diagram: -
	Min	Max	Factory setting
	1	127	126

Description: Display or setting of the CANopen Node ID.
 The Node ID can be set as follows:
 1) Using the address switch on the Control Unit.
 --> p8620 can then only be read and displays the selected Node ID.
 --> A change only becomes effective after a POWER ON.
 --> CANopen Node ID and PROFIBUS address are identical.
 2) Using p8620
 --> Only if address 0 is set using the address switch.
 --> the Node ID is set as standard to 126.
 --> A change only becomes effective after save and POWER ON.

Dependency: Refer to: r8621

Notice: For p0014 = 1, the following applies:
 After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.
 For p0014 = 0, the following applies:
 Before a changed setting becomes permanently effective, a non-volatile RAM to ROM data save is required. To do this, set p0971 = 1 or p0014 = 1.

Note: Every node ID change only becomes effective after a POWER ON.
 The active node ID is displayed in r8621.
 The parameter is not influenced by setting the factory setting.
 It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (pre-requisite: the address 0 is set for the address switch).

Re bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

Re bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

	Can be changed: T	Scaling: -	Dyn. index: -
	Units group: -	Unit selection: -	Func. diagram: -
	Min 0	Max 100	Factory setting 0
Description:	Setting and display when memory card is "removed safely". Procedure: Setting p9400 = 2 results in a value of 3 --> The memory card can be removed safely. After removal the value sets itself to 0 automatically. Setting p9400 = 2 results in a value of 100 --> The memory card cannot be removed safely. Removal may destroy the file system on the memory card. It may be necessary to set p9400 = 2 again.		
Value:	0: No memory card inserted 1: Memory card inserted 2: Request "safe removal" of the memory card 3: "Safe removal" possible 100: "Safe removal" not possible due to access		
Dependency:	Refer to: r9401		
Notice:	Removing the memory card without a request (p9400 = 2) and confirmation (p9400 = 3) may destroy the file system on the memory card. The memory card will then no longer work properly and must be replaced.		
Note:	The status when the memory card is being "removed safely" is shown in r9401. Re value = 0, 1, 3, 100: These values can only be displayed, not set.

p9850	SI F-DI changeover tolerance time (processor 2) / SI F-DI_chg tol P2		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(95)	Scaling: -	Dyn. index: -
	Units group: -	Unit selection: -	Func. diagram: 2810
	Min 0.00 [µs]	Max 2000000.00 [µs]	Factory setting 500000.00 [µs]

Description: Sets the tolerance time for the changeover of the failsafe digital input for STO on processor 2.
An F-DI changeover is not effective simultaneously due to the different runtimes in the two monitoring channels.
After an F-DI changeover, dynamic data is not subject to a crosswise data comparison during this tolerance time.

Dependency: Refer to: p9650

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For a crosswise data comparison between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated.

The parameterized time is rounded internally to an integer multiple of the monitoring clock cycle.

F-DI: Failsafe Digital Input

p9851	SI STO debounce time (processor 2) / SI STO t_debou P2		
	Access level: 3	Calculated: -	Data type: FloatingPoint32
	Can be changed: C(95)	Scaling: -	Dyn. index: -
	Units group: -	Unit selection: -	Func. diagram: -
	Min 0.00 [µs]	Max 100000.00 [µs]	Factory setting 0.00 [µs]

Description: Sets the debounce time for the failsafe digital inputs used to control the "STO" function.

The debounce time is rounded to whole milliseconds.

Dependency: Refer to: p9651

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: Rounding effects can occur in the last decimal place of the parameterized time.

The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

Symbols for computational and closed-loop control functions

Threshold value switch 1/0

Outputs at y a logical "1" if $x < S$.

Threshold value switch 0/1

Outputs at y a logical "1" if $x > S$.

Threshold value 1/0 with hysteresis

Outputs a logical "1" at y if $x < S$.
If $x \geq S + H$ then y returns to 0.

Threshold value 0/1 with hysteresis

Outputs a logical "1" at y if $x > S$.
If $x \leq S - H$ then y returns to 0.

Limiter

x is limited to the upper limit LU and the lower limit LL and output at y.
The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

Sample & Hold element

Sample and hold element.
 $y = x$ if SET = 1
(not retentively saved at POWER OFF)

Symbols for logic functions

Logical inversion

AND element with logical inversion of an input signal

OR element

Exclusiv-OR/XOR

$y = 1$ when $x1 \neq x2$ is.

R/S flip-flop

S = setting input
R = reset input
Q = non-inverted output
Q-bar = inverted output

Symbols for computational and closed-loop control functions

Sign reversal

$y = -x$

Absolute value generator

$y = |x|$

Divider

$y = \frac{x1}{x2}$

Comparator

Output y = a logical "1", if the analog signal $x > 0$, i.e. is positive.

Differentiator

$y = \frac{dx}{dt}$

Switch-on delay

The digital signal x must have the value "1" without any interruption during the time T before output y changes to "1".

Switch-off delay

The digital signal x must have the value "0" without interruption during the time T before output y changes to "0".

Delay (switch-on and switch-off)

The digital signal x must have the value "1" without interruption during time T1 or must have the value "0" during time T2 before output y changes its signal state.

Switch symbol

Simple changeover switch

The switch position is shown according to the factory setting (in this case, switch position 1 in the default state on delivery).

PT1 element

Delay element, first order.
 pxxxx = time constant

PT2 low pass

Natural frequency, denominator f_{n_n} pxxxx
 Damping, denominator D_n pxxxx

Transfer function

$$H(s) = \frac{1}{\left(\frac{s}{2\pi f_{n_n}}\right)^2 + \frac{2 \cdot D_n}{2\pi f_{n_n}} \cdot s + 1}$$

2nd-order filter (bandstop/general filter)

Natural frequency, numerator f_{n_z} pxxxx
 Damping, numerator D_z pxxxx

Natural frequency, denominator f_{n_n} pxxxx
 Damping, denominator D_n pxxxx

Used as bandstop filter

- center frequency $f_s: f_{n_z} = f_s$
- bandwidth $f_B: D_z = 0$
 $D_n = \frac{f_B}{2 \cdot f_s}$

Transfer function when used as general filter

$$H(s) = \frac{\left(\frac{s}{2\pi f_{n_z}}\right)^2 + \frac{2 \cdot D_z}{2\pi f_{n_z}} \cdot s + 1}{\left(\frac{s}{2\pi f_{n_n}}\right)^2 + \frac{2 \cdot D_n}{2\pi f_{n_n}} \cdot s + 1}$$

Analog adder can be activated

The following applies to I = 1 signal: $y = x_1 + x_2$
 The following applies to I = 0 signal: $y = x_1$

Handling BICO technology

Binector:  r0723.15

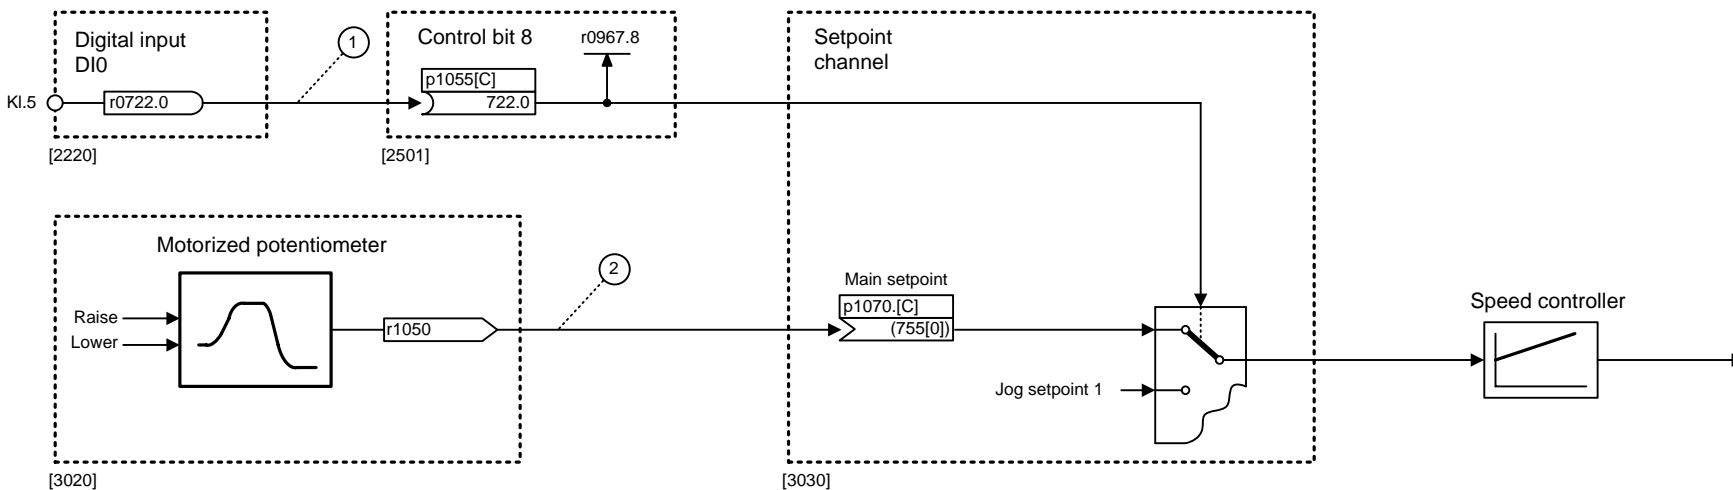

Connector:  r0723
 Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques).
 Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
 "Bl:" parameter for binectors (Bl = Binector Input)
 or
 "Cl:" parameter for connectors (Cl = Connector Input)

Example:

The main setpoint for the Speed controller (Cl: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (Bl: p1055) from Digital Input DI0 (BO: r0722.0, Terminal 5 (Kl. 5)) on the CU.

Parameterizing steps:

- ① p1055[0] = 722.0 Terminal 5 (Kl. 5) acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

- <1> In order to maintain the PROFdrive profile, receive word 1 must be used as control word (STW1) (due to bit 10 "control requested").
- Using the connector-binector converters, the bits can be extracted from two of the PZD receive words 3 to 8 and used as binectors.
- <2> The following representation applies for words: 4000 hex = 100 %.
- <3> The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).
- <4> The following applies for temperature values: 100° C -> 100 % = 4000 hex, 0° C -> 0 %.
- <5> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters r2050 or r2060 can have a value <> 0 for a PZD word.
- <6> When interconnecting a connector output multiple times all the connector inputs must have either Integer or FloatingPoint data type.

- <1> Motor holding brake configuration (p1215)
0 = No motor holding brake being used.
1 = Motor holding brake acc. to sequence control.
2 = Motor holding brake always released.
3 = Motor holding brake like sequence control, connection via BICO.
- <2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
- <3> If p1215 = 0, 2 -> t = 0 ms.
- <4> Only if Safety Integrated is active.
- <5> Monitoring time is initialized in dependence on the rated power of Power Module.
- <6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
- <7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or switching on inhibited).
r0046.21 = 1, if p0858 = 1 or p0856 = 0.
The signal generation is shown simplified.
- <8> The internal signal includes signals that lead to OFF1 or OFF3 (e. g. BICO or fault response).
- <9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.
- <10> Start frequency with U/f control: p1351, p1352 [6310.6]; Start torque with vector control: p1475 [6040.3]

3.1 Overview of faults and alarms

3.1.1 General information

Display of faults/alarms (messages)

If a fault occurs, the drive indicates the fault and/or alarm.

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET
- Display online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Tabelle 3-1 Differences between faults and alarms

Type	Description
<p>Faults</p>	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault reaction is initiated. • Status signal ZSW1.3 is set. • The fault is entered in the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
<p>Alarms</p>	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered in the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.

Fault reactions

The following fault reactions are defined:

Tabelle 3-2 Fault reactions

List	PROFI-drive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs.</p> <p>Note: With the "Basic positioner" (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p>Closed loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> • n_set = 0 is input immediately to brake the drive along the ramp-function generator deceleration ramp (p1121). • When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. <p>Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired.</p> <p>Torque control (p1300 = 22, 23)</p> <ul style="list-style-type: none"> • The following applies to closed-loop torque control mode: Reaction as for OFF2 • When the system switches to torque control with p1501, the following applies: No separate braking reaction. <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault reaction only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>
OFF2	COAST STOP	Internal/external pulse inhibit	<p>Closed-loop speed and torque control</p> <ul style="list-style-type: none"> • Instantaneous pulse suppression, the drive "coasts" to a standstill. • The motor holding brake (if one is being used) is closed immediately. • Switching on inhibited is activated.

Tabelle 3-2 Fault reactions, continued

List	PROFI-drive	Reaction	Description
OFF3	QUICK STOP	Brake along the OFF3 down ramp followed by pulse inhibit	<p>Closed loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 down ramp (p1135). When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the brake application time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired. Switching on inhibited is activated. <p>Torque control (p1300 = 22, 23)</p> <ul style="list-style-type: none"> Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.
STOP1	-	-	Under development.
STOP2	-	n_set = 0	<ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 down ramp (p1135). The drive remains in speed control mode.
IASC/ DCBRAKE	-	-	<ul style="list-style-type: none"> For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed. For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1230 to p1239).
ENCODER	-	Internal/external pulse inhibit (p0491)	<p>The fault reaction ENCODER is applied as a function of the setting in p0491.</p> <p>Factory setting: p0491 = 0 --> Encoder fault causes OFF2</p> <p>Notice: When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.</p>

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Tabelle 3-3 Acknowledgement of faults

Acknowledge-ment	Description
POWER ON	<p>The fault is acknowledged by a POWER ON process (switch drive unit off and on again).</p> <p>Note: If this action has not eliminated the fault cause, the fault is displayed again immediately after power-up.</p>
IMMEDIATELY	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Acknowledge by setting parameter: p3981 = 0 --> 1</p> <p>2 Acknowledge via binector inputs:</p> <p>p2103 BI: 1. Acknowledge faults p2104 BI: 2. Acknowledge faults p2105 BI: 3. Acknowledge faults</p> <p>3 Acknowledge using PROFIBUS control signal: STW1.7 = 0 --> 1 (edge)</p> <p>Note:</p> <ul style="list-style-type: none"> • These faults can also be acknowledged by a POWER ON operation. • If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment. • Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged.
PULSE INHIBIT	<p>The fault can only be acknowledged with a pulse inhibit (r0899.11 = 0). The same possibilities are available for acknowledging as described under acknowledge IMMEDIATELY.</p>

3.1.2 Explanation of the list of faults and alarms

The data in the following example has been chosen at random. The information listed below is the maximum amount of information that a description can contain: Some of the information is optional.

The list of faults and alarms (See Section 3.2) is structured as follows:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name
Reaction:	NONE
Acknowledgment:	NONE
Cause:	Description of possible causes Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional)
Remedy:	Description of possible remedies

----- **End of example** -----

- Axxxxx** **Alarm xxxxx**
- Axxxxx (F, N)** **Alarm xxxxx (message type can be changed to F or N)**
- Fxxxxx** **Fault xxxxx**
- Fxxxxx (A, N)** **Fault xxxxx (report type can be changed to A or N)**
- Nxxxxx** **No message**
- Nxxxxx (A)** **No message (message type can be changed to A)**
- Cxxxxx** **Safety message (separate message buffer)**

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm".
- F means "Fault".
- N means "No message" or "Internal message".
- C means "Safety message"

The optional parentheses indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgement for F).

Note:

You can change the default properties of a fault or alarm by setting parameters.

References: /BA7/ SINAMICS G120 Operating Instructions
SINAMICS G120C Frequency Converter,
Section "Alarms, faults, and system messages"

The list of faults and alarms (see Section 3.2) provides information in relation to the properties of a message that have been set as standard. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note:

See Table 3-2

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note:

See Table 3-3

Cause:

Describes the possible causes of the fault/alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

Remedy:

Description of the methods available for eliminating the cause of the active fault/alarm

Alarm

In certain cases, servicing and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

F01030	Sign-of-life failure for master control
Reaction:	OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	For active PC master control, no sign-of-life was received within the monitoring time. The master control was returned to the active BICO interconnection.

Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
 For the commissioning software, the monitoring time is set as follows:
 <Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
 Notice:
 The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

F01054	CU: System limit exceeded
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	At least one system overload has been identified. Fault value (r0949, interpret decimal): 1: Computing time load too high (r9976[1]). 5: Peak load too high (r9976[5]). As long as this fault is present, it is not possible to save the parameters (p0971). See also: r9976 (System utilization)
Remedy:	Re fault value = 1, 5: - reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %. - check the sampling times and adjust if necessary (p0115, p0799, p4099). - de-activate function modules. - de-activate drive objects. - remove drive objects from the target topology. - note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology. When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies - the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS). - if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001). - if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

A01066	Buffer memory: 70% fill level reached or exceeded
Reaction:	NONE
Acknowledge:	NONE
Cause:	The non-volatile buffer memory for parameter changes is filled to at least 70%. This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.
Remedy:	If required, de-activate and clear the buffer memory (p0014 = 0). If required, clear the buffer memory (p0014 = 2). In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared: - p0971 = 1 - power down/power up the Control Unit
A01067	Buffer memory: 100 % fill level reached
Reaction:	NONE

Cause:	The non-volatile buffer memory for parameter changes is filled to 100%. All additional parameter changes will no longer be taken into account in the non-volatile buffer memory. However, parameter changes can still be made in the volatile memory (RAM). This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.
Remedy:	If required, de-activate and clear the buffer memory (p0014 = 0). If required, clear the buffer memory (p0014 = 2). In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared: - p0971 = 1 - power down/power up the Control Unit

F01068	CU: Data memory memory overflow

F01072	Memory card restored from the backup copy
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective. After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.
Remedy:	Check that the firmware and parameterization is up-to-date.
A01073	POWER ON required for backup copy on memory card
Reaction:	NONE
Acknowledge:	NONE
Cause:	The parameter assignment on the visible partition of the memory card has changed. In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit. Note: It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).

F01340 Topology: Too many components on one line

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.
Fault value (r0949, interpret hexadecimal):
xyy hex: x = fault cause, yy = component number or connection number.
1yy:
The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.
2yy:
The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.
3yy:
Cyclic communication is fully utilized.
4yy:
The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.
The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.
5yy:
Internal buffer overflow for net data of a DRIVE-CLiQ connection.
6yy:
Internal buffer overflow for receive data of a DRIVE-CLiQ connection.
7yy:
Internal buffer overflow for send data of a DRIVE-CLiQ connection.

8yy:
The component clock cycles cannot be combined with one another
900:
The lowest common multiple of the clock cycles in the system is too high to be determined.
901:
The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.

Remedy:

- check the DRIVE-CLiQ connection.
 - Reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.
- Re fault value = 1yy - 4yy in addition:
- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.
 - if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).
 - reduce the function modules (r0108).
 - establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the order number)).
 - For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.
- Re fault value = 8yy in addition:
- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.
- Re fault value = 9yy in addition:
- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.

F01505 (A) BICO: Interconnection cannot be established

Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: A PROFIdrive telegram has been set (p0922).
 An interconnection contained in the telegram was not able to be established.
 Fault value (r0949, interpret decimal):
 Parameter receiver that should be changed.
Remedy: Establish another interconnection.

F01510 BICO: Signal source is not float type

Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The requested connector output does not have the correct data type. This interconnection is not established.
 Fault value (r0949, interpret decimal):
 Parameter number to which an interconnection should be made (connector output).
Remedy: Interconnect this connector input with a connector output having a float data type.

F01511 (A) BICO: Interconnection with different scalings

Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.
 - the BICO output has different normalized units than the BICO input.
 - message only for interconnections within a drive object.
 Example:
 The BICO output has, as normalized unit, voltage and the BICO input has current.
 This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.
 p2002: contains the reference value for current
 p2001: contains the reference value for voltage
 Fault value (r0949, interpret decimal):
 Parameter number of the BICO input (signal sink).
Remedy: Not necessary.

F01512	BICO: No scaling available
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	An attempt was made to determine a conversion factor for a scaling that does not exist. Fault value (r0949, interpret decimal): Unit (e.g. corresponding to SPEED) for which an attempt was made to determine a factor.
Remedy:	Apply scaling or check the transfer value.
F01513 (N, A)	BICO: Interconnection cross DO with different scalings
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Example 2: BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input. p2001: contains the reference value for voltage, drive objects 1, 2 Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).
Remedy:	Not necessary.
A01514 (F)	BICO: Error when writing during a reconnect
Reaction:	NONE
Acknowledge:	NONE
Cause:	During a reconnect operation (e.g. while booting or downloading - but can also occur in normal operation) a parameter was not able to be written to. Example: When writing to BICO input with double word format (DWORD), in the second index, the memory areas overlap (e.g. p8861). The parameter is then reset to the factory setting. Alarm value (r2124, interpret decimal): Parameter number of the BICO input (signal sink).
Remedy:	Not necessary.
F01515 (A)	BICO: Writing to parameter not permitted as the master control is active
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	When changing the number of CDS or when copying from CDS, the master control is active.

Acknowledge:	NONE
Cause:	The following functions or settings are not permissible in conjunction with a multiple trace: - measuring function. - long-time trace - trigger condition "immediate recording start" (IMMEDIATE) - trigger condition "start with function generator" (FG_START).
Remedy:	- Deactivate multiple trace. - Deactivate function or setting that is not permissible.
A02098	MTrace: cannot be saved
Reaction:	NONE
Acknowledge:	NONE
Cause:	It is not possible to save the measurement results of a multiple trace on the memory card. A multiple trace is not started or is canceled. Alarm value (r2124, interpret decimal): 1: memory card cannot be accessed (not inserted or blocked by a mounted USB drive). 3: data save operation too slow. A second trace has been completed before the measurement results of the first trace were able to be saved. 4: data save operation canceled (e.g. a file required for the save operation was no longer able to be found).
Remedy:	- insert or remove the memory card. - use a larger memory card. - configure the trace with a longer trace time or use an endless trace. - avoid saving parameters while the multiple trace is running. Saving parameters can block writing measurement result files to the card, so that this alarm is output with alarm value 3 - check whether other functions are presently accessing measurement result files of the multiple trace.

Reaction:	NONE
Acknowledge:	NONE
Cause:	The alarm threshold for the overtemperature of the rectifier has been reached. The response is set using p0290. If the temperature of the rectifier increases by an additional 5 K, then fault F30037 is triggered.
Remedy:	Check the following: - is the ambient temperature within the defined limit values? - have the load conditions and the load duty cycle been appropriately dimensioned? - has the fan failed? Check the direction of rotation. - has a phase of the line supply failed? - is an arm of the supply (incoming) rectifier defective?

A05006 (N)	Power unit: Overtemperature thermal model
Reaction:	NONE
Acknowledge:	NONE
Cause:	The temperature difference between the chip and heat sink has exceeded the permissible limit value (blocksize power units only). Depending on p0290, an appropriate overload response is initiated. See also: r0037 (Power unit temperatures)
Remedy:	Not necessary. The alarm disappears automatically once the limit value is undershot. Note: If the alarm does not disappear automatically and the temperature continues to rise, this can result in fault F30024. See also: p0290 (Power unit overload response)
F06310 (A)	Supply voltage (p0210) incorrectly parameterized
Reaction:	NONE (OFF1, OFF2)
Acknowledge:	IMMEDIATELY (POWER ON)

Cause:	The closed-loop control parameters have been parameterized incorrectly (e.g. p0356 = L_spread = 0). Fault value (r0949, interpret decimal): The fault value includes the parameter number involved. The following parameter numbers only occur as fault values for vector drives: p0310, for synchronous motors: p0341, p0344, p0350, p0357 The following parameter numbers do not occur as fault values for synchronous motors: p0354, p0358, p0360 See also: p0310, p0311, p0341, p0344, p0350, p0354, p0356, p0357, p0358, p0360, p0640, p1082, p1300

Cause:	The macro cannot be executed. Fault value (r0949, interpret hexadecimal): ccccbaa hex: cccc = preliminary parameter number, bb = supplementary information, aa = fault cause Fault causes for the trigger parameter itself: 19: Called file is not valid for the trigger parameter. 20: Called file is not valid for parameter 15. 21: Called file is not valid for parameter 700. 22: Called file is not valid for parameter 1000. 23: Called file is not valid for parameter 1500. 24: Data type of a TAG is incorrect (e.g. Index, number or bit is not U16). Fault causes for the parameters to be set: 25: Error level has an undefined value. 26: Mode has an undefined value. 27: A value was entered as string in the tag value that is not "DEFAULT". 31: Entered drive object type unknown. 32: A device was not able to be found for the determined drive object number. 34: A trigger parameter was recursively called. 35: It is not permissible to write to the parameter via macro. 36: Check, writing to a parameter unsuccessful, parameter can only be read, not available, incorrect data type, value range or assignment incorrect. 37: Source parameter for a BICO interconnection was not able to be determined. 38: An index was set for a non-indexed (or CDS-dependent) parameter. 39: No index was set for an indexed parameter. 41: A bit operation is only permissible for parameters with the parameter format DISPLAY_BIN. 42: A value not equal to 0 or 1 was set for a BitOperation. 43: Reading the parameter to be changed by the BitOperation was unsuccessful. 51: Factory setting for DEVICE may only be executed on the DEVICE. 61: The setting of a value was unsuccessful.
Remedy:	- check the parameter involved. - check the macro file and BICO interconnection. See also: p0015 (Macro drive unit), p1000 (Speed setpoint selection)

F07083	Macro: ACX file not found

Acknowledge:	IMMEDIATELY
Cause:	The ACX file (macro) to be executed was not able to be found in the appropriate directory. Fault value (r0949, interpret decimal): Parameter number with which the execution was started. See also: p0015 (Macro drive unit), p1000 (Speed setpoint selection)

F07084	Macro: Condition for WaitUntil not fulfilled
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The WaitUntil condition set in the macro was not fulfilled in a certain number of attempts. Fault value (r0949, interpret decimal): Parameter number for which the condition was set.
Remedy:	Check and correct the conditions for the WaitUntil loop.
F07086	Units changeover: Parameter limit violation due to reference value change
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation. The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting. Possible causes: - the steady-state minimum limit/maximum limit or that defined in the application was violated. Fault value (r0949, parameter): Diagnostics parameter to display the parameters that were not able to be re-calculated. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
Remedy:	Check the adapted parameter value and if required correct.
F07088	Units changeover: Parameter limit violation due to units changeover
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A changeover of units was initiated. This resulted in a violation of a parameter limit Possible causes for the violation of a parameter limit: - When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated. - inaccuracies for the data type "FloatingPoint". In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down. Fault value (r0949, interpret decimal): Diagnostics parameter to display all parameters whose value had to be adapted. See also: p0100 (IEC/NEMA mot stds), p0505 (Selecting the system of units), p0595 (Technological unit selection)

Remedy:	Restore units that have been changed over to the factory setting.
A07200	Drive: Master control ON command present
Reaction:	NONE
Acknowledge:	NONE
Cause:	The ON/OFF1 command is present (no 0 signal). The command is either influenced via binector input p0840 (current CDS) or control word bit 0 via the master control.
Remedy:	Switch the signal via binector input p0840 (current CDS) or control word bit 0 via the master control to 0.

F07220 (N, A)	Drive: Master control by PLC missing
Reaction:	OFF1 (NONE, OFF2, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	The "master control by PLC" signal was missing in operation. - interconnection of the binector input for "master control by PLC" is incorrect (p0854). - the higher-level control has withdrawn the "master control by PLC" signal. - data transfer via the fieldbus (master/drive) was interrupted.
Remedy:	- check the interconnection of the binector input for "master control by PLC" (p0854). - check the "master control by PLC" signal and, if required, switch in. - check the data transfer via the fieldbus (master/drive). Note: If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.
F07320	Drive: Automatic restart interrupted
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	- The specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt. - there is no active ON command. - the monitoring time for the power unit has expired. - when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically powered up again. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- increase the number of restart attempts (p1211). - increase the delay time in p1212 and/or the monitoring time in p1213. - issue an ON command (p0840). - Reduce the delay time for resetting the start counter p1213[1] so that fewer faults are registered in the time interval.
A07321	Drive: Automatic restart active
Reaction:	NONE
Acknowledge:	NONE
Cause:	The automatic restart (AR) is active. When the line supply returns and/or the causes of the existing faults are removed the drive is automatically restarted. The pulses are enabled and the motor starts to rotate. For p1210 = 26, the alarm after the line supply returns is also displayed if there is no fault and there is no ON command. Restarting is realized with the delayed setting of the ON command.
Remedy:	- the automatic restart (AR) should, if required, be inhibited (p1210 = 0). - an automatic restart can be directly interrupted by withdrawing the power-on command (BI: p0840). - for p1210 = 26: by withdrawing the OFF2- / OFF3 control commands.
F07330	Flying restart: Measured search current too low
Reaction:	OFF2 (NONE, OFF1)
Acknowledge:	IMMEDIATELY
Cause:	During a flying restart, it was identified that the search current reached is too low. It is possible that the motor is not connected.
Remedy:	Check the motor feeder cables.
F07331	Flying restart: Function not supported
Reaction:	OFF2 (NONE, OFF1)
Acknowledge:	IMMEDIATELY
Cause:	It is not possible to power up with the motor rotating (no flying restart). In the following cases, the "flying restart" function is not supported: Perm.-magnet synch. motors (PEM): operation with U/f char. and sensorless vector control.
Remedy:	De-activate the "flying restart" function (p1200 = 0).

A07400 (N)	Drive: DC link voltage maximum controller active
Reaction:	NONE
Acknowledge:	NONE
Cause:	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds. When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
Remedy:	If the controller is not to intervene: - increase the ramp-down times. - switch-off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control). If the ramp-down times are not to be changed: - use a chopper or regenerative feedback unit.
A07401 (N)	Drive: DC link voltage maximum controller de-activated
Reaction:	NONE
Acknowledge:	NONE
Cause:	The Vdc_max controller can no longer maintain the DC link voltage (r0070) below the limit value (r1242, r1282) and was therefore switched out (disabled). - the line supply voltage is permanently higher than specified for the power unit. - the motor is permanently in the regenerative mode as a result of a load that is driving the motor.
Remedy:	- check whether the input voltage is within the permissible range. - check whether the load duty cycle and load limits are within the permissible limits.
A07402 (N)	Drive: DC link voltage minimum controller active
Reaction:	NONE
Acknowledge:	NONE
Cause:	The DC link voltage controller has been activated as the lower switch-in threshold has been undershot (r1246, r1286). The kinetic energy of the motor is used to buffer the DC link. The drive is therefore braked. See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller configuration (vector control)), p1280 (Vdc controller configuration (U/f))
Remedy:	The alarm disappears when power supply returns.
F07404	Drive: DC link voltage monitoring Vdc_Max
Reaction:	OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The monitoring of the DC link voltage p1284 has responded (only U/f control).
Remedy:	- check the line supply voltage. - check the braking module. - adapt the device supply voltage (p0210). - adapt the DC link voltage monitoring (p1284).
F07405 (N, A)	Drive: Kinetic buffering minimum speed not reached
Reaction:	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	During kinetic buffering the speed fell below minimum speed (p1257 or p1297 for vector drives with U/f control) and the line supply did not return.
Remedy:	Check the speed threshold for the Vdc_min controller (kinetic buffering) (p1257, p1297). See also: p1257 (Vdc_min controller speed threshold)

F07406 (N, A)	Drive: Kinetic buffering maximum time exceeded
Reaction:	OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	The maximum buffer time (p1255 and p1295 for vector drives with U/f control) has been exceeded without the line supply having returned.
Remedy:	Check the time threshold for Vdc-min controller (kinetic buffering) (p1255, p1295). See also: p1255 (Vdc_min controller time threshold)
A07409	Drive: U/f control, current limiting controller active
Reaction:	NONE
Acknowledge:	NONE
Cause:	The current limiting controller of the U/f control was activated because the current limit was exceeded.
Remedy:	The alarm automatically disappears after one of the following measures: - increase current limit (p0640). - reduce the load. - slow down the ramp up to the setpoint speed.

Cause:	During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen.
Remedy:	<ul style="list-style-type: none"> - de-activate the holding command for the ramp-function generator (p1141). - suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

F07900 (N, A)	Drive: Motor blocked
Reaction:	OFF2 (NONE, OFF1, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	Motor has been operating at the torque limit at a low speed for a longer period of time and below the set speed threshold. This signal can also be triggered if the speed is oscillating and the speed controller output repeatedly goes to its limit. It may also be the case that thermal monitoring of the power unit reduces the current limit (see p0290), thereby causing the motor to decelerate.
Remedy:	<ul style="list-style-type: none"> - check that the motor can freely move. - check the effective torque limit (r1538, r1539). - check the direction of rotation enable signals for a flying restart of the motor (p1110, p1111). - for U/f control: check the current limits and acceleration times (p0640, p1120).

F07902 (N, A)	Drive: Motor stalled
Reaction:	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	The system has identified that the motor has stalled for a time longer than is set. Fault value (r0949, interpret decimal): 1: Reserved. 2: Stall detection using r1408.12 (p1745) or via (r0084 - r0083).
Remedy:	Steps should always be taken to ensure that both motor data identification and the rotating measurement were carried out (see p1900, r3925). - check whether the drive stalls solely due to the load in controlled mode or when the speed setpoint is still zero. If yes, then increase the current setpoint using p1610. - if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again. - check whether the motor cables are disconnected (see A07929). If there is no fault, then the fault tolerance can be increased (p1745). - check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized. - If the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553.

A07910 (N)	Drive: Motor overtemperature

Cause:	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in in p1233. If the standstill threshold is fallen below, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
Remedy:	Not necessary. The alarm automatically disappears once DC braking has been executed.

- check the voltage boost of the U/f control (p1310).
- carry out a standstill measurement to set the stator resistance (p0350).
