1. Introduction of RFM-003 module

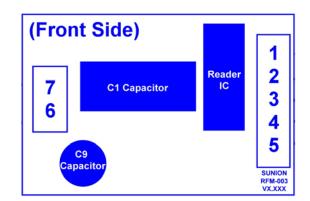

1-1 Type of application available

All 125KHz with ISO standard Read Only applications are available.

(For Read/Write application or other non-ISO standard applications please feel free to contact your Sunion personal.)

1-2 RFM-003 Pin assignments

RFM-003 Pin position and assignments:

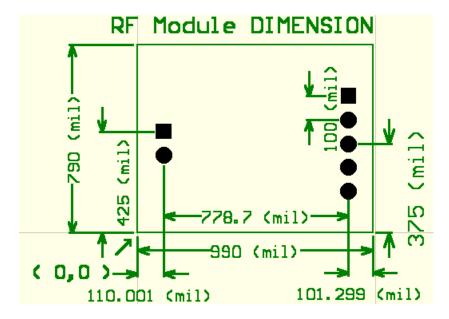

Pin No.	Name	Function
1	SCLK	Serial clock input
2	DATA	Serial data In/Out
3	GND	GND
4	GND	GND
5	VDD	VDD
6	ANT2	Antenna out 2
7	ANT1	Antenna out 1

1-3 Dimension specification

2. Electrical characteristics

2.1 Operation Specification

Temperature : Tamb = -40° C to $+85^{\circ}$ C Supply Voltage : Vdd = 4.1V to 5.5V

PARAMETERS AND CONDITIONS	SYMBOL	NOTE	MIN.	TYP.	MAX.	UNIT
Power Supply Supply Voltage Supply current power down mode Supply current excluding antenna current	$egin{array}{c} egin{array}{c} \egin{array}{c} \egin{array}{c} \egin{array}{c} \egin{array}{c} \egin{array}{c} \egin{array}$		4.1	5 1 5	5.5 5 10	V uA mA
Logic Signals Input logic high Input logic low Output logic high Output logic low Input leakage current	$egin{array}{c} V_{IH} \ V_{IL} \ V_{OH} \ V_{OL} \end{array}$		0.7V _{DD} 0.9V _{DD} -1		0.3V _{DD} 0.1V _{DD} 1	V V V V uA

PLL	SYMBOL	NOTE	MIN.	TYP	MAX.	UNIT
Antenna capture frequency range Antenna locking frequency range	$\begin{matrix} F_{ANT_C} \\ F_{ANT_L} \end{matrix}$		100 100	125	150 150	KHz KHz

NAME	SYMBOL	NOTE	MIN.	TYP	MAX.	UNIT
Current through ANT1 and ANT2 pins. Continuous wave Current through ANT1 and ANT2 pins. Duty cycle 20% t_{on} <400ms	_				180 400	mA _p

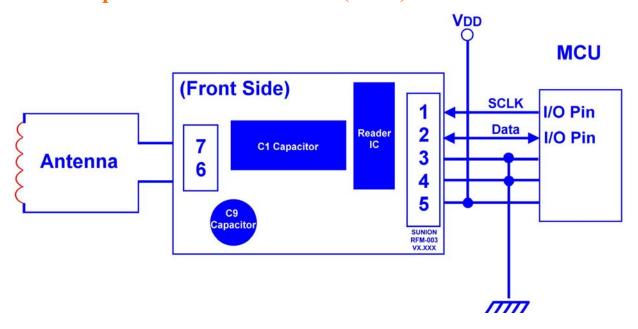

Antenna driver	SYMBOL	NOTE	MIN.	TYP	MAX.	UNIT
Diagnostic ANT driver threshold high Diagnostic ANT driver threshold low	$egin{array}{c} V_{H} \ V_{L} \end{array}$			0.5V _{DD} 0.5V _{DD}		V V

2.2 Antenna Specification

Antenna inductance = $430 \text{uH} \sim 460 \text{uH}$ Standard Antenna = 14 * 10.5 cm (Inductance = 425 uH)

2.3 Example of Micro-Control Unit (MCU) connection

3. Reading Control Procedure

3-1 Reset Module Timing:

First, set the "CLK" to High, then "DTAT" to high; Wait for a while (At least 200ns) then set the "CLK" to low, and also, set the "DATA" back to low (The minimum timing for ts is 50ns).

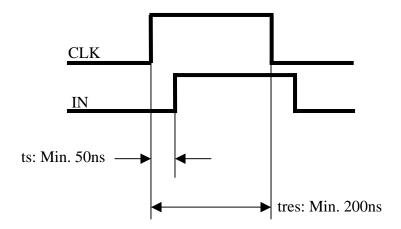

Fig 1.Module Reset

3-2 Module Timing of Entering Data:

First, set the "DATA" to high, then set "CLK" to High; Wait for a while (At least 200ns) then set the "CLK" to low, and also, set the "DATA" back to low (The minimum timing for ts is 50ns).

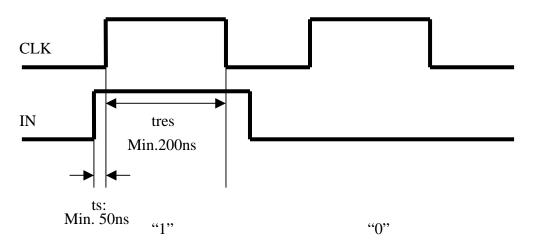

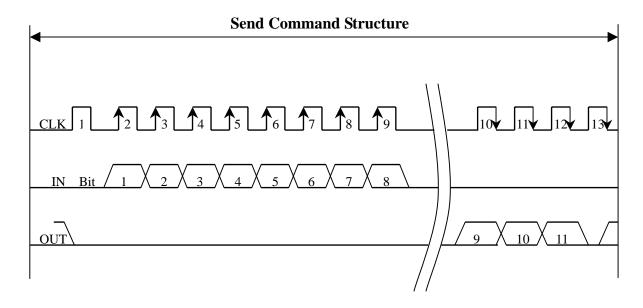

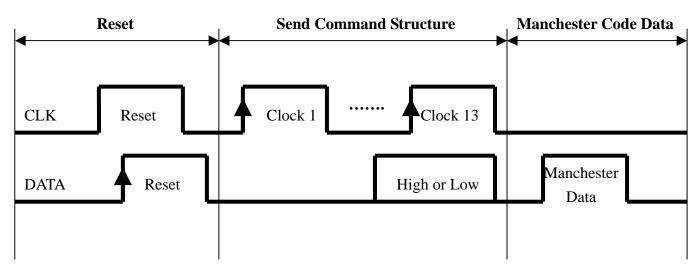

Fig. 2. Module timing of entering data

3-3 Transmit Command and receive Transponder Data:

First, send the "Reset" command then send the "Command Structure Data", IN/OUT will receive the Transponder Data.

3. Command Program; Command transmit clock as above

Activate RF to read the card:

	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8
ON	0	1	0	0	1	0	0	0
OFF	0	0	0	0	1	0	0	0

Respond from Module:

	Status	IF = "0"	IF = "1"	Correct Status
Bit9	Antenna Status	Correct Loading	Short Circuit	0
Bit10	Entering Status	Correct Signal	No-Enter-Signal	0
Bit11	PLL Status	Locked	Not Locked	0

Note: After transmit the No.9 CLK (CLK1~CLK9) and 8-bit command, send the other 4 CLK (CLK10~CLK13), wait for the module to feedback the status of that 3-bit (bit9~bit11).

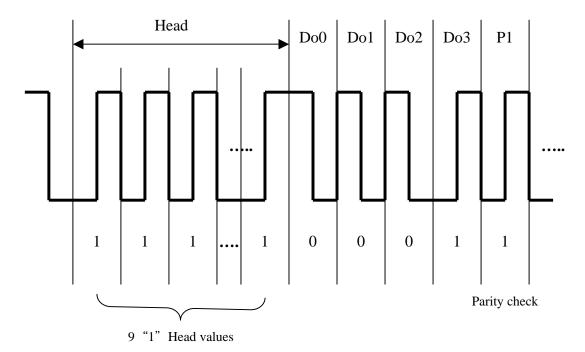

4. The data format of the Transponder

4-1 Description of Manchester Code:

"T" is a reference range, in practical, this figure will vary in depends on different card manufacturers or even with same manufacturer but different production lot. But in general, the "T" should fall in the range as stated above.

4-2 Data format example of EM Manchester Code:

4-3 Data saving format inside the memory

1 125 KHz Antenna Manufacturing instructions

- 1. Measure or examine the size and shape of the mechanism you want to put the antenna to decide of how big and what will be the shape of your antenna*.
- 2. Use the size and shape you measured for antenna to build up the tooling. You can use any kind of materials for that antenna tooling except metal; the only thing you have to worry about is would it be able to sustain the force when you wind the wire around? Also, after finished, the antenna should be able to pull easily out of that tooling.
- 3. Choose enamel-insulated wire with appropriate diameter, general speaking a wire with 0.5mm diameter should be ok; Also, to optimize the inductance and Q value, you should use thicker wire for bigger antenna (it also will decrease the amount of circles); the thinner wire for smaller antenna (the amount of circles, in the other hand, will increased); We suggest you make more circles on first trying, it would be very helpful when performing adjustment hereafter.
- 4. Winding the wires on that tooling circle by circle then use inductance meter to measure the inductance value, the right value is around 425 mH**. (Reduce circles if the value greater then 425 mH)
- 5. Use tape or other suitable things to fasten the antenna you have just made to prevent any possible distortion when adjusting or pulling out of the tooling.
- 6. Connect antenna to reader for testing; First, connect an oscilloscope's probe to a circuit with bigger inductance (like the relay circuit) then approaching it to antenna (fig.1), now, you should be able to see a wave pattern shown on your oscilloscope like fig.2.
- 7. Hold that position of both probe and circuit on it then try to slowly decrease or increase the amount of circles and also keep an eye on the scope, stop when reach the maximum amplitude. ***
- 8. Test the reader's reading range with transponder (tag) then repeat step 7th for fine tuning until you get the maximum reader range.
- **9.** Pull the antenna out from tooling, there we are~~!
 - *. According to our experience, the antenna's shape will have a great influence in reading; generally, with the same inductance the square type will have better range in compare with circle type and full square type is better then rectangle.
 - **. We suggests using the method of circle by circle to wind the wire instead of crisscross, because the effect is almost the same but more easily to adjust with circle by circle.
 - ***. Sometimes the maximum amplitude doesn't mean the best range, it is because even we have the best transmitting, but however, the sensitive of receiving is decreased (we are using same antenna for both transmit and receive, that why!), therefore, we need to repeat step 8th to make sure we are in the best configuration.

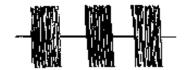

Fig.2
