

Mellanox MLNX-OS® User Manual for VPI

Rev 3.60

Software Version 3.4.1110

NOTE:

THIS HARDWARE, SOFTWARE OR TEST SUITE PRODUCT (“PRODUCT(S)”) AND ITS RELATED DOCUMENTATION ARE PROVIDED BY MELLANOX TECHNOLOGIES “AS-IS” WITH ALL FAULTS OF ANY KIND AND SOLELY FOR THE PURPOSE OF AIDING THE CUSTOMER IN TESTING APPLICATIONS THAT USE THE PRODUCTS IN DESIGNATED SOLUTIONS. THE CUSTOMER’S MANUFACTURING TEST ENVIRONMENT HAS NOT MET THE STANDARDS SET BY MELLANOX TECHNOLOGIES TO FULLY QUALIFY THE PRODUCT(S) AND/OR THE SYSTEM USING IT. THEREFORE, MELLANOX TECHNOLOGIES CANNOT AND DOES NOT GUARANTEE OR WARRANT THAT THE PRODUCTS WILL OPERATE WITH THE HIGHEST QUALITY. ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT ARE DISCLAIMED. IN NO EVENT SHALL MELLANOX BE LIABLE TO CUSTOMER OR ANY THIRD PARTIES FOR ANY DIRECT, INDIRECT, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES OF ANY KIND (INCLUDING, BUT NOT LIMITED TO, PAYMENT FOR PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY FROM THE USE OF THE PRODUCT(S) AND RELATED DOCUMENTATION EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Document Revision History	14
About this Manual	22
Chapter 1 Introduction	25
1.1 System Features	25
1.2 Ethernet Features	26
1.3 InfiniBand Features	26
1.4 Gateway Features	27
Chapter 2 Getting Started	29
2.1 Configuring the Switch for the First Time	29
2.1.1 Re-Running the Wizard	35
2.2 Starting the Command Line (CLI)	35
2.3 Starting the Web User Interface	36
2.4 Licenses	39
2.4.1 Installing MLNX-OS® License (CLI)	39
2.4.2 Installing MLNX-OS License (Web)	40
2.4.3 Retrieving a Lost License Key	43
2.4.4 Commands	44
Chapter 3 User Interfaces	49
3.1 Command Line Interface (CLI) Overview	49
3.1.1 CLI Modes	49
3.1.2 Syntax Conventions	50
3.1.3 Getting Help	50
3.1.4 Prompt and Response Conventions	51
3.1.5 Using the “no” Form	52
3.1.6 Parameter Key	53
3.1.7 Command Output Filtering	54
3.2 Web Interface Overview	55
3.2.1 Setup Menu	56
3.2.2 System Menu	57
3.2.3 Security Menu	58
3.2.4 Ports Menu	58
3.2.5 Status Menu	59
3.2.6 IB SM Mgmt	60
3.2.7 Fabric Inspector	60
3.2.8 ETH Mgmt	61
3.2.9 IP Route	62
3.2.10 Gateway	62
3.3 Secure Shell (SSH)	62
3.3.1 Adding a Host and Providing an SSH Key	62
3.3.2 Retrieving Return Codes when Executing Remote Commands	63
3.4 Commands	64

3.4.1	CLI Session	64
3.4.2	Banner	71
3.4.3	SSH	76
3.4.4	Remote Login	89
3.4.5	Web Interface	92
Chapter 4	System Management	107
4.1	Management Interface	107
4.1.1	Configuring Management Interfaces with Static IP Addresses	107
4.1.2	Configuring IPv6 Address on the Management Interface	107
4.1.3	Dynamic Host Configuration Protocol (DHCP)	107
4.1.4	Default Gateway	108
4.1.5	In-Band Management	108
4.1.6	Commands	110
4.2	NTP, Clock & Time Zones	158
4.2.1	Commands	159
4.3	Unbreakable Links	165
4.3.1	Link Level Retransmission (LLR)	165
4.3.2	Configuring Phy Profile & LLR	166
4.3.3	Commands	167
4.4	Virtual Protocol Interconnect (VPI)	172
4.4.1	Commands	174
4.5	System Profile	176
4.5.1	Commands	177
4.6	Software Management	178
4.6.1	Upgrading MLNX-OS Software	178
4.6.2	Upgrading MLNX-OS Software on Director Switches	181
4.6.3	Deleting Unused Images	182
4.6.4	Downgrading MLNX-OS Software	183
4.6.5	Upgrading System Firmware	186
4.6.6	Commands	189
4.7	Configuration Management	201
4.7.1	Saving a Configuration File	201
4.7.2	Loading a Configuration File	201
4.7.3	Restoring Factory Default Configuration	202
4.7.4	Managing Configuration Files	202
4.7.5	Commands	204
4.8	Logging	232
4.8.1	Monitor	232
4.8.2	Remote Logging	232
4.8.3	Commands	233
4.9	Debugging	251
4.9.1	Commands	252
4.10	Event Notifications	271
4.10.1	Supported Events	271
4.10.2	SNMP Trap Notifications	272

4.10.3	Terminal Notifications	272
4.10.4	Email Notifications	273
4.10.5	Commands	275
4.11	mDNS	294
4.11.1	Commands	295
4.12	User Management and Security	296
4.12.1	Authentication, Authorization and Accounting (AAA)	296
4.12.2	User Accounts	297
4.12.3	Commands	299
4.13	Cryptographic (X.509, IPSec)	340
4.13.1	Commands	341
4.14	Scheduled Jobs	353
4.14.1	Commands	353
4.15	Statistics and Alarms	363
4.15.1	Commands	363
4.16	Chassis Management	381
4.16.1	System Health Monitor	381
4.16.2	Power Management	383
4.16.3	Monitoring Environmental Conditions	386
4.16.4	USB Access	388
4.16.5	High Availability (HA)	389
4.16.6	System Reboot	392
4.16.7	Commands	394
4.17	Network Management Interfaces	424
4.17.1	SNMP	424
4.17.2	XML API	434
4.17.3	Commands	435
4.18	Puppet Agent	452
4.18.1	Setting the Puppet Server	452
4.18.2	Accepting the Switch Request	452
4.18.3	Installing Modules on the Puppet Server	453
4.18.4	Writing Configuration Classes	453
4.18.5	Supported Configuration Capabilities	455
4.18.6	Supported Resources for Each Type	459
4.18.7	Troubleshooting	460
4.18.8	Commands	461
4.19	Virtual Machine	468
4.19.1	Virtual Machine Configuration	468
4.19.2	Commands	470
4.20	Back-Up Battery Units	492
4.20.1	Commands	493
Chapter 5	Ethernet Switching	497
5.1	Interface	497
5.1.1	Break-Out Cables	497
5.1.2	56GbE Link Speed	500

5.1.3	Transceiver Information	501
5.1.4	High Power Transceivers	502
5.1.5	Commands	503
5.2	Link Aggregation Group (LAG)	518
5.2.1	Configuring Static Link Aggregation Group (LAG)	518
5.2.2	Configuring Link Aggregation Control Protocol (LACP)	518
5.2.3	Commands	520
5.3	MLAG	537
5.3.1	MLAG Keepalive and Failover	539
5.3.2	Unicast and Multicast Sync	539
5.3.3	MLAG Port Sync	539
5.3.4	MLAG Configuration	539
5.3.5	Commands	544
5.4	VLANs	561
5.4.1	Configuring Access Mode and Assigning Port VLAN ID (PVID)	561
5.4.2	Configuring Hybrid Mode and Assigning Port VLAN ID (PVID)	562
5.4.3	Configuring Trunk Mode VLAN Membership	562
5.4.4	Configuring Hybrid Mode VLAN Membership	563
5.4.5	Commands	564
5.5	MAC Address Table	571
5.5.1	Configuring Unicast Static MAC Address	571
5.5.2	MAC Learning Considerations	571
5.5.3	Commands	572
5.6	Spanning Tree	578
5.6.1	Port Priority and Cost	578
5.6.2	Port Type	578
5.6.3	BPDU Filter	579
5.6.4	BPDU Guard	579
5.6.5	Loop Guard	579
5.6.6	Root Guard	580
5.6.7	MSTP	580
5.6.8	RPVST	580
5.6.9	Commands	583
5.7	OpenFlow	612
5.7.1	Flow Table	612
5.7.2	Configuring OpenFlow	613
5.7.3	Commands	614
5.8	IGMP Snooping	621
5.8.1	Configuring IGMP Snooping	621
5.8.2	Defining a Multicast Router Port on a VLAN	621
5.8.3	IGMP Snooping Querier	623
5.8.4	Commands	624
5.9	Link Layer Discovery Protocol (LLDP)	640
5.9.1	Configuring LLDP	640
5.9.2	DCBX	640
5.9.3	Commands	642

5.10	Quality of Service (QoS)	658
5.10.1	Priority Flow Control and Link Level Flow Control	658
5.10.2	Enhanced Transmission Selection (ETS)	659
5.10.3	Commands.	662
5.11	Access Control List	672
5.11.1	Configuring Access Control List	672
5.11.2	ACL Actions	672
5.11.3	Commands.	674
5.12	Port Mirroring	684
5.12.1	Mirroring Sessions	684
5.12.2	Configuring Mirroring Sessions	687
5.12.3	Verifying Mirroring Sessions	689
5.12.4	Commands.	690
5.13	sFlow	699
5.13.1	Flow Samples	699
5.13.2	Statistical Samples	699
5.13.3	sFlow Datagrams.	700
5.13.4	Sampled Interfaces	700
5.13.5	Configuring sFlow	700
5.13.6	Verifying sFlow	701
5.13.7	Commands.	702
5.14	Transport Applications	714
5.14.1	RDMA over Converged Ethernet (RoCE)	714
Chapter 6	IP Routing.	718
6.1	General.	718
6.1.1	IP Interfaces	718
6.1.2	Equal Cost Multi-Path Routing (ECMP)	721
6.1.3	IPv4 Routing Mode.	722
6.1.4	Creating an IP Interface	722
6.1.5	Commands.	724
6.2	IPv6	752
6.2.1	Neighbor Discovery Protocol	752
6.2.2	Configuring IPv6.	753
6.2.3	Commands.	756
6.3	OSPF	782
6.3.1	Router ID.	782
6.3.2	ECMP	782
6.3.3	Configuring OSPF.	783
6.3.4	Verifying OSPF.	784
6.3.5	Commands.	787
6.4	BGP	822
6.4.1	State Machine	822
6.4.2	Configuring BGP	822
6.4.3	Verifying BGP	824
6.4.4	Commands.	825

6.4.5	IP AS-Path Access-List	877
6.4.6	IP Community-List	879
6.5	Policy Rules	882
6.5.1	Route Map	882
6.5.2	IP Prefix-List	912
6.6	Multicast (IGMP and PIM)	915
6.6.1	Basic PIM-SM	915
6.6.2	Bidirectional PIM	916
6.6.3	Bootstrap Router	916
6.6.4	Configuring Multicast	917
6.6.5	Commands	920
6.7	VRRP	961
6.7.1	Load Balancing	961
6.7.2	Configuring VRRP	962
6.7.3	Verifying VRRP	963
6.7.4	Commands	965
6.8	MAGP	976
6.8.1	MAGP Configuration	976
6.8.2	Commands	978
6.9	DHCP Relay	984
6.9.1	Commands	985
Chapter 7	InfiniBand Switching	993
7.1	Node Name	993
7.1.1	Commands	993
7.2	Fabric	995
7.2.1	Commands	995
7.3	Interface	999
7.3.1	Transceiver Information	999
7.3.2	High Power Transceivers	999
7.3.3	Commands	1000
7.4	Subnet Manager (SM)	1012
7.4.1	Enabling Subnet Manager	1012
7.4.2	Partitions	1012
7.4.3	Adaptive Routing	1013
7.4.4	Commands	1014
7.5	Subnet Manager (SM) High Availability (HA)	1153
7.5.1	Joining, Creating or Leaving an InfiniBand Subnet ID	1153
7.5.2	MLNX-OS Management Centralized Location	1154
7.5.3	High Availability Node Roles	1154
7.5.4	Configuring MLNX-OS SM HA Centralized Location	1155
7.5.5	Creating and Adding Systems to an InfiniBand Subnet ID	1155
7.5.6	Restoring Subnet Manager Configuration	1155
7.5.7	Commands	1159
7.6	Fabric Inspector	1164
7.6.1	Running Diagnostics	1164

7.6.2	Mapping GUIDs to Node Names	1169
7.6.3	Importing ibdiagnet Fabric Data	1169
7.6.4	Commands	1171
Chapter 8	Gateway	1190
8.1	Proxy-ARP Prerequisites	1190
8.2	Proxy-ARP Overview	1191
8.2.1	Proxy-ARP Modes	1191
8.2.2	Proxy-ARP High Availability	1194
8.2.3	Proxy-ARP Interface	1197
8.2.4	Proxy-ARP Resources	1199
8.3	Proxy-ARP Configuration	1200
8.3.1	Proxy-ARP Mode Configuration	1200
8.3.2	Standalone Proxy-ARP Configuration	1200
8.3.3	High Availability Proxy-ARP Configuration	1203
8.4	Advanced Settings	1206
8.4.1	Default Gateway	1206
8.4.2	vTCA Interface	1206
8.4.3	MTU	1207
8.5	Commands	1208
8.5.1	Config	1208
8.5.2	Interface Proxy-ARP	1214
8.5.3	Show	1239
Appendix A	MEX6200 System	1256
A.1	MEX6200 Overview	1256
A.2	Getting Started	1256
A.3	Fault Management	1258
A.4	Alarms	1258
A.5	Events	1258
A.6	Alarm and Event Messages	1259
A.7	Configuration Management	1262
A.8	Performance Monitoring	1263
A.9	Native Signal	1264
A.10	Optical Level	1266
A.11	Maintenance	1269
A.12	Upgrading Software on the MEX6200	1270
Appendix B	Strict Security Mode	1271
B.1	Overview	1271
B.2	Web Certificate	1271
B.3	Code Signing	1272
B.4	SNMP	1272
B.5	SSH	1273
B.6	HTTPS	1273
B.7	LDAP	1274
B.8	Password Hashing	1276

Document Revision	Date	Description
Rev 3.60	05 March, 2015	Added: • MLAG configuration Step 10 • The command “system-mac” on page 554 • The command “upgrade-timeout” on page 555 • Section 5.6.4, “BPDU Guard,” on page 579 Updated: • MLAG configuration verification Step 1 with system MAC and upgrade time-out • The command “show mlag” on page 556 • Table 51, “Supported VLANs by RPVST per Switch System,” on page 581
Rev 3.50	24 February, 2015	Added: • the command “show version concise” on page 402 Updated: • the command “show uboot” on page 403

Table 1 - Document Revision History

Document Revision	Date	Description
Rev 3.40	11 February, 2015	Added: • “List of Tables” and “List of Figures” Sections • Updated Section 2.4, “Licenses,” on page 39 • the command “license delete” on page 46 • the command “license install” on page 47 • the command “telnet” on page 89 • the command “terminal” on page 69 • the command “web cache-enable” on page 93 • the command “ip default-gateway” on page 113 • the command “boot bootmgr password” on page 190 • the command “boot system” on page 192 • the command “configuration write” on page 228 • the command “logging trap” on page 248 • the command “email autosupport enable” on page 275 • the command “email autosupport event” on page 276 • the command “crypto ipsec ike” on page 341 • Section 4.20, “Back-Up Battery Units,” on page 492 • the command “lACP-individual enable” on page 526 • the command “show interfaces port-channel” on page 533 • the command “show interfaces port-channel compatibility-parameters” on page 534 • the command “show interfaces port-channel load-balance” on page 535 • the command “show interfaces port-channel summary” on page 536 • Section 5.6.8, “RPVST,” on page 580 • the command “spanning-tree vlan forward-time” on page 602 • the command “spanning-tree vlan hello-time” on page 603 • the command “spanning-tree vlan max-age” on page 604 • the command “spanning-tree vlan priority” on page 605 • the command “show spanning-tree vlan” on page 611 • Section 6.2, “IPv6,” on page 752 • the command “auto-cost reference-bandwidth” on page 791 • the command “ip sm allow-both-pkeys” on page 1016 • the command “show ip multicast interface proxy-arp” on page 1253 Updated: • Section 2.3, “Starting the Web User Interface,” on page 36 • the command “image options” on page 198 • the command “reload” on page 208 • Section 4.8.2, “Remote Logging,” on page 232 • the command “logging debug-files” on page 235 • Section 4.9.1, “Commands,” on page 252

Table 1 - Document Revision History

Document Revision	Date	Description
		• Section 4.12.2, “User Accounts,” on page 297 • the command “username” on page 299 • the command “aaa authentication attempts track” on page 306 • the command “radius-server host” on page 318 • the command “tacacs-server host” on page 322 • Table 30, “System Health Monitor Alerts Scenarios,” on page 381 • the command “snmp-server auto-refresh” on page 435 • the command “snmp-server user” on page 445 • the command “show interfaces ethernet [<inf>] description” on page 514 • the command “show interfaces ethernet [<inf>] status” on page 515 • the command “show interfaces port-channel summary” on page 536 • the command “show interfaces mlag-port-channel summary” on page 559 • the command “spanning-tree mode” on page 584 • the command “show spanning-tree” on page 606 • the command “show spanning-tree detail” on page 607 • the command “show spanning-tree interface” on page 608 • the command “show spanning-tree mst” on page 609 • the command “show spanning-tree root” on page 610 • Section 5.8.2, “Defining a Multicast Router Port on a VLAN,” on page 621 • the command “dcb application-priority” on page 649 • the command “dcb priority-flow-control enable” on page 668 • Section 5.13.1, “Flow Samples,” on page 699 • the command “ip arp timeout” on page 744 • the command “redistribute” on page 793 • Section 7.3.2, “High Power Transceivers,” on page 999 • the command “ib sm root-guid” on page 1049 • the command “defmember” on page 1128 • the command “member” on page 1129 • the command “rate” on page 1132 • the command “ib qos level” on page 1144 • Chapter 8, “Gateway” on page 1190 • the command “show interfaces proxy-arp ha multicast-list” on page 1255
Rev 3.30	19 November, 2014	Added: • Section 5.1.4, “High Power Transceivers,” on page 502 • Section 7.3.2, “High Power Transceivers,” on page 999 Updated: • the command “web https” on page 100 • the command “show interfaces ethernet” on page 511 • the command “show interfaces ethernet [<inf>] transceiver” on page 516 • the command “dcb application-priority” on page 649 • the command “show interfaces ib” on page 1008 • the command “show interfaces ib transceiver” on page 1010 • Section B.6, “HTTPS,” on page 1273 • Section B.8, “Password Hashing,” on page 1276

Table 1 - Document Revision History

Document Revision	Date	Description
Rev 3.20	09 November, 2014	Added: - MAC addresses note in Section 4.4, “Virtual Protocol Interconnect (VPI),” on page 172 - Section 4.19, “Virtual Machine,” on page 468 - Section 5.5.2, “MAC Learning Considerations,” on page 571 - the command “mac-learning disable” on page 574 - Section 6.1.3, “IPv4 Routing Mode,” on page 722 - Appendix B, “Strict Security Mode,” on page 1271 Updated: - Section 1.2, “Ethernet Features,” on page 26 - Section 3.2, “Web Interface Overview,” on page 55 - the command “reset factory” on page 209 - Section 4.17.1.7, “SNMP SET Operations,” on page 429 - the command “interface port-channel” on page 520 - the command “show lacp interfaces neighbor” on page 529 - Section 5.3, “MLAG,” on page 537 - the command “mlag-channel-group mode” on page 551 - the command “show mlag statistics” on page 560 - the command “ip icmp redirect” on page 733 - Section 6.4, “BGP,” on page 822 - Section 6.7.2, “Configuring VRRP,” on page 962 - the command “show fabric” on page 996 - the command “proxy-arp ha” on page 1211 - Appendix A, “MEX6200 System,” on page 1256 Replaced: - the command “show lacp interfaces port-channel” with the command “show lacp” on page 531 - the command “show lacp system-identifier” with the command “show lacp interfaces system-identifier” on page 532
Rev 3.10	20 July, 2014	Added: - Section 5.14, “Transport Applications,” on page 714 - Section 6.1.1, “IP Interfaces,” on page 718 - Section 6.4, “BGP,” on page 822 - the command “show ip pim upstream joins” on page 942 Updated: - Chapter 1, “Introduction” on page 25 - Section 4.17.1.8, “IF-MIB and Interface Information,” on page 433 - Section 4.17.2, “XML API,” on page 434 - MAC addresses note in Section 5.3, “MLAG,” on page 537 - Chapter 6, “IP Routing” on page 718 with the appropriate configuration modes for the new configuration contexts and commands added - the command “route-map” on page 883 - the command “continue <sequence-number>” on page 884 - the command “abort” on page 885 - the command “exit” on page 886 - Section 6.6, “Multicast (IGMP and PIM),” on page 915 - the command “ip pim join-prune-interval” on page 931 - the command “show ip pim bsr” on page 936 - the command “show ip mroute” on page 946 - CPU type note in Section 7.5, “Subnet Manager (SM) High Availability (HA),” on page 1153

Table 1 - Document Revision History

Document Revision	Date	Description
Rev 3.00	05 June, 2014	Updated: - Section 6.6, “Multicast (IGMP and PIM),” on page 915 - Section 6.7.3, “Verifying VRRP,” on page 963
Rev 2.90	19 May, 2014	Added: - Section 4.17.1.8, “IF-MIB and Interface Information,” on page 433 - Section 6.6, “Multicast (IGMP and PIM),” on page 915 Updated: - the command “port type” on page 174 - the command “show configuration” on page 230 - the command “show uboot” on page 403 - the command “show voltage” on page 412 - Section 5.3, “MLAG,” on page 537 - the command “show mlag” on page 556 - Section 6.1.5.2, “Interface VLAN,” on page 726 - Section 6.1.5.3, “Loopback Interface,” on page 735 - Section 8.2.2.4, “Proxy-ARP Load Balancing,” on page 1196
Rev 2.80	08 May, 2014	Added: - supported versions note in Section 5.8, “IGMP Snooping,” on page 621 - Section 6.7, “VRRP,” on page 961 - Section 6.8, “MAGP,” on page 976 - Section 6.9, “DHCP Relay,” on page 984
Rev 2.60	10 April, 2014	Updated: - the command “interfaces ib internal notification” on page 446 - Table 35, “Private MIBs Supported,” on page 426

Table 1 - Document Revision History

Document Revision	Date	Description
Rev 2.50	April 2014	Updated: - Section 3.1.7, “Command Output Filtering,” on page 54 - Section 4.16.6, “System Reboot,” on page 392 - the command “show protocols” on page 418 - the command “show mac-address-table” on page 576 - the command “deny/permit (MAC ACL rule)” on page 676 - the command “show mac/ipv4 access-lists” on page 682 - the command “ha member ip address” on page 1235 Added: - Section 5.3, “MLAG,” on page 537 - configuration mode Config Interface MLAG Port Channel to the following commands: “flowcontrol” on page 504 “mtu” on page 505 “shutdown” on page 506 “description” on page 507 “speed” on page 508 “load-interval” on page 509 “clear counters” on page 510 “switchport mode” on page 567 “switchport access” on page 568 “spanning-tree port-priority” on page 588 “spanning-tree cost” on page 589 “spanning-tree port type” on page 590 “spanning-tree guard” on page 591 “ip igmp snooping fast-leave” on page 627 “dcb priority-flow-control mode on” on page 670 “ipv4/mac port access-group” on page 675 “sflow enable (interface)” on page 712
Rev 2.40	February, 2014	Updated: - Section 4.6.5.3, “Importing Firmware and Changing the Default Firmware,” on page 187 – updated Step 1 - Command “show running-config” on page 231 - Command “show log” on page 250 - Section 4.13, “Cryptographic (X.509, IPSec),” on page 340 - Section 5.2.1, “Configuring Static Link Aggregation Group (LAG),” on page 518 – removed unnecessary step - Command “lldp tlv-select” on page 648 - Command “show lldp interface” on page 651 - Chapter 8, “Gateway” on page 1190 Added: - Section 3.1.7, “Command Output Filtering,” on page 54 - FCoE and SX1700 GW license in Section 2.4, “Licenses,” on page 39 - Section 4.17.1.8, “IF-MIB and Interface Information,” on page 433 - Section 4.16.6, “System Reboot,” on page 392
Rev 2.30	January, 2014	Updated: - Section 4.18.4, “Writing Configuration Classes,” on page 453 - command “crypto certificate generation” on page 346 - command “crypto certificate name” on page 347

Table 1 - Document Revision History

Document Revision	Date	Description
Rev 2.20	January, 2014	Added: - command “interfaces ib internal notification” on page 446 - command “show interfaces ib internal notification” on page 449 Updated: - Section 4.18.5.11, “Installed Image Capabilities,” on page 459
Rev 2.10	January, 2014	Added: - Section 4.16.2.2, “Width Reduction Power Saving,” on page 384 Updated: - Section 2.2, “Starting the Command Line (CLI),” on page 35 - Section 2.3, “Starting the Web User Interface,” on page 36 - command “system profile” on page 177 - Section 4.6.1, “Upgrading MLNX-OS Software,” on page 178 with EULA note - Section 4.6.2, “Upgrading MLNX-OS Software on Director Switches,” on page 181 with a note - Section 4.18, “Puppet Agent,” on page 452 - Section 5.7, “OpenFlow,” on page 612 - command “openflow description” on page 615 - command “show openflow” on page 620 - command “deny/permit (IPv4 ACL rule)” on page 677 - command “load-interval” on page 509 with Config Interface Port Channel - command “switchport {hybrid, trunk} allowed-vlan” on page 569 with Config Interface Port Channel - command “spanning-tree port-priority” on page 588 with Config Interface Port Channel - command “spanning-tree cost” on page 589 with Config Interface Port Channel - command “spanning-tree port type” on page 590 with Config Interface Port Channel - command “spanning-tree guard” on page 591 with Config Interface Port Channel - the command “spanning-tree bpdudfilter” on page 592 with Config Interface Port Channel - command “sflow enable (interface)” on page 712 with Config Interface Port Channel - Section 6.3, “OSPF,” on page 782 - command “router-id” on page 789 - Section 7.4.3, “Adaptive Routing,” on page 1013 Merged sections “Restoring Factory Default Configuration on a Switch System (Single Management Module)” and “Restoring Factory Default Configuration on a Switch Directors (Dual Management Modules)” under Section 4.7.3, “Restoring Factory Default Configuration,” on page 202.

Table 1 - Document Revision History

Document Revision	Date	Description
Rev 2.00	December 2013	Added Section 5.1.3, “Transceiver Information,” on page 501 Added Section 7.3.1, “Transceiver Information,” on page 999 Added the command “run-interval” on page 464 Added note to Section 8.4.3, “MTU,” on page 1207 Updated Section 4.4, “Virtual Protocol Interconnect (VPI),” on page 172 with SX1012 and SX6012 Updated Section 4.6.1, “Upgrading MLNX-OS Software,” on page 178 Updated Section 4.6.3, “Deleting Unused Images,” on page 182 Updated Section 4.9, “Debugging,” on page 251 Updated the example of the command “show cpld” on page 404 Updated “Notification Indicator” column in Section 8.3.2, “Standalone Proxy-ARP Configuration,” on page 1200 Updated the command “show puppet-agent” on page 466 Updated the command “lldp tlv-select” on page 648 Updated the command “interface proxy-arp” on page 1210 Updated the command “ip address” on page 1214 Updated the command “ip vlan” on page 1216 Updated the command “ip pkey” on page 1217 Updated the command “ip route” on page 1218 Updated the command “counters” on page 1223 Moved Section 3.3, “Secure Shell (SSH),” on page 62 from 4.13.2 Removed mention of the MLNX-OS Command Reference Guide Removed the command “lldp tlv-select dcbx”
Rev 1.90	November 2013	Added Appendix A, “MEX6200 System,” on page 1256
Rev 1.80	October 2013	Added: • Section 4.18, “Puppet Agent,” on page 452 • Section 5.6.7, “MSTP,” on page 580 • Section 5.7, “OpenFlow,” on page 612 • Section 5.8.3, “IGMP Snooping Querier,” on page 623 • the command “ip igmp snooping querier” • the command “igmp snooping querier query-interval” • the command “show ip igmp snooping querier” • Section 5.9.2, “DCBX,” on page 640 • the command “lldp tlv-select dcbx” • the command “dcb application-priority” • the command “show dcb application-priority” • Section 6.9, “DHCP Relay,” on page 984 Updated • the command “show lldp interface” • the command “show lldp interfaces ethernet <inf> remote”
Rev 1.7.0	October 2013	Merged “MLNX-OS Command Reference Guide” Rev. 1.6.9 and “MLNX-OS User Manual” Rev. 1.6.9.

About this Manual

This manual provides general information concerning the scope and organization of this User's Manual.

Intended Audience

This manual is intended for network administrators who are responsible for configuring and managing Mellanox Technologies' SwitchX based Switch Platforms.

Related Documentation

The following table lists the documents referenced in this *User's Manual*.

Table 2 - Reference Documents

Document Name	Description
InfiniBand Architecture Specification, Vol. 1, Release 1.2.1	The InfiniBand Architecture Specification that is provided by IBTA.
Director switch Installation Guide	Each Mellanox Technologies' switch platform is shipped with an Installation Guide document to bring-up and initialize the switch platform.
System Hardware User Manual	This document contains hardware descriptions, LED assignments and hardware specifications among other things.
Switch Product Release Notes	Please look up the relevant SwitchX®-based switch system/series release note file
Mellanox Virtual Modular Switch Reference Guide	This reference architecture provides general information concerning Mellanox L2 and L3 Virtual Modular Switch (VMS) configuration and design.
Configuring Mellanox Hardware for VPI Operation Application Note	This manual provides information on basic configuration of the converged VPI networks.

All of these documents can be found on the Mellanox website. They are available either through the product pages or through the support page with a login and password.

Glossary

Table 3 - Glossary

AAA	Authentication, Authorization, and Accounting. Authentication - verifies user credentials (username and password). Authorization - grants or refuses privileges to a user/client for accessing specific services. Accounting - tracks network resources consumption by users.
ARP	Address Resolution Protocol. A protocol that translates IP addresses into MAC addresses for communication over a local area network (LAN).

Table 3 - Glossary

CLI	Command Line Interface. A user interface in which you type commands at the prompt
DCB	Data Center Bridging
DCBX	DCBX protocol is an extension of the Link Layer Discovery Protocol (LLDP). DCBX end points exchange request and acknowledgment messages. For flexibility, parameters are coded in a type-length-value (TLV) format.
DHCP	The Dynamic Host Configuration Protocol (DHCP) is an automatic configuration protocol used on IP networks.
Director Class Switch	A high density InfiniBand chassis switch system
DNS	Domain Name System. A hierarchical naming system for devices in a computer network
ETS	ETS provides a common management framework for assignment of bandwidth to traffic classes.
Fabric Management	The use of a set of tools (APIs) to configure, discover, and manage and a group of devices organized as a connected fabric.
FTP/TFTP/sFTP	File Transfer Protocol (FTP) is a standard network protocol used to transfer files from one host to another over a TCP-based network, such as the Internet.
Gateway	A network node that interfaces with another network using a different network protocol
GID (Global Identifier)	A 128-bit number used to identify a Port on a network adapter (see below), a port on a Router, or a Multicast Group.
GUID (Globally Unique Identifier)	A 64-bit number that uniquely identifies a device or component in a subnet
HA (High Availability)	A system design protocol that provides redundancy of system components, thus enables overcoming single or multiple failures in minimal downtime
Host	A computer platform executing an Operating System which may control one or more network adapters
IB	InfiniBand
LACP	Link Aggregation Control Protocol (LACP) provides a method to control the bundling of several physical ports together to form a single logical channel. LACP allows a network device to negotiate an automatic bundling of links by sending LACP packets to the peer (directly connected device that also implements LACP).
LDAP	The Lightweight Directory Access Protocol is an application protocol for reading and editing directories over an IP network.
LID (Local Identifier)	A 16 bit address assigned to end nodes by the subnet manager Each LID is unique within its subnet.

Table 3 - Glossary

MAC	A Media Access Control address (MAC address) is a unique identifier assigned to network interfaces for communications on the physical network segment. MAC addresses are used for numerous network technologies and most IEEE 802 network technologies including Ethernet.
MTU (Maximum Transfer Unit)	The maximum size of a packet payload (not including headers) that can be sent /received from a port
Network Adapter	A hardware device that allows for communication between computers in a network
PFC/FC	Priority Based Flow Control applies pause functionality to traffic classes OR classes of service on the Ethernet link.
RADIUS	Remote Authentication Dial In User Service. A networking protocol that enables AAA centralized management for computers to connect and use a network service.
RDMA (Remote Direct Memory Access)	Accessing memory in a remote side without involvement of the remote CPU
RSTP	Rapid Spanning Tree Protocol. A spanning-tree protocol used to prevent loops in bridge configurations. RSTP is not aware of VLANs and blocks ports at the physical level.
SA (Subnet Administrator)	The interface for querying and manipulating subnet management data
SCP	Secure Copy or SCP is a means of securely transferring computer files between a local and a remote host or between two remote hosts. It is based on the Secure Shell (SSH) protocol.
SM (Subnet Manager)	An entity that configures and manages the subnet, discovers the network topology, assign LIDs, determines the routing schemes and sets the routing tables. There is only one master SM and possible several slaves (Standby mode) at a given time. The SM administers switch routing tables thereby establishing paths through the fabric
SNMP	Simple Network Management Protocol. A network protocol for the management of a network and the monitoring of network devices and their functions
NTP	Network Time Protocol. A protocol for synchronizing computer clocks in a network
SSH	Secure Shell. A protocol (program) for securely logging in to and running programs on remote machines across a network. The program authenticates access to the remote machine and encrypts the transferred information through the connection.
syslog	A standard for forwarding log messages in an IP network
TACACS+	Terminal Access Controller Access-Control System Plus. A networking protocol that enables access to a network of devices via one or more centralized servers. TACACS+ provides separate AAA services.
XML Gateway	Extensible Markup Language Gateway. Provides an XML request-response protocol for setting and retrieving HW management information.

1 Introduction

Mellanox® Operating System (MLNX-OS®) enables the management and configuration of Mellanox Technologies' SwitchX® Family silicon based switch platforms. MLNX-OS supports the Virtual Protocol Interconnect (VPI) technology which enables it to be used for both Ethernet and InfiniBand technology providing the user with greater flexibility.

MLNX-OS provides a full suite of management options, including support for Mellanox's Unified Fabric Manager® (UFM), SNMPv1, 2, 3, and web user interface (WebUI). In addition, it incorporates a familiar industry-standard CLI, which enables administrators to easily configure and manage the system.

1.1 System Features

Table 4 - General System Features

Feature	Description
Software Management	- Dual software image - Software and firmware updates
File management	- FTP - TFTP - SCP
Logging	- Event history log - SysLog support
Management Interface	- DHCP/Zeroconf - IPv6
Chassis Management	- Monitoring environmental controlsPower management - Auto-temperature control - High availability
Network Management Interfaces	- SNMP v1,v2c,v3 - interfaces (XML Gateway) - Puppet Agent
Security	- SSH - Telnet - RADIUS - TACACS+
Date and Time	NTP
Cables & Transceivers	Transceiver info
Unbreakable links	LLR
Virtual Port Interconnect® (VPI)	- Ethernet - InfiniBand

1.2 Ethernet Features

Table 5 - Ethernet Features

Feature	Description
General	• ACL – 24K rules (permit/deny) • Breakout cables • Jumbo Frames (9K)
Ethernet support	• 48K Unicast MAC addresses • DCBX • DHCP Relay • ETS (802.1Qaz) • Flow control (802.3x) • IGMP snooping v1,2 • LAG/LACP (802.3ad), 16 links per LAG (64 LAGs) • LLDP • MLAG • MSTP • OpenFlow • PFC (802.1Qbb) • Rapid Spanning Tree (802.1w) • sFlow • VLAN (802.1Q) - 4K
IP routing	• BGP • DHCP Relay • ECMP • IGMP • IPv4 • IPv6 • OSPF • PIM • VLAN interface • Loopback interface • Router interface • VRRP

1.3 InfiniBand Features

Table 6 - InfiniBand Features

Feature	Description
Subnet Manager	• OpenSM • Partitions • High Availability Subnet Manager
Fabric diagnostics	• Fabric inspector
Gateway	• Proxy ARP • High Availability Proxy-ARP

1.4 Gateway Features

Table 7 - Gateway Features

Feature	Description
Proxy-ARP	- Proxy-ARP interface - Unicast - Multicast - High availability Proxy-ARP

Figure 1: Managing an Ethernet Fabric Using MLNX-OS

Figure 2: Managing an InfiniBand Software Using MLNX-OS

Figure 3: Managing a Gateway Software Using MLNX-OS

2 Getting Started

The procedures described in this chapter assume that you have already installed and powered on your switch according to the instructions in the *Hardware Installation Guide*, which was shipped with the product.

2.1 Configuring the Switch for the First Time

➤ **To configure the switch:**

- Step 1.** Connect the host PC to the console (RJ-45) port of the switch system using the supplied cable. The console ports for systems are shown below as examples.

Figure 4: Console Ports for SX60xx/SX65xx Managed Systems

On SX65xx systems, when having dual management systems, first connect the cable and configure the master card and only then configure the slave. By default the master card is the top management module. Initial configuration must be performed on all of the management modules.

Make sure to connect to the console RJ-45 port of the switch and not to the MGT port.

DHCP is enabled by default over the MGT port. Therefore, if you have configured your DHCP server and connected an RJ-45 cable to the MGT port, simply log in using the designated IP address.

Step 2. Configure a serial terminal with the settings described below.

This step may be skipped if the DHCP option is used and an IP is already configured for the MGT port.

Table 8 - Serial Terminal Program Configuration for PPC Based Systems

Parameter	Setting
Baud Rate	9600
Data bits	8
Stop bits	1
Parity	None
Flow Control	None

Table 9 - Serial Terminal Program Configuration for x86 Based Systems

Parameter	Setting
Baud Rate	115200
Data bits	8
Stop bits	1
Parity	None
Flow Control	None

Step 3. Login as *admin* and use *admin* as password.

Step 4. Go through the Mellanox configuration wizard.

The following table shows an example of a wizard session.

Table 10 - Configuration Wizard Session - IP Configuration by DHCP (Sheet 1 of 3)

Wizard Session Display (Example)	Comments
Mellanox configuration wizard Do you want to use the wizard for initial configuration? yes	You must perform this configuration the first time you operate the switch or after resetting the switch to the factory defaults. Type “y” and then press <Enter>.
Step1: Hostname? [switch-1]	If you wish to accept the default hostname, then press <Enter>. Otherwise, type a different hostname and press <Enter>.

Table 10 - Configuration Wizard Session - IP Configuration by DHCP (Sheet 2 of 3)

Wizard Session Display (Example)	Comments
Step 2: Use DHCP on mgmt0 interface? [yes]	Perform this step to obtain an IP address for the switch. (mgmt0 is the management port of the switch.) If you wish the DHCP server to assign the IP address, type “yes” and press <Enter>. If you type “no” (no DHCP), then you will be asked whether you wish to use the “zeroconf” configuration or not. If you enter “yes” (yes Zeroconf), the session will continue as shown in Table 11. If you enter “no” (no Zeroconf), then you need to enter a <i>static</i> IP, and the session will continue as shown in Table 12.
Step 3: Enable IPv6 [yes]	Perform this step to enable IPv6 on management ports. If you wish to enable IPv6, type “yes” and press <Enter>. If you enter “no” (no IPv6), then you will automatically be referred to Step 5.
Step 4: Enable IPv6 autoconfig (SLAAC) on mgmt0 interface	Perform this step to enable StateLess address autoconfig on external management port. If you wish to enable it, type “yes” and press <Enter>. If you wish to disable it, enter “no”.
Step 5: Admin password (Press <Enter> to leave unchanged)? <new_password> Step 4: Confirm admin password? <new_password>	To avoid illegal access to the machine, please type a password and then press <Enter>. Then confirm the password by re-entering it. Note that password characters are <i>not</i> printed.

Table 10 - Configuration Wizard Session - IP Configuration by DHCP (Sheet 3 of 3)

Wizard Session Display (Example)	Comments
You have entered the following information: 1. Hostname: <switch name> 2. Use DHCP on mgmt0 interface: yes 3. Enable IPv6: yes 4. Enable IPv6 autoconfig (SLAAC) on mgmt0 interface: yes 5. Admin password (Enter to leave unchanged): (CHANGED) To change an answer, enter the step number to return to. Otherwise hit <enter> to save changes and exit. Choice: <Enter> Configuration changes saved. To return to the wizard from the CLI, enter the “configuration jump-start” command from configuration mode. Launching CLI... <switch name> [standalone: master] >	The wizard displays a summary of your choices and then asks you to confirm the choices or to re-edit them. Either press <Enter> to save changes and exit, or enter the configuration step number that you wish to return to. Note: To run the command “configuration jump-start” you must be in Config mode.

Table 11 - Configuration Wizard Session - IP Zeroconf Configuration

Wizard Session Display - IP Zeroconf Configuration (Example)
Mellanox configuration wizard Do you want to use the wizard for initial configuration? y Step 1: Hostname? [switch-112126] Step 2: Use DHCP on mgmt0 interface? [no] Step 3: Use zeroconf on mgmt0 interface? [no] yes Step 4: Default gateway? [192.168.10.1] Step 5: Primary DNS server? Step 6: Domain name? Step 7: Enable IPv6? [yes] yes Step 8: Enable IPv6 autoconfig (SLAAC) on mgmt0 interface? [no] no Step 9: Admin password (Enter to leave unchanged)? You have entered the following information: 1. Hostname: switch-112126 2. Use DHCP on mgmt0 interface: no 3. Use zeroconf on mgmt0 interface: yes 4. Default gateway: 192.168.10.1 5. Primary DNS server: 6. Domain name: 7. Enable IPv6: yes 8. Enable IPv6 autoconfig (SLAAC) on mgmt0 interface: yes 9. Admin password (Enter to leave unchanged): (unchanged) To change an answer, enter the step number to return to. Otherwise hit <enter> to save changes and exit. Choice: Configuration changes saved. To return to the wizard from the CLI, enter the “configuration jump-start” command from configure mode. Launching CLI... <switch name> [standalone: master] >

Table 12 - Configuration Wizard Session - Static IP Configuration

Wizard Session Display - Static IP Configuration (Example)
Mellanox configuration wizard Do you want to use the wizard for initial configuration? y Step 1: Hostname? [switch-112126] Step 2: Use DHCP on mgmt0 interface? [yes] n Step 3: Use zeroconf on mgmt0 interface? [no] Step 4: Primary IP address? 192.168.10.4 Mask length may not be zero if address is not zero (interface mgmt0) Step 5: Netmask? [0.0.0.0] 255.255.255.0 Step 6: Default gateway? 192.168.10.1 Step 7: Primary DNS server? Step 8: Domain name? Step 9: Enable IPv6? [yes] yes Step 10: Enable IPv6 autoconfig (SLAAC) on mgmt0 interface? [no] no Step 11: Admin password (Enter to leave unchanged)? You have entered the following information: 1. Hostname: switch-112126 2. Use DHCP on mgmt0 interface: no 3. Use zeroconf on mgmt0 interface: no 4. Primary IP address: 192.168.10.4 5. Netmask: 255.255.255.0 6. Default gateway: 192.168.10.1 7. Primary DNS server: 8. Domain name: 9. Enable IPv6: yes 10. Enable IPv6 autoconfig (SLAAC) on mgmt0 interface: no 11. Admin password (Enter to leave unchanged): (unchanged) To change an answer, enter the step number to return to. Otherwise hit <enter> to save changes and exit. Choice: Configuration changes saved. To return to the wizard from the CLI, enter the “configuration jump-start” command from configure mode. Launching CLI... <switch name>[standalone: master] >

- Step 5.** Check the mgmt0 interface configuration before attempting a remote (for example, SSH) connection to the switch. Specifically, verify the existence of an IP address.

```
switch # show interfaces mgmt0
Interface mgmt0 state
Admin up:          yes
Link up:           yes
IP address:        169.254.15.134
Netmask:           255.255.0.0
IPv6 enabled:      yes
Autoconf enabled:  yes
Autoconf route:    yes
Autoconf privacy:  no
IPv6 addresses:    1
IPv6 address:      fe80::202:c9ff:fe11:a1b2/64
Speed:             1000Mb/s (auto)
Duplex:            full (auto)
Interface type:    ethernet
Interface source:  physical
MTU:               1500
HW address:        00:02:C9:11:A1:B2
Comment:
RX bytes:          11700449      TX bytes:          15139846

TX queue len:      1000
```

2.1.1 Re-Running the Wizard

➤ *To rerun the wizard:*

- Step 1.** Enter the config mode.

```
switch > enable
switch # config terminal
```

- Step 2.** Rerun the wizard.

```
switch (config) # configuration jump-start
```

2.2 Starting the Command Line (CLI)

- Step 1.** Set up an Ethernet connection between the switch and a local network machine using a standard RJ-45 connector.
- Step 2.** Start a remote secured shell (SSH) to the switch using the command “ssh -l <username> <switch ip address>.”
- ```
rem_mach1 > ssh -l <username> <ip address>
```
- Step 3.** Login to the switch (default username is *admin*, password *admin*)
- Step 4.** Read and accept the EULA when prompted.

- Step 5.** Once you get the prompt, you are ready to use the system.

```

```

## 2.3 Starting the Web User Interface

- *To start a WebUI connection to the switch platform:*

WebUI access is disabled by default  
To enable web access, run the command “web http enable” or “web https enable” through the CLI.

- Step 1.** Set up an Ethernet connection between the switch and a local network machine using a standard RJ-45 connector.
- Step 2.** Open a web browser – Firefox 12, Chrome 18, IE 8, Safari 5 or higher.  
**Note:** Make sure the screen resolution is set to 1024\*768 or higher.
- Step 3.** Type in the IP address of the switch or its DNS name in the format: http://<switch\_IP\_address>.
- Step 4.** Login to the switch (default user name is *admin*, password *admin*).

**Figure 5: MLNX-OS Login Window**

The image shows the Mellanox MLNX-OS Management Console login window. At the top, the Mellanox logo is on the left, and the title 'Mellanox MLNX-OS Management Console' is on the right. Below the title, it says 'Host: switch-5ea580' and 'User: (not logged in)' with a 'Login' button. A navigation bar contains icons for Setup, System, Security, Ports, Status, JB SM MGMT, Fabric Inspector, and ETH MGMT. The main area is titled 'Login' and contains the instruction 'Please enter your username and password, then click "Login"'. Below this are two input fields: 'Account' with the value 'admin' and 'Password' which is empty. A 'Login' button is at the bottom left. At the bottom of the page, it says 'Mellanox MLNX-OS Switch Management' and 'Best viewed using Firefox, Chrome, IE 7 or higher at 1024x768 resolution or higher.' and '© 2009-2012 Mellanox Technologies, Inc.'

- Step 5.** Read and accept the EULA if prompted.  
You are only prompted if you have not accessed the switch via CLI before.

**Figure 6: EULA Prompt**

The image shows the Mellanox MLNX-OS Management Console summary page. At the top, the Mellanox logo is on the left, and the title 'Mellanox MLNX-OS MSX1700 Management Console' is on the right. Below the title, it says 'Host: switch-64716c' and 'User: admin' with a 'Logout' button. A navigation bar contains icons for Setup, System, Security, Ports, Status, vPI, vPI, ETH Mgmt, IP Route, and Gateway. A 'Save' button is on the right. The main area is titled 'Summary' and contains a table of system information. A 'Notice' dialog box is overlaid on the page, asking the user to read and accept the Mellanox End User License Agreement. The dialog box has a 'Confirm' button. At the bottom of the page, it says '© 2009-2013 Mellanox Technologies, Inc.'

- Step 6.** The Welcome popup appears. After reading through the content, click OK to continue. You may click on the links under Documentation to reach the MLNX-OS documentation. The link under What's New takes you straight to the RN Changes and New Features section.

**Figure 7: Welcome Popup**

You may also tick the box to not show this popup again. But should you wish to see this window again, click “Product Documents” on the upper right corner of the WebUI.

- Step 7.** A default status summary is displayed as shown in Figure 8.

**Figure 8: Display After Login**

## 2.4 Licenses

Gateway is not supported in MLNX-OS release 3.4.1110.

MLNX-OS software package can be extended with premium features. Installing a license allows you to access the specified premium features.

This section is relevant only to switch systems with an internal management capability.

The following licenses are offered with MLNX-OS software:

**Table 13 - MLNX-OS Licenses**

| OPN                  | Valid on Product                                                 | Description                                       |
|----------------------|------------------------------------------------------------------|---------------------------------------------------|
| UPGR-6012-GW         | SX6012                                                           | Ethernet L2/L3, Gateway                           |
| UPGR-6012F-56GE      | SX6012                                                           | 56GbE link speed                                  |
| UPGR-1012-GW         | SX1012                                                           | InfiniBand, Ethernet L3, Gateway                  |
| UPGR-1012-56GE       | SX1012                                                           | 56GbE link speed                                  |
| UPGR-6018-GW         | SX6018                                                           | Ethernet L2/L3, Gateway                           |
| UPGR-6018F-56GE      | SX6018                                                           | 56GbE link speed                                  |
| UPGR-6036-GW         | SX6036                                                           | Ethernet L2/L3, Gateway                           |
| UPGR-6036F-56GE      | SX6036                                                           | 56GbE link speed                                  |
| UPGR-1036-GW         | SX1036                                                           | InfiniBand, Ethernet L3, Gateway                  |
| UPGR-1036-56GE       | SX1036                                                           | 56GbE link speed                                  |
| UPGR-1024-56GE       | SX1024                                                           | 56GbE link speed                                  |

### 2.4.1 Installing MLNX-OS® License (CLI)

➤ *To install an MLNX-OS license via CLI:*

**Step 1.** Login as *admin* and change to *Config* mode.

```
switch > enable
switch # config terminal
```

**Step 2.** Install the license using the key. Run:

```
switch (config) # license install <license key>
```

**Step 3.** Display the installed license(s) using the following command.

```
switch (config) # show licenses
License 1: <license key>
Feature: EFM_SX
Valid: yes
Active: yes
switch (config) #
```

Make sure that the “Valid” and “Active” fields both indicate “yes”.

**Step 4.** Save the configuration to complete the license installation. Run:

```
switch (config) # configuration write
```

If you do not save the installation session, you will lose the license at the next system start up.

## 2.4.2 Installing MLNX-OS License (Web)

➤ *To install an MLNX-OS license via WebUI:*

**Step 1.** Log in as *admin*.

**Step 2.** Click the **Setup** tab and then **Licensing** on the left side navigation pane.

If you do not save the installation session, you will lose the installed licenses at the next system boot.

### 2.4.3 Retrieving a Lost License Key

In case of a lost MLNX-OS® license key, contact your authorized Mellanox reseller and provide the switch's *chassis serial number*.

➤ **To obtain the switch's chassis serial number:**

**Step 1.** Login to the switch.

**Step 2.** Retrieve the switch's *chassis serial number* using the command “show inventory”.

```
switch (config) # show inventory
```

| Module  | Type       | Part number   | Serial Number |
|---------|------------|---------------|---------------|
| CHASSIS | SX1035     | MSX6036F-1BFR | MT1121X02692  |
| MGMT    | SX1035     | MSX6036F-1BFR | MT1121X02692  |
| FAN     | SXX0XX_FAN | MSX60-FF      | MT1121X02722  |
| PS1     | SXX0XX_PS  | N/A           | N/A           |
| CPU     | CPU        | SA000103      | MT1120X01027  |

```
switch (config) #
```

**Step 3.** Send your Mellanox reseller the following information to obtain the license key:

- The chassis serial number
- The type of license you need to retrieve. Refer to [“Licenses” on page 39](#).

**Step 4.** Once you receive the license key, you can install the license as described in the sections above.

## 2.4.4 Commands

### file eula upload

**file eula upload <filename> <URL>**

Uploads the Mellanox End User License Agreement to a specified remote location.

## file help-docs upload

**file help-docs upload <filename> <URL or scp://username[:password]@hostname/path/filename>**

Uploads the MLNX-OS UM or RN to a specified remote location.

|                           |                                                                                                                                                           |                                                         |

| <b>Note</b>               |                                                                                                                                                           |                                                         |

## license delete

**license delete <license-key>**

Removes license keys by ID.

|                           |                                                                     |
|---------------------------|---------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                 |
| <b>Default</b>            | N/A                                                                 |
| <b>Configuration Mode</b> | Config                                                              |
| <b>History</b>            | 3.4.1100                                                            |
| <b>Role</b>               | admin                                                               |
| <b>Example</b>            | switch (config) # license delete <license-key><br>switch (config) # |
| <b>Related Commands</b>   |                                                                     |
| <b>Note</b>               |                                                                     |

## license install

**licenses install <license-key>**

Installs a new license key.

|                           |                                                                       |
|---------------------------|-----------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                   |
| <b>Default</b>            | N/A                                                                   |
| <b>Configuration Mode</b> | Config                                                                |
| <b>History</b>            | 3.4.1100                                                              |
| <b>Role</b>               | admin                                                                 |
| <b>Example</b>            | switch (config) # licenses install <license-key><br>switch (config) # |
| <b>Related Commands</b>   |                                                                       |
| <b>Note</b>               |                                                                       |

## show licenses

### show licenses

Displays a list of all installed licenses. For each license, the following is displayed:

- a unique ID which is a small integer
- the text of the license key as it was added
- whether or not it is valid and active
- which feature(s) it is activating
- a list of all licensable features specifying whether or not it is currently activated by a license

|                           |                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                                                                                   |
| <b>Default</b>            | N/A                                                                                                                                   |
| <b>Configuration Mode</b> | Config                                                                                                                                |
| <b>History</b>            | 3.4.1100                                                                                                                              |
| <b>Role</b>               | admin                                                                                                                                 |
| <b>Example</b>            | <pre>switch (config) # show licenses License 1: &lt;license key&gt; Feature: SX_CONFIG Valid: yes Active: yes switch (config) #</pre> |
| <b>Related Commands</b>   |                                                                                                                                       |
| <b>Note</b>               |                                                                                                                                       |

## 3 User Interfaces

### 3.1 Command Line Interface (CLI) Overview

MLNX-OS® is equipped with an industry-standard CLI. The CLI is accessed through SSH or Telnet sessions, or directly via the console port on the front panel (if it exists).

#### 3.1.1 CLI Modes

The CLI can be in one of following modes, and each mode makes available a certain group (or level) of commands for execution. The different CLI configuration modes are:

**Table 14 - CLI Modes and Config Context**

| Configuration Mode            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standard                      | When the CLI is launched, it begins in Standard mode. This is the most restrictive mode and only has commands to query a restricted set of state information. Users cannot take any actions that directly affect the system, nor can they change any configuration.                                                                                                                                                                                                                                                                   |
| Enable                        | The <code>enable</code> command moves the user to Enable mode. This mode offers commands to view all state information and take actions like rebooting the system, but it does not allow any configurations to be changed. Its commands are a superset of those in Standard mode.                                                                                                                                                                                                                                                     |
| Config                        | The <code>configure terminal</code> command moves the user from Enable mode to Config mode. Config mode is allowed only for user accounts in the “admin” role (or capabilities). This mode has a full unrestricted set of commands to view anything, take any action, and change any configuration. Its commands are a superset of those in Enable mode. To return to Enable mode, enter <code>exit</code> or <code>no configure</code> .<br><br>Note that moving directly from/to Standard mode to/from Config mode is not possible. |
| Config Interface Management   | Configuration mode for management interface <code>mgmt0</code> , <code>mgmt1</code> and loopback.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Config Interface Ethernet     | Configuration mode for Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Config Interface Port Channel | Configuration mode for Port channel (LAG).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Config VLAN                   | Configuration mode for VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Any Command Mode              | Several commands such as “show” can be applied within any context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 3.1.2 Syntax Conventions

To help you identify the parts of a CLI command, this section explains conventions of presenting the syntax of commands.

**Table 15 - Syntax Conventions**

| Syntax Convention   | Description                                                                                                                                                                              | Example                                               |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| < > Angled brackets | Indicate a value/variable that must be replaced.                                                                                                                                         | <1...65535> or <switch inter-face>                    |
| [ ] Square brackets | Enclose optional parameters. However, only one parameter out of the list of parameters listed can be used. The user cannot have a combination of the parameters unless stated otherwise. | [destination-ip   destination-port   destination-mac] |
| { } Braces          | Enclose alternatives or variables that are required for the parameter in square brackets.                                                                                                | [mode {active   on   passive}]                        |
| Vertical bars       | Identify mutually exclusive choices.                                                                                                                                                     | active   on   passive                                 |

Do not type the angled or square brackets, vertical bar, or braces in command lines. This guide uses these symbols only to show the types of entries.

CLI commands and options are in lowercase and are case-sensitive. For example, when you enter the **enable** command, enter it all in lowercase. It cannot be **ENABLE** or **Enable**. Text entries you create are also case-sensitive.

### 3.1.3 Getting Help

You may request context-sensitive help at any time by pressing “?” on the command line. This will show a list of choices for the word you are on, or a list of top-level commands if you have not typed anything yet.

For example, if you are in Standard mode and you type “?” at the command line, then you will get the following list of available commands.

```
switch > ?
cli Configure CLI shell options
enable Enter enable mode
exit Log out of the CLI
help View description of the interactive help system
no Negate or clear certain configuration options
show Display system configuration or statistics
```

```

slogin Log into another system securely using ssh
switch Configure switch on system
telnet Log into another system using telnet
terminal Set terminal parameters
traceroute Trace the route packets take to a destination
switch-11a596 [standalone: master] >

```

If you type a legal string and then press “?” *without* a space character before it, then you will either get a description of the command that you have typed so far or the possible command/parameter completions. If you press “?” *after* a space character and “<cr>” is shown, this means that what you have entered so far is a complete command, and that you may press Enter (carriage return) to execute it.

Try the following to get started:

```

?
show ?
show c?
show clock?
show clock ?
show interfaces ? (from enable mode)

```

You can also enter “help” to view a description of the interactive help system.

Note also that the CLI supports command and/or parameter tab-completions and their shortened forms. For example, you can enter “en” instead of the “enable” command, or “cli cl” instead of “cli clear-history”. In case of ambiguity (more than one completion option is available, that is), then you can hit double tabs to obtain the disambiguation options. Thus, if you are in Enable mode and wish to learn which commands start with the letter “c”, type “c” and click twice on the tab key to get the following:

```

switch # c<tab>
clear cli configure
switch # c

```

(There are three commands that start with the letter “c”: cclear, cli and configure.)

### 3.1.4 Prompt and Response Conventions

The prompt always begins with the hostname of the system. What follows depends on what command mode the user is in. To demonstrate by example, assuming the machine name is “switch”, the prompts for each of the modes are:

```

switch > (Standard mode)
switch # (Enable mode)
switch (config) # (Config mode)

```

The following session shows how to move between command modes: \

```

switch > (You start in Standard mode)
switch > enable (Move to Enable mode)
switch # (You are in Enable mode)
switch # configure terminal (Move to Config mode)
switch (config) # (You are in Config mode)
switch (config) # exit (Exit Config mode)
switch # (You are back in Enable mode)
switch # disable (Exit Enable mode)
switch > (You are back in Standard mode)

```

Commands entered do not print any response and simply show the command prompt after you press <Enter>.

If an error is encountered in executing a command, the response will begin with “%”, followed by some text describing the error.

### 3.1.5 Using the “no” Form

Several Config mode commands offer the negation form using the keyword “no”. This no form can be used to disable a function, to cancel certain command parameters or options, or to reset a parameter value to its default. To re-enable a function or to set cancelled command parameters or options, enter the command without the “no” keyword (with parameter values if necessary).

The following example performs the following:

1. Displays the current CLI session options.
2. Disables auto-logout.
3. Displays the new CLI session options (auto-logout is disabled).
4. Re-enables auto-logout (after 15 minutes).
5. Displays the final CLI session options (auto-logout is enabled)

```
// 1. Display the current CLI session options
switch (config) # show cli
CLI current session settings:
 Maximum line size: 8192
 Terminal width: 157 columns
 Terminal length: 60 rows
 Terminal type: xterm
 Auto-logout: 15 minutes
 Paging: enabled
 Progress tracking: enabled
 Prefix modes: enabled
 ...
// 2. Disable auto-logout
switch (config) # no cli session auto-logout
// 3. Display the new CLI session options
switch-1 [standalone: master] (config) # show cli
CLI current session settings:
 Maximum line size: 8192
 Terminal width: 157 columns
 Terminal length: 60 rows
 Terminal type: xterm
 Auto-logout: disabled
 Paging: enabled
 Progress tracking: enabled
 Prefix modes: enabled
 ...
// 4. Re-enable auto-logout after 15 minutes
switch (config) # cli session auto-logout 15
```

```
// 5. Display the final CLI session options
switch (config) # show cli
CLI current session settings:
 Maximum line size: 8192
 Terminal width: 157 columns
 Terminal length: 60 rows
 Terminal type: xterm
 Auto-logout: 15 minutes
 Paging: enabled
 Progress tracking: enabled
 Prefix modes: enabled
 ...
```

### 3.1.6 Parameter Key

This section provides a key to the meaning and format of all of the angle-bracketed parameters in all the commands that are listed in this document.

**Table 16 - Angled Brackets Parameter Description**

| Parameter            | Description                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <domain>             | A domain name, e.g. “mellanox.com”.                                                                                                                                                                   |
| <hostname>           | A hostname, e.g. “switch-1”.                                                                                                                                                                          |
| <ifname>             | An interface name, e.g. “mgmt0”, “mgmt1”, “lo” (loopback), etc.                                                                                                                                       |
| <index>              | A number to be associated with aliased (secondary) IP addresses.                                                                                                                                      |
| <IP address>         | An IPv4 address, e.g. “192.168.0.1”.                                                                                                                                                                  |
| <log level>          | A syslog logging severity level. Possible values, from least to most severe, are: “debug”, “info”, “notice”, “warning”, “error”, “crit”, “alert”, “emerg”.                                            |
| <GUID>               | Globally Unique Identifier. A number that uniquely identifies a device or component.                                                                                                                  |
| <MAC address>        | A MAC address. The segments may be 8 bits or 16 bits at a time, and may be delimited by “:” or “.”. So you could say “11:22:33:44:55:66”, “1122:3344:5566”, “11.22.33.44.55.66”, or “1122.3344.5566”. |
| <netmask>            | A netmask (e.g. “255.255.255.0”) or mask length prefixed with a slash (e.g. “/24”). These two express the same information in different formats.                                                      |
| <network prefix>     | An IPv4 network prefix specifying a network. Used in conjunction with a netmask to determine which bits are significant. e.g. “192.168.0.0”.                                                          |
| <regular expression> | An extended regular expression as defined by the “grep” in the man page. (The value you provide here is passed on to “grep -E”.)                                                                      |
| <node id>            | ID of a node belonging to a cluster. This is a numerical value greater than zero.                                                                                                                     |
| <cluster id>         | A string specifying the name of a cluster.                                                                                                                                                            |
| <port>               | TCP/UDP port number.                                                                                                                                                                                  |

**Table 16 - Angled Brackets Parameter Description**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <TCP port> | A TCP port number in the full allowable range [0...65535].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <URL>      | <p>A normal URL, using any protocol that wget supports, including http, https, ftp, sftp, and tftp; or a pseudo-URL specifying an scp file transfer. The scp pseudo-URL format is scp://username:password@hostname/path/filename.</p> <p>Note that the path is an absolute path. Paths relative to the user's home directory are not currently supported. The implementation of ftp does not support authentication, so use scp or sftp for that.</p> <p>Note also that if you omit the “:password” part, you may be prompted for the password in a follow up prompt, where you can type it securely (without the characters being echoed). This prompt will occur if the “cli default prompt empty-password” setting is true; otherwise, the CLI will assume you do not want any password. If you include the “:” character, this will be taken as an explicit declaration that the password is empty, and you will not be prompted in any case.</p> |

### 3.1.7 Command Output Filtering

The MLNX-OS CLI supports filtering “show” commands to display lines containing or excluding certain phrases or characters. To filter the outputs of the “show” commands use the following format:

```
switch (config) # <show command> | [include | exclude] <extended regular expression>
[<ignore-case>] [next <lines>] [prev <lines>]
```

The filtering parameters are separated from the show command they filter by a pipe character (i.e. “|”). Quotation marks may be used to include or exclude a string including space, and multiple filters can be used simultaneously. For example:

```
switch (config) # <show command> | [include <extended regular expression> [<ignore-case>]
[next <lines>] [prev <lines>] | exclude <extended regular expression> [<ignore-case>]
[next <lines>] [prev <lines>]]
```

Examples:

```
switch (config) # switch (config) # switch (config) # show asic-version | include SX
SX module Version
SX 9.2.5440

arc-switch14 [standalone: master](config) # show module | exclude PS=====
Module Type Present Power Is Fatal =====
MGMT SX1036 1 N/A Not Fatal
FAN SXX0XX_FAN 1 N/A Not Fatal
CPU CPU 1 N/A Not Fatal

arc-switch14 [standalone: master] (config) # show interfaces | include "Eth|discard pac"
Eth1/1
0 discard packets
0 discard packets
Eth1/2
0 discard packets
0 discard packets
```

```

Eth1/3
0 discard packets
0 discard packets
Eth1/4
0 discard packets
0 discard packets
switch (config) # show interfaces | include "Tx" next 5 | exclude broad
Tx
0 packets
0 unicast packets
0 multicast packets
0 bytes
--
Tx
0 packets
0 unicast packets
0 multicast packets
0 bytes

```

## 3.2 Web Interface Overview

MLNX-OS® package equipped with web interface which is a web GUI that accept input and provide output by generating webpages which can be viewed by the user using a web browser.

The following web browsers are supported:

- Internet Explorer 8.0 or higher
- Chrome 18 or higher
- Mozilla Firefox 12 or higher
- Safari 5 or higher

The web interface makes available the following perspective tabs:

- Setup
- System
- Security
- Ports
- Status
- IB SM Management
- Fabric Inspector
- Ethernet Management
- IP Route
- Gateway

Make sure to save your changes before switching between menus or submenus. Click the “Save” button to the right of “Save Changes?”.

### 3.2.1 Setup Menu

The **Setup** menu makes available the following submenus (listed in order of appearance from top to bottom):

**Table 17 - WebUI Setup Submenus**

| Submenu Title      | Description                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces         | Obtains the status of, configures, or disables interfaces to the InfiniBand fabric. Thus, you can: set or clear the IP address and netmask of an interface; enable DHCP to dynamically assign the IP address and netmask; and set interface attributes such as MTU, speed, duplex, etc. |
| HA                 | Creates, joins or modifies an InfiniBand subnet.                                                                                                                                                                                                                                        |
| Routing            | Configures, removes or displays the default gateway, and the static and dynamic routes.                                                                                                                                                                                                 |
| Hostname           | Configures or modifies the hostname.<br>Configures or deletes static hosts.                                                                                                                                                                                                             |
| DNS                | Configures, removes, modifies or displays static and dynamic name servers.                                                                                                                                                                                                              |
| Login Messages     | Edits the login messages: Message of the Day (MOTD), Remote Login message, and Local Login message.                                                                                                                                                                                     |
| Address Resolution | Adds static and dynamic ARP entries, and clears the dynamic ARP cache.                                                                                                                                                                                                                  |

**Table 17 - WebUI Setup Submenus**

| Submenu Title       | Description                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------|
| IPSec               | Configures IPSec.                                                                                      |
| Neighbors           | Displays IPv6 neighbor discovery protocol.                                                             |
| Virtualization      | Manages the virtualization and virtual machines.                                                       |
| Virtual Switch Mgmt | Configures the system profile.                                                                         |
| Web                 | Configures web user interface and proxy settings.                                                      |
| SNMP                | Configures SNMP attributes, SNMP admin user, and trap sinks.                                           |
| Email Alerts        | Configures the destination of email alerts and the recipients to be notified.                          |
| XML gateway         | Provides an XML request-response protocol to get and set hardware management information.              |
| Logs                | Sets up system log files, remote log sinks, and log formats.                                           |
| Configurations      | Manages, activates, saves, and imports MLNX-OS SwitchX configuration files, and executes CLI commands. |
| Date and Time       | Configures the date, time, and time zone of the switch system.                                         |
| NTP                 | Configures NTP (Network Time Protocol) and NTP servers.                                                |
| Licensing           | Manages MLNX-OS licenses.                                                                              |

### 3.2.2 System Menu

The **System** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 18 - WebUI System Submenus**

| Submenu Title    | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modules          | Displays a graphic illustration of the system modules. By moving the mouse over the ports in the front view, a pop-up caption is displayed to indicate the status of the port. The port state (active/down) is differentiated by a color scheme (green for active, gray/black for down). By moving the mouse over the rear view, a pop-up caption is displayed to indicate the leaf part information. |
| Inventory        | Displays a table with the following information about the system modules: module name, type, serial number, ordering part number and Asic firmware version.                                                                                                                                                                                                                                           |
| Power Management | Displays a table with the following information about the system power supplies: power supply name, power, voltage level, current consumption, and status. A total power summary table is also displayed providing the power used, the power capacity, and the power available.                                                                                                                       |
| MLNX-OS Upgrade  | Displays the installed MLNX-OS images (and the active partition), uploads a new image, and installs a new image.                                                                                                                                                                                                                                                                                      |

**Table 18 - WebUI System Submenus**

| Submenu Title | Description                                                                              |
|---------------|------------------------------------------------------------------------------------------|
| Reboot        | Reboots the system. Make sure that you save your configuration prior to clicking reboot. |

### 3.2.3 Security Menu

The **Security** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 19 - WebUI Security Submenus**

| Submenu Title  | Description                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| Users          | Manages (setting up, removing, modifying) user accounts.                                                                           |
| Admin Password | Modifies the system administrator password.                                                                                        |
| SSH            | Displays and generate host keys.                                                                                                   |
| AAA            | Configures AAA (Authentication, Authorization, and Accounting) security services such as authentication methods and authorization. |
| Login Attempts | Manages login attempts                                                                                                             |
| RADIUS         | Manages Radius client.                                                                                                             |
| TACACS+        | Manages TACACS+ client.                                                                                                            |
| LDAP           | Manages LDAP client.                                                                                                               |
| Certificate    | Manages certificates.                                                                                                              |

### 3.2.4 Ports Menu

The Ports menu displays the port state and enables some configuration attributes of a selected port. It also enables modification of the port configuration. A graphical display of traffic over time (last hour or last day) through the port is also available.

**Table 20 - WebUI Ports Submenus**

| Submenu Title   | Description                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------|
| Ports           | Manages port attributes, counters, transceiver info and displays a graphical counters histogram. |
| Phy Profile     | Provides the ability to manage phy profiles.                                                     |
| Monitor Session | Displays monitor session summary and enables configuration of a selected session.                |
| Protocol Type   | Manages the link protocol type                                                                   |

### 3.2.5 Status Menu

The **Status** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 21 - WebUI Status Submenus**

| Submenu Title            | Description                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary                  | Displays general information about the switch system and the MLNX-OS image, including current date and time, hostname, uptime of system, system memory, CPU load averages, etc.                                                                |
| Profile and Capabilities | Displays general information about the switch system capabilities such as the enabled profiles (e.g IB/ETH) and their corresponding values.                                                                                                    |
| Temperature              | Provides a graphical display of the switch module sensors' temperature levels over time (1 hour). It is possible to display either the temperature level of one module's sensor or the temperature levels of all the module sensors' together. |
| Power Supplies           | Provides a graphical display of one of the switch's power supplies voltage level over time (1 hour).                                                                                                                                           |
| Fans                     | Provides a graphical display of fan speeds over time (1 hour). The display is per fan unit within a fan module.                                                                                                                                |
| CPU Load                 | Provides a graphical display of the management CPU load over time (1 hour).                                                                                                                                                                    |
| Memory                   | Provides a graphical display of memory utilization over time (1 day).                                                                                                                                                                          |
| Network                  | Provides a graphical display of network usage (transmitted and received packets) over time (1 day). It also provides per interface statistics.                                                                                                 |
| Logs                     | Displays the system log messages. It is possible to display either the currently saved system log or a continuous system log.                                                                                                                  |
| Maintenance              | Performs specific maintenance operations automatically on a predefined schedule.                                                                                                                                                               |
| Alerts                   | Displays a list of the recent health alerts and enables the user to configure health settings.                                                                                                                                                 |
| Virtualization           | Displays the virtual machines, networks and volumes.                                                                                                                                                                                           |

### 3.2.6 IB SM Mgmt

The IB SM MGMT menu is not supported in Ethernet systems.

The **IB SM Mgmt** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 22 - WebUI IB SM Mgmt Submenus**

| Submenu Title | Description                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary       | Displays the local Subnet Manager (SM) status (running time, failures, etc).                                                                                                                                                                   |
| Base SM       | Manages basic SM configuration (enabling SM, priority level, and restoring initial configuration).                                                                                                                                             |
| Advanced SM   | Manages basic SM configuration (enabling SM, priority level, and restoring initial configuration).                                                                                                                                             |
| Expert SM     | Configures security and GUID based prefixes (m_key, sm_key, sa_key, etc), and manages special SM attributes that should not be changed except by expert users of the Subnet Manager who understand the risks of manipulating these attributes. |
| Compute nodes | Adds compute nodes using network adapter port GUIDs.                                                                                                                                                                                           |
| Root nodes    | Adds root nodes using switch GUIDs.                                                                                                                                                                                                            |
| Partitions    | Manages partition keys (sets removes or displays the partition keys).                                                                                                                                                                          |
| Basic Qos     | Configures basic QoS attributes such as default QoS settings, and VL arbitration low and high entries. It also displays and manages SL-to-VL mappings.                                                                                         |

### 3.2.7 Fabric Inspector

The Fabric Inspctr menu is not applicable when the switch profile is not InfiniBand or VPI.

The Fabric Inspctr menu requires a license (LIC-fabric-inspector).

The **Fabric Inspctr** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 23 - WebUI Fabric Inspctr Submenus**

| Submenu Title | Description                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary       | Displays a fabric status summary, including the time of last fabric update, what systems are in the fabric, what InfiniBand devices are identified, etc. |

**Table 23 - WebUI Fabric Inspctr Submenus**

| Submenu Title | Description                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IB Systems    | Displays information about all identified InfiniBand systems in the fabric (adapters, switches, etc).                                                                                                                                                                        |
| IB Nodes      | Displays information about InfiniBand nodes in the fabric. It is possible to filter display by the type of InfiniBand node (HCA adapter, switch, etc).                                                                                                                       |
| IB Ports      | Displays all active InfiniBand ports in the fabric. It is possible to filter display by the type of InfiniBand port (HCA port, switch port, switch management port, etc), by the port rate (speed or width), by the Subnet Manager status on the node, by node traffic, etc. |
| Connections   | Displays all active connections in the fabric. It is possible to filter display by the link type (switch to switch, switch to HCA, etc) and by the link rate (speed or width).                                                                                               |
| System Names  | Allows the mapping of System Names to GUIDs to ease system identification.                                                                                                                                                                                                   |

### 3.2.8 ETH Mgmt

The Eth Mgmt menu is not applicable when the switch profile is not Ethernet or VPI.

The **ETH Mgmt** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 24 - WebUI ETH Mgmt Submenus**

| Submenu Title         | Description                                                                        |
|-----------------------|------------------------------------------------------------------------------------|
| Spanning Tree         | Configures and monitors spanning tree protocol.                                    |
| MAC Table             | Configures static mac addresses in the switch, and displays the MAC address table. |
| Link Aggregation      | Configures and monitors aggregated Ethernet links (LAG) and configures LACP.       |
| VLAN                  | Manages the switch VLAN table.                                                     |
| IGMP Snooping         | Manages IGMP snooping in the switch.                                               |
| ACL                   | Manages Access Control in the switch.                                              |
| Priority Flow Control | Manages priority flow control.                                                     |

### 3.2.9 IP Route

The **IP Route** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 25 - WebUI IP Route Submenus**

| Submenu Title      | Description                                          |
|--------------------|------------------------------------------------------|
| Router Global      | Enables/disables IP Routing protocol on the machine. |
| IP Route           | Not implemented.                                     |
| IP Interface       | Not implemented.                                     |
| Address Resolution | Not implemented.                                     |
| IP Diagnostic      | Not implemented.                                     |

### 3.2.10 Gateway

The **Gateway** menu makes available the following sub-menus (listed in order of appearance from top to bottom):

**Table 26 - WebUI Gateway Submenus**

| Submenu Title        | Description                                                                |
|----------------------|----------------------------------------------------------------------------|
| Proxy-ARP Global     | Displays and manages IP Proxy-ARP.                                         |
| Proxy-ARP Interfaces | Displays Proxy-ARP interfaces.                                             |
| Address Resolution   | Displays the address resolution (ARP) table.                               |
| Routing              | Configures, removes or displays the routing table per Proxy-ARP interface. |

## 3.3 Secure Shell (SSH)

It is recommended not to use more than 100 concurrent SSH sessions to the switch.

### 3.3.1 Adding a Host and Providing an SSH Key

➤ *To add entries to the global known-hosts configuration file and its SSH value:*

**Step 1.** Change to Config mode Run:

```
switch [standalone: master] > enable
switch [standalone: master] # configure terminal
switch [standalone: master] (config) #
```

**Step 2.** Add an entry to the global known-hosts configuration file and its SSH value. Run:

```
switch [standalone: master] (config) # ssh client global known-host "myserver ssh-rsa
AAAAB3NzaC1yc2EAAAABIwAAAIEAsXeklqc8T0EN2mnMcVcfhueaRYzIVqt4rVsrERIjmlJh4mkYYIa8hGGikNa+
t5xw2dRrNxnHYLK51bUsSG1ZNwZT1Dpme3pAZeMY7G4ZMgGIW9x0uaXgAA3eBeoUjFdi6+1BqchWk0nTb+gMfI/
MK/heQNns7AtTrvqg/05ryIc="
switch [standalone: master] (config) #
```

**Step 3.** Verify what keys exist in the host. Run:

```
switch [standalone: master] (config) # show ssh client
SSH client Strict Hostkey Checking: ask

SSH Global Known Hosts:
 Entry 1: myserver
 Finger Print: d5:d7:be:d7:6c:b1:e4:16:df:61:25:2f:b1:53:a1:06

No SSH user identities configured.

No SSH authorized keys configured.

switch [standalone: master] (config) #
```

### 3.3.2 Retrieving Return Codes when Executing Remote Commands

➤ *To stop the CLI and set the system to send return errors if some commands fail:*

**Step 1.** Connect to the system from the host SSH.

**Step 2.** Add the -h parameter after the cli (as shown in the example below) to notify the system to halt on failure and pass through the exit code.

```
ssh <username>@<hostname> cli -h "enable" "show interfaces brief"
```

## 3.4 Commands

### 3.4.1 CLI Session

This chapter displays all the relevant commands used to manage CLI session terminal.

#### **cli clear-history**

##### **cli clear-history**

Clears the command history of the current user.

|                           |                                                          |
|---------------------------|----------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                      |
| <b>Default</b>            | N/A                                                      |
| <b>Configuration Mode</b> | Config                                                   |
| <b>History</b>            | 3.1.0000                                                 |
| <b>Role</b>               | admin                                                    |
| <b>Example</b>            | switch (config) # cli clear-history<br>switch (config) # |
| <b>Related Commands</b>   | N/A                                                      |
| <b>Note</b>               |                                                          |

## cli default

**cli default {auto-logout <minutes> | paging enable | prefix-modes {enable | show-config} | progress enable | prompt {confirm-reload | confirm-reset | confirm-unsaved | empty-password}}**

**no cli default {auto-logout | paging enable | prefix-modes {enable | show-config} | progress enable prompt {confirm-reload | confirm-reset | confirm-unsaved | empty-password}}**

Configures default CLI options for all future sessions.

The no form of the command deletes or disables the default CLI options.

|                           |                                     |                                                                                                                                                                                                                                                                                                       |
|---------------------------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | minutes                             | Configures keyboard inactivity timeout for automatic logout. Range is 0-35791 minutes. Setting the value to 0 or using the no form of the command disables the auto-logout.                                                                                                                           |
|                           | paging enable                       | Enables text viewing one screen at a time.                                                                                                                                                                                                                                                            |
|                           | prefix-modes {enable   show-config} | Configures the prefix modes feature of CLI. <ul style="list-style-type: none"> <li>“prefix-modes enable” enables prefix modes for current and all future sessions</li> <li>“prefix-modes show-config” uses prefix modes in “show configuration” output for current and all future sessions</li> </ul> |
|                           | progress enable                     | Enables progress updates.                                                                                                                                                                                                                                                                             |
|                           | prompt confirm-reload               | Prompts for confirmation before rebooting.                                                                                                                                                                                                                                                            |
|                           | prompt confirm-reset                | Prompts for confirmation before resetting to factory state.                                                                                                                                                                                                                                           |
|                           | prompt confirm-unsaved              | Confirms whether or not to save unsaved changes before rebooting.                                                                                                                                                                                                                                     |
|                           | prompt empty-password               | Prompts for a password if none is specified in a pseudo-URL for SCP.                                                                                                                                                                                                                                  |
| <b>Default</b>            | N/A                                 |                                                                                                                                                                                                                                                                                                       |
| <b>Configuration Mode</b> | Config                              |                                                                                                                                                                                                                                                                                                       |
| <b>History</b>            | 3.1.0000                            |                                                                                                                                                                                                                                                                                                       |
| <b>Role</b>               | admin                               |                                                                                                                                                                                                                                                                                                       |

---

**Example**

```
switch (config) # cli default prefix-modes enable
switch (config) # show cli
CLI current session settings:
 Maximum line size: 8192
 Terminal width: 171 columns
 Terminal length: 38 rows
 Terminal type: xterm
 X display setting: (none)
 Auto-logout: disabled
 Paging: enabled
 Progress tracking: enabled
 Prefix modes: disabled

CLI defaults for future sessions:
 Auto-logout: disabled
 Paging: enabled
 Progress tracking: enabled
 Prefix modes: enabled (and use in 'show configuration')

Settings for both this session and future ones:
 Show hidden config: yes
 Confirm losing changes: yes
 Confirm reboot/shutdown: no
 Confirm factory reset: yes
 Prompt on empty password: yes
switch (config) #
```

---

**Related Commands**    show cli

---

**Note**

---

## cli session

**cli session {auto-logout <minutes> | paging enable | prefix-modes {enable | show-config} | progress enable | terminal {length <size> | resize | type <terminal-type> | width} | x-display full <display>}**  
**no cli session {auto-logout | paging enable | prefix-modes {enable | show-config} | progress enable | terminal type | x-display}**

Configures default CLI options for all future sessions.  
 The no form of the command deletes or disables the CLI sessions.

## terminal

**terminal {length <number of lines> | resize | type <terminal type> | width <number of characters>}**  
**no terminal type**

Configures default CLI options for all future sessions.  
 The no form of the command clears the terminal type.

|                           |                                                            |                                                                                                                |

## 3.4.2 Banner

### banner login

**banner {login | login-remote | login-local} <string>**  
**no banner login**

Sets the CLI welcome banner message. The login-remote refers to the SSH connections banner, while the login-local refers to the serial connection banner. The no form of the command resets the system login banner to its default.

| <b>Note</b>               | If more than one word is used (there is a space) quotation marks should be added (i.e. “xxxx xxxx”).                                                 |

## banner login-local

**banner login-local <string>**

**no banner login-local**

Sets system login local banner.

The no form of the command resets the banner.

| <b>Related Commands</b>   | show ssh server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Note</b>               | Disabling SSH server does not terminate existing SSH sessions, it only prevents new ones from being established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## ssh server host-key

**ssh server host-key {<key type> {private-key <private-key>| public-key <public-key>} | generate}**

Manipulates host keys for SSH.

|                           |                                |                                                                                                            |

**Related Commands**

```
show ssh server
```

**Note**

## ssh server listen

**ssh server listen {enable | interface <inf>}**  
**no ssh server listen {enable | interface <inf>}**

Enables the listen interface restricted list for SSH. If enabled, and at least one non-DHCP interface is specified in the list, the SSH connections are only accepted on those specified interfaces.

The no form of the command disables the listen interface restricted list for SSH. When disabled, SSH connections are not accepted on any interface.

## ssh server min-version

**ssh server min-version <version>**

**no ssh server min-version**

Sets the minimum version of the SSH protocol that the server supports.  
The no form of the command resets the minimum version of SSH protocol supported.

## ssh server ports

**ssh server ports {<port1> [<port2>...]}**

Specifies which ports the SSH server listens on.

| Syntax Description | port                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Port number in [1...65535]. |

## ssh server x11-forwarding

**ssh server x11-forwarding enable**  
**no ssh server x11-forwarding enable**

Enables X11 forwarding on the SSH server.  
 The no form of the command disables X11 forwarding.

## ssh client global

**ssh client global {host-key-check <policy>} | known-host <known-host-entry>}**  
**no ssh client global {host-key-check | known-host localhost}**

Configures global SSH client settings.

The no form of the command negates global SSH client settings.

## ssh client user

**ssh client user <username> {authorized-key sshv2 <public key> | identity <key type> {generate | private-key [<private key>] | public-key [<public key>]} | known-host <known host> remove}**  
**no ssh client user admin {authorized-key sshv2 <public key ID> | identity <key type>}**

Adds an entry to the global known-hosts configuration file, either by generating new key, or by adding manually a public or private key.

The no form of the command removes a public key from the specified user's authorized key list, or changes the key type.

| <b>Note</b>               | If a key is being pasted from a cut buffer and was displayed with a paging program, it is likely that newline characters have been inserted, even if the output was not long enough to require paging. One can specify “no cli session paging enable” before running the “show” command to prevent the newlines from being inserted. |                                                                                                                                                             |

## slogin

**slogin [<slogin options>] <hostname>**

Invokes the SSH client. The user is returned to the CLI when SSH finishes.

| <b>Note</b>               |                                                |

## telnet-server enable

**telnet-server enable**  
**no telnet-server enable**

Enables the telnet server.  
The no form of the command disables the telnet server.

|                           |                                                                                                              |

| <b>Note</b>               |                                                                                                              |

## show telnet-server

### show telnet-server

Displays telnet server settings.

|                           |                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                                     |
| <b>Default</b>            | N/A                                                                                     |
| <b>Configuration Mode</b> | Config                                                                                  |
| <b>History</b>            | 3.1.0000                                                                                |
| <b>Role</b>               | admin                                                                                   |
| <b>Example</b>            | switch (config) # show telnet-server<br>Telnet server enabled: yes<br>switch (config) # |
| <b>Related Commands</b>   | telnet-server enable                                                                    |
| <b>Note</b>               |                                                                                         |

### 3.4.5 Web Interface

#### web auto-logout

**web auto-logout <number of minutes>**  
**no web auto-logout <number of minutes>**

Configures length of user inactivity before auto-logout of a web session.  
 The no form of the command disables the web auto-logout (web sessions will never logged out due to inactivity).

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                            |

## web http

**web http {enable | port <port number> | redirect}**

**no web http {enable | port | redirect}**

Configures HTTP access to the web-based management console.

The no form of the command negates HTTP settings for the web-based management console.

## web httpd

**web httpd listen {enable | interface <ifName> }**  
**no web httpd listen {enable | interface <ifName> }**

Enables the listen interface restricted list for HTTP and HTTPS.  
 The no form of the command disables the HTTP server listen ability.

| <b>Note</b>               | If enabled, and if at least one of the interfaces listed is eligible to be a listen interface, then HTTP/HTTPS requests will only be accepted on those interfaces. Otherwise, HTTP/HTTPS requests are accepted on any interface.                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                          |

## web https

**web https {certificate {regenerate | name | default-cert} | enable | port <port number> | ssl ciphers {all | TLS | TLS1.2}}**  
**no web https {enable | port <port number>}**

Configures HTTPS access to the web-based management console.  
 The no form of the command negates HTTPS settings for the web-based management console.

|                           |                                         |                                                                  |
|---------------------------|-----------------------------------------|------------------------------------------------------------------|
| <b>Syntax Description</b> | certificate regenerate                  | Re-generates certificate to use for HTTPS connections.           |
|                           | certificate name                        | Configure the named certificate to be used for HTTPS connections |
|                           | certificate default-cert                | Configure HTTPS to use the configured default certificate        |
|                           | enable                                  | Enables HTTPS access to the web-based management console.        |
|                           | port                                    | Sets a TCP port for HTTPS access.                                |
|                           | ssl ciphers {all   TLS   TLS1.2}        | Sets ciphers to be used for HTTPS.                               |
| <b>Default</b>            | HTTPS is enabled<br>Default port is 443 |                                                                  |

---

**Example**

```
switch (config) # web https enable
switch (config) # show web

Web User Interface:
 Web interface enabled: yes
 HTTP enabled: yes
 HTTP port: 80
 HTTP redirect to HTTPS: no
 HTTPS enabled: yes
 HTTPS port: 443
 HTTPS ssl-ciphers: all
 HTTPS certificate name: default-cert
 Listen enabled: yes
 No Listen Interfaces.

 Inactivity timeout: 1 hr
 Session timeout: 2 hr 30 min
 Session renewal: 30 min

Web file transfer proxy:
 Proxy enabled: no

Web file transfer certificate authority:
 HTTPS server cert verify: yes
 HTTPS supplemental CA list: default-ca-list
switch (config) #
```

---

**Related Commands**

```
show web
web enable
```

---

**Note**

- Enabling HTTPS is meaningful if the WebUI as a whole is enabled.
  - See the command “crypto certificate default-cert name” for how to change the default certificate if inheriting the configured default certificate is preferred
-

## web session

**web session {renewal <minutes> | timeout <minutes>}**  
**no web session {renewal | timeout}**

Configures session settings.  
 The no form of the command resets session settings to default.

## web proxy auth

**web proxy auth {authtype <type>| basic [password <password> | username <username>]}**

**no web proxy auth {authtype | basic {password | username } }**

Configures authentication settings for web proxy authentication.  
The no form of the command resets the attributes to their default values.

|                           |                        |                                                                                                                                                                                                                    |

---

**Example**

```
switch (config) # web proxy auth authtype basic
switch (config) # web proxy auth basic username web-user
switch (config) # web proxy auth basic password web-password
switch (config) # show web
```

**Web User Interface:**

```
Web interface enabled: yes
HTTP enabled: yes
HTTP port: 80
HTTP redirect to HTTPS: no
HTTPS enabled: yes
HTTPS port: 443
HTTPS ssl-ciphers: all
HTTPS certificate name: default-cert
Listen enabled: yes
No Listen Interfaces.
```

```
Inactivity timeout: 1 hr
Session timeout: 2 hr 30 min
Session renewal: 30 min
```

**Web file transfer proxy:**

```
Proxy enabled: yes
Proxy address: 10.10.10.11
Proxy port: 40
Authentication type: basic
Basic auth username: web-user
Basic auth password: web-password
```

**Web file transfer certificate authority:**

```
HTTPS server cert verify: yes
HTTPS supplemental CA list: default-ca-list
```

```
switch (config) #
```

---

**Related Commands**

```
show web
web proxy host
```

---

**Note**

---

## web proxy host

**web proxy host** <IP address> [port <port number>]

**no web proxy**

Adds and enables a proxy to be used for any HTTP or FTP downloads.  
The no form of the command disables the web proxy.

## 4 System Management

### 4.1 Management Interface

#### 4.1.1 Configuring Management Interfaces with Static IP Addresses

If your switch system was set during initialization to obtain dynamic IP addresses through DHCP and you wish to switch to static assignments, perform the following steps:

**Step 1.** Enter Config mode. Run:

```
switch >
switch > enable
switch # configure terminal
switch (config) #
```

**Step 2.** Disable setting IP addresses using the DHCP using the following command:

```
switch (config) # no interface <ifname> dhcp
```

**Step 3.** Define your interfaces statically using the following command:

```
switch (config) # interface <ifname> ip address <IP address> <netmask>
```

#### 4.1.2 Configuring IPv6 Address on the Management Interface

**Step 1.** Enable IPv6 on this interface.

```
switch (config) # interface mgmt0 ipv6 enable
```

**Step 2.** Set the IPv6 address to be configured automatically.

```
switch (config) # interface mgmt0 ipv6 address autoconfig
```

**Step 3.** Verify the IPv6 address is configured correctly.

```
switch (config) # show interfaces mgmt0 brief
```

#### 4.1.3 Dynamic Host Configuration Protocol (DHCP)

DHCP is used for automatic retrieval of management IP addresses.

For all other systems (and software versions) DHCP is disabled by default.

If a user connects through SSH, runs the wizard and turns off DHCP, the connection is immediately terminated as the management interface loses its IP address.

```
<localhost># ssh admin@<ip-address>
Mellanox MLNX-OS Switch Management
Password:
Mellanox Switch
Mellanox configuration wizard
Do you want to use the wizard for initial configuration? yes
Step 1: Hostname? [my-switch]
Step 2: Use DHCP on mgmt0 interface? [yes] no
<localhost>#
```

In such case the serial connection should be used.

### 4.1.4 Default Gateway

To configure manually the default gateway, use the “ip route” command, with “0.0.0.0” as prefix and mask. The next-hop address must be within the range of one of the IP interfaces on the system.

```
switch (config)# ip route 0.0.0.0 0.0.0.0 10.209.0.2
switch (config)# show ip route
```

| Destination | Mask          | Gateway    | Interface | Source |
|-------------|---------------|------------|-----------|--------|
| default     | 0.0.0.0       | 10.209.0.2 | mgmt0     | static |
| 10.209.0.0  | 255.255.254.0 | 0.0.0.0    | mgmt0     | direct |

```
switch (config)#
```

### 4.1.5 In-Band Management

In-band management is a management path passing through the data ports. In-band management can be created over one of the VLANs in the systems.

The in-band management feature does not require any license. However, it works only for system profiles VPI and Ethernet. It cannot be enabled with IP Routing or IP Proxy-ARP.

➤ **To set an in-band management channel:**

**Step 1.** Create a VLAN. Run:

```
switch (config) # vlan 10
switch (config vlan 10) #
```

**Step 2.** Create a VLAN interface. Run:

```
switch (config) # interface vlan 10 create
```

**Step 3.** Enter the VLAN interface configuration mode and configure L3 attributes. Run:

```
switch (config) # interface vlan10
switch (config interface vlan10)#ip address 10.10.10.10 /24
```

**Step 4.** (Optional) Verify in-band management configuration. Run:

```
switch (config) # show interfaces vlan10
Interface vlan10 status:
 Comment:
 Admin up: yes
 Link up: yes
 DHCP running: no
 IP address: 10.10.10.10
 Netmask: 255.255.255.0
 IPv6 enabled: no
```

```
Speed: N/A
Duplex: N/A
Interface type: ethernet
Interface source: vlan

 TX queue len: 0

switch (config) #
```

## 4.1.6 Commands

### 4.1.6.1 Interface

This chapter describes the commands should be used to configure and monitor the management interface.

#### interface

**interface {mgmt0 | mgmt1 | lo | vlan<id> | ib0}**

Enters a management interface context.

|                           |                                                                                |                                                                         |
|---------------------------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Syntax Description</b> | mgmt0                                                                          | Management port 0 (out of band).                                        |
|                           | mgmt1                                                                          | Management port 1 (out of band).                                        |
|                           | lo                                                                             | Loopback interface.                                                     |
|                           | vlan<id>                                                                       | In-band management interface (e.g. vlan10).                             |
|                           | ib0                                                                            | IPoIB in-band management, relevant only for Infini-Band switch systems. |
| <b>Default</b>            | N/A                                                                            |                                                                         |
| <b>Configuration Mode</b> | Config                                                                         |                                                                         |
| <b>History</b>            | 3.1.0000                                                                       |                                                                         |
| <b>Role</b>               | admin                                                                          |                                                                         |
| <b>Example</b>            | <pre>switch (config) # interface mgmt0 switch (config interface mgmt0) #</pre> |                                                                         |
| <b>Related Commands</b>   | show interfaces <ifname>                                                       |                                                                         |
| <b>Note</b>               |                                                                                |                                                                         |

## interface vlan create

**interface vlan <id> create**  
**no interface vlan <id> create**

Creates an in-band management interface.  
 The no form of the command deletes the in-band management interface.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Example</b>            | switch (config) # interface vlan 10 create<br>switch (config) #                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Related Commands</b>   | interface<br>show interfaces <ifname>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Note</b>               | <ul style="list-style-type: none"> <li>• This command does not requires any license</li> <li>• If IP Proxy-ARP or IP Routing is enabled, the interface cannot be created</li> <li>• No more than 60 in-band management interfaces can be created</li> <li>• All management interface commands are applicable under this interface (ip address, mtu, dhcp, shutdown, zeroconf ...)</li> <li>• To enter the interface VLAN configuration mode you need to use the command “interface vlan&lt;id&gt;” (e.g. interface vlan10)</li> </ul> |

## ip address

**ip address** <IP address> <netmask>

**no ip address**

Sets the IP address and netmask of this interface.

The no form of the command clears the IP address and netmask of this interface.

| Syntax Description        | IP address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | IPv4 address              |

| <b>Note</b>               | If DHCP is enabled on the specified interface, then the DHCP IP assignment will hold until DHCP is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                           |

## ip default-gateway

**ip default-gateway <next hop IP address or interface name>**  
**no ip default-gateway**

Configures a default route.  
 The no form of the command removes the current default route.

## alias

**alias <index> ip address < IP address> <netmask>**  
**no alias <index>**

Adds an additional IP address to the specified interface. The secondary address will appear in the output of “show interface” under the data of the primary interface along with the alias.

The no form of the command removes the secondary address to the specified interface.

**Related Commands**

---

show interfaces &lt;ifname&gt;

**Note**

- If DHCP is enabled on the specified interface, then the DHCP IP assignment will hold until DHCP is disabled
  - More than one additional IP address can be added to the interface
-

## mtu

**mtu <bytes>**  
**no mtu <bytes>**

Sets the Maximum Transmission Unit (MTU) of this interface.  
 The no form of the command resets the MTU to its default.

| Syntax Description | bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The entry range is 68-1500. |

## duplex

**duplex <duplex>**

**no duplex**

Sets the interface duplex.

The no form of the command resets the duplex setting for this interface to its default value.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                         |

## speed

**speed <speed>**  
**no speed**

Sets the interface speed.  
 The no form of the command resets the speed setting for this interface to its default value.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                           |  |

**Note**

- Setting the speed to “auto” also sets the duplex to “auto”
  - Setting the speed to one of the manual settings (generally “10”, “100”, or “1000”) also sets the duplex to a manual setting which is determined by querying the interface to find out its current auto-detected state

## dhcp

### dhcp [renew]

### no dhcp

Enables DHCP on the specified interface.

The no form of the command disables DHCP on the specified interface.

## shutdown

**shutdown**  
**no shutdown**

Disables the specified interface.  
 The no form of the command enables the specified interface.

## zeroconf

**zeroconf**  
**no zeroconf**

Enables zeroconf on the specified interface. It randomly chooses a unique link-local IPv4 address from the 169.254.0.0/16 block. This command is an alternative to DHCP.

The no form of the command disables the use of zeroconf on the specified interface.

## ipv6 enable

**ipv6 enable**  
**no ipv6 enable**

Enables all IPv6 addressing for this interface.  
 The no form of the command disables all IPv6 addressing for this interface.

---

**Related Commands**

ipv6 address  
show interface <ifname>

---

**Note**

- The interface identifier is a 64-bit long modified EUI-64, which is based on the MAC address of the interface
  - If IPv6 is enabled on an interface, the system will automatically add a link-local address to the interface. Link-local addresses can only be used to communicate with other hosts on the same link, and packets with link-local addresses are never forwarded by a router.
  - A link-local address, which may not be removed, is required for proper IPv6 operation. The link-local addresses start with “fe80::”, and are combined with the interface identifier to form the complete address.

## ipv6 address

**ipv6 address** {<IPv6 address/netmask> | **autoconfig** [**default** | **privacy**]}  
**no ipv6** {<IPv6 address/netmask> | **autoconfig** [**default** | **privacy**]}

Configures IPv6 address and netmask to this interface, static or autoconfig options are possible.

The no form of the command removes the given IPv6 address and netmask or disables the autoconfig options.

|                           |                                                 |                                                                                                                                                                                                                                          |
|---------------------------|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | IPv6 address/netmask                            | Configures a static IPv6 address and netmask.<br>Format example: 2001:db8:1234::5678/64.                                                                                                                                                 |
|                           | autoconfig                                      | Enables IPv6 stateless address auto configuration (SLAAC) for this interface. An address will be automatically added to the interface based on an IPv6 prefix learned from router advertisements, combined with an interface identifier. |
|                           | autoconfig default                              | Enables default learning routes. The default route will be discovered automatically, if the autoconfig is enabled.                                                                                                                       |
|                           | autoconfig privacy                              | Uses privacy extensions for SLAAC to construct the autoconfig address, if the autoconfig is enabled.                                                                                                                                     |

 TX queue len: 1000

switch (config interface mgmt0) #

```

**Related Commands**

```

ipv6 enable
show interface <ifname>

```

**Note**

- Unlike IPv4, IPv6 can have multiple IPv6 addresses on a given interface
- For Ethernet, the default interface identifier is a 64-bit long modified EUI-64, which is based on the MAC address of the interface

## ipv6 dhcp

**ipv6 dhcp {primary-intf <if-name> | stateless}**  
**no ipv6 dhcp {primary-intf | stateless}**

Configures global DHCPv6 settings.  
 The no form of the command resets certain global DHCPv6 settings.

## 4.1.6.2 Hostname Resolution

### hostname

**hostname <hostname>**  
**no hostname**

Sets a static system hostname.  
 The no form of the command clears the system hostname.

## ip/ipv6 host

**{ip | ipv6} host <hostname> <IP Address>**  
**no {ip | ipv6} host <hostname> <IP Address>**

Configures the static hostname IPv4 or IPv6 address mappings.  
 The no form of the command clears the static mapping.

## ip/ipv6 map-hostname

**{ip |ipv6} map-hostname**  
**no {ip | ipv6} map-hostname**

Maps between the currently-configured hostname and the loopback address 127.0.0.1.

The no form of the command clears the mapping.

### 4.1.6.3 Routing

## ip/ipv6 route

**{ip | ipv6} route <network-prefix> <netmask> {<nexthop-address> | <ifname>}**  
**no ip route <network-prefix> <netmask> {<nexthop-address> | <ifname>}**

Sets a static route for a given IP.

The no form of the command deletes the static route.

## ipv6 default-gateway

**ipv6 default-gateway** {<ip-address> | <ifname>}  
**no ipv6 default-gateway**

Sets a static default gateway.  
 The no form of the command deletes the default gateway.

| <b>Example</b>            | <pre>switch (config) # ip default-gateway 10.10.10.10 switch (config) # show ip default-gateway Active default gateways:     172.30.0.1 (interface: mgmt0) switch (config) # show ip default-gateway static Configured default gateway: 10.10.10.10</pre> |                                                           |
| <b>Related Commands</b>   | show ip default-gateway                                                                                                                                                                                                                                   |                                                           |
| <b>Note</b>               | The configured IPv4 default gateway will not be used if DHCP is enabled.                                                                                                                                                                                  |                                                           |

#### 4.1.6.4 Network to Media Resolution (ARP & NDP)

IPv4 network use Address Resolution Protocol (ARP) to resolve IP address to MAC address, while IPv6 network uses Network Discovery Protocol (NDP) that performs basically the same as ARP.

### ip arp

**ip arp <IP address> <MAC address>**  
**no ip arp <IP address> <MAC address>**

Sets a static ARP entry.  
 The no form of the command deletes the static ARP.

## ip arp timeout

**ip arp timeout <timeout-value>**

**no ip arp timeout**

Sets the dynamic ARP cache timeout.

The no form of the command sets the timeout to default.

| Syntax Description | timeout-value                                                                                                                                                                                                                                                                                                                                                                                                 | Time (in seconds) that an entry remains in the ARP cache. Range: 60-28800. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Default            | 1500 seconds                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                            |

## ipv6 neighbor

**ipv6 neighbor** <IPv6 address> <ifname> <MAC address>  
**no ipv6 neighbor** <IPv6 address> <ifname> <MAC address>

Adds a static neighbor entry.  
 The no form of the command deletes the static entry.

| <b>Note</b>               | <ul style="list-style-type: none"> <li>• ARP is used only with IPv4. In IPv6 networks, Neighbor Discovery Protocol (NDP) is used similarly.</li> <li>• Use The no form of the command to remove static entries. Dynamic entries can be cleared via the “clear ipv6 neighbors” command.</li> </ul> |                                               |

## clear ipv6 neighbors

### clear ipv6 neighbors

Clears the dynamic neighbors cache.

|                           |                                                                                                                                                                                                                                                                                                                                                     |

## 4.1.6.5 DHCP

**ip dhcp**

**ip dhcp {default-gateway yield-to-static| hostname <hostname>| primary-intf <ifname> | send-hostname }**

**no ip dhcp {default-gateway yield-to-static| hostname || primary-intf | send-hostname}**

Sets global DHCP configuration.

The no form of the command deletes the DHCP configuration.

| Syntax Description | yield-to-static                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Does not allow you to install a default gateway from DHCP if there is already a statically configured one.            |       |  |      |      |       |           |         |         |       |       |  |  |  |    |    |    |    |       |     |     |     |       |     |     |    |

#### 4.1.6.6 General IPv6 Commands

### ipv6 enable

**ipv6 enable**  
**no ipv6 enable**

Enables IPv6 globally on the management interface.  
 The no form of the command disables IPv6 globally on the management interface.

|                           |                                                                                                                                                                                              |

### 4.1.6.7 IP Diagnostic Tools

## ping

**ping** [-LRUbdnqrvVaA] [-c count] [-i interval] [-w deadline] [-p pattern] [-s packetsize] [-t ttl] [-I interface or address] [-M mtu discovery hint] [-S sndbuf] [-T timestamp option] [-Q tos] [hop1 ...] destination

Sends ICMP echo requests to a specified host.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## traceroute

```
traceroute [-46dFITUnrAV] [-f first_ttl] [-g gate,...] [-i device] [-m max_ttl] [-N
squeries] [-p port] [-t tos] [-l flow_label] [-w waittime] [-q nqueries] [-s src_addr]
[-z sendwait] host [packetlen]
```

Traces the route packets take to a destination.

|                    |    |                                                                                                                                                                                                                                                           |
|--------------------|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | -4 | Uses IPv4.                                                                                                                                                                                                                                                |
|                    | -6 | Uses IPv6.                                                                                                                                                                                                                                                |
|                    | -d | Enables socket level debugging.                                                                                                                                                                                                                           |
|                    | -F | Sets DF (do not fragment bit) on.                                                                                                                                                                                                                         |
|                    | -I | Uses ICMP ECHO for tracerouting.                                                                                                                                                                                                                          |
|                    | -T | Uses TCP SYN for tracerouting.                                                                                                                                                                                                                            |
|                    | -U | Uses UDP datagram (default) for tracerouting.                                                                                                                                                                                                             |
|                    | -n | Does not resolve IP addresses to their domain names.                                                                                                                                                                                                      |
|                    | -r | Bypasses the normal routing and send directly to a host on an attached network.                                                                                                                                                                           |
|                    | -A | Performs AS path lookups in routing registries and print results directly after the corresponding addresses.                                                                                                                                              |
|                    | -V | Prints version info and exit.                                                                                                                                                                                                                             |
|                    | -f | Starts from the first_ttl hop (instead from 1).                                                                                                                                                                                                           |
|                    | -g | Routes packets throw the specified gateway (maximum 8 for IPv4 and 127 for IPv6).                                                                                                                                                                         |
|                    | -i | Specifies a network interface to operate with.                                                                                                                                                                                                            |
|                    | -m | Sets the max number of hops (max TTL to be reached). Default is 30.                                                                                                                                                                                       |
|                    | -N | Sets the number of probes to be tried simultaneously (default is 16).                                                                                                                                                                                     |
|                    | -p | Uses destination port. It is an initial value for the UDP destination port (incremented by each probe, default is 33434), for the ICMP seq number (incremented as well, default from 1), and the constant destination port for TCP tries (default is 80). |
|                    | -t | Sets the TOS (IPv4 type of service) or TC (IPv6 traffic class) value for outgoing packets.                                                                                                                                                                |
|                    | -l | Uses specified flow_label for IPv6 packets.                                                                                                                                                                                                               |
|                    | -w | Sets the number of seconds to wait for response to a probe (default is 5.0). Non-integer (float point) values allowed too.                                                                                                                                |
|                    | -q | Sets the number of probes per each hop. Default is 3.                                                                                                                                                                                                     |
|                    | -s | Uses source src_addr for outgoing packets.                                                                                                                                                                                                                |
|                    | -z | Sets minimal time interval between probes (default is 0). If the value is more than 10, then it specifies a number in milliseconds, else it is a number of seconds (float point values allowed too).                                                      |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>            | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Configuration Mode</b> | Config                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>History</b>            | 3.1.0000                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## tcpdump

```
tcpdump [-aAdDeflLnNOpqRStuUvxX] [-c count] [-C file_size]
 [-E algo:secret] [-F file] [-i interface] [-M secret]
 [-r file] [-s snaplen] [-T type] [-w file]
 [-W filecount] [-y datalinktype] [-Z user]
 [expression]
```

Invokes standard binary, passing command line parameters straight through. Runs in foreground, printing packets as they arrive, until the user hits Ctrl+C.

## 4.2 NTP, Clock & Time Zones

Network Time Protocol (NTP) is a networking protocol for clock synchronization between computer systems over packet-switched, variable-latency data networks. NTP is intended to synchronize all participating computers to within a few milliseconds of Coordinated Universal Time (UTC) and is designed to mitigate the effects of variable network latency. NTP can usually maintain time to within tens of milliseconds over the public Internet, and can achieve better than one millisecond accuracy in local area networks under ideal conditions.

## 4.2.1 Commands

### clock set

**clock set** <hh:mm:ss> [<yyyy/mm/dd>]

Sets the time and date.

|                           |                                                                                                                                                                                                                  |       |

## clock timezone

**clock timezone [<zone word> [<zone word> [<zone word>] [<zone word>]]]**

Sets the system time zone. The time zone may be specified in one of three ways:

- A nearby city whose time zone rules to follow. The system has a large list of cities which can be displayed by the help and completion system. They are organized hierarchically because there are too many of them to display in a flat list. A given city may be required to be specified in two, three, or four words, depending on the city.
  - An offset from UTC. This will be in the form UTC-offset UTC, UTC-offset UTC+<0-14>, UTC-offset UTC-<1-12>.
  - UTC (Universal Time, which is almost identical to GMT), and this is the default time zone
- The no form of the command resets time zone to its default (GMT).

## ntp

**ntp {disable | enable | {peer | server} <IP address> [version <number> | disable]}**  
**no ntp {disable | enable | {peer | server} <IP address> [disable]}**

Configures NTP.  
 The no form of the command negates NTP options.

|                           |                                                                          |                                                                            |

## 4.3 Unbreakable Links

MLNX-OS® offers a phy profile configuration for VPI interfaces.

PHY profile includes Link Level Retransmission (LLR) configuration. A PHY profile is bind to any VPI interface.

### 4.3.1 Link Level Retransmission (LLR)

Link Level Retransmission (LLR) is used on signal integrity marginal systems to decrease and/or eliminate the impact of physical errors on the system's performance.

- LLR transmitter breaks the transmitted Layer 2 data stream into Cells and adds a CRC checksum to each cell.
- LLR receiver checks the Cell CRC, in case there is no CRC errors, it forwards the cell and acknowledges the peer.

If a cell is dropped by the receiver the transmitter retransmits the cell.

LLR is a Mellanox proprietary feature and will only work with Mellanox to Mellanox ports.

LLR is not operational for cables longer then 30m.

### LLR Mode

The following LLR modes are applicable per port per speed:

- disable – no LLR
- enable – the port becomes passive, only if it got a request to use LLR it activates, otherwise it remains disabled
- enable-request – the port becomes active, it keeps sending LLR requests to the peer

### LLR Negotiation

Both ports on the link perform LLR discovery and negotiation. In order the LLR to be in active state on the link, the following should apply:

- One port must be configured with LLR “enable-request” on the specified speed.
- The other port (peer) may be configured with LLR “enable-request” or “enable” on the same specified speed

If both the local port and remote port configured with LLR “enabled” the LLR negotiation will not be activated - the ports will remain in LLR in-active state.

### LLR Status

LLR status is a port parameter that states the current state of the LLR.

- Active – LLR is operationally running
- In-Active – LLR is not running

### 4.3.2 Configuring Phy Profile & LLR

➤ *To configure a phy profile:*

**Step 1.** Create/edit a phy profile and enter a phy profile configuration mode. Run:

```
switch (config) # phy-profile my-profile
switch (config phy profile my-profile) #
```

**Step 2.** Configure LLR attributes. Run:

All ports mapped to the phy profile must be in shutdown state before editing the profile.

```
switch (config phy profile my-profile) # llr support ib speed FDR enable-request
switch (config phy profile my-profile) # llr support ib speed QDR disable
switch (config phy profile my-profile) # ...
```

**Step 3.** Bind the profile to the desired interface. Run:

The port must be in shutdown state before binding the phy-profile.

```
switch (config) # interface ib 1/1
switch (config interface ib 1/1) # shutdown
switch (config interface ib 1/1) # phy-profile map my-profile
switch (config interface ib 1/1) # no shutdown
switch (config interface ib 1/1) #
```

**Step 4.** Verify LLR configuration and status. Run:

```
switch (config) # show interface ib llr

Interface phy-profile LLR status ...
ib 1/1 my-profile Active
ib 1/2 disable Inactive
...
switch (config) #
```

**Step 5.** Display phy-profile configuration. Run:

```
switch (config) # show phy-profile my-profile
Profile: my-profile
llr support ib-speed
SDR: disable
DDR: disable
QDR: disable
FDR10: enable-request
FDR: enable-request
switch (config) #
```

### 4.3.3 Commands

## phy-profile

**phy-profile <profile-name>**  
**no phy-profile <profile-name>**

Creates a PHY profile (port physical parameters), and enter the profile configuration mode.

The no form of the command deletes the phy-profile

|                           | <ul style="list-style-type: none"> <li>When deleting a profile, all interface related to that profile need to be in shutdown state.</li> </ul> |                 |

## llr support ib-speed

**llr support ib-speed <speed-options> <speed-actions>**

**no llr support ib-speed <speed-options>**

Sets LLR InfiniBand supported speeds.

The no form of the command disables the llr on this speed.

|                           |                                                                                                                                                                    |                                                                                                                       |

## phy-profile map

**phy-profile map <profile-name>**  
**no phy-profile map**

Binds a phy-profile to the interface.  
 The no form of the command set the port mapping to the default profile.

## 4.4 Virtual Protocol Interconnect (VPI)

Virtual Protocol Interconnect (VPI) technology allows InfiniBand and Ethernet traffic to co-exist on one platform.

VPI technology can be achieved in different levels:

- System level VPI – it can be decided, per system, whether to use InfiniBand or Ethernet for all the interfaces in the system. Either Ethernet switch or InfiniBand switch profile can be configured on the system in order to determine the running link protocol for all the system ports.
- Interface level VPI – it can be decided, per system port, whether to use InfiniBand or Ethernet as a link protocol. A single VPI SWID can be configured as the system profile, and, per port, the link protocol may be selected. Configuring the switch to VPI mode allows splitting the hardware into two separate switches (an Ethernet switch and an InfiniBand switch). Traffic does not pass between those switches. While configuring the VPI system profile, bridging (or gateway) capabilities can be added to pass traffic from the Ethernet to the InfiniBand hosts.

Configuring your system to VPI single-switch mode splits your network interfaces to two groups:

- The Ethernet set of ports, which are connected to the Ethernet switch
- The InfiniBand set of ports, which are connected to the InfiniBand switch

VPI single switch profile is not a gateway. Ethernet traffic does not pass to the InfiniBand ports and vice versa.

VPI mode requires using either a SX6036G system, or installing a license (UPGR-XXXX-GW) on SX1012, SX1700, SX1710, SX1036, SX6012, SX6018, and SX6710 and SX6036. Refer to [Section 2.4, “Licenses,” on page 39](#) for more details on the licenses.

In order to set your system to work with VPI, the system profile should be changed to “vpi-single-switch”. In addition, the required set of ports should be changed from InfiniBand to Ethernet or vice versa.

The following systems can be configured as VPI switches:

- SX1012, SX1700, SX1710, SX1036
- SX6012, SX6018, SX6710, SX6036, SX6036G

The SX6036G system supports VPI by default, with the port configured as follows:

- Interfaces 1/1-1/8 Ethernet
- Interfaces 1/9-1/36 InfiniBand

### ➤ *To make an Ethernet switch system support VPI in a single-switch mode:*

**Step 1.** Make sure you have the latest software version installed.

**Step 2.** Install a gateway license.

**Step 3.** Set the system profile to be “vpi-single-switch”.

When changing to a VPI profile the number of unicast MAC addresses is decreased by 2k to 46k entries.

**Step 4.** Use the port type force command to change the disabled ports from Ethernet to InfiniBand.

This step may take several minutes.

```
switch (config)# license install <license>
switch (config)# system profile vpi-single-switch
...
switch (config)# port 1/9-1/36 type infiniband force
switch (config)# show ports type
Ethernet: 1/1, 1/2, ... 1/8
Infiniband: 1/9, 1/10 ... 1/36
switch (config) #
```

➤ **To make an InfiniBand switch system support VPI in a single-switch mode:**

**Step 1.** Make sure you have the latest software version installed

**Step 2.** Install a gateway license. See [Section 2.4, “Licenses,”](#) on page 39.

**Step 3.** Set the system profile to be “vpi-single-switch”.

**Step 4.** Use the command port type force to change the disabled ports from InfiniBand to Ethernet.

```
switch (config)# license install <license>
switch (config)# system profile vpi-single-switch
...
switch (config)# port 1/1-1/8 type ethernet force
switch (config)# interface ethernet 1/1-1/8 no shutdown
switch (config)# show ports type
Ethernet: 1/1, 1/2, ... 1/8
Infiniband: 1/9, 1/10 ... 1/36
switch (config) #
```

Changing the system profile deletes all the existing switch configurations and reboots the system. Management connectivity, however, is kept.

Note that the port type force command is valid for admin state only. In case of ETH ports, the user must remove specific configurations such as LAG, port mirror and split before moving to InfiniBand mode.

## 4.4.1 Commands

### port type

**port <slot>/<port>[-<slot>/<port>] type <ethernet/infiniband> [force]**  
**no port <slot>/<port>[-<slot>/<port>] type <ethernet/infiniband>**

Sets the port link protocol type on a specific port or a range of ports.  
 The no form of the command sets the port type to default on the specified port(s).

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                        |

## 4.5 System Profile

MLNX-OS has the ability to change the system profile upon license acquisition. The following are the possible system profiles:

- Ethernet single switch
- InfiniBand single switch
- InfiniBand single switch without adaptive routing
- VPI single switch

Changing the system profile requires one of the following licenses:

- Ethernet systems require a UPGR-10xx-GW license to change the system's profile to InfiniBand or VPI
- InfiniBand systems require a UPGR-60xx-GW license to change the system's profile to Ethernet or VPI

Changing the system profile will delete all the existing switch configuration and reboot the system. Management connectivity, however, will be kept.

Externally managed InfiniBand switch systems cannot run an Ethernet license.

### ➤ *To change the system profile:*

**Step 1.** Verify the appropriate license is installed. Run `show licenses`.

**Step 2.** To change the system profile to:

- an Ethernet system profile, run `system profile eth-single-switch`.
- an InfiniBand system profile, run `system profile ib-single-switch`.
- InfiniBand without adaptive system profile, run `ib-no-adaptive-routing-single-switch`.
- a VPI system profile, run `system profile vpi-single-switch`.

Upon approval, the configuration is deleted and the switch is rebooted with the new profile.

**Step 3.** To verify the system profile, run `show system profile`.

In case the system profile is `vpi-single-switch`, it is possible to change the link protocol from InfiniBand to Ethernet or vice versa using “port type” command.

## 4.5.1 Commands

### system profile

#### system profile <profile> [force]

Sets the profile of the system to either InfiniBand, Ethernet or VPI.

- In ib-single-switch profile, all network interfaces link protocol set to InfiniBand.
- In ib-no-adaptive-routing-single-switch profile, all network interfaces link protocol set to InfiniBand with disabled adaptive routing.
- In eth-single-switch profile, all network interfaces link protocol set to Ethernet.
- In vpi-single-switch profile, some ports can be defined as Ethernet while some other as InfiniBand.

## 4.6 Software Management

### 4.6.1 Upgrading MLNX-OS Software

When upgrading from a software version older than 3.2.0100 to software version 3.3.0000 or higher, the upgrade procedure must be done in two steps. First update the software to 3.2.0300-100 (for InfiniBand platforms) or 3.2.0506 (for Ethernet platforms), then update to the desired software version.

Upgrading an SX65xx system can take up to 30 minutes during which time the system is indisposed.

The system being upgraded becomes indisposed throughout the upgrade procedure.

The upgrade procedure burns the software image as well as the firmware should there be a need.

If running a system with dual management cards, refer to [Section 4.6.2, “Upgrading MLNX-OS Software on Director Switches,”](#) on page 181.

You have to read and accept the End-User License Agreement (EULA) after image upgrade in case the EULA is modified. The EULA link is only available upon first login to CLI.

To upgrade MLNX-OS software on your system, perform the following steps:

**Step 1.** Change to Config mode.

```
switch > enable
switch # configure terminal
switch (config) #
```

**Step 2.** Obtain the previously available image (.img file). You *must* delete this image in the next step to make room for fetching the new image.

```
switch (config) # show images
Installed images:
```

```
Partition 1:
SX_PPC_M460EX 3.3.3130 2013-03-20 21:32:25 ppc
```

```

Partition 2:
SX_PPC_M460EX 3.3.3130 2013-03-20 21:32:25 ppc

Images available to be installed:

image-PPC_M460EX-SX_3.3.3256.img
SX_PPC_M460EX 3.3.3256 2013-03-20 21:32:25 ppc

Serve image files via HTTP/HTTPS: no

No image install currently in progress.

Boot manager password is set.

No image install currently in progress.

Require trusted signature in image being installed: yes (default)
switch (config) #

```

- Step 3.** Delete the old image (if one exists) that is listed under Images available to be installed prior to fetching the new image. Use the command `image delete` for this purpose.

```

switch (config) # image delete image-PPC_M460EX-3.0.1224.img
switch (config) #

```

When deleting an image, you delete the file but not the partition. This is recommended so as to not overload system resources.

- Step 4.** Fetch the new software image.

```

switch (config) # image fetch scp://username:password@192.168.10.125/var/www/html/
<image_name>
Password (if required): ***** 100.0%[#####]
#####]
switch (config) #

```

- Step 5.** Display the available images.

To recover from image corruption (e.g., due to power interruption), there are two installed images on the system. See the commands:

```

image boot next
image boot location.

```

```

switch (config) # show images
Installed images:
Partition 1:
SX <old ver> 2013-04-28 16:02:50

Partition 2:

```

```

SX <new ver> 2013-04-28 16:52:50

Images available to be installed:
 new_image.img
 SX <new ver> 2013-04-28 16:52:50

Serve image files via HTTP/HTTPS: no

No image install currently in progress.

Boot manager password is set.

No image install currently in progress.

Require trusted signature in image being installed: yes (default)
switch (config) #

```

**Step 6.** Install the new image.

```

switch (config) # image install <image_name>
Step 1 of 4: Verify Image
 100.0% [#####]
Step 2 of 4: Uncompress Image
 100.0% [#####]
Step 3 of 4: Create Filesystems
 100.0% [#####]
Step 4 of 4: Extract Image
 100.0% [#####]
switch (config) #

```

CPU utilization may go up to 100% during image upgrade.

**Step 7.** Have the new image activate during the next boot. Run:

```
switch (config) # image boot next
```

**Step 8.** Run `show images` to review your images. Run:

```

switch (config) # show images
Images available to be installed:
 new_image.img
 SX <new ver> 2011-04-28 16:52:50

Installed images:
 Partition 1:
 SX <old ver> 2011-04-28 16:02:50

 Partition 2:

```

```
SX <new ver> 2011-04-28 16:52:50
```

```
Last boot partition: 1
```

```
Next boot partition: 2
```

```
No boot manager password is set.
```

```
switch (config) #
```

**Step 9.** Save current configuration. Run:

```
switch (config) # configuration write
```

```
switch (config)#
```

**Step 10.** Reboot the switch to run the new image. Run:

```
switch (config) # reload
```

```
Configuration has been modified; save first? [yes] yes
```

```
Configuration changes saved.
```

```
Rebooting...
```

```
switch (config)#
```

After software reboot, the software upgrade will also automatically upgrade the firmware version.

On SX65xx systems with dual management, the software must be upgraded on both the master and the slave modules.

In order to upgrade the system on dual management system refer to [Section 4.6.1, “Upgrading MLNX-OS Software,”](#) on page 178.

When performing upgrade from the WebUI, make sure that the image you are trying to upgrade to is not located already in the system (i.e. fetched from the CLI).

## 4.6.2 Upgrading MLNX-OS Software on Director Switches

Director switches feature dual management modules.

**Step 1.** Identify the chassis HA master. Run:

```
show chassis ha
```

**Step 2.** Upgrade the chassis master according to steps 1-8 in section [Section 4.6.1, on page 178.](#)

Please DO NOT reboot.

**Step 3.** Upgrade the second management module according to steps 1-8 in section [Section 4.6.1](#), on [page 178](#). Please DO NOT reboot.

**Step 4.** Reset the slave management module. In the master management module, run:

```
chassis ha reset other
```

**Step 5.** After invoking the command above, please reboot the master management immediately. Run:

```
reload
```

An alternative for steps 4 and 5 is to power cycle the system.

**Step 6.** Check that 'reset count' equals 0 or 1. Run:

```
show chassis ha
```

If the reset count is not equal to either 0 or 1, power cycle the system.

**Step 7.** Verify all the systems are back online as members of the IB subnet ID. Run:

```
show ib smnodes {brief}
```

Using a director switch (SX65xx) with different software versions on its two management boards is not supported.

When replacing a management board the software running on the replacement board must be aligned with the version of the software running on the other management board.

### 4.6.3 Deleting Unused Images

#### ➤ *To delete unused images:*

**Step 1.** Enter Config mode. Run:

```
switch >
switch > enable
switch # configure terminal
```

**Step 2.** Get a list of the unused images. Run

```
switch (config) # show images
Images available to be installed:
 image-PPC_M460EX-3.1.1224.img
 SX-OS_PPC_M460EX 3.1.1224 2011-04-28 12:29:48 ppc
Installed images:
Partition 1:
SX-OS_PPC_M460EX 3.1.0000-dev-HA 2011-04-10 12:02:49 ppc
Partition 2:
SX-OS_PPC_M460EX 3.1.0000-dev-HA 2011-04-10 12:02:49 ppc

Last boot partition: 1
```

```

Next boot partition: 1
Boot manager password is set.
No image install currently in progress.
Require trusted signature in image being installed: yes
switch (config) #

```

**Step 3.** Delete the unused images. Run:

```

switch (config) # image delete image-PPC_M460EX-3.0.1224.img
switch (config) #

```

When deleting an image, you delete the file but not the partition. This is recommended so as to not overload system resources.

## 4.6.4 Downgrading MLNX-OS Software

Prior to downgrading software, please make sure the following prerequisites are met:

**Step 1.** Log into your switch via the CLI using the console port.

**Step 2.** Backup your configuration according to the following steps:

1. Change to Config mode. Run:

```

switch-112094 [standalone: master] > enable
switch-112094 [standalone: master] # configure terminal
switch-112094 [standalone: master] (config) #

```

2. Disable paging of CLI output. Run:

```

switch-112094 [standalone: master] (config) # no cli default paging enable

```

3. Display commands to recreate current running configuration. Run:

```

switch-112094 [standalone: master] (config) # show running-config

```

4. Copy the output to a text file.

### 4.6.4.1 Downloading Image

**Step 1.** Log into the system to obtain the serial number. Run:

```

switch-112094 [standalone: master] (config) # show inventory

```

**Step 2.** Download the requested MLNX-OS version from the following link:

<http://support.mellanox.com/SupportWeb/>

**Step 3.** Enter your username and password when prompted.

**Step 4.** Log into the switch via the CLI using the console port.

**Step 5.** Change to Config mode. Run:

```

switch > enable
switch # configure terminal
switch (config) #

```

**Step 6.** Delete all previous images from the Images available to be installed prior to fetching the new image. Run:

```

switch (config) # image delete image-EFM_PPC_M405EX-ppc-m405ex 20090531-190132.img

```

**Step 7.** Fetch the requested software image. Run:

```
switch (config) # image fetch scp://username:password@192.168.10.125/var/www/html/
<image_name>
100.0%[#####]
```

#### 4.6.4.2 Downgrading Image

The procedure below assumes that booting and running is done from Partition 1 and the downgrade procedure is performed on Partition 2.

**Step 1.** Log in as admin.

**Step 2.** Enter config mode. Run:

```
switch > enable
switch # configure terminal
```

**Step 3.** Show all image files on the system. Run:

```
switch (config) # show images
Images available to be installed:
new_image.img
<downgrade version> 2010-09-19 16:52:50
Installed images:
Partition 1:
<current version> 2010-09-19 03:46:25
Partition 2:
<current version> 2010-09-19 03:46:25
Last boot partition: 1
Next boot partition: 1
No boot manager password is set.
switch (config) #
```

**Step 4.** Install the MLNX-OS image. Run:

```
switch (config) # image install <image_name>
Step 1 of 4: Verify Image
100.0% [#####]
Step 2 of 4: Uncompress Image
100.0% [#####]
Step 3 of 4: Create Filesystems
100.0% [#####]
Step 4 of 4: Extract Image
100.0% [#####]
switch (config) #
```

**Step 5.** Show all image files on the system. Run:

```
switch (config) # show images
Images available to be installed:
new_image.img
<downgrade version> 2010-09-19 16:52:50
```

```

Installed images:
Partition 1:
 <current version> 2010-09-19 03:46:25
Partition 2:
 <downgrade version> 2010-09-19 16:52:50
Last boot partition: 1
Next boot partition: 2
No boot manager password is set.
switch (config) #

```

**Step 6.** Set the boot location to be the other partition (next). Run:

```
switch (config) # image boot next
```

There are two installed images on the system. Therefore, if one of the images gets corrupted (due to power interruption, for example), in the next reboot the image will go up from the second partition.

In case you are downloading to an older software version which has never been run yet on the switch, use the following command sequence as well:

```
switch (config) # no boot next fallback-reboot enable
switch (config) # configuration write
```

**Step 7.** Reload the switch. Run:

```
switch (config) # reload
```

#### 4.6.4.3 Switching to Partition with Older Software Version

The system saves a backup configuration file when upgrading from an older software version to a newer one. If the system returns to the older software partition, it uses this backup configuration file. Note that all configuration changes done with the new software are lost when returning to the older software version.

There are 2 instances where the backup configuration file does not exist:

- The user has run “reset factory” command, which clears all configuration files in the system
- The user has run “configuration switch-to” to a configuration file with different name then the backup file

Also note that the configuration file becomes empty if the switch is downgraded to a software version which has never been installed yet.

To allow switching partition to the older software version, in these cases above, follow the steps below:

**Step 1.** Run the command:

```
switch (config)# no boot next fallback-reboot enable
```

**Step 2.** Set the boot partition. Run:

```
switch (config)# image boot next
```

**Step 3.** Save the configuration. Run:

```
switch (config)# configuration write
```

**Step 4.** Reload the system. Run:

```
switch (config)# reload
```

## 4.6.5 Upgrading System Firmware

Each MLNX-OS software package version has a default switch firmware version. When you update the MLNX-OS software to a new version, an automatic firmware update process will be attempted by MLNX-OS. This process is described below.

### 4.6.5.1 After Updating MLNX-OS Software

Upon rebooting your switch system after updating the MLNX-OS software, MLNX-OS compares its default firmware version with the currently programmed firmware versions on all the switch modules (leafs and spines on director-class switches, or simply the switch card on edge switch systems).

If one or more of the switch modules is programmed with a firmware version other than the default version, then MLNX-OS automatically attempts to burn the default firmware version instead.

If a firmware update takes place, then the login process is delayed a few minutes.

To verify that the firmware update was successful, log into MLNX-OS and run the command “show asic-version” (can be run in any mode). This command lists all of the switch modules along with their firmware versions. Make sure that all the firmware versions are the same and match the default firmware version. If the firmware update failed for one or more modules, then the following warning is displayed.

Some subsystems are not updated with a default firmware.

If you detect a mismatch in firmware version for one or more modules of the switch system, please contact your assigned Mellanox Technologies field application engineer.

#### 4.6.5.2 After Inserting a Switch Spine or Leaf

This section is applicable to director-class switch systems only.

If you insert a switch spine or leaf with a firmware version other than the default version of MLNX-OS, an automatic firmware update process will take place immediately to the inserted module *only*.

The firmware update may take a few minutes. It is recommended not to run any commands until the firmware update completes.

During firmware upgrade internal link status (up/down) notifications may be sent.

To verify that the firmware update was successful, run the command “show asic-version” (can be run in any mode). Check that the firmware version of the inserted switch spine or leaf has the default firmware version.

If you detect a firmware version mismatch for the newly inserted module, please contact your assigned Mellanox Technologies field application engineer.

#### 4.6.5.3 Importing Firmware and Changing the Default Firmware

To perform an automatic firmware update by MLNX-OS for a different switch firmware version without changing the MLNX-OS version, import the firmware package as described below. MLNX-OS sets it as the new default firmware and performs the firmware update automatically as described in the previous subsections.

From version 3.3.4400 and above, the firmware update file format has been changed to mfa format. TGZ format is no longer supported.

##### Default Firmware Change on Standalone Systems

**Step 1.** Import the firmware image (.mfa file). Run:

```
switch (config) # image fetch image fetch scp://root@1.1.1.1:/tmp/fw-SX-rel-9_2_6440-FIT.tgz
Password (if required): *****
100.0% [#####]
switch (config) # image default-chip-fw fw-SX-rel-9_2_6440-FIT.mfa
Installing default firmware image. Please wait...
Default Firmware 9.2.6440 updated. Please save configuration and reboot for new FW to take effect.
switch (config) #
```

**Step 2.** Save the configuration. Run:

```
switch (config) # configuration write
switch (config) #
```

**Step 3.** Reboot the system to enable auto update.

### Default Firmware Change Dual Management Systems

This flow should be implemented on both Orca managements in parallel.

**Step 1.** Import the firmware image (.tgz file) on both management modules.

```
switch (config) # image fetch scp://username:password@10.7.34.115//my_directory/fw-SX-
rel-9_1_6470-FIT.tgz
100.0% [#####]
```

**Step 2.** Change default firmware on the management modules using the command `image default-chip-fw`.

**Step 3.** Verify that both master and slave have successfully installed the new firmware. The following message should be displayed:

```
Default firmware <fw> updated. Please save configuration and reboot for new Fw to take
effect.
```

**Step 4.** Run `configuration write` on both management modules.

**Step 5.** Run `chassis ha reset other` on master only.

**Step 6.** Run `reload` on master only.

## 4.6.6 Commands

This chapter displays all the relevant commands used to manage the system software image.

### image boot

**image boot {location <location ID> | next}**

Specifies the default location where the system should be booted from.

|                           |                                                                      |                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | location ID                                                          | Specifies the default destination location. There can be up to 2 images on the system. The possible values are 1 or 2.                     |
|                           | next                                                                 | Sets the boot location to be the next once after the one currently booted from, thus avoiding a cycle through all the available locations. |
| <b>Default</b>            | N/A                                                                  |                                                                                                                                            |
| <b>Configuration Mode</b> | enable/config                                                        |                                                                                                                                            |
| <b>History</b>            | 3.1.0000                                                             |                                                                                                                                            |
| <b>Role</b>               | admin                                                                |                                                                                                                                            |
| <b>Example</b>            | <pre>switch (config) # image boot location 2 switch (config) #</pre> |                                                                                                                                            |
| <b>Related Commands</b>   | show images                                                          |                                                                                                                                            |
| <b>Note</b>               |                                                                      |                                                                                                                                            |

## boot bootmgr password

**boot bootmgr password [<pass-encryption> <password>] [<password>]**  
**no boot bootmgr password**

Specifies a boot manager password.

The no form of the command resets system boot manager password.

|                           |                                                      |                                                                                                                                                                                               |
|---------------------------|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | pass-encryption                                      | Possible values: <ul style="list-style-type: none"> <li>0 – specifies a boot manager password in cleartext</li> <li>7 – specifies a boot manager password with an encrypted string</li> </ul> |
|                           | password                                             | Cleartext password                                                                                                                                                                            |

## boot next

**boot next fallback-reboot enable**  
**no boot next fallback-reboot enable**

Sets the default setting for next boot. Normally, if the system fails to apply the configuration on startup (after attempting upgrades or downgrades, as appropriate), it will reboot to the other partition as a fallback.

The no form of the command tells the system not to do that, only for the next boot.

| <b>Note</b>               | <ul style="list-style-type: none"> <li>• Normally, if the system fails to apply the configuration on startup (after attempting upgrades or downgrades, as appropriate) it reboots to the other partition as a fallback.</li> <li>• The no form of this command tells the system not to do that <b>only</b> for the next boot. In other words, this setting is not persistent, and goes back to enabled automatically after each boot.</li> <li>• When downgrading to an older software version which has never been run yet on a system, the “fallback reboot” <b>always</b> happens, unless the command “no boot next fallback-reboot enable” is used. However, this also happens when the older software version <i>has</i> been run before, but the configuration file has been switched since upgrading. In general, a downgrade only works (without having the fallback reboot forcibly disabled) if the process can find a snapshot of the configuration file (by the same name as the currently active one) which was taken before upgrading from the older software version. If that is not found, a fallback reboot is performed in preference to falling back to the initial database because the latter generally involves a loss of network connectivity, and avoiding that is of paramount importance.</li> </ul> |

## boot system

**boot system {location | next}**

**no boot system next**

Configures which system image to boot by default.

The no form of the command resets the next boot location to the current active one.

## image options

**image options {require-sig | serve}**

**no image options {require-sig | serve all}**

Configures options and defaults for image usage.

The no form of the command disables options and defaults for image usage.

| <b>Note</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 4.7 Configuration Management

### 4.7.1 Saving a Configuration File

To save the current configuration to the active configuration file, you can either use the `configuration write` command (requires running in Config mode) or the `write memory` command (requires running in Enable mode).

- To save the configuration to the active configuration file, run:

```
switch (config) # configuration write
```

- To save the configuration to a user-specified file without making the new file the active configuration file, run:

```
switch (config) # configuration write to myconf no-switch
```

- To save the configuration to a user-specified file and make the new file the active configuration file, run:

```
switch (config) # configuration write to myconf
```

- To display the available configuration files and the active file, run:

```
switch (config) # show configuration files
initial
myconf (active)
switch (config) #
```

### 4.7.2 Loading a Configuration File

By default, or after a system reset, the system loads the default “initial” configuration file.

- **To load a different configuration file and make it the active configuration:**

```
switch [standalone: master] >
switch [standalone: master] > enable
switch [standalone: master] # configure terminal
switch [standalone: master] (config) # configuration switch-to myconfig
switch [standalone: master] (config) #
```

On SX65xx systems with dual management modules, load the configuration file according to the following:

- Step 1.** Power cycle the system.
- Step 2.** Load the configuration on the top CPU that serves as the chassis master according to the procedure described above.

If the configuration file is loaded on a different CPU than the SM HA master (SM HA master that serves the VIP), the SM configuration is overwritten.

### 4.7.3 Restoring Factory Default Configuration

In cases where the system configuration becomes corrupted it is suggested to restore the factory default configuration.

➤ **To restore factory default configuration on a single management module system:**

**Step 1.** Run the command `reset factory [reboot] [keep-basic] [keep-all-config]:.`

```
switch (config) # reset factory keep-basic
```

➤ **To restore factory default configuration on a dual management module system:**

If the system configuration ever becomes corrupted it is suggested to restore the factory default configuration.

**Step 1.** Connect to a remote console/serial connection.

**Step 2.** Remove the slave management module.

**Step 3.** Run the command `reset factory [keep-basic] [keep-all-config]:.`

```
switch (config) # reset factory keep-basic
```

Please wait for reboot to complete before moving to the next step.

**Step 4.** Log in as “admin” and start running the Mellanox Configuration Wizard.

**Step 5.** Insert the slave management module.

**Step 6.** Remove the master management module.

A takeover will occur changing the Slave management module role to Master.

**Step 7.** Repeat Step 3 on the new Master management module.

**Step 8.** Insert the other management module. No takeover will occur at this stage.

**Step 9.** Power cycle the system.

### 4.7.4 Managing Configuration Files

There are two types of configuration files that can be applied on the switch, BIN files (binary) and text-based configuration files.

#### 4.7.4.1 BIN Configuration Files

BIN configuration files are not human readable and cannot be edited.

➤ **To create a new BIN configuration file**

```
switch (config) # configuration new my-filename
```

➤ **To upload a BIN configuration file from a switch to an external file server**

```
switch (config) # configuration upload my-filename scp://root@my-server/root/tmp/my-filename
```

➤ **To fetch a BIN configuration file**

```
switch (config) # configuration fetch scp://root@my-server/root/tmp/my-filename
```

➤ **To see the available configuration files**

```
switch (config) # show configuration files
initial (active)
my-filename

Active configuration: initial
Unsaved changes: no
switch (config) #
```

➤ **To load a BIN configuration file:**

```
switch (config) # configuration switch-to my-filename
```

Applying a new BIN configuration file changes the whole switch's configuration and requires system reboot which can be preformed using the command `reload`.

#### 4.7.4.2 Text Configuration Files

Text configuration files are text based and editable.

➤ **To create a new text-based configuration file:**

```
switch (config) # configuration text generate active running save my-filename
```

➤ **To apply a text-based configuration file:**

```
switch (config) # configuration text file my-filename apply
```

Applying a text-based configuration file to an existing/running data port configuration may result in unpredictable behavior. It is therefore suggested to first clear the switch's configuration by applying a specific configuration file (following the procedure in [Section 4.7.4.1](#)) or by resetting the switch back to factory default.

➤ **To upload a text-based configuration file from a switch to an external file server**

```
switch (config) # configuration text file my-filename upload scp://root@my-server/root/
tmp/my-filename
```

➤ **To fetch a text-based configuration file from an external file server to a switch**

```
switch (config) # configuration text fetch scp://root@my-server/root/tmp/my-filename
```

➤ **To apply a text-based configuration file:**

```
switch (config) # configuration text file my-filename apply
```

When applying a text-based configuration file, the configuration is appended to the switch's existing configuration. Reboot is not required.

After applying text-based configuration file, the SM will not be enabled automatically, since the hostname is different. To enable the sm, run the command `ib sm enable`.

## 4.7.5 Commands

### 4.7.5.1 File System

#### debug generate dump

##### debug generate dump

Generates a debug dump.

|                           |                                                                                                                         |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                                                                     |
| <b>Default</b>            | N/A                                                                                                                     |
| <b>Configuration Mode</b> | Config                                                                                                                  |
| <b>History</b>            | 3.1.0000                                                                                                                |
| <b>Role</b>               | admin                                                                                                                   |
| <b>Example</b>            | switch (config) # debug generate dump<br>Generated dump sysdump-switch-112104-201140526-091707.tgz<br>switch (config) # |
| <b>Related Commands</b>   | file debug-dump                                                                                                         |
| <b>Note</b>               | The dump can then be manipulated using the “file debug-dump...” commands.                                               |

## file debug-dump

**file debug-dump {delete {<filename> | latest} | email {<filename> | latest} | upload {{<filename> | latest} <URL>}}**

Manipulates debug dump files.

|                           |                                                                                                        |                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | delete {<filename>   latest}                                                                           | Deletes a debug dump file.                                                                                                                                                             |
|                           | email {<filename>   latest}                                                                            | Emails a debug dump file to pre-configured recipients for “informational events”, regardless of whether they have requested to receive “detailed” notifications or not.                |
|                           | upload {{<filename>   latest} <URL>}}                                                                  | Uploads a debug dump file to a remote host. The URL to the remote host: HTTP, HTTPS, FTP, TFTP, SCP and SFTP are supported. Example: scp://username[:password]@hostname/path/filename. |
| <b>Default</b>            | N/A                                                                                                    |                                                                                                                                                                                        |

## 4.7.5.2 Configuration Files

### configuration audit

**configuration audit max-changes <number>**

Chooses settings related to configuration change auditing.

| Syntax Description | max-changes                                                                                                                                                         | Set maximum number of audit messages to log per change. |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Default            | 1000                                                                                                                                                                |                                                         |
| Configuration Mode | Config                                                                                                                                                              |                                                         |
| History            | 3.1.0000                                                                                                                                                            |                                                         |
| Role               | admin                                                                                                                                                               |                                                         |

## configuration new

**configuration new <filename> [factory [keep-basic] [keep-connect]]**

Creates a new configuration file under the specified name. The parameters specify what configuration, if any, to carry forward from the current running configuration.

## 4.8 Logging

### 4.8.1 Monitor

➤ **To print logging events to the terminal:**

Set the modules or events you wish to print to the terminal. For example, run:

```
switch (config) # logging monitor events notice
switch (config) # logging monitor sx-sdk warning
```

These commands print system events in severity “notice” and sx-sdk module notifications in severity “warning” to the screen. For example, in case of interface-down event, the following gets printed to the screen.

```
switch (config) #
Wed Jul 10 11:30:42 2013: Interface IB1/17 changed state to DOWN
Wed Jul 10 11:30:43 2013: Interface IB1/18 changed state to DOWN
switch (config) #
```

To see a list of the events, refer to [Table 27, “Supported Event Notifications and MIB Mapping,” on page 271](#).

### 4.8.2 Remote Logging

➤ **To configure remote syslog to send syslog messages to a remote syslog server:**

**Step 1.** Enter Config mode. Run:

```
switch >
switch > enable
switch # configure terminal
```

**Step 2.** Set remote syslog server. Run

```
switch (config) # logging <IP address>
```

**Step 3.** Set the minimum severity of the log level to info. Run:

```
switch (config) # logging <IP address> trap info
```

**Step 4.** Override the log levels on a per-class basis. Run:

```
switch (config) # logging <IP address> trap override class <class name> priority <level>
```

### 4.8.3 Commands

#### logging <syslog IP address>

**logging <syslog IP address> [trap {<log-level> | override class <class> priority <log-level>}]**

**no logging <syslog IP address> [trap {<log-level> | override class <class> priority <log-level>}]**

Enables (by setting the IP address) sending logging messages, with ability to filter the logging messages according to their classes.

The no form of the command stops sending messages to the remote syslog server.

| Syntax Description        | syslog IP address          | IPv4 address of the remote syslog server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

---

**Example**

```
switch (config) # logging local info
switch (config) # show logging
Local logging level: info
Default remote logging level: notice
No remote syslog servers configured.
Allow receiving of messages from remote hosts: no
Number of archived log files to keep: 10
Log rotation size threshold: 5.000% of partition (43 megabytes)
Log format: standard
Subsecond timestamp field: disabled
Levels at which messages are logged:
 CLI commands: notice
 Audit messages: notice
switch (config) #
```

---

**Related Commands**

```
show logging
logging local override
```

---

**Note**

## logging local override

**logging local override [class <class> priority <log-level>]**

**no logging local override [class <class> priority <log-level>]**

Enables class-specific overrides to the local log level.

The no form of the command disables all class-specific overrides to the local log level without deleting them from the configuration, but disables them so that the logging level for all classes is determined solely by the global setting.

---

**Example**

```
switch (config) # logging local override class mgmt-front priority
warning
switch (config) # show logging
Local logging level: info
 Override for class mgmt-front: warning
Default remote logging level: notice
No remote syslog servers configured.
Allow receiving of messages from remote hosts: no
Number of archived log files to keep: 10
Log rotation size threshold: 5.000% of partition (43 megabytes)
Log format: standard
Subsecond timestamp field: disabled
Levels at which messages are logged:
 CLI commands: notice
 Audit messages: notice
switch (config) #
```

---

**Related Commands**

```
show logging
logging local
```

---

**Note**

---

## logging fields

**logging fields seconds {enable | fractional-digits <f-digit> | whole-digits <w-digit>}**

**no logging fields seconds {enable | fractional-digits <f-digit> | whole-digits <w-digit>}**

Specifies whether to include an additional field in each log message that shows the number of seconds since the Epoch or not.

The no form of the command disallows including an additional field in each log message that shows the number of seconds since the Epoch.

| <b>Syntax Description</b> | freq                                                                                | Sets rotation criteria according to time. Possible options are: <ul style="list-style-type: none"> <li>• Daily</li> <li>• Weekly</li> <li>• Monthly</li> </ul>                                                                                                                                                                                                             |
|                           | size-mb                                                                             | Sets rotation criteria according to size in mega bytes. The range is 1-9999.                                                                                                                                                                                                                                                                                               |
|                           | size-percentage                                                                     | Sets rotation criteria according to size in percentage of the partition where the logging files are kept in. The percentage given is truncated to three decimal points (thousandths of a percent).                                                                                                                                                                         |
|                           | force                                                                               | Forces an immediate rotation of the log files. This does not affect the schedule of auto-rotation if it was done based on time: the next automatic rotation will still occur at the same time for which it was previously scheduled. Naturally, if the auto-rotation was based on size, this will delay it somewhat as it reduces the size of the active log file to zero. |
|                           | number-of-files                                                                     | The number of log files will be kept. If the number of log files ever exceeds this number (either at rotation time, or when this setting is lowered), the system will delete as many files as necessary to bring it down to this number, starting with the oldest.                                                                                                         |
| <b>Default</b>            | 10 files are kept by default with rotation criteria of 5% of the log partition size |                                                                                                                                                                                                                                                                                                                                                                            |

---

**Example**

```
switch (config) # logging files rotation criteria size-pct 6
switch (config) # show logging
Local logging level: info
 Override for class mgmt-front: warning
Default remote logging level: notice
No remote syslog servers configured.
Allow receiving of messages from remote hosts: no
Number of archived log files to keep: 10
Log rotation size threshold: 6.000% of partition (51.60 megabytes)
Log format: standard
Subsecond timestamp field: enabled
Subsecond timestamp precision: 1 whole digit; 3 fractional digits
Levels at which messages are logged:
 CLI commands: info
 Audit messages: notice
switch (config)
```

---

**Related Commands**

```
show logging
show log files
```

---

**Note**

---

## logging files upload

**logging files upload {current | <file-number>} <url>**

Uploads a log file to a remote host.

## logging format

**logging format {standard | welf [fw-name <hostname>]}**  
**no logging format {standard | welf [fw-name <hostname>]}**

Sets the format of the logging messages.  
 The no form of the command resets the format to its default.

## logging level

**logging level {cli commands <log-level> | audit mgmt <log-level>}**

Sets the severity level at which CLI commands or the management audit message that the user executes are logged. This includes auditing of both configuration changes and actions.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## logging monitor

**logging monitor** <facility> <priority-level>  
**no logging monitor** <facility> <priority-level>

Sets monitor log facility and level to print to the terminal.  
 The no form of the command disables printing logs of facilities to the terminal.

## logging receive

**logging receive**  
**no logging receive**

Enables receiving logging messages from a remote host.  
 The no form of the command disables the option of receiving logging messages from a remote host.

## logging trap

**logging trap**  
**no logging trap**

Configures the minimum severity of log messages sent to syslog servers.  
 The no form of the command disables sending event log messages to syslog servers.

| <b>Note</b>               | When using a regular expression containing   (OR), the expression should be surrounded by quotes (“<expression>”), otherwise it is parsed as filter (PIPE) command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                          |

## 4.9 Debugging

➤ *To use the debugging logs feature:*

**Step 1.** Enable debugging. Run:

```
switch (config) # debug ethernet all
```

**Step 2.** Display the debug level set. Run:

```
switch (config) # show debug ethernet
```

**Step 3.** Display the logs. Run:

```
switch (config) # show log debug {match|continue}
```

## 4.9.1 Commands

### debug ethernet all

**debug ethernet all**  
**no debug ethernet all**

Enables debug traces for Ethernet modules.  
The no form of the command disables the debug traces for all Ethernet modules.

## debug ethernet ip igmp-snooping

**debug ethernet ip igmp-snooping {all | forward-db-messages | group-info | init-shut | packet-dump | query | source-info | system-resources-management | timer | vlan-info}**

**no debug ethernet ip igmp-snooping {all | forward-db-messages | group-info | init-shut | packet-dump | query | source-info | system-resources-management | timer | vlan-info}**

Configures the trace level for IGMP snooping.  
The no form of the command disables tracking a specified level.

**Related Commands**

**Note**

## debug ethernet vlan

**debug ethernet vlan {all | fwd | priority | filters}**  
**no debug ethernet vlan {all | fwd | priority | filters}**

Configures the trace level for VLAN.  
 The no form of the command disables the configured VLAN debug traces.

## 4.10 Event Notifications

MLNX-OS features a variety of supported events. Events are printed in the system log file, and, optionally, can be sent to the system administrator via email, SNMP trap or directly prompted to the terminal.

### 4.10.1 Supported Events

The following table presents the supported events and maps them to their relevant MIB OID.

**Table 27 - Supported Event Notifications and MIB Mapping**

| Event Name                | Event Description                               | MIB OID                                   | Comments                                                                               |
|---------------------------|-------------------------------------------------|-------------------------------------------|----------------------------------------------------------------------------------------|
| asic-chip-down            | ASIC (chip) down                                | Mellanox-EFM-MIB: asicChipDown            | Not supported                                                                          |
| cpu-util-high             | CPU utilization has risen too high              | Mellanox-EFM-MIB: cpuUtilHigh             |                                                                                        |

**Table 27 - Supported Event Notifications and MIB Mapping**

| Event Name                                                              | Event Description                           | MIB OID                                   | Comments                          |
|-------------------------------------------------------------------------|---------------------------------------------|-------------------------------------------|-----------------------------------|
| new_root                                                                | Local bridge became a root bridge           | Bridge-MIB: newRoot                       | Supported for Ethernet            |
| paging-high                                                             | Paging activity has risen too high          | N/A                                       | Not supported                     |
| power-redundancy-mismatch                                               | Power redundancy mismatch                   | Mellanox-EFM-MIB: powerRedundancyMismatch | Supported for SX65xx only systems |
| process-crash                                                           | A process in the system has crashed         | Mellanox-EFM-MIB: procCrash               |                                   |
| process-exit                                                            | A process in the system unexpectedly exited | Mellanox-EFM-MIB: procUnexpectedExit      |                                   |
| snmp-authtrap                                                           | An SNMPv3 request has failed authentication | Not implemented                           |                                   |
| topology_change                                                         | Topology change triggered by a local bridge | Bridge-MIB: topology-Change               | Supported for Ethernet            |
| unexpected-shutdown                                                     | Unexpected system shutdown                  | Mellanox-EFM-MIB: unexpectedShutdown      |                                   |
| To send, use the CLI command: <code>snmp-server notify send-test</code> | Send a testing event                        | testTrap                                  |                                   |
| N/A                                                                     | Reset occurred due to over-heating of ASIC  | Mellanox-EFM-MIB: asicOverTempReset       | Not supported                     |
| temperature-too-high                                                    | Temperature is too high                     | Mellanox-EFM-MIB: asicOverTemp            |                                   |

### 4.10.2 SNMP Trap Notifications

To set SNMP notification see [Section 4.17.1.6, “Configuring an SNMP Notification,”](#) on page 428.

### 4.10.3 Terminal Notifications

#### ➤ To print events to the terminal:

Set the events you wish to print to the terminal. Run:

```
switch (config) # logging monitor events notice
```

This command prints system events in the severity “notice” to the screen. For example, in case of interface-down event, the following gets printed to the screen.

```
switch (config) #
Wed Jul 10 11:30:42 2013: Interface IB1/17 changed state to DOWN
Wed Jul 10 11:30:43 2013: Interface IB1/18 changed state to DOWN
switch (config) #
```

#### 4.10.4 Email Notifications

➤ *To configure MLNX-OS to send you emails for all configured events and failures:*

**Step 1.** Enter to Config mode. Run:

```
switch >
switch > enable
switch # configure terminal
```

**Step 2.** Set your mailhub to the IP address to be your mail client's server – for example, Microsoft Outlook exchange server.

```
switch (config) # email mailhub <IP address>
```

**Step 3.** Add your email address for notifications. Run:

```
switch (config) # email notify recipient <email address>
```

**Step 4.** Configure the system to send notifications for a specific event. Run:

```
switch (config) # email notify event <event name>
```

**Step 5.** Show the list of events for which an email is sent. Run:

```
switch (config) # show email events
Failure events for which emails will be sent:
 process-crash: A process in the system has crashed
 unexpected-shutdown: Unexpected system shutdown

Informational events for which emails will be sent:
 asic-chip-down: ASIC (Chip) Down
 cpu-util-high: CPU utilization has risen too high
 cpu-util-ok: CPU utilization has fallen back to normal levels
 disk-io-high: Disk I/O per second has risen too high
 disk-io-ok: Disk I/O per second has fallen back to acceptable levels
 disk-space-low: Filesystem free space has fallen too low
.
.
.
switch (config) #
```

**Step 6.** Have the system send you a test email. Run:

```
switch # email send-test

The last command should generate the following email:
-----Original Message-----
From: Admin User [mailto:do-not-reply@switch.]
Sent: Sunday, May 01, 2011 11:17 AM
To: <name>
Subject: System event on switch: Test email for event notification

==== System information:
Hostname: switch
Version: <version> 2011-05-01 14:56:31
...
Date: 2011/05/01 08:17:29
```

Uptime: 17h 8m 28.060s

This is a test email.

==== Done.

## 4.10.5 Commands

### 4.10.5.1 Email Notification

#### email autosupport enable

**email autosupport enable**  
**no email autosupport enable**

Sends automatic support notifications via email.

The no form of the command stops sending automatic support notifications via email.

|                           |                                            |
|---------------------------|--------------------------------------------|

## email autosupport event

**email autosupport event <event>**

**no email autosupport event**

Specifies for which events to send auto-support notification emails.

The no form of the command resets auto-support email security mode to its default.

| Syntax Description | event |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Related Commands</b>   | N/A                                                     |
| <b>Note</b>               |                                                         |

## email autosupport ssl mode

**email autosupport ssl mode {none | tls | tls-none}**

**no email autosupport ssl mode**

Configures type of security to use for auto-support email.

The no form of the command resets auto-support email security mode to its default.

|                           |                                                  |                                                                                                                    |
|---------------------------|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | none                                             | Does not use TLS to secure auto-support email.                                                                     |
|                           | tls                                              | Uses TLS over the default server port to secure auto-support email and does not send an email if TLS fails.        |
|                           | tls-none                                         | Attempts TLS over the default server port to secure auto-support email, and falls back on plaintext if this fails. |
| <b>Default</b>            | tls-none                                         |                                                                                                                    |
| <b>Configuration Mode</b> | Config                                           |                                                                                                                    |

| <b>History</b>            | 3.2.3000                                            |
| <b>Role</b>               | admin                                               |
| <b>Example</b>            | switch (config) # email autosupport ssl cert-verify |
| <b>Related Commands</b>   | N/A                                                 |
| <b>Note</b>               |                                                     |

## email autosupport ssl ca-list

**email autosupport ssl ca-list {<ca-list-name> | default\_ca\_list | none}**  
**no email autosupport ssl ca-list**

Configures supplemental CA certificates for verification of server certificates.  
 The no form of the command removes supplemental CA certificate list.

|                           |                                                                 |                                                |
|---------------------------|-----------------------------------------------------------------|------------------------------------------------|
| <b>Syntax Description</b> | default_ca_list                                                 | Default supplemental CA certificate list.      |
|                           | none                                                            | No supplemental list; uses built-in list only. |
| <b>Default</b>            | default_ca_list                                                 |                                                |
| <b>Configuration Mode</b> | Config                                                          |                                                |
| <b>History</b>            | 3.2.3000                                                        |                                                |
| <b>Role</b>               | admin                                                           |                                                |
| <b>Example</b>            | switch (config) # email autosupport ssl ca-list default_ca_list |                                                |
| <b>Related Commands</b>   | N/A                                                             |                                                |
| <b>Note</b>               |                                                                 |                                                |

## email dead-letter

**email dead-letter {cleanup max-age <duration> | enable}**  
**no email dead-letter**

Configures settings for saving undeliverable emails.  
 The no form of the command disables sending of emails to vendor auto-support upon certain failures.

|                           |                                                                 |                                                                |
|---------------------------|-----------------------------------------------------------------|----------------------------------------------------------------|
| <b>Syntax Description</b> | duration                                                        | Example: “5d4h3m2s” for 5 days, 4 hours, 3 minutes, 2 seconds. |
|                           | enable                                                          | Saves dead-letter files for undeliverable emails.              |
| <b>Default</b>            | Save dead letter is enabled<br>The default duration is 14 days  |                                                                |
| <b>Configuration Mode</b> | Config                                                          |                                                                |
| <b>History</b>            | 3.1.0000                                                        |                                                                |
| <b>Role</b>               | admin                                                           |                                                                |
| <b>Example</b>            | switch (config) # email dead-letter enable<br>switch (config) # |                                                                |
| <b>Related Commands</b>   | show email                                                      |                                                                |
| <b>Note</b>               |                                                                 |                                                                |

## email domain

**email domain** <hostname or IP address>

**no email domain**

Sets the domain name from which the emails will appear to come from (provided that the return address is not already fully-qualified). This is used in conjunction with the system hostname to form the full name of the host from which the email appears to come.

The no form of the command clears email domain override.

| Syntax Description | hostname or IP address                                                                                                                                                                                                             | IP address. |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| Default            | No email domain                                                                                                                                                                                                                    |             |
| Configuration Mode | Config                                                                                                                                                                                                                             |             |
| History            | 3.1.0000                                                                                                                                                                                                                           |             |

## email mailhub

**email mailhub <hostname or IP address>**

**no email mailhub**

Sets the mail relay to be used to send notification emails.

The no form of the command clears the mail relay to be used to send notification emails.

| Syntax Description | hostname or IP address                                                                                                                                                                                                                     | Hostname or IP address. |

## email mailhub-port

**email mailhub-port <hostname or IP address>**

**no email mailhub-port**

Sets the mail relay port to be used to send notification emails.  
The no form of the command resets the port to its default.

| <b>Note</b>               | This does not affect auto-support emails. Auto-support can be disabled overall, but if it is enabled, all auto-support events are sent as emails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                        |

## email notify recipient

**email notify recipient** <email addr> [class {info | failure} | detail]  
**no email notify recipient** <email addr> [class {info | failure} | detail]

Adds an email address from the list of addresses to which to send email notifications of events.

The no form of the command removes an email address from the list of addresses to which to send email notifications of events.

## email return-addr

**email return-addr <username>**  
**no email domain**

Sets the username or fully-qualified return address from which email notifications are sent.

- If the string provided contains an “@” character, it is considered to be fully-qualified and used as-is.
- Otherwise, it is considered to be just the username, and we append “@<host-name>.<domain>”. The default is “do-not-reply”, but this can be changed to “admin” or whatnot in case something along the line does not like fictitious addresses.

The no form of the command resets this attribute to its default.

## email ssl mode

**email ssl mode {none | tls | tls-none}**

**no email ssl mode**

Sets the security mode(s) to try for sending email.

The no form of the command resets the email SSL mode to its default.

|                           |                                           |                                                                                                            |

## email ssl cert-verify

**email ssl cert-verify**  
**no email ssl cert-verify**

Enables verification of SSL/TLS server certificates for email.  
The no form of the command disables verification of SSL/TLS server certificates for email.

|                           |                                                |
|---------------------------|------------------------------------------------|
| <b>Syntax Description</b> | N/A                                            |
| <b>Default</b>            | N/A                                            |
| <b>Configuration Mode</b> | Config                                         |
| <b>History</b>            | 3.2.3000                                       |
| <b>Role</b>               | admin                                          |
| <b>Example</b>            | switch (config) # email ssl cert-verify        |
| <b>Related Commands</b>   | N/A                                            |
| <b>Note</b>               | This command has no impact unless TLS is used. |

## email ssl ca-list

**email ssl ca-list {<ca-list-name> | default-ca-list | none}**

**no email ssl ca-list**

Specifies the list of supplemental certificates of authority (CA) from the certificate configuration database that is to be used for verification of server certificates when sending email using TLS, if any.

The no form of the command uses no list of supplemental certificates.

|                           |                                                                                         |                                                |
|---------------------------|-----------------------------------------------------------------------------------------|------------------------------------------------|
| <b>Syntax Description</b> | ca-list-name                                                                            | Specifies CA list name.                        |
|                           | default-ca-list                                                                         | Uses default supplemental CA certificate list. |
|                           | none                                                                                    | Uses no list of supplemental certificates.     |
| <b>Default</b>            | default-ca-list                                                                         |                                                |
| <b>Configuration Mode</b> | Config                                                                                  |                                                |
| <b>History</b>            | 3.2.3000                                                                                |                                                |
| <b>Role</b>               | admin                                                                                   |                                                |
| <b>Example</b>            | switch (config) # email ssl ca-list none                                                |                                                |
| <b>Related Commands</b>   | N/A                                                                                     |                                                |
| <b>Note</b>               | This command has no impact unless TLS is used, and certificate verification is enabled. |                                                |

## show email

### show email [events]

Shows email configuration or events for which email should be sent upon.

| Syntax Description | events                      show event list                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 4.11 mDNS

Multicast DNS (mDNS) protocol is used by the SM HA to deliver control information between the InfiniBand nodes via the management interface. To block sending mDNS traffic from the management interface run the command `no ha dns enable`.

### 4.11.1 Commands

## ha dns enable

**ha dns enable**  
**no ha dns enable**

Allows mDNS traffic.  
 The no form of the command blocks mDNS traffic from being sent from mgmt0.

## 4.12 User Management and Security

### 4.12.1 Authentication, Authorization and Accounting (AAA)

AAA is a term describing a framework for intelligently controlling access to computer resources, enforcing policies, auditing usage, and providing the information necessary to bill for services. These combined processes are considered important for effective network management and security. The AAA feature allows you to verify the identity of, grant access to, and track the actions of users managing the MLNX-OS switch. The MLNX-OS switch supports Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control device Plus (TACACS+) protocols.

- **Authentication** - authentication provides the initial method of identifying each individual user, typically by entering a valid username and password before access is granted. The AAA server compares a user's authentication credentials with the user credentials stored in a database. If the credentials match, the user is granted access to the network or devices. If the credentials do not match, authentication fails and network access is denied.
- **Authorization** - following the authentication, a user must gain authorization for performing certain tasks. After logging into a system, for instance, the user may try to issue commands. The authorization process determines whether the user has the authority to issue such commands. Simply put, authorization is the process of enforcing policies: determining what types or qualities of activities, resources, or services a user is permitted. Usually, authorization occurs within the context of authentication. Once you have authenticated a user, they may be authorized for different types of access or activity.
- **Accounting** - the last level is accounting, which measures the resources a user consumes during access. This includes the amount of system time or the amount of data a user has sent and/or received during a session. Accounting is carried out by logging of session statistics and usage information, and is used for authorization control, billing, trend analysis, resource utilization, and capacity planning activities.

Authentication, authorization, and accounting services are often provided by a dedicated AAA server, a program that performs these functions. Network access servers interface with AAA servers using the Remote Authentication Dial-In User Service (RADIUS) protocol.

#### 4.12.1.1 RADIUS

RADIUS (Remote Authentication Dial-In User Service), widely used in network environments, is a client/server protocol and software that enables remote access servers to communicate with a central server to authenticate dial-in users and authorize their access to the requested system or service. It is commonly used for embedded network devices such as routers, modem servers, switches and so on. RADIUS is currently the de-facto standard for remote authentication. It is prevalent in both new and legacy systems.

It is used for several reasons:

- RADIUS facilitates centralized user administration
- RADIUS consistently provides some level of protection against an active attacker

#### 4.12.1.2 TACACS+

TACACS (Terminal Access Controller Access Control System), widely used in network environments, is a client/server protocol that enables remote access servers to communicate with a central server to authenticate dial-in users and authorize their access to the requested system or service. It is commonly used for providing NAS (Network Access Security). NAS ensures secure access from remotely connected users. TACACS implements the TACACS Client and provides the AAA (Authentication, Authorization and Accounting) functionalities.

TACACS is used for several reasons:

- Facilitates centralized user administration
- Uses TCP for transport to ensure reliable delivery
- Supports inbound authentication, outbound authentication and change password request for the authentication service
- Provides some level of protection against an active attacker

#### 4.12.1.3 LDAP

LDAP (Lightweight Directory Access Protocol) is an authentication protocol that allows a remote access server to forward a user's logon password to an authentication server to determine whether access can be allowed to a given system. LDAP is based on a client/server model. The switch acts as a client to the LDAP server. A remote user (the remote administrator) interacts only with the switch, not the back-end server and database.

LDAP authentication consists of the following components:

- A protocol with a frame format that utilizes TCP over IP
- A centralized server that stores all the user authorization information
- A client: in this case, the switch

Each entry in the LDAP server is referenced by its Distinguished Name (DN). The DN consists of the user-account name concatenated with the LDAP domain name. If the user-account name is John, the following is an example DN:

```
uid=John,ou=people,dc=domain,dc=com
```

### 4.12.2 User Accounts

There are two general user account types: *admin* and *monitor*. As *admin*, the user is privileged to execute all the available operations. As *monitor*, the user can execute operations that display system configuration and status, or set terminal settings.

**Table 28 - User Roles (Accounts) and Default Passwords**

| User Role | Default Password |
|-----------|------------------|
| admin     | admin            |
| monitor   | monitor          |
| xmladmin  | xmladmin         |
| xmluser   | xmluser          |

To remove passwords from the XML users, run the command `username <username> nopassword`.

## 4.12.3 Commands

### 4.12.3.1 User Accounts

#### username

**username** <username> [capability <cap> | disable [login | password] | full-name <name> | nopassword | password [0 | 7] <password>]  
**no username** <username> [capability | disable [login | password] | full-name]

Creates a user and sets its capabilities, password and name.  
 The no form of the command deletes the user configuration.

|                           |                            |                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | username                   | Specifies a username and creates a user account. New users are created initially with admin privileges but is disabled.                                                                                                                                                                                                                                                                    |
|                           | capability <cap>           | Defines user capabilities. <ul style="list-style-type: none"> <li>• admin - full administrative capabilities</li> <li>• monitor - read only capabilities, can not change the running configuration</li> <li>• unpriv – can only query the most basic information, and cannot take any actions or change any configuration</li> <li>• v_admin – basic administrator capabilities</li> </ul> |
|                           | disable [login   password] | <ul style="list-style-type: none"> <li>• Disable - disable this account</li> <li>• Disable login - disable all logins to this account</li> <li>• Disable password - disable login to this account using a local password</li> </ul>                                                                                                                                                        |
|                           | name                       | Full name of the user.                                                                                                                                                                                                                                                                                                                                                                     |
|                           | nopassword                 | The next login of the user will not require password.                                                                                                                                                                                                                                                                                                                                      |
|                           | 0   7                      | <ul style="list-style-type: none"> <li>• 0: specifies a login password in cleartext</li> <li>• 7: specifies a login password in encrypted text</li> </ul>                                                                                                                                                                                                                                  |
|                           | password                   | Specifies a password for the user in string form. If [0   7] was not specified then the password is in cleartext.                                                                                                                                                                                                                                                                          |
|                           | <b>Default</b>             | The following usernames are available by default: <ul style="list-style-type: none"> <li>• admin</li> <li>• monitor</li> <li>• xmladmin</li> <li>• xmluser</li> </ul>                                                                                                                                                                                                                      |
| <b>Configuration Mode</b> | Config                     |                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>History</b>            | 3.1.0000                   |                                                                                                                                                                                                                                                                                                                                                                                            |
|                           | 3.4.0000                   | Updated Example                                                                                                                                                                                                                                                                                                                                                                            |
|                           | 3.4.1100                   | Updated Example                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Role</b>               | admin                      |                                                                                                                                                                                                                                                                                                                                                                                            |

**Example**

```
switch (config) # username monitor full-name smith
switch (config) # show usernames
USERNAME FULL NAME CAPABILITY ACCOUNT STATUS
USERID System Administrator admin Password set
admin System Administrator admin Password set
monitor smith monitor Password set (SHA512)
xmladmin XML Admin User admin Password set (SHA512)
xmluser XML Monitor User monitor Password set (SHA512)
switch (config) #
```

**Related Commands**

```
show usernames
show users
```

**Note**

- To enable a user account, just set a password on it (or use the command `username <user> nopassword` to enable it with no password required for login)
- Removing a user account does not terminate any current sessions that user has open; it just prevents new sessions from being established
- Encrypted password is useful for the command `show configuration`, since the cleartext password cannot be recovered after it is set

## show usernames

### show usernames

Displays list of users and their capabilities.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                          |

### 4.12.3.2 AAA Methods

## aaa accounting

**aaa accounting changes default stop-only tacacs+**  
**no aaa accounting changes default stop-only tacacs+**

Enables logging of system changes to an AAA accounting server.  
 The no form of the command disables the accounting.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                            |

## aaa authentication login

**aaa authentication login default <auth method> [<auth method> [<auth method> [<auth method> [<auth method>]]]]**  
**no aaa authentication login**

Sets a sequence of authentication methods. Up to four methods can be configured. The no form of the command resets the configuration to its default.

| <b>Related Commands</b>   | show aaa                                                                                                                                                                                                                                                                                                                |
| <b>Note</b>               | The order in which the methods are specified is the order in which the authentication is attempted. It is required that “local” is one of the methods selected. It is recommended that “local” be listed first to avoid potential problems logging in to local accounts in the face of network or remote server issues. |

## aaa authentication attempts track

**aaa authentication attempts track {downcase | enable}**  
**no aaa authentication attempts track {downcase | enable}**

Configure tracking for failed authentication attempts.  
 The no form of the command clears configuration for tracking authentication failures.

| <b>Note</b>               | <ul style="list-style-type: none"> <li>This is required for the lockout functionality described below, but can also be used on its own for informational purposes.</li> <li>Disabling tracking does not clear any records of past authentication failures, or the locks in the database. However, it does prevent any updates to this database from being made: no new failures are recorded. It also disables lockout, preventing new lockouts from being recorded and existing lockouts from being enforced.</li> </ul> |                                                                                                  |

## **aaa authentication attempts logout**

**aaa authentication attempts logout {enable | lock-time | max-fail | unlock-time}**  
**no aaa authentication attempts logout {enable | lock-time | max-fail | unlock-time}**

Configures logout of accounts based on failed authentication attempts.  
The no form of the command clears configuration for logout of accounts based on failed authentication attempts.

|                           |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>enable</b>      | <p>Enables locking out of user accounts based on authentication failures.</p> <p>This both suspends enforcement of any existing lockouts, and prevents any new lockouts from being recorded. If lockouts are later re-enabled, any lockouts that had been recorded previously resume being enforced; but accounts which have passed the max-fail limit in the meantime are NOT automatically locked at this time. They would be permitted one more attempt, and then locked, because of how the locking is done: lockouts are applied after an authentication failure, if the user has surpassed the threshold at that time. Lockouts only work if tracking is enabled. Enabling lockouts automatically enables tracking. Disabling tracking automatically disables lockouts.</p>                                                                                                                                                                   |
|                           | <b>lock-time</b>   | <p>Sets maximum permitted consecutive authentication failures before locking out users.</p> <p>Unlike the “max-fail” setting, this does take effect immediately for all accounts</p> <p>If both unlock-time and lock-time are set, the unlock-time must be greater than the lock-time</p> <p>This is not based on the number of consecutive failures, and is therefore divorced from most of the rest of the tally feature, except for the tracking of the last login failure</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                           | <b>max-fail</b>    | <p>Sets maximum permitted consecutive authentication failures before locking out users.</p> <p>This setting only impacts what lockouts are imposed while the setting is active; it is not retroactive to previous logins. So if max-fail is disabled or changed, this does not immediately cause any users to be changed from locked to unlocked or vice-versa.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                           | <b>unlock-time</b> | <p>Enables the auto-unlock of an account after a specified number of seconds if a user account is locked due to authentication failures, counting from the last valid login attempt.</p> <p>Unlike the “max-fail” setting, this does take effect immediately for all accounts.</p> <p>If both unlock-time and lock-time are set, the unlock-time must be greater than the lock-time.</p> <p>Careful with disabling the unlock-time, particularly if you have max-fail set to something, and have not overridden the behavior for the admin (i.e. they are subject to lockouts also). If the admin account gets locked out, and there are no other administrators who can aid, the user may be forced to boot single-user and use the <code>pam_tallybyname</code> command-line utility to unlock your account manually. Even if one is careful not to incur this many authentication failures, it makes the system more subject to DOS attacks.</p> |

## aaa authentication attempts class-override

**aaa authentication attempts class-override {admin [no-lockout] | unknown {no-track | hash-username}}**

**no aaa authentication attempts class-override {admin | unknown {no-track | hash-username}}**

Overrides the global settings for tracking and lockouts for a type of account. The no form of the command removes this override and lets the admin be handled according to the global settings.

|                           |                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | admin                                                                         | Overrides the global settings for tracking and lockouts for the admin account. This applies only to the single account with the username “admin”. It does not apply to any other users with administrative privileges.                                                                                                                                                                                                    |
|                           | no-lockout                                                                    | Prevents the admin user from being locked out, though the authentication failure history is still tracked (if tracking is enabled overall).                                                                                                                                                                                                                                                                               |
|                           | unknown                                                                       | Overrides the global settings for tracking and lockouts for unknown accounts. The “unknown” class here contains the following categories: <ul style="list-style-type: none"> <li>• Real remote usernames which simply failed authentication</li> <li>• Mis-typed remote usernames</li> <li>• Passwords accidentally entered as usernames</li> <li>• Bogus usernames made up as part of an attack on the system</li> </ul> |
|                           | hash-username                                                                 | Applies a hash function to the username, and stores the hashed result in lieu of the original.                                                                                                                                                                                                                                                                                                                            |
|                           | no-track                                                                      | Does not track authentication for such users (which of course also implies no-lockout).                                                                                                                                                                                                                                                                                                                                   |
|                           |                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                           |

## aaa authorization

**aaa authorization map [default-user <username> | order <policy>]**

**no aaa authorization map [default-user | order]**

Sets the mapping permissions of a user in case a remote authentication is done.  
The no form of the command resets the attributes to default.

### 4.12.3.3 RADIUS

## radius-server

**radius-server** {key <secret>| retransmit <retries> | timeout <seconds>}  
**no radius-server** {key | retransmit | timeout}

Sets global RADIUS server attributes.

The no form of the command resets the attributes to their default values.

|                           |                                                                                                                                                                                                                   |                                                                                              |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | secret                                                                                                                                                                                                            | Sets a secret key (shared hidden text string), known to the system and to the RADIUS server. |
|                           | retries                                                                                                                                                                                                           | Number of retries (0-5) before exhausting from the authentication.                           |

| <b>Example</b>            | <pre>switch (config) #radius-server retransmit 3 switch (config) # show radius RADIUS defaults:   Key:           3333   Timeout:       3   Retransmit:    1 No RADIUS servers configured. switch (config) #</pre> |                                                                                              |
| <b>Related Commands</b>   | <pre>aaa authorization radius-server host show radius</pre>                                                                                                                                                       |                                                                                              |
| <b>Note</b>               | Each RADIUS server can override those global parameters using the command “radius-server host”.                                                                                                                   |                                                                                              |

## radius-server host

**radius-server host** <IP address> [enable | auth-port <port> | key <secret> | prompt-key | retransmit <retries> | timeout <seconds>]  
**no radius-server host** <IP address> [auth-port | enable]

Configures RADIUS server attributes.

The no form of the command resets the attributes to their default values and deletes the RADIUS server.

**Related Commands**

aaa authorization  
radius-server  
show radius

---

**Note**

- RADIUS servers are tried in the order they are configured
  - If you do not specify a parameter for this configured RADIUS server, the configuration will be taken from the global RADIUS server configuration. Refer to “radius-server” command.
-

## show radius

### show radius

Displays RADIUS configurations.

### 4.12.3.4 TACACS+

#### **tacacs-server**

**tacacs-server {key <secret> | retransmit <retries> | timeout <seconds>}**  
**no tacacs-server {key | retransmit | timeout}**

Sets global TACACS+ server attributes.  
 The no form of the command resets the attributes to default values.

| <b>Related Commands</b>   | <pre>aaa authorization show radius show tacacs tacacs-server host</pre>                                                                                                                                                |                                                                                              |
| <b>Note</b>               | Each TACACS+ server can override those global parameters using the command "tacacs-server host".                                                                                                                       |                                                                                              |

## tacacs-server host

**tacacs-server host <IP address> {enable | auth-port <port> | auth-type <type> | key <secret> | prompt-key | retransmit <retries> | timeout <seconds>}**  
**no tacacs-server host <IP address> {enable | auth-port}**

Configures TACACS+ server attributes.

The no form of the command resets the attributes to their default values and deletes the TACACS+ server.

| Syntax Description        | IP address                                                               | TACACS+ server IP address                                                                                                                             |

| <b>Role</b>               | admin                                                                    |                                                                                                                                                       |

**Example**

```
switch (config) # tacacs-server host 40.40.40.40
switch (config) # show tacacs
TACACS+ defaults:
 Key: 3333
 Timeout: 3
 Retransmit: 1
TACACS+ servers:
 40.40.40.40:49
 Enabled: yes
 Auth-type PAP
 Key: 3333 (default)
 Timeout: 3 (default)
 Retransmit: 1 (default)
switch (config) #
```

**Related Commands**

```
aaa authorization
show tacacs
tacacs-server
```

**Note**

- TACACS+ servers are tried in the order they are configured
- A PAP auth-type similar to an ASCII login, except that the username and password arrive at the network access server in a PAP protocol packet instead of being typed in by the user, so the user is not prompted
- If the user does not specify a parameter for this configured TACACS+ server, the configuration will be taken from the global TACACS+ server configuration. Refer to “tacacs-server” command.

## show tacacs

### show tacacs

Displays TACACS+ configurations.

## 4.12.3.5 LDAP

### ldap base-dn

**ldap base-dn <string>**  
**no ldap base-dn**

Sets the base distinguished name (location) of the user information in the schema of the LDAP server.

The no form of the command resets the attribute to its default values.

## ldap bind-dn/bind-password

**ldap {bind-dn | bind-password} <string>**

**no ldap {bind-dn | bind-password}**

Gives the distinguished name or password to bind to on the LDAP server. This can be left empty for anonymous login (the default).

The no form of the command resets the attribute to its default values.

## ldap group-attribute/group-dn

**ldap {group-attribute {<group-att> | member | uniqueMember} | group-dn  
<group-dn>}**

**no ldap {group-attribute | group-dn}**

Sets the distinguished name or attribute name of a group on the LDAP server.  
The no form of the command resets the attribute to its default values.

## ldap host

**ldap host <IP Address> [order <number> last]**

**no ldap host <IP Address>**

Adds an LDAP server to the set of servers used for authentication.  
The no form of the command deletes the LDAP host.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                     |

**ldap login-attribute {<string> | uid | sAMAccountName}**

**no ldap login-attribute**

Sets the attribute name which contains the login name of the user.  
The no form of the command resets this attribute to its default.

## ldap port

**ldap port <port>**  
**no ldap port**

Sets the TCP port on the LDAP server to connect to for authentication.  
 The no form of the command resets this attribute to its default value.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |

## ldap referrals

**ldap referrals**  
**no ldap referrals**

Enables LDAP referrals.  
 The no form of the command disables LDAP referrals.

| <b>Note</b>               | Referral is the process by which an LDAP server, instead of returning a result, will return a referral (a reference) to another LDAP server which may contain further information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## ldap scope

**ldap scope <scope>**

**no ldap scope**

Specifies the extent of the search in the LDAP hierarchy that the server should make when it receives an authorization request.

The no form of the command resets the attribute to its default value.

## ldap ssl

**ldap ssl {ca-list <options> | cert-verify | ciphers {all | TLS1.2} | mode <mode> | port <port-number>}**  
**no ldap ssl {cert-verify | ciphers | mode | port}**

Sets SSL parameter for LDAP.

The no form of the command resets the attribute to its default value.

| Syntax Description | options                                                                                            | This command specifies the list of supplemental certificates of authority (CAs) from the certificate configuration database that is to be used by LDAP for authentication of servers when in TLS or SSL mode. The options are: <ul style="list-style-type: none"> <li>default-ca-list - uses default supplemental CA certificate list</li> <li>none - no supplemental list, uses the built-in one only</li> </ul> CA certificates are ignored if “ldap ssl mode” is not configured as either “tls” or “ssl”, or if “no ldap ssl cert-verify” is configured. The default-ca-list is empty in the factory default configuration. Use the command: “crypto certificate ca-list default-ca-list name” to add trusted certificates to that list. The “default-ca-list” option requires LDAP to consult the system’s configured global default CA-list for supplemental certificates. |

In case the mode is TLS, the LDAP port number will be used.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                      |

## ldap timeout

**ldap {timeout-bind | timeout-search} <seconds>**

**no ldap {timeout-bind | timeout-search}**

Sets a global communication timeout in seconds for all LDAP servers to specify the extent of the search in the LDAP hierarchy that the server should make when it receives an authorization request.

The no form of the command resets the attribute to its default value.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                           |

## ldap version

**ldap version <version>**

**no ldap version**

Sets the LDAP version.

The no form of the command resets the attribute to its default value.

## 4.13 Cryptographic (X.509, IPSec)

This chapter contains commands for configuring, generating and modifying x.509 certificates used in the system. Certificates are used for creating a trusted SSL connection to the system.

Crypto commands also cover IPSec configuration commands used for establishing a secure connection between hosts over IP layer which is useful for transferring sensitive information.

### 4.13.1 Commands

#### crypto ipsec ike

**crypto ipsec ike {clear sa [peer {any | <IPv4 or IPv6 address>} local <IPv4 or IPv6 address>] | restart}**

Manage the IKE (ISAKMP) process or database state

| Syntax                    | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clear                     | Clears IKE (ISAKMP) peering state                                                                                                                                                                                                                                                                                                                  |
| sa                        | Clears IKE generated ISAKMP and IPSec security associations (remote peers are affected)                                                                                                                                                                                                                                                            |
| peer                      | Clears security associations for the specified IKE peer (remote peers are affected)<br>all – clears security associations for all IKE peerings with a specific local address (remote peers are affected)<br>IPv4 or IPv6 address – clears security associations for specific IKE peering with a specific local address (remote peers are affected) |
| IPv4 or IPv6 address      | Clears security associations for the specified IKE peering (remote peer is affected)                                                                                                                                                                                                                                                               |
| local                     | Clear security associations for the specified/all IKE peering (remote peer is affected)                                                                                                                                                                                                                                                            |
| restart                   | Restarts the IKE (ISAKMP) daemon (clears all IKE state, peers may be affected)                                                                                                                                                                                                                                                                     |

| <b>Note</b>               |                                                                                             |

## crypto certificate ca-list

**crypto certificate ca-list [default-ca-list name {<cert-name> | system-self-signed}]**

**no crypto certificate ca-list [default-ca-list name {<cert-name> | system-self-signed}]**

Adds the specified CA certificate to the default CA certificate list.  
The no form of the command removes the certificate from the default CA certificate list.

## crypto certificate default-cert

**crypto certificate default-cert name {<cert-name> | system-self-signed}**  
**no crypto certificate default-cert name {<cert-name> | system-self-signed}**

Designates the named certificate as the global default certificate role for authentication of this system to clients.

The no form of the command reverts the default-cert name to “system-self-signed” (the “cert-name” value is optional and ignored).

## crypto certificate generation

**crypto certificate generation default {country-code | days-valid | email-addr | hash-algorithm {sha1 | sha256} | key-size-bits | locality | org-unit | organization | state-or-prov}**

Configures default values for certificate generation.

| <b>Example</b>            | switch (config) # crypto certificate generation default hash-algorithm sha256 |                                                                                                                                                |
| <b>Related Commands</b>   | N/A                                                                           |                                                                                                                                                |
| <b>Note</b>               | The default hashing algorithm used is sha1.                                   |                                                                                                                                                |

## crypto certificate name

**crypto certificate name** {<cert-name> | system-self-signed} {comment <new comment> | generate self-signed [comment <cert-comment> | common-name <domain> | country-code <code> | days-valid <days> | email-addr <address> | hash-algorithm {sha1 | sha256} | key-size-bits <bits> | locality <name> | org-unit <name> | organization <name> | serial-num <number> | state-or-prov <name>]} | private-key pem <PEM string> | prompt-private-key | public-cert [comment <comment string> | pem <PEM string>] | regenerate days-valid <days> | rename <new name>}

**no crypto certificate name** <cert-name>

Configures default values for certificate generation.

The no form of the command clears/deletes certain certificate settings.

| Syntax Description | cert-name            | Unique name by which the certificate is identified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## show crypto certificate

**show crypto certificate** [**detail** | **public-pem** | **default-cert** [**detail** | **public-pem**] | **[name <cert-name> [detail | public-pem] | ca-list [default-ca-list]]**]

Displays information about all certificates in the certificate database.

|                           |                 |                                                                                                              |
|---------------------------|-----------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | ca-list         | Displays the list of supplemental certificates configured for the global default system CA certificate role. |
|                           | default-ca-list | Displays information about the currently configured default certificates of the CA list.                     |
|                           | default-cert    | Displays information about the currently configured default certificate.                                     |
|                           | detail          | Displays all attributes related to the certificate.                                                          |
|                           | name            | Displays information about the certificate specified.                                                        |
|                           | public-pem      | Displays the uninterpreted public certificate as a PEM formatted data string                                 |
| <b>Default</b>            | N/A             |                                                                                                              |
| <b>Configuration Mode</b> | Config          |                                                                                                              |
| <b>History</b>            | 3.2.1000        |                                                                                                              |
| <b>Role</b>               | admin           |                                                                                                              |

**Example**

```

switch (config)# show crypto certificate
Certificate with name 'system-self-signed' (default-cert)
 Comment: system-generated self-signed certifi-
icate
 Private Key: present
 Serial Number: 0x546c935511bcafc21ac0e8249fbe0844
 SHA-1 Fingerprint: fe6df38dd26801971cb2d44f62d-
be492b6063c5f

 Validity:
 Starts: 2012/12/02 13:45:05
 Expires: 2013/12/02 13:45:05

| <b>Note</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 4.14 Scheduled Jobs

Use the commands in this section to manage and schedule the execution of jobs

### 4.14.1 Commands

#### job

**job <job ID>**  
**no job <job ID>**

Creates a job.  
 The no form of the command deletes the job.

|                           |                                                        |             |
|---------------------------|--------------------------------------------------------|-------------|
| <b>Syntax Description</b> | job ID                                                 | An integer. |
| <b>Default</b>            | N/A                                                    |             |
| <b>Configuration Mode</b> | Config                                                 |             |
| <b>History</b>            | 3.1.0000                                               |             |
| <b>Role</b>               | admin                                                  |             |
| <b>Example</b>            | switch (config) # job 100<br>switch (config job 100) # |             |
| <b>Related Commands</b>   | show jobs                                              |             |
| <b>Note</b>               | Job state is lost on reboot.                           |             |

## command

**command** <sequence #> | <command>

**no command** <sequence #>

Adds a CLI command to the job.

The no form of the command deletes the command from the job.

| <b>Example</b>            | <pre>switch (config)# job 100 switch (config job 100) # execute switch (config job 100) #</pre>                                                                                                                                                        |
| <b>Related Commands</b>   | show jobs                                                                                                                                                                                                                                              |
| <b>Note</b>               | <ul style="list-style-type: none"> <li>• The job timer (if set) is not canceled and the job state is not changed: i.e. the time of the next automatic execution is not affected</li> <li>• The job will not be run if not currently enabled</li> </ul> |

## fail-continue

**fail-continue**  
**no fail-continue**

Continues the job execution regardless of any job failures.  
 The no form of the command returns fail-continue to its default.

## schedule type

**schedule type <recurrence type>**

**no schedule type**

Sets the type of schedule the job will automatically execute on.  
The no form of the command resets the schedule type to its default.

| <b>Note</b>               | A schedule type is essentially a structure for specifying one or more future dates and times for a job to execute. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## schedule <recurrence type>

**schedule <recurrence type> <interval and date>**

**no schedule**

Sets the type of schedule the job will automatically execute on.

The no form of the command resets the schedule type to its default.

| <b>Note</b>               | A schedule type is essentially a structure for specifying one or more future dates and times for a job to execute.   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## show jobs

### show jobs [<job-id>]

Displays configuration and state (including results of last execution, if any exist) of all jobs, or of one job if a job ID is specified.

| Syntax Description | job-id                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Job ID. |

## 4.15 Statistics and Alarms

### 4.15.1 Commands

#### **stats alarm <alarm-id> clear**

**stats alarm <alarm ID> clear**

Clears alarm state.

|                           |                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## stats alarm <alarm-id> enable

**stats alarm <alarm-id> enable**  
**no stats alarm <alarm-id> enable**

Enables the alarm.

The no form of the command disables the alarm, notifications will not be received.

## stats alarm <alarm-id> event-repeat

**stats alarm <alarm ID> event-repeat {single | while-not-cleared}**

**no stats alarm <alarm ID> event-repeat**

Configures repetition of events from this alarm.

## stats chd <chd-id> compute time

**stats chd <CHD ID> compute time {interval | range} <number of seconds>**

Sets parameters for when this CHD is computed.

| Syntax Description        | CHD ID                                                                                                                                                                                                                                                                                                   | Possible IDs:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## stats sample <sample-id> enable

**stats sample <sample-id> enable**  
**no stats sample <sample-id> enable**

Enables the sample.  
 The no form of the command disables the sample.

|                           |                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## stats sample <sample-id> interval

**stats sample <sample ID> interval <number of seconds>**

Sets the amount of time between samples for the specified group of sample data.

|                           |                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## stats clear-all

### stats clear all

Clears data for all samples, CHDs, and status for all alarms.

## stats export

**stats export** <format> <report name> [{after | before} <yyyy/mm/dd>  
<hh:mm:ss>] [filename <filename>]

Exports statistics to a file.

|                           |                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                |

## show stats cpu

### show stats cpu

Displays some basic stats about CPU utilization:

- the current level
- the peak over the past hour
- the average over the past hour

## show stats sample

**show stats sample [<sample ID>]**

Displays sampling interval for all samples, or the specified one.

|                           |                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 4.16 Chassis Management

The Chassis Manager provides the user access to the following information:

**Table 29 - Chassis Manager Information**

| Accessible Parameters | Description                                           |
|-----------------------|-------------------------------------------------------|
| switch temperatures   | Displays system's temperature                         |
| power supply voltages | Displays power supplies' voltage levels               |
| fan unit              | Displays system fans' status                          |
| power unit            | Displays system power consumers                       |
| Flash memory          | Displays information about system memory utilization. |

Additionally, it monitors:

- AC power to the PSUs
- DC power out from the PSUs
- Chassis failures

### 4.16.1 System Health Monitor

The system health monitor scans the system to decide whether or not the system is healthy. When the monitor discovers that one of the system's modules (leaf, spine, fan, or power supply) is in an unhealthy state or returned from an unhealthy state, it notifies the users through the following methods:

- System logs – accessible to the user at any time as they are saved permanently on the system
- Status LEDs – changed by the system health monitor when an error is found in the system and is resolved
- email/SNMP traps – notification on any error found in the system and resolved

#### 4.16.1.1 Re-Notification on Errors

When the system is in an unhealthy state, the system health monitor notifies the user about the current unresolved issue every X seconds. The user can configure the re-notification gap by running the “health notif-cntr <counter>” command.

#### 4.16.1.2 System Health Monitor Alerts Scenarios

- System Health Monitor sends notification alerts in the following cases:

**Table 30 - System Health Monitor Alerts Scenarios (Sheet 1 of 3)**

| Alert Message                                 | Scenario                                                                                                                 | Notification Indicator                                         | Recovery Action                          | Recovery Message                                       |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|------------------------------------------|--------------------------------------------------------|
| Fan <fan_number> speed is below minimal range | A chassis fan speed is below minimal threshold: <ul style="list-style-type: none"> <li>• 15% of maximum speed</li> </ul> | Email, fan LED and system status LED set red, log alert, SNMP. | Check the fan and replace it if required | Fan <fan_number> has been restored to its normal state |

**Table 30 - System Health Monitor Alerts Scenarios (Sheet 2 of 3)**

| Alert Message                                                                | Scenario                                                                                                             | Notification Indicator                                                 | Recovery Action                                                                   | Recovery Message                                                                            |
|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Fan <fan_number> speed in spine number <spine_number> is below minimal range | A spine fan speed is below minimal threshold: <ul style="list-style-type: none"> <li>30% of maximum speed</li> </ul> | Email, fan LED and system status LED set red, log alert, SNMP          | Check the fan and replace it if required                                          | Fan speed <fan_number> in spine number <spine_number> has been restored to its normal state |
| Fan <fan_number> is unresponsive                                             | A chassis fan is not responsive on MLNX-OS systems                                                                   | Email, fan LED and system status LED set red, log alert, SNMP          | Check fan connectivity and replace it if required                                 | Fan <fan_number> has been restored to its normal state                                      |
| Fan <fan_number> in spine number <spine_number> is unresponsive              | A spine fan is not responsive on MLNX-OS systems                                                                     | Email, fan LED and system status LED set red, log alert, SNMP          | Check fan connectivity and replace it if required                                 | Fan <fan_number> in spine number <spine_number> has been restored to its normal state       |
| Fan <fan_number> is not present                                              | A chassis fan is missing                                                                                             | Email, fan LED and system status LED set red, log alert, SNMP          | Insert a fan unit                                                                 | Fan <fan_number> has been restored to its normal state                                      |
| Fan <fan_number> in spine number <spine_number> is not present.              | A spine fan is missing                                                                                               | Email, fan LED and system status LED set red, log alert, SNMP          | Insert a fan unit                                                                 | Fan <fan_number> in spine number <spine_number> has been restored to its normal state       |
| Insufficient number of working fans in the system                            | Insufficient number of working fans in the system                                                                    | Email, fan LED and system status LED set red, log alert, SNMP          | Plug in additional fans or change faulty fans                                     | The system currently has sufficient number of working fans                                  |
| Power supply <ps_number> is unresponsive                                     | A power supply unit is not responsive, or the power supplied to the PS unit is below 10V on MLNX-OS systems          | Email, power supply LED and system status LED set red, log alert, SNMP | Check the PS module                                                               | Power supply <ps_number> has been restored to its normal state                              |
| Power supply <ps_number> temperature is too hot                              | A power supply unit temperature is higher than the maximum threshold of 70 Celsius on MLNX-OS systems                | Email, power supply LED and system status LED set red, log alert, SNMP | Check chassis fans connections. On MLNX-OS systems, check system fan connections. | Power supply <ps_number> temperature is back to normal                                      |
| Unit/leaf/spine <leaf/spine number> is unresponsive                          | A leaf /spine is not responsive                                                                                      | Email, system status LED set red, log alert, SNMP                      | Check leaf/spine connectivity and replace it if required                          | Leaf/spine number <leaf/spine number> has been restored to its normal state                 |

**Table 30 - System Health Monitor Alerts Scenarios (Sheet 3 of 3)**

| Alert Message                           | Scenario                                                                                                                                                | Notification Indicator                            | Recovery Action         | Recovery Message                      |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|-------------------------|---------------------------------------|
| Unit/leaf/spine voltage is out of range | One of the voltages in a MLNX-OS unit is below minimal threshold or higher than the maximum threshold - both thresholds are 15% of the expected voltage | Email, system status LED set red, log alert, SNMP | Check leaf connectivity | Unit voltage is in range              |
| ASIC temperature is too hot             | A SwitchX unit temperature is higher than the maximum threshold of 105 Celsius on MLNX-OS systems                                                       | Email, system status LED set red, log alert, SNMP | Check the fans system   | SwitchX temperature is back to normal |

## 4.16.2 Power Management

### 4.16.2.1 Power Supply Options

MLNX-OS offers power redundancy configurations and monitoring for SX65xx systems. SX65xx systems have the following redundancy configuration modes:

- “combined” – no power supply is reserved, the redundancy is not enabled.
- “ps-redundant” – one power supply unit is redundant to the rest. The system can work with one less power supply unit.
- “grid-redundant” – the power supplies are split into two logical power supply grids, first half of the PSUs belongs to grid A and the second half to grid B. The systems can work with only one grid. When using grid-redundancy mode the power budget is calculated according to the minimum power budget between the grids. This mode is available only in SX65xx-NR chassis systems. During switch initialization, or hot-plugging of switch components, MLNX-OS enables and/or disables switch components according to the available power budget.

MLNX-OS may send power alarms (via SNMP or email) as follow:

- If the available budget is insufficient for all the system components an `insufficient-Power` event is generated. In this mode several switch components may be disabled.
- If the total power of the system is insufficient for redundancy, a `lowPower` event is generated.
- If a connected power supply provides below 1.6K Watts or grid-redundancy mode is configured and a power supply is connected to a 110V grid, then a `powerRedundancy-Mismatch` event is generated, where grid redundancy can not be achieved in such configuration.

In case of an insufficient-power mode, the order in which the FRUs are turned ON is first leafs (max...3,2,1) and then the spines (max ... 3), while the order of the FRUs in case of turning them OFF is first the spines (3..max) and then the leafs (1,2,3 ... max). The management cards are not affected.

For the trap OID, please refer to the Mellanox-MIB file.

Power cycle is needed after changing power redundancy mode on SX65xx system.

#### 4.16.2.2 Width Reduction Power Saving

Link width reduction (LWR) is a Mellanox proprietary power saving feature to be utilized to economize the power usage of the fabric. LWR may be used to manually or automatically configure a certain connection between Mellanox switch systems to lower the width of a link from 4X operation to 1X based on the traffic flow.

LWR is relevant only for 40GbE and InfiniBand FDR speeds in which the links are operational at a 4X width.

When “show interfaces” is used, a port’s speed appears unchanged even when only one lane is active.

LWR has three operating modes per interface:

- Disabled – LWR does not operate and the link remains in 4X under all circumstances.
- Automatic – the link automatically alternates between 4X and 1X based on traffic flow.
- Force – a port is forced to operate in 1X mode lowering the throughput capability of the port. This mode should be chosen in cases where constant low throughput is expected on the port for a certain time period – after which the port should be configured to one of the other two modes, to allow higher throughput to pass through the port.

See command “[power-management width](#)” on page 397.

**Table 31 - LWR Configuration Behavior**

| Switch-A Configuration | Switch-B Configuration | Behavior                                                                                                                                      |
|------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Disable                | Disable                | LWR is disabled.                                                                                                                              |
| Disable                | Force                  | Transmission from Switch-B to Switch-A operates at 1X. On the opposite direction, LWR is disabled.                                            |
| Disable                | Auto                   | Depending on traffic flow, transmission from Switch-B to Switch-A may operate at 1X. On the opposite direction, LWR is disabled.              |
| Auto                   | Force                  | Transmission from Switch-B to Switch-A operates at 1 lane. Transmission from Switch-A to Switch-B may operate at 1X depending on the traffic. |

**Table 31 - LWR Configuration Behavior**

| Switch-A Configuration | Switch-B Configuration | Behavior                                            |
|------------------------|------------------------|-----------------------------------------------------|
| Auto                   | Auto                   | Width of the connection depends on the traffic flow |
| Force                  | Force                  | Connection between the switches operates at 1X      |

#### 4.16.2.3 Managing Chassis Power

It is possible to shut down or power up modules in a chassis by using the `power enable` and `no power enable` commands.

**Step 1.** Change to Config mod. Run:

```
switch [standalone: master] > enable
switch [standalone: master] # configure terminal
switch [standalone: master] (config) #
```

**Step 2.** Run the command `power enable ?` to get a list of modules that are available to power up or down.

**Step 3.** To power down a module run the command `no power enable` followed by a module.

```
switch [standalone: master] (config) # no power enable ps1
switch [standalone: master] (config) #
```

**Step 4.** To power up a module run the command `power enable` followed by a module.

```
switch [standalone: master] (config) # power enable ps1
switch [standalone: master] (config) #
```

Using the `show power` command it is possible to see the power consumption of the system and also the power consumption by power supply unit.

### 4.16.3 Monitoring Environmental Conditions

**Step 1.** Display module's temperature. Run:

```
switch (config) # show temperature
=====
Module Sensor CurTemp Status
 (Celsius)
=====
MGMT CPU_BOARD_MONITOR 40.00 OK
L01 BOARD_MONITOR 27.00 OK
L01 QSFP_TEMP1 24.00 OK

L02 28.75 48.00 0.60 OK
MGMT 16.08 48.00 0.34 OK
S01 37.34 48.00 0.78 OK
S02 35.09 48.00 0.73 OK

Total power used : 211.79 W
Max power : 686.00 W
switch (config) #
```

#### 4.16.4 USB Access

MLNX-OS can access USB devices attached to switch systems. USB devices are automatically recognized and mounted upon insertion. To access a USB device for reading or writing a file, you need to provide the path to the file on the mounted USB device in the following format:

```
scp://username:password@hostname/var/mnt/usb1/<file name>
```

While username and password are the admin username and password and hostname is the IP of the switch.

Examples:

- **To fetch an image from a USB device, run the command:**

```
switch (config) # "image fetch scp://admin:admin@10.10.10.10/var/mnt/usb1/image.img
```

- **To save log file 'my-logfile' to a USB device under the name test\_logfile using the logging files command, run (in Enable or Config mode):**

```
switch (config) # logging files upload my-logfile scp://username:password@hostname/var/
mnt/usb1/test_logfile
switch (config) #
```

- **To safely remove the USB and to flush the cache, after writing (log files, for example) to a USB, use the usb eject command (in Enable or Config mode).**

```
switch (config) # usb eject
switch (config) #
```

### 4.16.5 High Availability (HA)

Mellanox high end management SX65xx systems support redundant management modules. Chassis HA reduces downtime as it assures continuity of the work even when a management module dies. Chassis HA management allows the systems administrator to associate a single IP address with the appliance. Connecting to that IP address allows the user to change and review the system's chassis parameters regardless of the active management module.

**Figure 13: SX65xx with Dual Management Modules**

#### 4.16.5.1 Chassis High Availability Nodes Roles

Every node in the Chassis HA has one of the following roles/modes:

- Master – the node that manages chassis configurations and services the chassis IP addresses
- Slave – the node that replaces the Master node and takes over its responsibilities once the Master node is down.

The master node is the only node that has access to chassis components such as temperature, inventory and firmware.

The CPU role of the current management node can be recognized by the following methods:

- Run the show chassis ha command.

```
switch (config) # show chassis ha
2-node HA state:
 Box management IP: 172.30.1.200/16
 interface: mgmt0

 local role: master
 local slot: 1
 other state: active
 reset count: 0

switch (config) #
```

- Check the LEDs in the management modules as displayed in the figure below.

**Figure 14: SX60xx's LEDs**

- Go to the WebUI => System => Modules page and see the information on the LEDs.

#### 4.16.5.2 Malfunctioned CPU Behavior

When a CPU is not responding to an internal communication with the other CPU, the non responding CPU will be reset by the other CPU. Each time a CPU resets, a counter is incremented. After 5 resets a CPU is considered malfunctioned and will be shut down.

To verify how many times a CPU is reset, run the following command:

```
switch-11a14e [default: master] (config) # show chassis ha
2-node HA state:
 Box management IP: 172.30.1.200/16
 interface: mgmt0

 local role: master
 local slot: 1
 other state: active
 reset count: 1

switch-11a14e [default: master] (config) #
```

To verify if a CPU has been shut down, either run the following command:

```
switch-11a14e [default: master] (config) # show chassis ha
2-node HA state:
 Box management IP: 172.30.1.200/16
 interface: mgmt0

 local role: master
 local slot: 1
 other state: shot
 reset count: 5

switch-11a14e [default: master] (config) #
```

Or check the system page in the WebUI, the management figure will be grayed out.

To enable the malfunctioned CPU, first replace it and run `chassis ha reset other`.

#### 4.16.5.3 Box IP Centralized Location

Box IP (BIP) centralized management infrastructure enables you to configure and monitor the system. The BIP continues to function even if one of the management blades dies. Box IP is defined by running the `chassis ha bip <board IP address>` command. The created BIP is used as the master IP's alias.

##### Example:

```
SX648 [standalone: master] (config) # chassis ha bip 192.168.10.100 255.255.255.0
SX648 [standalone: master] (config) #
```

#### 4.16.5.4 System Configuration

System configuration changes should be performed by the master using the BIP otherwise they are overridden by the master configuration.

Chassis HA is based on database replication enabling the entire master configuration to be replicated to the slave. Data such as chassis configuration is replicated. However, run time information such as time, logs, active user lists, is not copied. Additionally, node specific configuration information such as host name and IP address is not copied..

Chassis HA requires connectivity of both management modules (mgmt0, mgmt1) in the same broadcast domain.

#### 4.16.5.5 Takeover Functionally

Management CPU functional takeover takes up to 20-30 seconds. However, when plugging in a module, you need to wait for approximately 3 minutes before making any other hardware change. During the takeover process, the Master LED status is differentiated by a color scheme, see [Figure 14](#). To verify the system's status, run the “show chassis ha” command on both managements.

In case of CPU malfunction the system tries to reset it 5 times to solve the issue. If the CPU is not activated after resetting, the system powers it off as well as its attached spine. Once the CPU is powered off, the user should replace the malfunctioned CPU module. To power on the CPU and the attached spine, plug the module in, log into the Master CPU and run the “chassis ha power enable other” command.

Although the LEDs are functional during the takeover, wait for approximately 3 minutes before making any other hardware change.

### Master Example

```
switch [default: master] (config) # show chassis ha
2-node HA state:
 Box management IP: 172.30.1.200/16
 interface: mgmt0

 local role: master
 local slot: 1
 other state: active
 reset count: 1

switch [default: master] (config) #
```

### Slave Example

```
switch [default: master] (config) # show chassis ha
2-node HA state:
 Box management IP: 172.30.1.200/16
 interface: mgmt0

 local role: slave
 local slot: 2
 other state: active
 reset count: 0

switch [default: master] (config) #
```

Not following these instructions may result in some errors in the log. These errors may be safely ignored.

## 4.16.6 System Reboot

### 4.16.6.1 Rebooting 1U Switches

➤ **To reboot a 1U switch system:**

**Step 1.** Enter Config mode. Run:

```
switch >
switch > enable
switch # configure terminal
```

**Step 2.** Reboot the system. Run:

```
switch (config) # reload
```

### 4.16.6.2 Rebooting Director Switches

Mellanox high end management SX65xx systems support redundant management modules. Chassis HA reduces downtime as it assures continuity of the work even when a management module dies. Chassis HA management allows the systems administrator to associate a single IP address with the appliance. Connecting to that IP address allows the user to change and review the system's chassis parameters regardless of the active management module.

➤ **To reboot director switches:**

**Step 1.** Connect to BIP. Please refer to [Section 4.16.5.3, “Box IP Centralized Location,”](#) on page 391 for more information.

**Step 2.** Enter Config mode. Run:

```
switch >
switch > enable
switch # configure terminal
```

**Step 3.** Reboot the slave management. Run:

```
switch [default: master] (config) # chassis ha reset other
switch [default: master] (config) #
```

**Step 4.** Reboot the master management. Run:

```
switch [default: master] (config) # reload
```

## 4.16.7 Commands

### 4.16.7.1 Chassis Management

#### clear counters

**clear counters [all | interface <type> <number>]**

Clears switch counters.

|                           |                                  |                             |
|---------------------------|----------------------------------|-----------------------------|
| <b>Syntax Description</b> | all                              | Clears all switch counters. |
|                           | type                             | A specific interface type   |
|                           | number                           | The interface number.       |
| <b>Default</b>            | N/A                              |                             |
| <b>Configuration Mode</b> | Config Interface Port Channel    |                             |
| <b>History</b>            | 3.2.3000                         |                             |
| <b>Role</b>               | admin                            |                             |
| <b>Example</b>            | switch (config) # clear counters |                             |
| <b>Related Commands</b>   |                                  |                             |
| <b>Note</b>               |                                  |                             |

## health

**health {max-report-len <length> | re-notif-cntr <counter> | report-clear}**

Configures health daemon settings.

|                           |                                                                 |                                                                                             |
|---------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | max-report-len <length>                                         | Sets the length of the health report - number of line entries. Possible values: 10-2048.    |
|                           | re-notif-cntr <counter>                                         | Health control changes notification counter, in seconds. Possible values: 120-7200 seconds. |
|                           | report-clear                                                    | Clears the health report.                                                                   |
| <b>Default</b>            | max-report-len: 50<br>re-notif-cntr:                            |                                                                                             |
| <b>Configuration Mode</b> | Config                                                          |                                                                                             |
| <b>History</b>            | 3.1.0000                                                        |                                                                                             |
| <b>Role</b>               | admin                                                           |                                                                                             |
| <b>Example</b>            | switch (config) # health re-notif-cntr 125<br>switch (config) # |                                                                                             |
| <b>Related Commands</b>   | show health-report                                              |                                                                                             |
| <b>Note</b>               |                                                                 |                                                                                             |

## power enable

**power enable <module name>**  
**no power enable <module name>**

Powers on the module.  
 The no form of the command shuts down the module.

|                           |                                                                 |                                    |
|---------------------------|-----------------------------------------------------------------|------------------------------------|
| <b>Syntax Description</b> | module name                                                     | Enables power for selected module. |
| <b>Default</b>            | Power is enabled on all modules.                                |                                    |
| <b>Configuration Mode</b> | Config                                                          |                                    |
| <b>History</b>            | 3.1.0000                                                        |                                    |
| <b>Role</b>               | admin                                                           |                                    |
| <b>Example</b>            | <pre>switch (config) # power enable L01 switch (config) #</pre> |                                    |
| <b>Related Commands</b>   | <pre>show power show power consumers</pre>                      |                                    |
| <b>Note</b>               | This command is not applicable for 1U systems.                  |                                    |

## power-management width

**power-management width {auto | force}**  
**no power-management width**

Sets the width of the interface to be automatically adjusted.  
 The no form of the command disables power-saving.

|                           |                                                                                     |                                                                                        |
|---------------------------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | auto                                                                                | Allows the system to automatically decide whether to work in power-saving mode or not. |
|                           | force                                                                               | Forces power-saving mode on the port.                                                  |
| <b>Default</b>            | Disabled                                                                            |                                                                                        |
| <b>Configuration Mode</b> | Config Interface IB<br>Config Interface Ethernet                                    |                                                                                        |
| <b>History</b>            | 3.3.4000                                                                            |                                                                                        |
| <b>Role</b>               | admin                                                                               |                                                                                        |
| <b>Example</b>            | switch (config interface ib 1/1) # power-management width auto<br>switch (config) # |                                                                                        |
| <b>Related Commands</b>   | show interface                                                                      |                                                                                        |
| <b>Note</b>               |                                                                                     |                                                                                        |

## power redundancy-mode

**power redundancy-mode [combined | grid-redundant | ps-redundant]**

Controls the power supply redundancy mode.

|                           |                                                                                                                                                                                                                                                                |                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | combined                                                                                                                                                                                                                                                       | No redundancy - no alarm threshold.                                                                                                    |
|                           | grid-redundant                                                                                                                                                                                                                                                 | N+N – the alarm threshold will be set to a level, indicating when the power availability falls below power that can support N+N scheme |
|                           | ps-redundant                                                                                                                                                                                                                                                   | N+1 – the alarm threshold will be set to a level, indicating when the power availability falls below power that can support N+1 scheme |

## show temperature

### show temperature

Displays the system's temperature sensors status.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Example</b>            | switch (config) # chassis ha bip 192.168.10.100<br>switch (config) # |                                      |
| <b>Related Commands</b>   | show chassis ha                                                      |                                      |
| <b>Note</b>               | This command is applicable only for SX65xx systems.                  |                                      |

## chassis ha

### chassis ha reset other

Performs a reset to the other management card in the chassis.

|                           |                                                               |
|---------------------------|---------------------------------------------------------------|

| <b>Role</b>               | admin                                                         |
| <b>Example</b>            | switch (config) # chassis ha reset other<br>switch (config) # |
| <b>Related Commands</b>   | show chassis ha                                               |
| <b>Note</b>               | This command is applicable only for SX65xx systems.           |

## chassis ha power enable other

**chassis ha power enable other**  
**no chassis ha power enable other**

Enables the other management card in the chassis.  
The no form of the command disables the other management card in the chassis.

|                           |                                                                      |
|---------------------------|----------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                  |
| <b>Default</b>            | The other management card is enabled.                                |
| <b>Configuration Mode</b> | Config                                                               |

## 4.17 Network Management Interfaces

### 4.17.1 SNMP

Simple Network Management Protocol (SNMP), is a network protocol for the management of a network and the monitoring of network devices and their functions. SNMP supports asynchronous event (trap) notifications and queries.

MLNX-OS supports:

- SNMP versions v1, v2c and v3
- SNMP trap notifications
- Standard MIBs
- Mellanox private MIBs

#### 4.17.1.1 Standard MIBs

**Table 32 - Standard MIBs – Textual Conventions and Conformance MIBs**

| MIB                             | Standard | Comments |
|---------------------------------|----------|----------|
| INET-ADDRESS-MIB                | RFC-4001 |          |
| SNMPV2-CONF                     |          |          |
| SNMPV2-TC                       | RFC 2579 |          |
| SNMPV2-TM                       | RFC 3417 |          |
| SNMP-USM-AES-MIB                | RFC 3826 |          |
| IANA-LANGUAGE-MIB               | RFC 2591 |          |
| IANA-RTPROTO-MIB                | RFC 2932 |          |
| IANAifType-MIB                  |          |          |
| IANA-ADDRESS-FAMILY-NUMBERS-MIB |          |          |

**Table 33 - Standard MIBs – Structure, Management Interface and General SNMP**

| MIB                     | Standard | Comments             |
|-------------------------|----------|----------------------|
| SNMPv2-MIB              | RFC 3418 |                      |
| SNMP-FRAMEWORK-MIB      | RFC 2571 |                      |
| SNMP-VIEW-BASED-SM-MIB  | RFC 3414 |                      |
| SNMP-VIEW-BASED-ACM-MIB | RFC 3415 |                      |
| SNMP-MPD-MIB            | RFC 2572 |                      |
| IP-MIB                  | RFC 4293 | Management interface |

**Table 33 - Standard MIBs – Structure, Management Interface and General SNMP**

| MIB                                        | Standard | Comments             |
|--------------------------------------------|----------|----------------------|
| TCP-MIB                                    | RFC 4022 | Management interface |
| UDP-MIB                                    | RFC 4113 | Management interface |

| LLDP-MIB          | 802.1AB-2005 | This MIB is not relevant to InfiniBand.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 4.17.1.2 Private MIB

**Table 35 - Private MIBs Supported**

| MIB                    | Description                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------|
| MELLANOX-SMI-MIB       | Mellanox Private MIB main structure (no objects)                                                              |
| MELLANOX-PRODUCTS-MIB  | List of OID – per managed system (sysObjID)                                                                   |
| MELLANOX-IF-VPI-MIB    | IfTable extensions                                                                                            |
| MELLANOX-EFM-MIB       | Partially deprecated MIB (based on Mellanox-MIB)<br>Traps definitions and test trap set scalar are supported. |
| MELLANOX-ENTITY-MIB    | Enhances the standard ENTITY-MIB (contains GUID and ASIC revision).                                           |
| MELLANOX-POWER-CYCLE   | Allows rebooting the switch system                                                                            |
| MELLANOX-SW-UPDATE-MIB | Allows viewing what SW images are installed, uploading and installing new SW images                           |
| MELLANOX-CONFIG-DB     | Allows loading, uploading, or deleting configuration files                                                    |

Mellanox private MIBs can be downloaded from the [Mellanox Support](#) webpage.

### 4.17.1.3 Mellanox Private Traps

The following private traps are supported by MLNX-OS.

**Table 36 - SNMP Traps**

| Trap               | Action Required                                                                                |
|--------------------|------------------------------------------------------------------------------------------------|
| asicChipDown       | Reboot the system.                                                                             |
| asicOverTempReset  | Check fans and environmental temperature.                                                      |
| asicOverTemp       | Check fans and environmental temperature.                                                      |
| lowPower           | Add/connect power supplies.                                                                    |
| internalBusError   | N/A                                                                                            |
| procCrash          | Generate SysDump and contact Mellanox support.                                                 |
| cpuUtilHigh        | N/A                                                                                            |
| procUnexpectedExit | Generate SysDump and contact Mellanox support.                                                 |
| diskSpaceLow       | Clean images and sysDump files using the commands “image delete” and “file debug-dump delete”. |
| systemHealthStatus | Refer to Health Status table.                                                                  |
| lowPowerRecover    | N/A                                                                                            |
| insufficientFans   | Check Fans and environmental conditions.                                                       |

**Table 36 - SNMP Traps**

| Trap                     | Action Required                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------|
| insufficientFansRecover  | N/A                                                                                         |
| insufficientPower        | Add/connect power supplies, or change power mode using the command “power redundancy mode”. |
| insufficientPowerRecover | N/A                                                                                         |

For additional information refer to MELLANOX-EFM-MIB.

For event-to-MIB mapping, please refer to [Table 27, “Supported Event Notifications and MIB Mapping,”](#) on page 271.

#### 4.17.1.4 Configuring SNMP

##### ➤ *To set up the SNMP:*

- Step 1.** Activate the SNMP server on the MLNX-OS switch (in configure mode) using the following commands:

Community strings are case sensitive.

Director switches (SX65xx systems) require SNMP timeout configuration on the agent of 60 seconds.

```
switch (config) # snmp-server enable
switch (config) # snmp-server enable notify
switch (config) # snmp-server community public ro
switch (config) # snmp-server contact "contact name"
switch (config) # snmp-server host <host IP address> traps version 2c public
switch (config) # snmp-server location "location name"
switch (config) # snmp-server user admin v3 enable
switch (config) # snmp-server user admin v3 prompt auth md5 priv des
```

#### 4.17.1.5 Configuring an SNMPv3 User

##### ➤ *To configure SNMP V3 user:*

- Step 1.** Configure the user using the command:

```
switch (config) # snmp-server user [role] v3 prompt auth <hash type> priv <privacy type>
```

where

- user role – admin

- auth type – md5 or sha
- priv type – des or aes-128

**Step 2.** Enter authentication password and its confirmation.

**Step 3.** Enter privacy password and its confirmation.

```
switch (config) # snmp-server user admin v3 prompt auth md5 priv des
Auth password: *****
Confirm: *****
Privacy password: *****
Confirm: *****
switch (config) #
```

To retrieve the system table, run the following SNMP command:

```
snmpwalk -v3 -l authPriv -a MD5 -u admin -A "<Authentication password>" -x DES -X "<privacy password>" <system ip> SNMPv2-MIB::system
```

#### 4.17.1.6 Configuring an SNMP Notification

➤ **To set up the SNMP Notification (traps or informs):**

**Step 1.** Make sure SNMP and SNMP notification are enable. Run:

```
switch (config) # snmp-server enable
switch (config) # snmp-server enable notify
switch (config) #
```

**Step 2.** Configure SNMP host with the desired arguments (IP Address, SNMP version, authentication methods). More than one host can be configured. Each host may have different attributes. Run:

```
switch (config) # snmp-server host 10.134.47.3 traps version 3 user my-username auth sha
my-password
switch (config) #
```

**Step 3.** Verify the SNMP host configuration. Run:

```
switch (config) # show snmp host
Notifications enabled: yes
Default notification community: public
Default notification port: 162

Notification sinks:

 10.134.47.3
 Enabled: yes
 Port: 162 (default)
 Notification type: SNMP v3 trap
 Username: my-username
 Authentication type: sha
 Privacy type: aes-128
 Authentication password: (set)
 Privacy password: (set)

switch (config) #
```

**Step 4.** Configure the desired event to be sent via SNMP. Run:

```
switch (config) # snmp-server notify event interface-up
switch (config) #
```

This particular event is used as an example only.

**Step 5.** Verify the list of traps and informs being sent to out of the system. Run:

```
switch (config) # show snmp events
Events for which traps will be sent:
asic-chip-down: ASIC (Chip) Down
cpu-util-high: CPU utilization has risen too high
disk-space-low: Filesystem free space has fallen too low
health-module-status: Health module Status
insufficient-fans: Insufficient amount of fans in system
insufficient-fans-recover: Insufficient amount of fans in system recovered
insufficient-power: Insufficient power supply
interface-down: An interface's link state has changed to down
interface-up: An interface's link state has changed to up
internal-bus-error: Internal bus (I2C) Error
liveness-failure: A process in the system was detected as hung
low-power: Low power supply
low-power-recover: Low power supply Recover
new_root: local bridge became a root bridge
paging-high: Paging activity has risen too high
power-redundancy-mismatch: Power redundancy mismatch
process-crash: A process in the system has crashed
process-exit: A process in the system unexpectedly exited
snmp-authtrap: An SNMP v3 request has failed authentication
topology_change: local bridge triggered a topology change
unexpected-shutdown: Unexpected system shutdown
switch (config) #
```

To print event notifications to the terminal (SSH or CONSOLE) refer to [Section 4.8.1, “Monitor,”](#) on page 232.

#### 4.17.1.7 SNMP SET Operations

MLNX-OS allows the user to use SET operations via SNMP interface. This is needed to configure a user/community supporting SET operations.

##### Enabling SNMP SET

➤ **To allow SNMP SET operations using SNMPv1/v2:**

**Step 1.** Enable SNMP communities. Run:

```
switch (config) # snmp-server enable communities
```

**Step 2.** Configure a read-write community. Run:

```
switch (config) # snmp-server community my-community-name rw
```

**Step 3.** Make sure SNMP communities are enabled (enabled by default). Make sure “(DISABLED)” does not appear beside “Read-only communities” / “Read-write communities”. Run:

```
switch (config) # show snmp
SNMP enabled: yes
SNMP port: 161
System contact:
System location:
Read-only communities:
 public

Read-write communities:
 my-community-name
switch (config) # show snmp
No Listen Interfaces.
```

**Step 4.** Configure this RW community in your MIB browser.

➤ **To allow SNMP SET operations using SNMPv3:**

**Step 1.** Create an SNMPv3 user. Run:

```
switch (config) # snmp-server user myuser v3 auth sha <password1> priv aes-128 <pass-
word2>
```

It is possible to use other configuration options not specified in the example above. Please refer to the command “[snmp-server user](#)” on [page 445](#) for more information.

**Step 2.** Make sure the username is enabled for SET access and has admin capability level. Run:

```
switch (config) # show snmp user
User name: myuser
 Enabled overall: yes
 Authentication type: sha
 Privacy type: aes-128
 Authentication password: (set)
 Privacy password: (set)
 Require privacy: yes
 SET access:
 Enabled: yes
 Capability level: admin
```

MLNX-OS supports the OIDs for SET operation listed in Table 37 which are expanded upon in the following subsections.

**Table 37 - Supported SET OIDs**

| MIB Name         | OID Name        | OID                           |
|------------------|-----------------|-------------------------------|
| MELLANOX-EFM-MIB | sendTestTrapSet | 1.3.6.1.4.1.33049.2.1.1.1.6.0 |

**Table 37 - Supported SET OIDs**

| MIB Name             | OID Name                          | OID                            |

**Sending a Test Trap SET Request**

MLNX-OS allows the user to use test the notification mechanism via SNMP SET. Sending a SET request with the designated OID triggers a test trap.

**Prerequisites:**

1. Enable SET operations by following the instructions in [Section , “Enabling SNMP SET,” on page 429.](#)
2. Configure host to which to send SNMP notifications.
3. Set a trap receiver in the MIB browser.

**➤ To send a test trap:**

**Step 1.** Send a SET request to the switch IP with the OID 1.3.6.1.4.1.33049.2.1.1.6.0.

**Step 2.** Make sure the test trap is received by the aforementioned trap receiver (OID: 1.3.6.1.4.1.33049.2.1.2.13).

**Setting Hostname with SNMP**

Mellanox supports setting system hostname using an SNMP SET request as described in SNMPv2-MIB (sysName, OID: 1.3.6.1.2.1.1.5.0).

The restrictions on setting a hostname via CLI also apply to setting a hostname through SNMP. Refer to the command [“hostname” on page 133](#) for more information.

**Power Cycle with SNMP**

Mellanox supports power cycling its systems using an SNMP SET request as described in MELLANOX-POWER-CYCLE MIB.

Power cycle command is issued via the OID `mellanoxPowerCycleCmdExecute`. The following options are available:

- Reload – saves any unsaved configuration and reloads the switch

- Reload discard – reboots the system and discards of any unsaved changes
- Reload force – forces an expedited reload on the system even if it is busy without saving unsaved configuration (equals the CLI command `reload force`)
- Reload slave – reloads the slave management on dual management systems (must be executed from the master management module)

On dual management systems it is advised to connect via the BIP to make sure commands are executed from the master management.

### Changing Configuration with SNMP

Mellanox supports making configuration changes on its systems using SNMP SET requests. Configuration requests are performed by setting several values (arguments) and then executing a command by setting the value for the relevant operation.

It is possible to set the parameters and execute the commands on the same SNMP request or separate them to several SET operations. Upon executing a command, the values of its arguments remain and can be read using GET commands.

Once a command is executed there may be two types of errors:

- Immediate: This error results in a failure of the SNMP request. This means a critical error in the SNMP request has occurred or that a previous SET request is being executed
- Delayed: The SET request has been accepted by the switch but an error occurred during its execution.

For example, when performing a fetch (download) operation, an immediate error can occur when the given URL is invalid. A delayed error can occur if the download process fails due to network connectivity issues.

The following parameters are arguments are supported:

- Command URI – URI to fetch the configuration file from or upload the file to (for supported URI format please refer to the CLI command “configuration fetch” for more details)
- Config file name – filename to save the configuration file to or to upload to remote location

The following commands are supported:

- BinarySwitchTo – replaces the configuration file with a new binary configuration file. This option fetches the configuration file from the URI provided in the `mellanoxConfigDBCmdUri` and switches to that configuration file. This command should be preceded by a reload command in order for the new configuration to apply.
- TextApply – fetches a configuration file in human-readable format and applies its configuration upon the current configuration.
- BinaryUpload – uploads a binary format configuration file of the current running configuration or an existing configuration file on the switch to the URI in the `mellanoxConfigDBCmdUri` command. The filename parameter indicates what configuration file on the switch to upload.

- **TextUpload** – uploads a human-readable configuration file of the current running configuration or an existing configuration file on the switch to the URI in the `mellanoxConfigDBCmdUri` command. The `filename` parameter indicates what configuration file on the switch to upload.
- **ConfigWrite** – saves active configuration to a filename on the switch as given in the `filename` parameter. In case filename is “active”, active configuration is saved to the current saved configuration (same as the CLI command `configuration write`).

#### Upgrading MLNX-OS Software with SNMP

Mellanox supports upgrading MLNX-OS software using an SNMP SET request as described in MELLANOX-SW-UPDATE MIB.

The software upgrade command is issued via the OID `mellanoxSWUpdateCmdExecute`. The following options are available:

- **Update** – fetches the image from a specified URI (equivalent to the command “`image fetch`” followed by “`image install`”)

The image to update from is defined by the OID `mellanoxSWUpdateCmdUri`. The restrictions on the URI are identical to what is supported in the CLI command “`image fetch`” on page 195.

- **Set-Next** – changes the image for the next boot equivalent to the CLI command “`image boot`”)

The partition from which to boot is defined by the OID `mellanoxSWUpdateCmdSetNext`. The parameters for this OID are as follows:

- 0 – no change
- 1 – partition 1
- 2 – partition 2
- 3 – next partition (default)

Using the OIDs `mellanoxSWUpdateCmdStatus` and `mellanoxSWUpdateCmdStatusString` you may view the status of the latest operation performed from the aforementioned in either integer values, or human-readable forms, respectively. The integer values presented may be as follows:

- 0 – no operation
- 1-100 – progress%
- 101 – success
- 200 – failure

#### 4.17.1.8 IF-MIB and Interface Information

MLNX-OS supports displaying information of switch ports, LAG ports, MLAG ports and VLAN interfaces on all systems via SNMP interface. This feature is enabled by default. The interface information is available in the `ifTables`, `ifXTable` and `mellanoxIfVPITable`. Additionally, traps for interface up/down, and internal link suboptimal speed are enabled. The user has the ability to enable one or both of these traps.

Interface up/down traps are sent whenever there is a change in the interface’s operational state. These traps are suppressed for internal links when the internal link’s speed does not match the configured speed of the link (mismatch condition).

### 4.17.2 XML API

MLNX-OS XML API is currently under development. For further information please contact Mellanox support.

## 4.17.3 Commands

### 4.17.3.1 SNMP

The commands in this section are used to manage the SNMP server.

#### snmp-server auto-refresh

**snmp-server auto-refresh {enable | interval <time>}**  
**no snmp-server auto-refresh enable**

Configures SNMPD refresh settings.  
 The no form of the command disables SNMPD refresh mechanism.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                        |

## snmp-server community

**snmp-server community <community> [ ro | rw]**

**no snmp-server community <community>**

Sets a community name for either read-only or read-write SNMP requests.  
The no form of the command sets the community string to default.

## snmp-server contact

**snmp-server contact <contact name>**

**no snmp-server contact**

Sets a value for the sysContact variable in MIB-II.

The no form of the command resets the parameter to its default value.

## snmp-server enable

**snmp-server enable [communities | mult-communities | notify]**  
**no snmp-server enable [communities | mult-communities | notify]**

Enables SNMP-related functionality.  
 The no form of the command disables the SNMP server.

| <b>Related Commands</b>   | show snmp                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                           |
| <b>Note</b>               | SNMP traps are only sent if there are trap sinks configured with the “snmp-server host...” command, and if these trap sinks are themselves enabled.                                                                                                                                                                                                                                                               |                                                                                                                           |

## snmp-server host

**snmp-server host** <IP address> {disable | {traps | informs} [<community> | <port> | version <snmp version>]}

**no snmp-server host** <IPv4 or IPv6 address> {disable | {traps| informs} [<community> | <port>]}

Configures hosts to which to send SNMP traps.  
The no form of the commands removes a host from which SNMP traps should be sent.

**Example**

```
switch (config) # snmp-server host 10.10.10.10 traps version 1
switch (config) # show snmp
SNMP enabled: yes
SNMP port: 161
System contact:
System location:

Read-only communities:
 public

Read-write communities:
 (none)

Interface listen enabled: yes
No Listen Interfaces.

Traps enabled: yes
Default trap community: public
Default trap port: 162

Trap sinks:
 10.10.10.10
 Enabled: yes
 Type: traps version 1
 Port: 162 (default)
 Community: public (default)
switch (config) #
```

**Related Commands**

```
show snmp
snmp-server enable
```

**Note**

This setting is only meaningful if traps are enabled, though the list of hosts may still be edited if traps are disabled. Refer to “snmp-server enable” command.

## snmp-server listen

**snmp-server listen {enable | interface <ifName>}**  
**no snmp-server listen {enable | interface <ifName> }**

Configures SNMP server interface access restrictions.  
 The no form of the command disables the listen interface restricted list for SNMP server.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                        |

| <b>Note</b>               | If enabled, and if at least one of the interfaces listed is eligible to be a listen interface, then SNMP requests will only be accepted on those interfaces. Otherwise, SNMP requests are accepted on any interface.                                                                                                                                                                                                                                                                                                         |                                                                                        |

## snmp-server location

**snmp-server location** <system location>

**no snmp-server location**

Sets a value for the sysLocation variable in MIB-II.

The no form of the command clears the contents of the sysLocation variable.

## snmp-server notify

**snmp-server notify {community <community> | event <event name> | port <port> | send-test}**

**no snmp-server notify {community | event <event name> | port}**

Configures SNMP notifications (traps and informs).

The no form of the commands negate the SNMP notifications.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                     |

## snmp-server port

**snmp-server port <port>**

**no snmp-server port**

Sets the UDP listening port for the SNMP agent.

The no form of the command resets the parameter to its default value.

| Syntax Description | port                                                                                                                                                                                                                                                                                                                                                                                                                                                   | UDP port. |

## snmp-server user

```
snmp-server user {admin | <username>} v3 {[encrypted] auth <hash-type>
<password> [priv <privacy-type> [<password>]] | capability <cap> | enable
<sets> | prompt auth <hash-type> [priv <privacy-type>] | require-privacy}
no snmp-server user {admin | <username> } v3 {[encrypted] auth <hash-type>
<password> [priv <privacy-type> [<password>]] | capability <cap> | enable
<sets> | prompt auth <hash-type> [priv <privacy-type>]}
```

Specifies an existing username, or a new one to be added.  
The no form of the command disables access via SNMP v3 for the specified user.

## interfaces ib internal notification

**interfaces ib internal notification [link-speed-mismatch | link-state-change]**  
**no interfaces ib internal notification [link-speed-mismatch | link-state-change]**

Enables notifications on internal links in SNMP.  
 The no form of the command disables notifications on internal links in SNMP.

|                           |                                                                                                                                                                                      |                                                                  |

### 4.17.3.2 XML API

## xml-gw enable

**xml-gw enable**  
**no xml-gw enable**

Enables the XML gateway.  
The no form of the command disables the XML gateway.

|                           |                                                                                                                   |

## 4.18 Puppet Agent

Puppet is a software that allows network administrators to automate repetitive tasks. MLNX-OS includes a built-in agent for the open-source “Puppet” configuration change management system. The Puppet agent enables configuring Mellanox switches in accordance with the standard “puppet-netdev-stdlib” type library and with the “Mellanox-netdev-stdlib-mlnxos” and “Mellanox-netdev-ospf-stdlib” type libraries provided by Mellanox Technologies to the Puppet community.

For more information, please refer to the CLI commands, to the NetDev documentation at <https://github.com/puppetlabs/puppet-netdev-stdlib> and to Mellanox’s Puppet modules GitHub page at <https://github.com/Mellanox>.

### 4.18.1 Setting the Puppet Server

➤ *To set the puppet server:*

**Step 1.** Define the Puppet server (the name has to be a DNS and not IP). Run:

```
switch (config) # puppet-agent master-hostname <please_type_your_hostname_DNS_here>
switch (config) #
```

**Step 2.** Enable the Puppet agent. Run:

```
switch (config) # puppet-agent enable
switch (config) #
```

**Step 3.** (Optional) Verify there are no errors in the Puppet agent log. Run:

```
switch (config) # show puppet-agent log continuous
switch (config) #
```

### 4.18.2 Accepting the Switch Request

This is to be performed on the first run only.

➤ *To accept the switch’s request:*

Option 1 – using Puppet CLI commands:

**Step 1.** Ensure the certificate request. Run:

```
puppet cert list
"<switch>"
(F4:B4:20:3B:2B:11:76:37:14:34:D0:D1:03:ED:3D:B5)
```

**Step 2.** Sign the certificate request if the cert\_name parameter (e.g. switch1.domain) is in the list. Run:

```
puppet cert sign <full_domain_name>
```

**Step 3.** Verify the request is removed from the Puppet certification list. Run:

```
puppet cert list
```

Option 2 – accept certificate requests in the puppet server console:

**Step 1.** Go to the “nodes requests” page (the button is at the top right), and wait for a certificate request for the switch and then accept it.

**Figure 15: Accepting an Agent Request through the Console**

Pending node requests: 1

Accept All
Reject All
There are no accepted/rejected requests to clear

| Name                        | Fingerprint    | Action                                  |
|-----------------------------|----------------|-----------------------------------------|
| switch-632476.mtr.labs.mlnx | 29:9F:4B:1F... | <span>Accept</span> <span>Reject</span> |

### 4.18.3 Installing Modules on the Puppet Server

Mellanox uses netdev-stdlib types and provides a package of Mellanox providers for those types which have to be installed at the Puppet server prior to the first Puppet configuration run (before configuring resources on the Mellanox switch).

To install those modules, run the following commands in the Puppet server:

```
puppet module install netdevops-netdev_stdlib
puppet module install mellanox-netdev_ospf_stdlib
puppet module install mellanox-netdev_stdlib_mlnxos
```

In case of an already installed module, please use the command “puppet module upgrade <module\_name>” or “puppet module install <module\_name> - -force” instead of “puppet module install <module\_name>” to reinstall the modules.

For more information please refer to the Network Automation Tools document or Puppet category in the Mellanox community site at: <http://community.mellanox.com/community/support/solutions>.

### 4.18.4 Writing Configuration Classes

#### ➤ To write configuration classes:

##### Step 1. Assigning Configuration Classes to a Node

Configuration files can be written and changed in the puppet server machine in the directory “/etc/puppetlabs/puppet/manifests/” (or “/etc/puppet/manifests” in case of an open source puppet server).

The file “/etc/puppetlabs/puppet/manifests/site.pp” is the main file for Puppet-classes-to-nodes association. To associate a configuration to a Puppet agent node, just append association lines as below:

```
import "netdev_vlan_example"
import "netdev_l2_vlan_example"
import "netdev_lag_example"
node 'switch-6375dc.mtr.labs.mlnx'{

 netdev_device { $hostname: }

 include vlan_example # Asserts a class vlan_example in one of the files
 include l2_interface_example
```

```
include lag_example

}
```

If you have a puppet console, you may assign classes of configuration in the following way:

- Add the relevant classes (using the console add class button on the “nodes” page).
- Assign the classes to the relevant nodes/groups in the puppet server console (in the console node/group page -> edit -> Classes).

### Step 2. Update VLAN

Manifest example (located in “/etc/puppetlabs/puppet/manifests/netdev\_vlan\_example.pp”).

```
class vlan_example{

 $vlans = {
 'Vlan244' => {vlan_id => 244, ensure => present},
 'Vlan245' => {vlan_id => 245, ensure => present},
 }

 create_resources(netdev_vlan, $vlans)
}
```

### Step 3. Update Layer 2 Interface.

Manifest example (located in “/etc/puppetlabs/puppet/manifests/netdev\_l2\_interface\_example.pp”)

```
class vlans_ensure_example{

 $vlans = {
 'Vlan347' => {vlan_id => 347, ensure => present},
 'Vlan348' => {vlan_id => 348, ensure => present},
 'Vlan349' => {vlan_id => 349, ensure => present},
 }

 create_resources(netdev_vlan, $vlans)
}

class l2_interface_example{

 include vlans_ensure_example #class to Ensure VLANs before assigning

 $l2_interfaces = {
 'ethernet 1/3' => {ensure => absent, vlan_tagging => disable}, #default
 'ethernet 1/4' => {ensure => present, vlan_tagging => enable,
 tagged_vlans => [Vlan348,Vlan347], untagged_vlan => Vlan349} #hybrid
 }

 create_resources(netdev_l2_interface, $l2_interfaces)
}
```

**Step 4.** Update LAG.

Manifest example (located in “/etc/puppetlabs/puppet/manifests/netdev\_lag\_example.pp”)

```
class lag_example{

 $lags = {
 'port-channel 101' => {ensure => present,
 links => ['ethernet 1/12', 'ethernet 1/13'], lacp => active},
 'port-channel 102' => {ensure => present,
 links => ['ethernet 1/6', 'ethernet 1/5'], lacp => disabled},
 }

 create_resources(netdev_lag, $lags)
}
```

You may add classes to ensure that all assigned links are with the same layer 1 and layer 2 configurations (similarly to the way we did in update l2\_interface section with vlans\_ensure\_example class).

## 4.18.5 Supported Configuration Capabilities

### 4.18.5.1 Ethernet, Port-Channel, and InfiniBand Interface Capabilities

**Table 38 - Ethernet, Port-Channel, and InfiniBand Interface Capabilities**

| Field       | Description                                                            | Values                        | Example                            |
|-------------|------------------------------------------------------------------------|-------------------------------|------------------------------------|
| ensure      | Sets the given values or restores the interface to default             | absent, present               | ensure => present                  |
| speed       | Sets the speed of the interface.                                       | auto* 10m 100m 1g 10g 40g 56g | speed => 1g                        |
| admin       | Disables/enables interface admin state.                                | up, down                      | admin => up                        |
| mtu         | Configures the maximum transmission unit frame size for the interface. | Ethernet: 1518-9216           | mtu => 1520                        |
| description | Sets the Ethernet, LAG and InfiniBand description.                     | Text                          | description => “changed_by_puppet” |

### 4.18.5.2 VLAN Capabilities

**Table 39 - VLAN Capabilities**

| Field   | Description                                         | Values           | Example           |
|---------|-----------------------------------------------------|------------------|-------------------|
| ensure  | Creates or destroys the VLAN given as a resource ID | absent, present  | ensure => present |
| vlan_id | The VLAN ID                                         | 1-4094 (integer) | vlan_id => 245    |

### 4.18.5.3 Layer 2 Ethernet Interface Capabilities

**Table 40 - L2 Ethernet and Port-Channel Interface Capabilities**

| Field         | Description                                                         | Values          | Example                           |
|---------------|---------------------------------------------------------------------|-----------------|-----------------------------------|
| ensure        | Sets the given values or restores the Layer 2 interface to default. | absent, present | ensure => present                 |
| vlan_tagging  | VLAN tagging mode                                                   | enable,disable  | vlan_tagging => enable            |
| tagged_vlans  | List of tagged (trunked) VLANs                                      | 2-4994 (range)  | tagged_vlans => [Vlan348,Vlan347] |
| untagged_vlan | Untag (access) VLAN                                                 | <VLAN name>     | untagged_vlan => Vlan349          |

### 4.18.5.4 LAG (Port-Channel) Capabilities

**Table 41 - LAG Capabilities**

| Field  | Description                                                 | Values                | Example                                  |
|--------|-------------------------------------------------------------|-----------------------|------------------------------------------|
| ensure | creates or destroys the port-channel given as a resource ID | absent, present       | ensure => present                        |
| lacp   | The LACP mode of the LAG                                    | passive   active   on | lacp => on                               |
| links  | List of ports assigned to the LAG                           | List of link names    | links => ['ethernet 1/6','ethernet 1/5'] |

### 4.18.5.5 Layer 3 Interface Capabilities

**Table 42 - L3 Interface Capabilities**

| Field  | Description                                                          | Values          | Example           |
|--------|----------------------------------------------------------------------|-----------------|-------------------|
| ensure | Creates or destroys the interface VLAN specified in the resource ID. | present, absent | ensure => present |

**Table 42 - L3 Interface Capabilities**

| Field     | Description                                                                        | Values                                                                                                 | Example                    |
|-----------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|----------------------------|
| ipaddress | Sets IP address on the Layer 3 interface (requires netmask).                       | A valid IP address                                                                                     | ipaddress => '192.168.4.2' |
| netmask   | Sets netmask for the IP address.                                                   | A valid netmask (of the form X.1X2.X3.X4), which creates a valid combination with the given IP address | netmask => '255.255.255.0' |
| method    | Configures the method of the L3 interface (currently supports only static method). | static                                                                                                 | method => static           |

#### 4.18.5.6 OSPF Interface Capabilities

**Table 43 - OSPF Interface Capabilities**

| Field   | Description                                                                                                 | Values                     | Example                  |
|---------|-------------------------------------------------------------------------------------------------------------|----------------------------|--------------------------|
| ensure  | Creates or destroys the OSPF interface of the associated interface of the VLAN specified in the resource ID | present, absent            | ensure => present        |
| area_id | The associated area ID                                                                                      | Integer representing an IP | area_id => '7200'        |
| Type    | The network type                                                                                            | broadcast, point_to_point  | type => 'point_to_point' |

#### 4.18.5.7 OSPF Area Capabilities

**Table 44 - OSPF Area Capabilities**

| Field          | Description                                                                 | Values             | Example                              |
|----------------|-----------------------------------------------------------------------------|--------------------|--------------------------------------|
| ensure         | Creates or destroys the OSPF area specified in the resource ID              | present, absent    | ensure => present                    |
| router_id      | The OSPF area associated router ID (currently supports only default router) | default            | router_id => 'default'               |
| ospf_area_mode | The OSPF area mode                                                          | normal, stub, nssa | ospf_area_mode => 'stub'             |
| subnets        | A list of associated subnets                                                | List of subnets    | ['192.168.4.0/24', '192.168.5.0/24'] |

#### 4.18.5.8 Router OSPF Capabilities

**Table 45 - Router OSPF Capabilities**

| Field  | Description                                                 | Values          | Example           |
|--------|-------------------------------------------------------------|-----------------|-------------------|
| ensure | Enables/disables the router ID specified in the resource ID | present, absent | ensure => present |

#### 4.18.5.9 Protocol LLDP, SNMP, IP Routing and Spanning Tree Capabilities

**Table 46 - Protocol Enable/Disable Capabilities**

| Field  | Description                                                | Values          | Example           |
|--------|------------------------------------------------------------|-----------------|-------------------|
| ensure | Enables/disables the protocol specified in the resource ID | present, absent | ensure => present |

#### 4.18.5.10 Fetched Image Capabilities

**Table 47 - Fetched Image Capabilities**

| Field        | Description                                                                                      | Values                            | Example             |
|--------------|--------------------------------------------------------------------------------------------------|-----------------------------------|---------------------|
| ensure       | Enables/disables the protocol specified in the resource ID                                       | present, absent                   | ensure => present   |
| protocol     | Specifies the protocol for fetch method                                                          | http, https, ftp, tftp, scp, sftp | protocol => scp     |
| host         | The host where the file-name located                                                             | DNS/IP                            | host => my_DNS      |
| user         | The username for fetching the image                                                              | Username                          | user => my_username |
| password     | The password for fetching the image                                                              | Password                          | password => my_pass |
| location     | The location of the file name in the host file system                                            | Directory full path               | location => '/tmp'  |
| force_delete | Remove all the images or only the ones which are not installed on any partition, before fetching | yes, no                           | force_delete => no  |

#### 4.18.5.11 Installed Image Capabilities

**Table 48 - Installed Image Capabilities**

| Field               | Description                                                                              | Values          | Example                    |
|---------------------|------------------------------------------------------------------------------------------|-----------------|----------------------------|
| ensure              | Specifies if the image version given in as resource ID is ensured to be installed or not | present, absent | ensure => present          |
| is_next_boot        | Ensures that the installed image is the next boot partition                              | yes, no         | is_next_boot => yes        |
| configuration_write | Writes configurations to database.                                                       | yes, no         | configuration_write => yes |
| force_reload        | Reload if image is in other partition.                                                   | yes, no         | force_reload => no         |

#### 4.18.6 Supported Resources for Each Type

**Table 49 - Fetched Image Capabilities**

| Resource Type     | Puppet Type Name      | Supported Resource IDs                             | Example                                                                                  |
|-------------------|-----------------------|----------------------------------------------------|------------------------------------------------------------------------------------------|
| Network device    | netdev_device         | \$hostname                                         | netdev_device { \$hostname: }                                                            |
| Layer 1 interface | netdev_interface      | 'ethernet <#ID>', 'port-channel <#id>', 'ib <#ID>' | netdev_interface{'ethernet 1/3': ensure => absent}                                       |
| Layer 2 interface | netdev_l2_interface   | 'ethernet <#ID>', 'port-channel <#id>'             | netdev_l2_interface{'ethernet 1/3': ensure => absent}                                    |
| VLAN              | netdev_vlan           | VLAN name string                                   | netdev_vlan {'Vlan244': vlan_id => 244, ensure => present }                              |
| LAG               | netdev_lag            | 'port-channel <#id>'                               | netdev_lag {'port-channel 101': ensure => present }                                      |
| Layer 3 interface | netdev_l3_interface   | 'vlan <#ID>'                                       | netdev_l3_interface { 'vlan 4': ipaddress => '192.168.4.2', netmask => '255.255.255.0' } |
| OSPF interface    | netdev_ospf_interface | 'vlan <#ID>'                                       | netdev_ospf_interface { 'vlan 4': ensure => present, area_id => '10' }                   |
| OSPF area         | netdev_ospf_area      | Valid area ID (representing an IP)                 | netdev_ospf_area { '10': ensure => present, ospf_area_mode => 'stub' }                   |

**Table 49 - Fetched Image Capabilities**

| Resource Type   | Puppet Type Name   | Supported Resource IDS                | Example                                                                   |
|-----------------|--------------------|---------------------------------------|---------------------------------------------------------------------------|
| OSPF router     | netdev_router_ospf | Currently only supports 'default'     | netdev_router_ospf { 'default': ensure => present }                       |
| Protocol        | mlnx_protocol      | ip_routing, lldp, snmp, spanning_tree | mlnx_protocol { 'ip_routing': ensure => present }                         |
| Fetched image   | mlnx_fetched_img   | The image file name                   | mlnx_fetched_image { 'image-PPC_M460EX-3.3.4300.img': ensure => present } |
| Installed image | mlnx_installed_img | The image version name                | mlnx_installed_img { '3.3.4300': ensure => present }                      |

### 4.18.7 Troubleshooting

This section presents common issues that may prevent the switch from connecting to the puppet server.

#### 4.18.7.1 Switch and Server Clocks are not Synchronized

This can be fixed by using NTP to synchronize the clocks at the switch (using the CLI command `ntp`) and at the server (e.g. using `ntpdate`).

#### 4.18.7.2 Outdated or Invalid SSL Certificates Either on the Switch or the Server

This can be fixed on the switch using the CLI command `puppet-agent clear-certificates` (requires `puppet-agent restart` to take effect).

On the server it can be fixed by running `puppet cert clean <switch_fqdn>` (FQDN is the Fully Qualified Domain Name which consists of a hostname and a domain suffix).

#### 4.18.7.3 Communications Issue

Make sure it is possible to ping the puppet server hostname from the switch (using the CLI command `ping`).

If the hostname is not reachable (e.g. no DNS server) it can be statically added to the switch local hosts lookup (using the CLI command `ip host`).

Make sure that port 8140 is open (using the command `tracpath {<hostname> | <ip>}/8140`).

## 4.18.8 Commands

### puppet-agent

#### puppet-agent

Enters puppet agent configuration mode.

|                           |                                                                  |
|---------------------------|------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                              |
| <b>Default</b>            | None                                                             |
| <b>Configuration Mode</b> | Config                                                           |
| <b>History</b>            | 3.3.4200                                                         |
| <b>Role</b>               | admin                                                            |
| <b>Example</b>            | switch (config) # puppet-agent<br>switch (config puppet-agent) # |
| <b>Related Commands</b>   |                                                                  |
| <b>Note</b>               |                                                                  |

## master-hostname

**master-hostname** <hostname>

**no master-hostname**

Sets the puppet server hostname.

The no form of the command resets the parameter to its default.

|                           |                                                                                                                     |                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <b>Syntax Description</b> | hostname                                                                                                            | Puppet server hostname. Free string may be entered. |
| <b>Default</b>            | puppet                                                                                                              |                                                     |
| <b>Configuration Mode</b> | Config Puppet                                                                                                       |                                                     |
| <b>History</b>            | 3.3.4200                                                                                                            |                                                     |
| <b>Role</b>               | admin                                                                                                               |                                                     |
| <b>Example</b>            | <pre>switch (config puppet-agent) # master-hostname my-puppet-server-host-name switch (config puppet-agent) #</pre> |                                                     |

| <b>Note</b>               |                                                                                                                     |                                                     |

## enable

**enable**  
**no enable**

Enables the puppet server on the switch.  
The no form of the command disables the puppet server.

|                           |                                                                         |
|---------------------------|-------------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                     |
| <b>Default</b>            | Disabled                                                                |
| <b>Configuration Mode</b> | Config Puppet                                                           |
| <b>History</b>            | 3.3.4200                                                                |
| <b>Role</b>               | admin                                                                   |
| <b>Example</b>            | switch (config puppet-agent) # enable<br>switch (config puppet-agent) # |
| <b>Related Commands</b>   |                                                                         |
| <b>Note</b>               |                                                                         |

## run-interval

### **run-interval <time>**

Configures the time interval in which the puppet agent reports to the puppet server.

|                           |                                                                                   |                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | time                                                                              | Can be in seconds ("30" or "30s"), minutes ("30m"), hours ("6h"), days ("2d"), or years ("5y"). |
| <b>Default</b>            | 30m                                                                               |                                                                                                 |
| <b>Configuration Mode</b> | Config Puppet                                                                     |                                                                                                 |
| <b>History</b>            | 3.3.4302                                                                          |                                                                                                 |
| <b>Role</b>               | admin                                                                             |                                                                                                 |
| <b>Example</b>            | switch (config puppet-agent) # run-interval 40m<br>switch (config puppet-agent) # |                                                                                                 |
| <b>Related Commands</b>   | show puppet-agent                                                                 |                                                                                                 |
| <b>Note</b>               |                                                                                   |                                                                                                 |

## restart

### **puppet-agent restart**

Restarts the puppet agent.

|                           |                                                                          |
|---------------------------|--------------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                      |
| <b>Default</b>            | N/A                                                                      |
| <b>Configuration Mode</b> | Config Puppet                                                            |
| <b>History</b>            | 3.3.4200                                                                 |
| <b>Role</b>               | admin                                                                    |
| <b>Example</b>            | switch (config puppet-agent) # restart<br>switch (config puppet-agent) # |
| <b>Related Commands</b>   |                                                                          |
| <b>Note</b>               |                                                                          |

## show puppet-agent

### show puppet-agent

Displays Puppet agent status and configuration.

|                           |                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | N/A                                                                                                                                                                  |
| <b>Default</b>            | N/A                                                                                                                                                                  |
| <b>Configuration Mode</b> | Any Command Mode                                                                                                                                                     |
| <b>History</b>            | 3.3.4200                                                                                                                                                             |
|                           | 3.3.4302 Updated output with run interval                                                                                                                            |
| <b>Role</b>               | admin                                                                                                                                                                |
| <b>Example</b>            | <pre>switch (config puppet-agent) # show puppet-agent Puppet agent is disabled Puppet master hostname: puppet Run interval: 40m switch (config puppet-agent) #</pre> |
| <b>Related Commands</b>   |                                                                                                                                                                      |
| <b>Note</b>               |                                                                                                                                                                      |

## show puppet-agent log

**show puppet-agent log** [[not] [matching | continuous] <string> | files [[not] matching] <string>]

Displays the Puppet agent's log file.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                              |

## 4.19 Virtual Machine

A virtual machine (VM) on a switch is added to allow additional OS to run on top of the switch. The VM OS can connect through mgmt0 interface to the switch system's management interface. In addition, the VM is also connected to the out-of-band network. This allows it to communicate through the network and to control the switch management software.

The number of VMs that may run on a system is user-configurable and also relies on resource availability.

The number of configurable VMs is limited to 4.

Each VM consumes the following resources:

- Memory
- Processing power which is not policed (the user may determine the core to be used)
- MACs which are required for each vNIC (user configurable)

### 4.19.1 Virtual Machine Configuration

➤ *To configure a VM:*

The example below installs Ubuntu 14 and defines 3GB storage with 512MB memory (default) using the first core of the switch system (default) through mgmt0 interface (default) with an auto-generated MAC (default).

**Step 1.** Enable the VM feature. Run:

```
switch (config) # virtual-machine enable
```

**Step 2.** Create a VM. Run:

```
switch (config) # virtual-machine host my-vm
switch (config virtual-machine host my-vm) #
```

**Step 3.** Define storage for the VM. Run:

```
switch (config virtual-machine host my-vm) # storage create disk size-max 3000
100.0% [#####]
Created empty virtual disk volume 'vdisk001.img' in pool 'default'
Device attached to drive number 1.
switch (config virtual-machine host my-vm) #
```

**Step 4.** Display the VM parameters (notice boldface). Run:

```
switch (config virtual-machine host my-vm) # show virtual-machine host my-vm
VM 'my-vm'
 Status: shut off Architecture: x86_64
 VCPU used: 0 sec Number of VCPUs: 1
 Boot order: hd, cdrom Memory size: 512 MB
 Consoles: text, graphics
 Storage:
 IDE bus, drive 1: default/vdisk001.img (3000 MB capacity)
 Interfaces:
 1: on bridge 'mgmt0' address unknown (MAC 52:54:00:2F:89:69)
```

```
switch (config virtual-machine host my-vm) # exit
switch (config) #
```

**Step 5.** Import the VM image. Run:

```
switch (config) # virtual-machine volume fetch url scp://root@<ip>/.../ubuntu-14.04-
server-amd64.iso
Password (if required): *****
100.0% [#####]
```

**Step 6.** Install the imported image. Run:

```
switch (config) # virtual-machine host my-vm
switch (config virtual-machine host my-vm) # install cdrom file ubuntu-14.04-server-
amd64.iso
```

**Step 7.** Switch to a different terminal, and run the following command to connect VNC viewer to the VM:

```
$ vncviewer -via admin@<switch IP> 127.0.0.1:0
...
Mellanox MLNX-OS Switch Management

Password: *****
```

Continue VM installation from the VNC prompt.

The switch prompt is unresponsive pending a successful VM installation. Successful VM installation is indicated by the reboot of the VM.

VM IP is determined by DHCP configuration according to the MAC address in [Step 4](#).

➤ **To verify VM configuration, run:**

```
switch (config virtual-machine host my-vm) # show virtual-machine host my-vm
VM 'my-vm'
 Status: running Architecture: x86_64
 VCPU used: 12 min 27.440 sec Number of VCPUs: 1
 Boot order: cdrom, hd Memory size: 512 MB
 Consoles: text, graphics
 Storage:
