	Recovery Environment .....	4-2
	Recovery Procedure.....	4-2

Thank you for purchasing the Moxa DA-682 Series of x86 ready-to-run embedded computers. This manual introduces the software configuration and management of the DA-682-LX, which runs the Linux operating system. For hardware installation, connector interfaces, setup, and upgrading the BIOS, please refer to the “DA-682 Series Hardware User’s Manual.”

Linux is an open, scalable operating system that allows you to build a wide range of innovative, small footprint devices. Software written for desktop PCs can be easily ported to the embedded computer with a GNU cross compiler and a minimum of source code modifications. A typical Linux-based device is designed for a specific use, and is often not connected to other computers, or a number of such devices connect to a centralized, front-end host. Examples include enterprise tools such as industrial controllers, communications hubs, point-of-sale terminals, and display devices, which include HMIs, advertisement appliances, and interactive panels.

This chapter covers the following topics:

- Overview**
- Product Features**
- Software Specifications**
- Journaling Flash File System (JFFS2)**
- Software Components**

## Overview

The Moxa DA-682 Series of x86-based rackmount embedded computers are designed for industrial data acquisition applications. Their state-of-the-art two expansion module design gives users a versatile combination of up to 16 RS-232/422/485 serial ports, or up to 4+8 Ethernet ports. This friendly design gives users the advantage of being able to swap out modules quickly and easily. Additional expansion modules will be available soon.

The DA-682 main system is based on the Intel Celeron M processor and 915GME chipset, which supports standard X86 VGA, USB, PS/2 keyboard/mouse, 4 Gigabit LAN ports, and IDE/SATA disk interface. In addition, the DA-682 supports a CompactFlash Socket and pre-installed embedded ready-to-run operating system. Programmers will find the full-function development kit a great benefit for developing software and building reliable communication applications.

The housing is a standard 2U, 19-inch wide rack-mounted rugged enclosure. This robust, rack-mountable design provides the hardened protection needed for industrial environment applications.

## Product Features

The DA-682 Series Basic System has the following features:

- Intel Celeron M 1 GHz processor with 400/533 MHz FSB
- Intel 915GME + ICH6M chipset
- 200-pin DDR2 SODIMM socket supporting DDR2 400/533 up to 1 GB
- 4 Gigabit Ethernet ports for network redundancy
- 1 CompactFlash socket
- 1 SATA connector for storage expansion
- USB 2.0 ports for high speed peripherals
- Two expansion module slots for flexible I/O expansion
- 19-inch rackmount, 2U high form factor
- Fanless Design
- 100/240 VAC/VDC power inputs

*Special features of the DA-682-LX Linux model:*

- Shipped with DDR2 512 MB of memory
- Ready-to-run Linux 2.6 platform pre-installed on a 1 GB flash disk module

*Features supported by expansion modules:*

- 8 or 16 isolated or non-isolated software selectable RS-232/422/485 serial ports
- Serial port baudrate from 50 to 921.6 Kbps (supports most nonstandard baudrates in this range)
- Additional 4 or 8 10/100 Mbps Ethernet ports

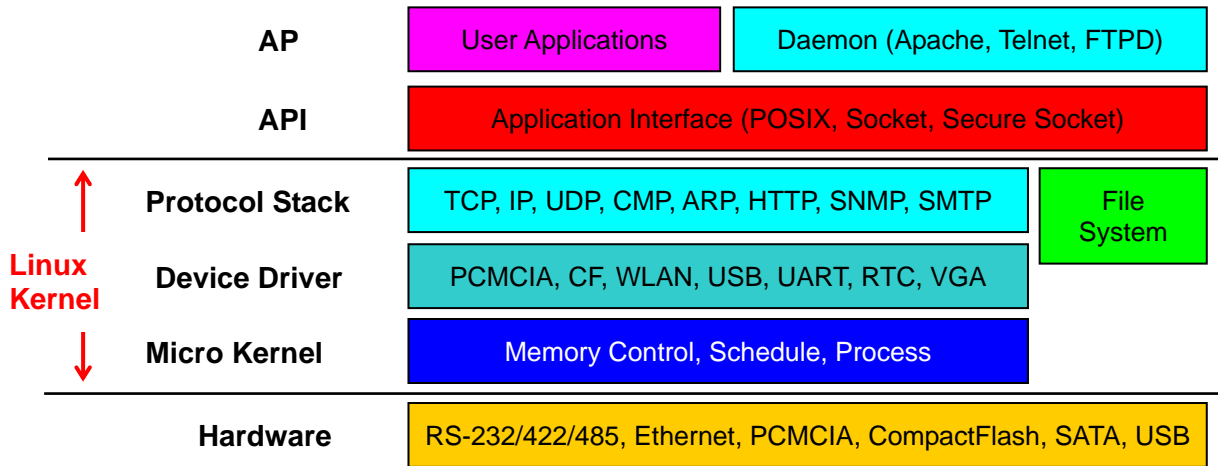

### ATTENTION

Refer to section “**Baud Rate Speed**” for calculation of baud rate speed supported.

## Software Specifications

The Linux operating system pre-installed on the DA-682 embedded computer is the **Debian Etch 4.0r2** distribution. The Debian project is a worldwide group of volunteers who endeavor to produce an operating system distribution that composed entirely of free software. The Debian GNU/Linux follows the standard Linux architecture, making it easy to use programs that meet the POSIX standard. Program porting can be done with the GNU Tool Chain provided by Moxa. In addition to Standard POSIX APIs, device drivers for Moxa UART and other special peripherals are also included. An example software architecture is shown below:

**ATTENTION**

Refer to <http://www.debian.org/> and <http://www.gnu.org/> for information and documentation of the Debian GNU/Linux and free software concept.

**ATTENTION**

The above software architecture is only an example. Different models or different build revisions of the Linux operating system may include components not shown in the above graphic.

## Journaling Flash File System (JFFS2)

The pre-installed root file system is protected in a read-only partition to prevent file system crash problems normally caused by power loss. But some directories or files, such as **/home**, **/root**, **/var**, **/etc/network/**, **/etc/ppp/**, **/ect/openvpn/**, and **/etc/resolv.conf**, which need write permission, are located in another writable partition and formatted with the JFFS2 file system. The formatting process places a compressed file system in the Flash memory, transparent to the user.

The Journaling Flash File System (JFFS2), which was developed by Axis Communications in Sweden, puts a file system directly on the flash, instead of emulating a block device. It is designed for use on flash-ROM chips and recognizes the special write requirements of a flash-ROM chip. JFFS2 implements wear-leveling to extend the life of the flash disk, and stores the flash directory structure in the RAM. A log-structured file system is maintained at all times. The system is always consistent, even if it encounters crashes or improper power-downs, and does not require **fsck** (file system check) on boot-up.

JFFS2 is the newest version of JFFS. It provides improved wear-leveling and garbage-collection performance, improved RAM footprint and response to system-memory pressure, improved concurrency and support for suspending flash erases, marking of bad sectors with continued use of the remaining good sectors, native data compression inside the file system design, and support for hard links. JFFS2 enhances the write-life of the flash devices.

The key features of JFFS2 are:

- Targets the Flash ROM directly
- Robustness
- Consistency across power failures
- No integrity scan (fsck) is required at boot time after normal or abnormal shutdown
- Explicit wear leveling
- Transparent compression

Although JFFS2 is a journaling file system, this does not preclude the loss of data. The file system will remain in a consistent state across power failures and will always be mountable. However, if the board is powered down during a write then the incomplete write will be rolled back on the next boot, but writes that have already been completed will not be affected.

### ATTENTION

Additional information about JFFS2 is available at:

<http://sources.redhat.com/jffs2/jffs2.pdf>

<http://developer.axis.com/software/jffs/>

## Software Components

The DA-682-LX pre-installed Debian Etch 4.0r2 Linux distribution has the following software components:

Component	Version	Description
acpid	1.0.4-5	Utilities for using ACPI power management
adduser	3.102	Add and remove users and groups
apache2	2.2.3-4+etch4	Next generation, scalable, extendable web server
apache2-mpm-prefork	2.2.3-4+etch4	Traditional model for Apache HTTPD 2.1
apache2-utils	2.2.3-4+etch4	Utility programs for web servers
apache2.2-common	2.2.3-4+etch4	Next generation, scalable, extendable web server
libapache2-mod-php5	5.2.0-8+etch10	Server-side, HTML-embedded scripting language
apt	0.6.46.4-0.1	Advanced front-end for dpkg
apt-utils	0.6.46.4-0.1	APT utility programs
aptitude	0.4.4-4	Terminal-based apt frontend
base-files	4	Debian base system miscellaneous files
base-passwd	3.5.11	Debian base system master password and group
bash	3.1dfsg-8	The GNU Bourne Again SHell
bc	1.06-20	The GNU bc arbitrary precision calculator language
bind9-host	9.3.4-2etch1	Version of "host" bundled with BIND 9.X
binutils	2.17-3	The GNU assembler, linker and binary utilities
bridge-utils	1.2-1	Utilities for configuring the Linux ethernet bridge
bsdmainutils	6.1.6	Collection of more utilities from FreeBSD
bsdutils	2.12r-19etch1	Basic utilities from 4.4BSD-Lite
busybox	1.1.3-4	Tiny utilities for small and embedded system
console-common	0.7.69	Basic infrastructure for text console configuration
console-data	1.01-7	Keymaps, fonts, charset maps, fallback table for console-tools
console-tools	0.2.3dbs-65	Linux console and font utilities
coreutils	5.97-5.3	The GNU core utilities
cpio	2.6-18	GNU cpio -- a program to manage archives of files
cpp	4.1.1-15	The GNU C preprocessor (cpp)
cpp-4.1	4.1.1-21	The GNU C preprocessor
cron	3.0pl1-100	Management of regular background processing
debconf	1.5.11etch1	Debian configuration management system
debconf-i18n	1.5.11etch1	Full internationalization support for debconf
debian-archive-keyring	2007.07.31~etch1	GnuPG archive keys of the Debian archive

Component	Version	Description
debianutils	2.17	Miscellaneous utilities specific to Debian
dhcp3-client	3.0.4-13	DHCP Client
dhcp3-common	3.0.4-13	Common files used by all the dhcp3* packages
dictionaries-common	0.70.10	Common utilities for spelling dictionary tools
diff	2.8.1-11	File comparison utilities
dmidecode	2.8-4	Dump Desktop Management Interface data
dnstools	9.3.4-2etch1	Clients provided with BIND
dpkg	1.13.25	Package maintenance system for Debian
dselect	1.13.25	User tool to manage Debian packages
e2fslibs	1.39+1.40-WIP-2006.	11.14+dfsg-2etch1 ext2 filesystem libraries
e2fsprogs	1.39+1.40-WIP-2006.	11.14+dfsg-2etch1 ext2 file system utilities and libraries
findutils	4.2.28-1etch1	Utilities for finding files--find, xargs, an
ftp	0.17-16	The FTP client
g++	4.1.1-15	The GNU C++ compiler
g++-4.1	4.1.1-21	The GNU C++ compiler
gcc	4.1.1-15	The GNU C compiler
gcc-4.1	4.1.1-21	The GNU C compiler
gcc-4.1-base	4.1.1-21	The GNU Compiler Collection (base package)
gnupg	1.4.6-2	GNU privacy guard - a free PGP replacement
gpgv	1.4.6-2	GNU privacy guard - signature verification tool
grep	2.5.1.ds2-6	GNU grep, egrep and fgrep
grub	0.97-27	GRand Unified Bootloader
gzip	1.3.5-15	The GNU compression utility
hostname	2.93	Utility to set/show the host name or domain
ifrename	28-1	Rename network interfaces based on various static criteria
ifupdown	0.6.8	High level tools to configure network interfaces
initramfs-tools	0.85h	Tools for generating an initramfs
initscripts	2.86.ds1-38	Scripts for initializing and shutting down the system
iproute	20061002-3	Professional tools to control the networking in Linux kernels
iptables	1.3.6.0debian1-5	Administration tools for packet filtering and NAT netfilter and iptables provide a Linux kernel framework for stateful and stateless packet filtering, network and port address translation, and other IP packet manipulation. The framework is the successor to ipchains.

Component	Version	Description
iputils-ping	20020927-6	Tools to test the reachability of network hosts
klibc-utils	1.4.34-2	Small statically-linked utilities built with klibc
klogd	1.4.1-18	Kernel Logging Daemon
libacl1	2.2.41-1	Access control list shared library
libattr1	2.4.32-1	Extended attribute shared library
libbind9-0	9.3.4-2etch1	BIND9 Shared Library used by BIND
libblkid1	1.39+1.40-WIP-2006.	11.14+dfsg-2etch1 block device id library
klibc	1.0.3-6	Small statically-linked utilities built with klibc
libc6	2.3.6.ds1-13etch5	GNU C Library: Shared libraries
libc6-dev	2.3.6.ds1-13etch5	GNU C Library: Development Libraries and Header Files
libc6-i686	2.3.6.ds1-13etch5	GNU C Library: Shared libraries [i686 optimized]
libcap1	1.10-14	Support for getting/setting POSIX.1e capabilities
libcomerr2	1.39+1.40-WIP-2006.	11.14+dfsg-2etch1 common error description library
libconsole	0.2.3dbs-65	Shared libraries for Linux console and font
libcupsys2	1.2.7-4etch2	Common UNIX Printing System(tm) - libs
libdb4.2	4.2.52+dfsg-2	Berkeley v4.2 Database Libraries [runtime]
libdb4.3	4.3.29-8	Berkeley v4.3 Database Libraries [runtime]
libdb4.4	4.4.20-8	Berkeley v4.4 Database Libraries [runtime]
libdevmapper1.02	1.02.08-1	The Linux Kernel Device Mapper userspace library
libdns22	9.3.4-2etch1	DNS Shared Library used by BIND
libedit2	2.9.cvs.20050518-2.2	BSD editline and history libraries
libevent1	1.1a-1	An asynchronous event notification library
libgc1c2	6.8-1	Conservative garbage collector for C and C++
libgcc1	4.1.1-21	GCC support library
libgcrypt11	1.2.3-2	LGPL Crypto library - runtime library
libgdbm3	1.8.3-3	GNU dbm database routines (runtime version)
libgnutls13	1.4.4-3	The GNU TLS library - runtime library
libgpg-error0	1.4-1	Library for common error values and messages
libgpmg1	1.19.6-25	General Purpose Mouse - shared library
libgssapi2	0.10-4	A mechanism-switch gssapi library
libidn11	0.6.5-1	GNU libidn library, implementation of IETF I
libisc11	9.3.4-2etch1	ISC Shared Library used by BIND
libisccc0	9.3.4-2etch1	Command Channel Library used by BIND

Component	Version	Description
libiscfg1	9.3.4-2etch1	Config File Handling Library used by BIND
libiw28	28-1	Wireless tools - library
libklibc	1.4.34-2	Minimal libc subset for use with initramfs
libkrb53	1.4.4-7etch4	MIT Kerberos runtime libraries
libldap2	2.1.30-13.3	OpenLDAP libraries
liblocale-gettext-perl	1.05-1	Using libc functions for internationalization in Perl
liblockfile1	1.06.1	NFS-safe locking library, includes dotlockfile program
liblwres9	9.3.4-2etch1	Lightweight Resolver Library used by BIND
liblzo1	1.08-3	Data compression library (old version)
liblzo2-2	2.02-2	Data compression library
libmagic1	4.17-5etch3	File type determination library using "magic" numbers
libmysqlclient15off	5.0.32-7etch5	mysql database client library
libncurses5	5.5-5	Shared libraries for terminal handling
libncursesw5	5.5-5	S Shared libraries for terminal handling (wide character support)
libnet-lite-ftp-perl	0.47-2	Perl FTP client with support for TLS
libnet-ssleay-perl	1.30-1	Perl module for Secure Sockets Layer (SSL)
libnet-telnet-perl	3.03-1	Script telnetable connections
libnewt0.52	0.52.2-10	Not Erik's Windowing Toolkit - text mode windowing with slang
libnfsidmap2	0.18-0	An nfs idmapping library
libopencdk8	0.5.9-2	Open Crypto Development Kit (OpenCDK) (runtime)
libpam-modules	0.79-5	Pluggable Authentication Modules for PAM
libpam-runtime	0.79-5	Runtime support for the PAM library
libpam0g	0.79-5	Pluggable Authentication Modules library
libpcap0.8	0.9.5-1	System interface for user-level packet capture
libpci2	2.1.11-3	Obsolete shared library for accessing pci devices
libpcre3	6.7+7.4-3	Perl 5 Compatible Regular Expression Library
libpopt0	1.10-3	lib for parsing cmdline parameters
libpq4	8.1.11-0etch1	PostgreSQL C client library
libreadline5	5.2-2	GNU readline and history libraries, run-time
libroken16-heimdal	0.7.2.dfsg.1-10	Libraries for Heimdal Kerberos
librpcsecgss3	0.14-2etch3	Allows secure rpc communication using the rpcsec_gss protocol
libsasl2	2.1.22.dfsg1-8	Authentication abstraction library

Component	Version	Description
libsasl2-2	2.1.22.dfsg1-8	Authentication abstraction library
libselinux1	1.32-3	SELinux shared libraries
libsemanage1	1.8-1	Shared libraries used by SELinux policy manipulation tools
libsensors3	2.10.1-3	Library to read temperature/voltage/fan sensors
libsepol1	1.14-2	Security Enhanced Linux policy library for changing policy binaries
libsigc++-2.0-0c2a	2.0.17-2	Type-safe Signal Framework for C++ - runtime
libslang2	2.0.6-4	The S-Lang programming library - runtime version
libslp1	1.2.1-6.2	OpenSLP libraries
libsnmp-base	5.2.3-7etch2	NET SNMP (Simple Network Management Protocol) MIBs and Docs
libsnmp9	5.2.3-7etch2	NET SNMP (Simple Network Management Protocol ) MIBs and Docs
libss2	1.39+1.40-WIP-2006.	11.14+dfsg-2etch1 command-line interface parsing library
libssl0.9.8	0.9.8c-4etch1	SSL shared libraries
libssp0	4.1.1-21	GCC stack smashing protection library
libstdc++6	4.1.1-21	The GNU Standard C++ Library v3
libstdc++6-4.1-dev	4.1.1-21	The GNU Standard C++ Library v3 (development files)
libsysfs2	2.1.0-1	Interface library to sysfs
libtasn1-3	0.3.6-2	Manage ASN.1 structures (runtime)
libtasn1-3-bin	0.3.6-2	Manage ASN.1 structures (binaries)
libtext-charwidth-perl	0.04-4	Get display widths of characters on the term
libtext-iconv-perl	1.4-3	Converts between character sets in Perl
libtext-wrapi18n-perl	0.06-5	Internationalized substitute of Text:Wrap
libusb-0.1-4	0.1.12-5	userspace USB programming library
libuuid1	1.39+1.40-WIP-2006.	11.14+dfsg-2etch1 universally unique id library
libvolume-id0	0.105-4	libvolume_id shared library
libwrap0	7.6.dbs-13	Wietse Venema's TCP wrappers library
linux-image-2.6-686	2.6.18+6etch2	Linux kernel 2.6 image on PPro/Celeron/PII/PIII/P4
linux-image-2.6.18-5-686	2.6.18.dfsg.1-17	Linux 2.6.18 image on PPro/Celeron/PII/PIII/P4
linux-kernel-headers	2.6.18-7	Linux Kernel Headers for development
locales	2.3.6.ds1-13etch5	GNU C Library: National Language (locale) data [support]
lockfile-progs	0.1.10	Programs for locking and unlocking files and mailboxes
login	4.0.18.1-7	System login tools

Component	Version	Description
logrotate	3.7.1-3	Log rotation utility
lsb-base	3.1-23.2etch1	Linux Standard Base 3.1 init script function
make	3.81-2	The GNU version of the "make" utility.
makedev	2.3.1-83	Creates device files in /dev
manpages	2.39-1	Manual pages about using a GNU/Linux system
mawk	1.3.3-11	A pattern scanning and text processing language
mime-support	3.39-1	MIME files "mime.types" & "mailcap", and support programs
minicom	2.2-5	Friendly menu driven serial communication program
mktemp	1.5-2	Makes unique filenames for temporary files
modconf	0.3.1	Device Driver Configuration
module-init-tools	3.3-pre4-2	Tools for managing Linux kernel modules
mount	2.12r-19etch1	Tools for mounting and manipulating filesystems
mtd-tools	20061007-1	Memory Technology Device Tools
mysql-common	5.0.32-7etch5	Mysql database common files (e.g. /etc/mysql my.cnf)
ncurses-base	5.5-5	Descriptions of common terminal types
ncurses-bin	5.5-5	Terminal-related programs and man pages
ncurses-term	5.5-5	Additional terminal type definitions
net-tools	1.60-17	The NET-3 networking toolkit
netbase	4.29	Basic TCP/IP networking system
nfs-common	1.0.10-6+etch.1	NFS support files common to client and server
openbsd-inetd	0.20050402-6	The OpenBSD Internet Superserver
openssh-client	4.3p2-9	Secure shell client, an rlogin/rsh/rcp replacement
openssh-server	4.3p2-9	Secure shell server, an rshd replacement
openssl	0.9.8c-4etch1	Secure Socket Layer (SSL) binary and related cryptographic tools
openvpn	2.0.9-4etch1	Virtual Private Network daemon
passwd	4.0.18.1-7	Change and administer password and group data
pciutils	2.2.4~pre4-1	Linux PCI Utilities
perl	5.8.8-7etch1	Larry Wall's Practical Extraction and Report
perl-base	5.8.8-7etch1	The Pathologically Eclectic Rubbish Lister
perl-modules	5.8.8-7etch1	Core Perl modules
portmap	5-26	The RPC portmapper
ppp	2.4.4rel-8	Point-to-Point Protocol (PPP) daemon
pppconfig	2.3.15.etch1	A text menu based utility for configuring ppp

Component	Version	Description
pppoe	3.8-1.1	PPP over Ethernet driver
procps	3.2.7-3	/proc file system utilities
proftpd	1.3.0-19	Versatile, virtual-hosting FTP daemon
readline-common	5.2-2	GNU readline and history libraries, common files
sed	4.1.5-1	The GNU sed stream editor
snmp	5.2.3-7etch2	NET SNMP (Simple Network Management Protocol) Apps
snmpd	5.2.3-7etch2	NET SNMP (Simple Network Management Protocol) Agents
ssh	4.3p2-9	Secure shell client and server (transitional package)
ssl-cert	1.0.14	Simple debconf wrapper for openssl
strace	4.5.14-2	A system call tracer
syslogd	1.4.1-18	System Logging Daemon
sysv-rc	2.86.ds1-38	System-V-like runlevel change mechanism
sysvinit	2.86.ds1-38	System-V-like init utilities
sysvinit-utils	2.86.ds1-38	System-V-like utilities
tar	1.16-2etch1	GNU tar
tcpd	7.6.dbs-13	Wietse Venema's TCP wrapper utilities
tcpdump	3.9.5-2etch1	A powerful tool for network monitoring and data acquisition
telnet	0.17-34	The telnet client
telnetd	0.17-34	The telnet server
tftpd	0.17-15	Trivial file transfer protocol server
time	1.7-21	The GNU time program for measuring cpu resource usage
traceroute	1.4a12-21	Traces the route taken by packets over a TCP
tzdata	2007j-1etch1	Time Zone and Daylight Saving Time Data
ucf	2.002	Update Configuration File: preserves user changes to config files.
udev	0.105-4	/dev/ and hotplug management daemon
update-inetd	4.27-0.5	inetd.conf updater
usbmount	0.0.14.1	Automatically mount and unmount USB mass storage devices
usbutils	0.72-7	USB console utilities
util-linux	2.12r-19etch1	Miscellaneous system utilities
vim	7.0-122+1etch3	Vi IMproved - enhanced vi editor
vim-common	7.0-122+1etch3	Vi IMproved - Common files
vim-runtime	7.0-122+1etch3	Vi IMproved - Runtime files

Component	Version	Description
vim-tiny	7.0-122+letch3	Vi IMproved - enhanced vi editor - compact version
w3m	0.5.1-5.1	WWW browsable pager with excellent tables/frames support
wget	1.10.2-2	Retrieves files from the web
whiptail	0.52.2-10	Displays user-friendly dialog boxes from shell scripts
whois	4.7.20	The GNU whois client
zlib1g	1.2.3-13	Compression library - runtime

# 2

## Software Configuration

---

In this chapter, we explain how to operate a DA-682-LX computer directly or from a PC near you. There are three ways to connect to the DA-682-LX computer: through VGA monitor, by using Telnet over the network, or by using an SSH console from a Windows or Linux machine. This chapter describes basic Linux operating system configurations. The advanced network management and configuration will be described in the next chapter “Managing Communications.”

This chapter covers the following topics:

- Starting from a VGA Console**
- Connecting from a Telnet Console**
- Connecting from an SSH Console**
  - Windows Users
  - Linux Users
- Adjusting the System Time**
  - Setting the Time Manually
  - NTP Client
  - Updating the Time Automatically
- Enabling and Disabling Daemons**
- Setting the Run-Level**
- Cron—Daemon for Executing Scheduled Commands**
- Inserting a USB Storage Device into the Computer**
- Inserting a CompactFlash Card into the Computer**
- Checking the Linux Version**
- APT—Installing and Removing Packages**

## Starting from a VGA Console

Connect the display monitor to the DA-682-LX VGA connector, and then power it up by connecting it to the power adaptor. It takes about 30 to 60 seconds for the system to boot up. Once the system is ready, a login screen will appear on your monitor.

To log in, type the login name and password as requested. The default values are both **root**.

**Login:** root

**Password:** root

```
login as: root
root@192.168.3.12's password:
Last login: Mon Jan 22 19:02:16 2007 from 192.168.3.120

#####          #####          #####          #####          #####          ##
###           #####          ###           ###           #####          ###
###           ###           ###           ###           ###           ##           ###
###           #####          ##           ##           ###           #           #####
#####          # ##          ###           ###           ###          ##          ##
### ##          # ##          ###           ##           #####          # ##
### ##          ## ##          ##           ##           #####          # ##
## ##          # ##          ##           ##           ###           #####          # ##
## ##          # ##          ##           ##           #####          # ##
##           ##           ##           ##           ##           ##           ##           ##
##           ##           ##           ##           ##           #           ##           #
#####          #           #####          #####          #####          #####

For further information check:
http://www.moxa.com/
Mount user file system.

DA682:~#
```

## Connecting from a Telnet Console

The DA-682-LX computer comes with four basic Gigabit Ethernet ports named LAN1 to LAN4. The default IP addresses and netmasks of the network interfaces are as follows:

	Default IP Address	Netmask
LAN 1	192.168.3.127	255.255.255.0
LAN 2	192.168.4.127	255.255.255.0
LAN 3	192.168.5.127	255.255.255.0
LAN 4	192.168.6.127	255.255.255.0

Before using the Telnet client, you should change the IP address of your development workstation so that the network ports are on the same subnet as the IP address for the LAN port that you connect to. For example, if you connect to LAN 1, you could set your PC's IP address to 192.168.3.126, and the netmask to 255.255.255.0. If you connect to LAN 2, you can set your PC's IP address to 192.168.4.126, and the netmask to 255.255.255.0.

Use a cross-over Ethernet cable to connect your development workstation directly to the target computer, or use a straight-through Ethernet cable to connect the computer to a LAN hub or switch. Next, use a Telnet client on your development workstation to connect to the target computer. After a connection has been established, type the login name and password as requested to log on to the computer. The default values are both **root**.

**Login: root**

**Password: root**

**ATTENTION**

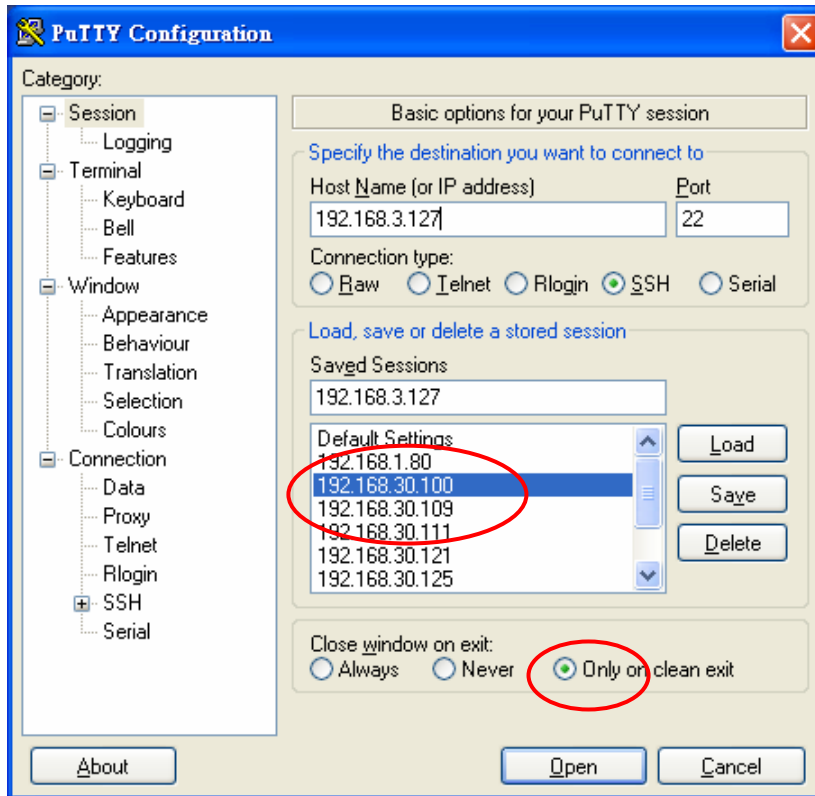

If you cannot get connected on the first try, re-check the IP address and netmask settings, and then unplug and re-plug the DA-682-LX's power cord.

## Connecting from an SSH Console

The DA-682-LX computer supports an SSH Console to offer users with better security over the network compared to Telnet.

### Windows Users

Click on the link <http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html> to download PuTTY (free software) to set up an SSH console for the DA-682-LX in a Windows environment. The following screen shows an example of the configuration that is required.

## Linux Users

From a Linux machine, use the `ssh` command to access the DA-682-I-LX's console utility via SSH.

`#ssh 192.168.3.127`

Select `yes` to open the connection.

```
[root@bee_notebook root]# ssh 192.168.3.127
The authenticity of host '192.168.3.127 (192.168.3.127)'
can't be established.
RSA key fingerprint is
8b:ee:ff:84:41:25:fc:cd:2a:f2:92:8f:cb:1f:6b:2f.
Are you sure you want to continue connection (yes/no)? yes_
```

## Adjusting the System Time

The DA-682-LX has two time settings. One is the system time, and the other is provided by an RTC (Real Time Clock) built into the DA-682-LX's hardware.

### Setting the Time Manually

Use the **date** command to query the current system time or set a new system time. Use **hwclock** to query the current RTC time or set a new RTC time.

Use the following command to set the system time.

```
# date MMDDhhmmYYYY
```

MM: Month

DD: Date

hhmm: Hour and Minute

YYYY: Year

Use the following command to write the current system time to the RTC.

```
# hwclock -w
```

```
DA682:~# date
          Fri Jun 23 23:30:31 CST 2000
DA682:~# hwclock
Fri Jun 23 23:30:35 2000 -0.557748 seconds
DA682:~# date 120910002004
Thu Dec  9 10:00:00 CST 2004
DA682:~# hwclock -w
DA682:~# date ; hwclock
Thu Dec  9 10:01:07 CST 2004
Thu Dec  9 10:01:08 2004 -0.933547 seconds
DA682:~#
```

### NTP Client

The DA-682-LX has a built-in NTP (Network Time Protocol) client that is used to initialize a time request to a remote NTP server. Use **ntpdate** to update the system time.

```
#ntpdate time.stdtime.gov.tw
```

```
#hwclock -w
```

Visit <http://www.ntp.org> for more information about NTP and NTP server addresses.

```
DA682:~# date ; hwclock
Sat Jan 1 00:00:36 CST 2000
Sat Jan 1 00:00:37 2000 -0.772941 seconds
DA682:~#
DA682:~# ntpdate time.stdtime.gov.tw
 9 Dec 10:58:53 ntpdate[207]: step time server 220.130.158.52
offset 155905087.9
84256 sec
DA682:~#
DA682:~# hwclock -w
DA682:~# date ; hwclock
Thu Dec 9 10:59:11 CST 2004
Thu Dec 9 10:59:12 2004 -0.844076 seconds
DA682:~#
```

**ATTENTION**

Before using the NTP client utility, check your IP address and network settings to make sure an Internet connection is available.

## Updating the Time Automatically

This section describes how to use a shell script to update the time automatically.

### Example shell script for updating the system time periodically

```
#!/bin/sh
ntpdate time.nist.gov
# You can use the time server's ip address or domain
# name directly. If you use domain name, you must
# enable the domain client on the system by updating
# /etc/resolv.conf file.
hwclock -w
sleep 100
# Updates every 100 seconds. The min. time is 100 seconds.
# Change 100 to a larger number to update RTC less often.
```

Save the shell script using any file name. For example, **fixtime**.

### How to run the shell script automatically when the kernel boots up

Because the root file system is mounted in Read-only mode, we need to re-mount it using writable permission.

```
# mount -o remount,rw /dev/hda1 /
```

Copy the example shell script **fixtime** to directory **/etc/init.d**, and then use **chmod 755 fixtime** to change the shell script mode.

```
# chmod 755 fixtime
```

Next, use **vi** editor to edit the file **/etc/inittab**.

```
# vi /etc/inittab
```

Add the following line to the bottom of the file:

```
ntp : 2345 : respawn : /etc/init.d/fixtime
```

After you finish writing or modifying the code, remember to execute “**umount /**” to change the root directory back to Read-only mode.

```
# umount /
```

Use the command **#init q** to re-initialize the kernel.

```
# init q
```

## Enabling and Disabling Daemons

The following daemons are enabled when the DA-682-LX boots up for the first time.

- **snmpd**           SNMP Agent Daemon
- **telnetd**        Telnet Server/Client Daemon
- **inetd**          Internet Daemons
- **ftpd**           FTP Server/Client Daemon
- **sshd**           Secure Shell Server Daemon
- **httpd**          Apache WWW Server Daemon

Type the command **ps -ef** to list all processes currently running.

```
DA682:~# ps -ef
  PID  Uid        VmSize  Stat  Command
    1  root          1296  S    init
    2  root                S    [keventd]
    3  root                S    [ksoftirqd_CPU0]
    4  root                S    [kswapd]
    5  root                S    [bdflood]
    6  root                S    [kupdated]
    7  root                S    [mtdblockd]
    8  root                S    [khubd]
   10  root                S    [jffs2_gcd_mtd3]
   32  root                D    [ixp425_csr]
   38  root          1256  S    stdef
   47  root          1368  S    /usr/sbin/inetd
   53  root          4464  S    /usr/sbin/httpd
   63  nobody        4480  S    /usr/sbin/httpd
   64  nobody        4480  S    /usr/sbin/httpd
   65  nobody        4480  S    /usr/sbin/httpd
   66  nobody        4480  S    /usr/sbin/httpd
   67  nobody        4480  S    /usr/sbin/httpd
   92  bin           1460  S    /sbin/portmap
  105  root          1556  S    /usr/sbin/rpc.statd
  109  root          4044  S    /usr/sbin/snmpd -s -l /dev/null
  111  root          2832  S    /usr/sbin/snmptrapd -s
  140  root          1364  S    /sbin/cardmgr
  144  root          1756  S    /usr/sbin/rpc.nfsd
  146  root          1780  S    /usr/sbin/rpc.mountd
  153  root          2960  S    /usr/sbin/sshd
  161  root          1272  S    /bin/reportip
  162  root          3464  S    /bin/massupfirm
  163  root          1532  S    /sbin/getty 115200 ttyS0
  164  root          1532  S    /sbin/getty 115200 ttyS1
  166  root          3464  S    /bin/massupfirm
  168  root          3464  S    /bin/massupfirm
  171  root          3652  S    /usr/sbin/sshd
  172  root           2200  S    -bash
  174  root          1592  S    ps -ef
DA682:~#
```

To run a private daemon, you can edit the file **rc.local** as follows:

1. Because the root file system is mounted in Read-only mode, you need to re-mount it with write permission.

```
DA682:~# mount -o remount,rw /dev/hda1 /
```

2. Type **cd /etc/** to change directories.

```
DA682:~# cd /etc/
```

3. Type **vi rc.local** to edit the configuration file with vi editor.

```
DA682:/etc/# vi rc.local
```

4. Next, add the application daemon that you want to run. We use the example program **tcps2-release** to illustrate, and configure it to run in the background.

```
# !/bin/sh
# Add you want to run daemon
/root/tcps2-release &~
```

5. After you finish writing or modifying the code, remember to execute “**umount /**” to change the root directory back to Read-only mode.

```
DA682:~# umount /
```

6. You should be able to find the enabled daemon after you reboot the system.

```
DA682:~# ps -ef
  PID  Uid      VmSize  Stat  Command
    1  root      1296  S    init
    2  root           S    [keventd]
    3  root           S    [ksoftirqd_CPU0]
    4  root           S    [kswapd]
    5  root           S    [bdflush]
    6  root           S    [kupdated]
    7  root           S    [mtdblockd]
    8  root           S    [khubd]
   10  root           S    [jffs2_gcd_mtd3]
   32  root           D    [ixp425_csr]
   38  root      1256  S    stdef
   47  root      1368  S    /usr/sbin/inetd
   53  root      4464  S    /usr/sbin/httpd
   63  nobody    4480  S    /usr/sbin/httpd
   64  nobody    4480  S    /usr/sbin/httpd
   65  nobody    4480  S    /usr/sbin/httpd
   66  nobody    4480  S    /usr/sbin/httpd
   67  nobody    4480  S    /usr/sbin/httpd
   92  bin       1460  S    /sbin/portmap
   97  root      1264  S    /root/tcps2-release
  105  root      1556  S    /usr/sbin/rpc.statd
  109  root      4044  S    /usr/sbin/snmpd -s -l
/dev/null
  111  root      2832  S    /usr/sbin/snmptrapd -s
  140  root      1364  S    /sbin/cardmgr
  144  root      1756  S    /usr/sbin/rpc.nfsd
  146  root      1780  S    /usr/sbin/rpc.mountd
  153  root      2960  S    /usr/sbin/sshd
  161  root      1272  S    /bin/reportip
  162  root      3464  S    /bin/massupfirm
  163  root      1532  S    /sbin/getty 115200 ttyS0
  164  root      1532  S    /sbin/getty 115200 ttyS1
  166  root      3464  S    /bin/massupfirm
  168  root      3464  S    /bin/massupfirm
  171  root      3652  S    /usr/sbin/sshd
  172  root      2200  S    -bash
  174  root      1592  S    ps -ef
DA682:~#
```

## Setting the Run-Level

To set the Linux run-level and execution priority of a program, use the following command (because the root file system is mounted in Read-only mode, we need to re-mount it with write permission).

```
DA682:~# mount -o remount,rw /dev/hda1 /
```

Edit a shell script to execute `/root/tcps2-release` and save to `tcps2` as an example.

```
#cd /etc/rc2.d
```

```
#ln -s /etc/root/tcps2 S60tcps2
```

or

```
#ln -s /etc/root/tcps2 k30tcps2
```

```
DA682:~# cd /etc/rc2.d
DA682:/etc/rc2.d#
DA682:/etc/rc2.d# ls
S19nfs-common          S25nfs-user-server  S99showreadyled
S20snmpd               S55ssh
S24pcmcia              S99rmnologin
DA682:/etc/rc2.d#
DA682:/etc/rc2.d# ln -s /root/tcps2-release S60tcps2
DA682:/etc/rc2.d# ls
S19nfs-common          S25nfs-user-server  S99rmnologin
S20snmpd               S55ssh               S99showreadyled
S24pcmcia              S60tcps2
DA682:/etc/rc2.d#
```

The command **SxxRUNFILE** has the following meaning:

**S:** Start the run file while Linux boots up.  
**xx:** A number between 00-99. The smaller number has a higher priority.  
**RUNFILE:** The script file name

The command **KxxRUNFILE** has the following meaning:

**K:** Start the run file while Linux shuts down or halts.  
**xx:** A number between 00-99. The smaller number has a higher priority.  
**RUNFILE:** The script file name

To remove the daemon, remove the run file from `/etc/rc2.d` by using the following command:

```
# rm -f /etc/rc2.d/S60tcps2
```

After you finish writing or modifying the code, remember to execute `umount /` to change the root directory back to Read-only mode.

```
DA682:~# umount /
```

## Cron—Daemon for Executing Scheduled Commands

The Cron daemon will search `/etc/crontab` for crontab files, which are named after accounts in `/etc/passwd`.

Cron wakes up every minute and checks each command to see if it should be run in that minute. When executing commands, output is mailed to the owner of the **crontab** (or to the user named in the MAILTO environment variable in the **crontab**, if such a user exists).

Modify the file `/etc/crontab` to set up your scheduled applications. **Crontab** files have the following format:

<b>mm</b>	<b>h</b>	<b>dom</b>	<b>mon</b>	<b>dow</b>	<b>user</b>	<b>command</b>
minute	hour	date	month	week	user	command
0-59	0-23	1-31	1-12	0-6 (0 is Sunday)		

For example, if you want to launch a program at 8:00 every day

```
#minute hour date month week user command
*      8    *    *    *    root  /path/to/your/program
```

The following example demonstrates how to use **Cron** to update the system time and RTC time every day at 8:00.

1. Write a shell script named `fixtime.sh` and save it to `/home/`.

```
#!/bin/sh
ntpdate time.nist.gov
hwclock -w
exit 0
```

2. Change mode of `fixtime.sh`

```
# chmod 755 fixtime.sh
```
3. Modify `/etc/crontab` file to run `fixtime.sh` at 8:00 every day.

Add the following line to the end of crontab:

```
* 8 * * * root /home/fixtime.sh
```

## Inserting a USB Storage Device into the Computer

Since mounting USB storage devices manually can be difficult, a program named **usbmount** to mount the USB drivers automatically. **usbmount** is a small application that relies on **udev** to mount USB storage devices automatically at certain mount points. The USB storage devices will be mounted on `/media/usb0`, `/media/usb1`, etc.

```
DA682:~# mount
/dev/hda1 on / type ext2 (rw,errors=remount-ro)
tmpfs on /lib/init/rw type tmpfs (rw,nosuid,mode=0755)
proc on /proc type proc (rw,noexec,nosuid,nodev)
sysfs on /sys type sysfs (rw,noexec,nosuid,nodev)
procbususb on /proc/bus/usb type usbfs (rw)
udev on /dev type tmpfs (rw,mode=0755)
tmpfs on /dev/shm type tmpfs (rw,nosuid,nodev)
devpts on /dev/pts type devpts
(rw,noexec,nosuid,gid=5,mode=620)
/dev/hdb2 on /home type ext2 (rw)
nfsd on /proc/fs/nfsd type nfsd (rw)
rpc_pipefs on /var/lib/nfs/rpc_pipefs type rpc_pipefs (rw)
/dev/sda1 on /media/usb0 type vfat
(rw,noexec,nodev,sync,noatime,gid=25,dmask=0007,fmask=0117)
/dev/sdb1 on /media/usb1 type vfat
(rw,noexec,nodev,sync,noatime,gid=25,dmask=0007,fmask=0117)
DA682:~#
```

**ATTENTION**

Remember to type the command # **sync** before you disconnect the USB storage device. If you do not issue the command, you may lose data.

**ATTENTION**

Remember to exit the **/media/usb0** or **/media/usb1** directory when you disconnect the USB storage device. If you stay in **/media/usb0** or **/media/usb1**, the automatic un-mount process will fail. If that happens, type # **umount /media/usb0** to un-mount the USB device manually.

## Inserting a CompactFlash Card into the Computer

The CompactFlash card is treated as a local disk drive in the DA-682-LX computer. It is identified as a block device at **/dev/hdb**. You can add one line to **/etc/fstab** to force the CompactFlash card to mount automatically at boot time.

**ATTENTION**

The DA-682 Series Embedded Computer does not support the CompactFlash hot swap function. You must remove the power source first before inserting or removing the CompactFlash card. If you do not shut down the power source, you could damage your CompactFlash card.

```
DA680:~# mount -o remount,rw /dev/hda1 /
DA680:~# vi /etc/fstab
# /etc/fstab: static file system information.
#
# <file system> <mount point> <type> <options>
# <dump> <pass>
proc /proc proc defaults
0 0
/dev/hda1 / ext2
ro,defaults,errors=remount-ro 0 1
/dev/hdb1 /mnt/hdb ext2
defaults,errors=remount-ro 0 2
none /tmp tmpfs defaults
0 1
/dev/mtdblock0 /home jffs2 defaults
0 2
/dev/hdc /media/cdrom0 udf,iso9660 user,noauto
0 0
#/dev/fd0 /media/floppy0 auto rw,user,noauto
0 0

"etc/fstab" 9 lines, 534 characters
DA680:~#
DA680:~# umount /
DA680:~#
```

## Checking the Linux Version

The program **uname**, which stands for “Unix Name” and is part of the Unix operating system, prints the name, version, and other details about the operating system running on the computer. Use the **-a** option to generate a response similar to the one shown below:

```
DA682:~# uname -a
Linux DA680 2.6.18-5-686 #1 SMP Mon Dec 24 16:41:07 UTC 2007
i686 GNU/Linux
DA682:~#
```

## APT—Installing and Removing Packages

APT is the Debian tool used to install and remove packages. Before installing a package, you need to configure the apt source file, `/etc/apt/sources.list`, which is located in the read-only partition.

1. Mount the root file system with write permission.

```
DA682:~# mount -o remount,rw /dev/hdb1 /
```

2. Next, configure the `/etc/apt/sources.list` using `vi` editor.

```
DA682:~# vi /etc/apt/sources.list

#deb cdrom:[Debian GNU/Linux 4.0 r2 _Etch_ - Official i386
NETINST Binary-1 20080103-00:44]/ etch contrib main

deb http://ftp.debian.org/debian/ etch main
deb-src http://ftp.debian.org/debian/ etch main

deb http://security.debian.org/ etch/updates main contrib
deb-src http://security.debian.org/ etch/updates main contrib
DA682:~#
```

3. Update the source list after you configure it.

```
DA682:~# apt-get update
DA682:~#
```

4. Once you indicate which package you want to install (`openswan`, for example), type:

```
DA682:~# apt-get install openswan
DA682:~#
```

5. Use one of the following commands to remove a package:
  - (a) For a simple package removal:

```
DA682:~# apt-get remove openswan
DA682:~#
```

- (b) For a complete package removal:

```
DA682:~# apt-get remove openswan --purge
DA682:~#
```

6. If the installation is complete, remember to unmount the root directory back to read-only mode.

```
DA682:~# umount /
DA682:~#
```

**ATTENTION**

The APT cache space `/etc/cache/apt` is located in **tmpfs**. If you need to install a huge package, link `/etc/cache/apt` to USB mass storage or mount it to an NFS space to generate more free space. Use `df -h` to check how much free space is available on **tmpfs**.

```
DA682:~# df -h
Filesystem      Size  Used Avail Use% Mounted on
rootfs          790M  219M  531M  30% /
udev            10M   44K   10M   1% /dev
/dev/hdb1       790M  219M  531M  30% /
/dev/hdb1       790M  219M  531M  30% /dev/.static/dev
tmpfs           248M     0  248M   0% /dev/shm
none            248M   13M  236M   6% /tmp
/dev/mtdblock0 161M   25M  136M  16% /home
DA682:~#
```

**ATTENTION**

You can free up the cache space with the command `# apt-get clean`

```
DA682:~# apt-get clean
DA682:~#
```

## Managing Communications

---

The DA-682-LX ready-to-run embedded computer is a network-centric platform designed to serve as a front-end for data acquisition and industrial control applications. This chapter describes how to configure the various communication functions supported by the Linux operating system.

This chapter covers the following topics:

- ❑ **Changing the Network Settings**
  - Changing the “interfaces” Configuration File
  - Adjusting IP Addresses with “ifconfig”
- ❑ **Serial Port Operation Mode**
- ❑ **Telnet/FTP Server**
- ❑ **DNS Client**
- ❑ **Apache Web Server**
  - Default Homepage
  - Disabling the CGI Function
  - Saving Web Pages to a USB Storage Device
- ❑ **IPTABLES**
  - IPTABLES Hierarchy
  - IPTABLES Modules
  - Observe and Erase Chain Rules
  - Define Policy for Chain Rules
  - Append or Delete Rules
- ❑ **NAT (Network Address Translation)**
  - NAT Example
  - Enabling NAT at Bootup
- ❑ **PPP (Point to Point Protocol)**
  - Connecting to a PPP Server over a Simple Dial-up Connection
  - Connecting to a PPP Server over a Hard-wired Link
  - Checking the Connection
  - Setting up a Machine for Incoming PPP Connections
- ❑ **PPPoE**
- ❑ **NFS (Network File System) Client**
- ❑ **SNMP (Simple Network Management Protocol)**
- ❑ **OpenVPN**
  - Ethernet Bridging for Private Networks on Different Subnets
  - Ethernet Bridging for Private Networks on the Same Subnet
  - Routed IP

## Changing the Network Settings

The DA-682-LX computer has four basic Gigabit Ethernet ports named LAN1 to LAN4. The LAN Port Expansion Module supports an additional four 10/100 Mbps Ethernet ports named LAN5 to LAN8. The default IP addresses and netmasks of the network interfaces are as follows:

	Default IP Address	Netmask
LAN 1	192.168.3.127	255.255.255.0
LAN 2	192.168.4.127	255.255.255.0
LAN 3	192.168.5.127	255.255.255.0
LAN 4	192.168.6.127	255.255.255.0

These network settings can be modified by changing the **interfaces** configuration file, or they can be adjusted temporarily with the **ifconfig** command.

## Changing the “interfaces” Configuration File

1. Type **cd /etc/network** to change directory.

```
DA682:~# cd /etc/network
```

2. Type **vi interfaces** to edit the network configuration file with **vi** editor. You can configure the DA-682-LX's Ethernet ports for static or dynamic (DHCP) IP addresses.

```
DA682:/etc/network# vi interfaces
```

### Static IP Address

As shown in the example shown below, the default static IP addresses can be modified.

```
# The loopback network interface
auto lo eth0 eth1 eth2 eth3 eth4 eth5 eth6 eth7
iface lo inet loopback

# The primary network interface
allow-hotplug eth0
iface eth0 inet static
    address 192.168.3.127
    netmask 255.255.255.0
    broadcast 192.168.3.255

allow-hotplug eth1
iface eth1 inet static
    address 192.168.4.127
    netmask 255.255.255.0
    broadcast 192.168.4.255

allow-hotplug eth2
iface eth2 inet static
    address 192.168.5.127
    netmask 255.255.255.0
    broadcast 192.168.5.255
```

## Dynamic IP Address using DHCP

To configure one or both LAN ports to request an IP address dynamically, replace **static** with **dhcp** and then delete the rest of the lines.

```
# The primary network interface
allow-hotplug eth0
iface eth0 inet dhcp
```

After modifying the boot settings of the LAN interface, issue the following command to activate the LAN settings immediately.

```
# /etc/init.d/networking restart
```

```
DA682:~# /etc/init.d/networking restart
```

## Adjusting IP Addresses with “ifconfig”

IP settings can be adjusted during run-time, but the new settings will not be saved to the flash ROM without modifying the file **/etc/network/interfaces**. For example, type the command **# ifconfig eth1 192.168.1.1** to change the IP address of LAN1 to 192.168.1.1.

```
DA682:~# ifconfig eth1 192.168.1.1
DA682:~#
```

## Serial Port Operation Mode

The serial port expansion module has 8 serial ports named COM1 to COM8. The ports support RS-232, RS-422, 4-wire RS-485, and 4-wire RS-485 operation modes with baudrate settings up to 921600 bps.

By default, the serial interface is set to RS-232. You can use the **setinterface** command to change the serial port operation mode, as indicated below:

```
setinterface device-node [interface-no]
```

device-node: /dev/ttyMn; n = 0,1,2,...

interface-no: [see following table]:

interface-no	Operation Mode
None	Display current setting
0	RS-232
1	2-wire RS-485
2	RS-422
3	4-wire RS-485

For example, use the following commands to set **/dev/ttyM0** to RS-422:

```
DA682:~# setinterface /dev/ttyM0 2
DA682:~# setinterface /dev/ttyM0
Now setting is RS422 interface.
DA682:~#
```

## Telnet/FTP Server

In addition to supporting Telnet client/server and FTP client/server, the DA-682-LX also supports SSH and sftp client/server. To enable or disable the Telnet/ftp server, you need to edit the file `/etc/inetd.conf`.

1. Mount the root file system with write permission.

```
DA682:~# mount -o remount,rw /dev/hda1 /
```

2. Type `# cd /etc` to change the directory.

```
DA682:~# cd /etc
```

3. Type `# vi inetd.conf` to edit the configuration file.

```
DA682:/etc# vi inetd.conf
```

### Enabling the Telnet/FTP Server

The following example shows the default content of the file `/etc/inetd.conf`. The default is to “enable the Telnet/ftp server:”

```
discard dgram udp wait root /bin/discard
discard stream tcp nowait root /bin/discard
telnet stream tcp nowait root /bin/telnetd
ftp stream tcp nowait root /bin/ftpd -l
```

### Disabling the Telnet/FTP Server

Disable the daemon by typing “#” in front of the first character of the row to comment out the line. For example, to disable the **FTP** server, use the following commands:

```
discard dgram udp wait root /bin/discard
discard stream tcp nowait root /bin/discard
telnet stream tcp nowait root /bin/telnetd
#ftp stream tcp nowait root /bin/ftpd -l
```

After you finish writing or modifying the code, remember to execute “`umount /`” to change the root directory back to Read-only mode.

```
DA682:~# umount /
```

## DNS Client

The DA-682-LX supports DNS client (but not DNS server). To set up DNS client, you need to edit three configuration files: `/etc/hostname`, `/etc/resolv.conf`, and `/etc/nsswitch.conf`.

### `/etc/hostname`

1. Mount the root file system with write permission.

```
DA682:~# mount -o remount,rw /dev/hda1 /
```

2. Edit `/etc/hostname`:

```
DA682:~# vi /etc/hostname
DA682
```

3. After you finish writing or modifying the code, remember to execute “`umount /`” to change the root directory back to Read-only mode.

```
DA682:~# umount /
```

4. Re-configure the hostname.

```
DA682:~# /etc/init.d/hostname.sh start
```

5. Check the new hostname.

```
DA682:~# hostname
```

### `/etc/resolv.conf`

This is the most important file that you need to edit when using DNS. For example, before you using `# ntpdate time.nist.gov` to update the system time, you will need to add the DNS server address to the file. Ask your network administrator which DNS server address you should use. The DNS server's IP address is specified with the `nameserver` command. For example, add the following line to `/etc/resolv.conf` (assuming the DNS server's IP address is 168.95.1.1):

**nameserver 168.95.1.1**

```
DA682:/etc# cat resolv.conf
#
# resolv.conf This file is the resolver configuration file
# See resolver(5).
#
#nameserver 192.168.1.16
nameserver 168.95.1.1
nameserver 140.115.1.31
nameserver 140.115.236.10
DA682:/etc#
```

## **/etc/nsswitch.conf**

This file defines the sequence of files, **/etc/hosts** or **/etc/resolv.conf**, to be read to resolve the IP address.

The **hosts** line in **/etc/nsswitch.conf** means use **/etc/host** first and DNS service to resolve the address.

```
# /etc/nsswitch.conf
#
# Example configuration of GNU Name Service Switch
# functionality.
# If you have the `glibc-doc-reference' and `info' packages
# installed, try:
# `info libc "Name Service Switch"' for information about this
# file.

passwd:          compat
group:           compat
shadow:         compat

hosts:           files dns
networks:        files

protocols:       db files
services:        db files
ethers:          db files
rpc:             db files

netgroup:        nis
```

## **Apache Web Server**

### **Default Homepage**

The Apache web server's main configuration file is **/etc/apache2/sites-available/default**, with the default homepage located at **/var/www/apache2-default/index.html**.

Save your own homepage to the following directory:

**/var/www/apache2-default**

Save your CGI page to the following directory:

**/var/www/apache2-default/cgi-bin/**

Before you modify the homepage, use a browser (such as Microsoft Internet Explore or Mozilla Firefox) from your PC to test if the Apache web server is working. Type the LAN1 IP address in the browser's address box to open the homepage. For example, if the default IP address 192.168.3.127 is still active, type:

**http://192.168.3.127/**

To test the default CGI page, type:

**http://192.168.3.127/cgi-bin/w3mail.cgi**

## Disabling the CGI Function

The CGI function is enabled by default. If you want to disable the function, modify the file `/etc/apache2/sites-available/default`.

1. Mount the root file system with write permission.

```
DA682:~# mount -o remount,rw /dev/hda1 /
```

2. Type `# vi /etc/apache2/sites-available/default` to edit the configuration file.

```
DA682:/etc# vi /etc/apache2/sites-available/default
```

3. After you finish writing or modifying the code, remember to execute “`umount /`” to change the root directory back to Read-only mode.

```
DA682:~# umount /
```

4. Re-start the apache server.

```
DA682:~# /etc/init.d/apache2 restart
```

### ATTENTION

When you develop your own CGI application, make sure your CGI file is executable.

## Saving Web Pages to a USB Storage Device

Some applications may have web pages that take up a lot of memory space. This section describes how to save web pages to the USB mass storage device, and then configure the Apache web server's DocumentRoot to open these pages. The files used in this example can be downloaded from Moxa's website.

1. Prepare the web pages and then save the pages to the USB storage device. Click on the following link to download the web page test suite:  
**<http://www.w3.org/MarkUp/Test/HTML401.zip>**.
2. Uncompress the zip file to your desktop PC, and then use FTP to transfer it to the DA-682-LX's `/media/usb0` directory.
3. Mount the root file system with write permission.

```
DA682:~# mount -o remount,rw /dev/hda1 /
```

4. Type `# vi /etc/apache2/sites-available/default` to edit the configuration file.

```
DA682:/etc# vi /etc/apache2/sites-available/default
```

5. Change the DocumentRoot directory to the USB storage directory `/media/usb0/www`.

```
...
<VirtualHost *:80>
...
...
    DocumentRoot /media/usb0/www
    <Directory />
        Options FollowSymLinks
        AllowOverride None
    </Directory>
...
...
    ScriptAlias /cgi-bin/ /media/usb0/www/cgi-bin/
    <Directory "/media/usb0/www/cgi-bin/">
        AllowOverride None
        Options ExecCGI -MultiViews +SymLinksIfOwnerMatch
        Order allow,deny
        Allow from all
    </Directory>
...
</VirtualHost>
...
<VirtualHost *:443>
...
...
    DocumentRoot /media/usb0/www
    <Directory />
        Options FollowSymLinks
        AllowOverride None
    </Directory>
...
...
    ScriptAlias /cgi-bin/ /media/usb0/www/cgi-bin/
    <Directory "/media/usb0/wwwz/cgi-bin/">
        AllowOverride None
        Options ExecCGI -MultiViews +SymLinksIfOwnerMatch
        Order allow,deny
        Allow from all
    </Directory>
...
</VirtualHost>
```

6. Use the following commands to restart the Apache web server:  
**#cd /etc/init.d**  
**#!/apache restart**
7. Open your browser and connect to the DA-682-LX by typing the current LAN1 IP address in the browser's address box.
8. After finishing modification or writing, remember to execute "umount /" to change the root directory back to Read-only mode.

```
DA682:~# umount /
```

9. Re-start the apache server.

```
DA682:~# /etc/init.d/apache2 restart
```

**ATTENTION**

Visit the Apache website at <http://httpd.apache.org/docs/> for more information about setting up Apache servers.

## IPTABLES

IPTABLES is an administrative tool for setting up, maintaining, and inspecting the Linux kernel's IP packet filter rule tables. Several different tables are defined, with each table containing built-in chains and user-defined chains.

Each chain is a list of rules that apply to a certain type of packet. Each rule specifies what to do with a matching packet. A rule (such as a jump to a user-defined chain in the same table) is called a **target**.

The DA-682-LX supports three types of IPTABLES: Filter tables, NAT tables, and Mangle tables.

**Filter Table—includes three chains:**

INPUT chain  
OUTPUT chain  
FORWARD chain

**NAT Table—includes three chains:**

PREROUTING chain—transfers the destination IP address (DNAT).

POSTROUTING chain—works after the routing process and before the Ethernet device process to transfer the source IP address (SNAT).

OUTPUT chain—produces local packets.

**Sub-tables**

Source NAT (SNAT)—changes the first source packet IP address.

Destination NAT (DNAT)—changes the first destination packet IP address.

MASQUERADE—a special form for SNAT. If one host can connect to the Internet, then the other computers that connect to this host can connect to the Internet when the computer does not have an actual IP address.

REDIRECT—a special form of DNAT that re-sends packets to a local host independent of the destination IP address.

**Mangle Table—includes two chains**

PREROUTING chain—pre-processes packets before the routing process.

OUTPUT chain—processes packets after the routing process.

Mangle tables can have one of three extensions—TTL, MARK, TOS.

### IPTABLES Hierarchy

The following figure shows the IPTABLES hierarchy.

## IPTABLES Modules

The DA-682-LX supports the following sub-modules. Be sure to use the module that matches your application.

arptable_filter.ko	arp_tables.ko	arpt_mangle.ko	ip_conntrack_amanda.ko
ip_conntrack_ftp.ko	ip_conntrack_h323.ko	ip_conntrack_irc.ko	ip_conntrack.ko
ip_conntrack_netbios_ns.ko	ip_conntrack_netlink.ko	ip_conntrack_pptp.ko	ip_conntrack_proto_sctp.ko
ip_conntrack_sip.ko	ip_conntrack_tftp.ko	ip_nat_amanda.ko	ip_nat_ftp.ko
ip_nat_h323.ko	ip_nat_irc.ko	ip_nat.ko	ip_nat_pptp.ko
ip_nat_sip.ko	ip_nat_snmp_basic.ko	ip_nat_tftp.ko	ip_queue.ko
iptables_filter.ko	iptables_mangle.ko	iptables_nat.ko	iptables_raw.ko
ip_tables.ko	ipt_addrtype.ko	ipt_ah.ko	ipt_CLUSTERIP.ko
ipt_dscp.ko	ipt_DSCP.ko	ipt_ecn.ko	ipt_ECN.ko
ipt_hashlimit.ko	ipt_iprange.ko	ipt_LOG.ko	ipt_MASQUERADE.ko
ipt_NETMAP.ko	ipt_owner.ko	ipt_recent.ko	ipt_REDIRECT.ko
ipt_REJECT.ko	ipt_SAME.ko	ipt_TCPMSS.ko	ipt_tos.ko
ipt_TOS.ko	ipt_ttl.ko	ipt_TTL.ko	ipt_ULOG.ko

The basic syntax to enable and load an IPTABLES module is as follows:

```
# lsmod
# modprobe ip_tables
# modprobe iptable_filter
```

Use **lsmod** to check if the **ip\_tables** module has already been loaded in the DA-682-LX. Use **modprobe** to insert and enable the module.

Use the following command to load the modules (**iptables\_filter**, **iptables\_mangle**, **iptables\_nat**):

```
# modprobe iptable_filter
```

Use **iptables**, **iptables-restore**, **iptables-save** to maintain the database.

### ATTENTION

IPTABLES plays the role of packet filtering or NAT. Be careful when setting up the IPTABLES rules. If the rules are not correct, remote hosts that connect via a LAN or PPP may be denied. We recommend using the VGA console to set up the IPTABLES. Click on the following links for more information about IPTABLES.

<http://www.linuxguruz.com/iptables/>

<http://www.netfilter.org/documentation/HOWTO//packet-filtering-HOWTO.html>

Since the IPTABLES command is very complex, to illustrate the IPTABLES syntax we have divided our discussion of the various rules into three categories: Observe and erase chain rules, Define policy rules, and Append or delete rules.

## Observe and Erase Chain Rules

### Usage:

```
# iptables [-t tables] [-L] [-n]
```

- t tables: Table to manipulate (default: 'filter'); example: nat or filter.
- L [chain]: List List all rules in selected chains. If no chain is selected, all chains are listed.
- n: Numeric output of addresses and ports.

```
# iptables [-t tables] [-FXZ]
```

- F: Flush the selected chain (all the chains in the table if none is listed).
- X: Delete the specified user-defined chain.
- Z: Set the packet and byte counters in all chains to zero.

### Examples:

```
# iptables -L -n
```

In this example, since we do not use the -t parameter, the system uses the default "filter" table. Three chains are included: INPUT, OUTPUT, and FORWARD. INPUT chains are accepted automatically, and all connections are accepted without being filtered.

```
# iptables -F
# iptables -X
# iptables -Z
```

## Define Policy for Chain Rules

### Usage:

```
# iptables [-t tables] [-P] [INPUT, OUTPUT, FORWARD, PREROUTING, OUTPUT,
POSTROUTING] [ACCEPT, DROP]
```

- P: Set the policy for the chain to the given target.
- INPUT: For packets coming into the DA-682-I-LX.
- OUTPUT: For locally-generated packets.
- FORWARD: For packets routed out through the DA-682-I-LX.
- PREROUTING: To alter packets as soon as they come in.
- POSTROUTING: To alter packets as they are about to be sent out.

### Examples:

```
#iptables -P INPUT DROP
#iptables -P OUTPUT ACCEPT
#iptables -P FORWARD ACCEPT
#iptables -t nat -P PREROUTING ACCEPT
#iptables -t nat -P OUTPUT ACCEPT
#iptables -t nat -P POSTROUTING ACCEPT
```

In this example, the policy accepts outgoing packets and denies incoming packets.

## Append or Delete Rules

### Usage:

```
# iptables [-t table] [-AI] [INPUT, OUTPUT, FORWARD] [-io interface] [-p tcp, udp, icmp,
all] [-s IP/network] [--sport ports] [-d IP/network] [--dport ports] -j [ACCEPT. DROP]
```

- A: Append one or more rules to the end of the selected chain.
- I: Insert one or more rules in the selected chain as the given rule number.
- i: Name of an interface via which a packet is going to be received.
- o: Name of an interface via which a packet is going to be sent.
- p: The protocol of the rule or of the packet to check.
- s: Source address (network name, host name, network IP address, or plain IP address).
- sport: Source port number.
- d: Destination address.
- dport: Destination port number.
- j: Jump target. Specifies the target of the rules; i.e., how to handle matched packets.

For example, ACCEPT the packet, DROP the packet, or LOG the packet.

### Examples:

Example 1: Accept all packets from the lo interface.

```
# iptables -A INPUT -i lo -j ACCEPT
```

Example 2: Accept TCP packets from 192.168.0.1.

```
# iptables -A INPUT -i eth0 -p tcp -s 192.168.0.1 -j ACCEPT
```

Example 3: Accept TCP packets from Class C network 192.168.1.0/24.

```
# iptables -A INPUT -i eth0 -p tcp -s 192.168.1.0/24 -j ACCEPT
```

Example 4: Drop TCP packets from 192.168.1.25.

```
# iptables -A INPUT -i eth0 -p tcp -s 192.168.1.25 -j DROP
```

Example 5: Drop TCP packets addressed for port 21.

```
# iptables -A INPUT -i eth0 -p tcp --dport 21 -j DROP
```

Example 6: Accept TCP packets from 192.168.0.24 to DA-682-I-LX's port 137, 138, 139

```
# iptables -A INPUT -i eth0 -p tcp -s 192.168.0.24 --dport 137:139 -j ACCEPT
```

Example 7: Log TCP packets that visit DA-682-I-LX's port 25.

```
# iptables -A INPUT -i eth0 -p tcp --dport 25 -j LOG
```

Example 8: Drop all packets from MAC address 01:02:03:04:05:06.

```
# iptables -A INPUT -i eth0 -p all -m mac --mac-source 01:02:03:04:05:06 -j DROP
```

### ATTENTION

In Example 8, remember to issue the command `# modprobe ipt_mac` first to load the module `ipt_mac`.

## NAT (Network Address Translation)

The NAT (Network Address Translation) protocol translates IP addresses used on one network into IP addresses used on a connecting network. One network is designated the inside network and the other is the outside network. Typically, the DA-682-LX connects several devices on a network and maps local inside network addresses to one or more global outside IP addresses, and un-maps the global IP addresses on incoming packets back into local IP addresses.

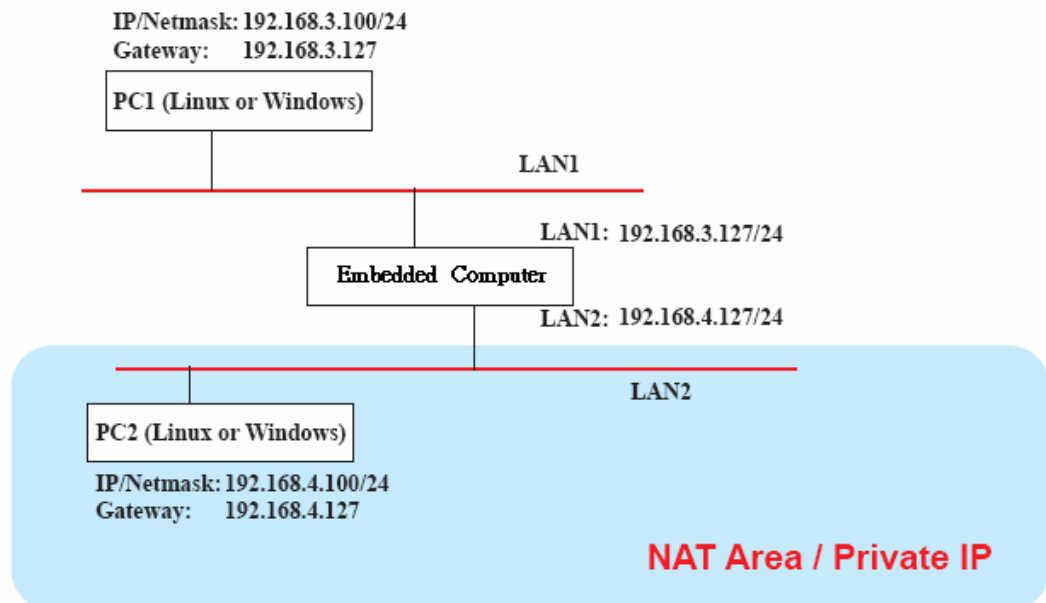

### ATTENTION

Click on the following links for more information about NAT.

<http://www.netfilter.org/documentation/HOWTO//packet-filtering-HOWTO.html>

## NAT Example

The IP address of all packets leaving LAN1 are changed to **192.168.3.127** (you will need to load the module `ipt_MASQUERADE`):

```
#ehco 1 > /proc/sys/net/ipv4/ip_forward
#modprobe ipt_MASQUERADE
#iptables -t nat -A POSTROUTING -o eth0 -j MASQUERADE
```

## Enabling NAT at Bootup

In most real world situations, you will want to use a simple shell script to enable NAT when the DA-682-LX boots up. The following script is an example.

```
#!/bin/bash
# If you put this shell script in the /home/nat.sh
# Remember to chmod 744 /home/nat.sh
# Edit the rc.local file to make this shell startup automatically.
# vi /etc/rc.local
# Add a line in the end of rc.local /home/nat.sh

EXIF="eth0" #This is an external interface for setting up a valid IP address.
EXNET="192.168.4.0/24" #This is an internal network address.

# Step 1. Insert modules.

# Here 2> /dev/null means the standard error messages will be dump to null device.

modprobe ip_tables 2> /dev/null
modprobe ip_nat_ftp 2> /dev/null
modprobe ip_nat_irc 2> /dev/null
modprobe ip_conntrack 2> /dev/null
modprobe ip_conntrack_ftp 2> /dev/null
modprobe ip_conntrack_irc 2> /dev/null

# Step 2. Define variables, enable routing and erase default rules.

PATH=/bin:/sbin:/usr/bin:/usr/sbin:/usr/local/bin:/usr/local/sbin
export PATH
echo "1" > /proc/sys/net/ipv4/ip_forward
/sbin/iptables -F
/sbin/iptables -X
/sbin/iptables -Z
/sbin/iptables -F -t nat
/sbin/iptables -X -t nat
/sbin/iptables -Z -t nat
/sbin/iptables -P INPUT ACCEPT
/sbin/iptables -P OUTPUT ACCEPT
/sbin/iptables -P FORWARD ACCEPT
/sbin/iptables -t nat -P PREROUTING ACCEPT
/sbin/iptables -t nat -P POSTROUTING ACCEPT
/sbin/iptables -t nat -P OUTPUT ACCEPT

# Step 3. Enable IP masquerade.
```

## PPP (Point to Point Protocol)

PPP (Point to Point Protocol) is used to run IP (Internet Protocol) and other network protocols over a serial link. PPP can be used for direct serial connections (using a null-modem cable) over a Telnet link, and links established using a modem over a telephone line.

Modem/PPP access is almost identical to connecting directly to a network through the DA-682-LX's Ethernet port. Since PPP is a peer-to-peer system, the DA-682-LX can also use PPP to link two networks (or a local network to the Internet) to create a Wide Area Network (WAN).

## ATTENTION

Click on the following links for more information about PPP.

<http://tldp.org/HOWTO/PPP-HOWTO/index.html>

<http://axion.physics.ubc.ca/ppp-linux.html>

## Connecting to a PPP Server over a Simple Dial-up Connection

The following command is used to connect to a PPP server by modem. Use this command for old ppp servers that prompt for a login name (replace “username” with the correct name) and password (replace “password” with the correct password). Note that “debug crtscts” and “defaultroute 192.1.1.17” are optional.

```
#pppd connect 'chat -v "" ATDT5551212 CONNECT ""' ogin: username word: password'
/dev/ttyM0 115200 debug crtscts modem defaultroute 192.1.1.17
```

If the PPP server does not prompt for the username and password, the command should be entered as follows. Replace “username” with the correct username and replace “password” with the correct password.

```
#pppd connect 'chat -v "" ATDT5551212 CONNECT ""' user username password password
/dev/ttyM0 115200 crtscts modem
```

The pppd options are described below:

**connect 'chat etc...'** This option gives the command to contact the PPP server. The **chat** program is used to dial a remote computer. The entire command is enclosed in single quotes because pppd expects a one-word argument for the **connect** option. The options for **chat** are given below:

<b>-v</b>	verbose mode; log what we do to syslog
<b>“ “</b>	Double quotes—don't wait for a prompt, but instead do ... (note that you must include a space after the second quotation mark)
<b>ATDT5551212</b>	Dial the modem, and then ...
<b>CONNECT</b>	Wait for an answer.
<b>“ “</b>	Send a return (null text followed by the usual return)
<b>ogin: username word: password</b>	Log in with username and password.

Refer to the chat man page, chat.8, for more information about the **chat** utility.

<b>/dev/</b>	Specify the callout serial port.
<b>115200</b>	The baud rate.
<b>debug</b>	Log status in syslog.
<b>crtscts</b>	Use hardware flow control between computer and modem (at 115200 this is a must).
<b>modem</b>	Indicates that this is a modem device; pppd will hang up the phone before and after making the call.
<b>defaultroute</b>	Once the PPP link is established, make it the default route; if you have a PPP link to the Internet, this is probably what you want.

- 192.1.1.17** This is a degenerate case of a general option of the form `x.x.x.x:y.y.y.y`. Here `x.x.x.x` is the local IP address and `y.y.y.y` is the IP address of the remote end of the PPP connection. If this option is not specified, or if just one side is specified, then `x.x.x.x` defaults to the IP address associated with the local machine's hostname (located in `/etc/hosts`), and `y.y.y.y` is determined by the remote machine.

## Connecting to a PPP Server over a Hard-wired Link

If a username and password are not required, use the following command (note that `noipdefault` is optional):

```
#pppd connect 'chat -v' ' ' ' ' noipdefault /dev/ttyM0 19200 crtscts
```

If a username and password is required, use the following command (note that `noipdefault` is optional, and `root` is both the username and password):

```
#pppd connect 'chat -v' ' ' ' ' user root password root noipdefault /dev/ttyM0 19200 crtscts
```

## Checking the Connection

Once you have set up a PPP connection, there are some steps you can take to test the connection. First, type:

```
#!/sbin/ifconfig
```

Depending on your distribution, the command might be located elsewhere. After executing the command, you should be able to see all of the network interfaces that are UP.

`ppp0` should be one of them, and you should recognize the first IP address as your own and the **P-t-P address** (point-to-point address, the address of your server). The output is similar to the following:

```
lo      Link encap Local Loopback
        inet  addr 127.0.0.1      Bcast 127.255.255.255  Mask
        255.0.0.0
        UP LOOPBACK RUNNING  MTU 2000  Metric 1
        RX packets 0 errors 0 dropped 0 overrun 0

ppp0    Link encap Point-to-Point Protocol
        inet  addr 192.76.32.3    P-t-P 129.67.1.165  Mask
        255.255.255.0
        UP POINTOPOINT RUNNING  MTU 1500  Metric 1
        RX packets 33 errors 0 dropped 0 overrun 0
        TX packets 42 errors 0 dropped 0 overrun 0
```

Now, type:

```
#ping z.z.z.z
```

where `z.z.z.z` is the address of your name server. The output is similar to the following:

```

DA682:~# ping 129.67.1.165
PING 129.67.1.165 (129.67.1.165): 56 data bytes
64 bytes from 129.67.1.165: icmp_seq=0 ttl=225 time=268 ms
64 bytes from 129.67.1.165: icmp_seq=1 ttl=225 time=247 ms
64 bytes from 129.67.1.165: icmp_seq=2 ttl=225 time=266 ms
^C
--- 129.67.1.165 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 247/260/268 ms
DA682:~#

```

Try typing:

```
#netstat -nr
```

This should show three routes similar to the following:

```

Kernel routing table
Destination Gateway Genmask Flags Metric Ref Use
iface
129.67.1.165 0.0.0.0 255.255.255.255 UH 0 0 6
ppp0
127.0.0.0 0.0.0.0 255.0.0.0 U 0 0 0 lo
0.0.0.0 129.67.1.165 0.0.0.0 UG 0 0 6298
ppp0

```

If your output looks similar but does not have the “destination 0.0.0.0” line (which refers to the default route used for connections), you may have run `pppd` without the `defaultroute` option. At this point, you can try using Telnet, ftp, or finger, bearing in mind that you will have to use numeric IP addresses unless you have configured `/etc/resolv.conf` correctly.

## Setting up a Machine for Incoming PPP Connections

### Method 1: `pppd` dial-in with `pppd` commands

This first example applies to using a modem, and requiring authorization with a username and password.

```
#pppd /dev/ttyM0 115200 crtscts modem 192.168.16.1:192.168.16.2 login auth
```

You should also add the following line to the file `/etc/ppp/pap-secrets`:

```
* * “” *
```

The first star (\*) lets everyone login. The second star (\*) lets every host connect. The pair of double quotation marks (“”) indicates that the file `/etc/passwd` can be used to check the password. The last star (\*) is to let any IP connect.

The following example does not check the username and password:

```
# pppd/dev/ttyM0 115200 crtscts modem 192.168.16.1:192.168.16.2
```

### Method 2: `pppd` dial-in with `pppd` script

Configure a dial-in script `/etc/ppp/peer/dialin`

```
# You usually need this if there is no PAP authentication
noauth
#auth
#login

# The chat script (be sure to edit that file, too!)
init "/usr/sbin/chat -v -f /etc/ppp/ppp-ttyM0.chat"

# Set up routing to go through this PPP link
defaultroute

# Default modem (you better replace this with /dev/ttySx!)
/dev/ttyM0

# Speed
115200

# Keep modem up even if connection fails
persist
crtcts
modem
192.168.16.1:192.168.16.2
debug
-detach
```

Configure the chat script `/etc/ppp/ppp-ttyM0.chat`

```
SAY      'Auto Answer ON\n'
'        ATSO=1
```

Start the `pppd` dial-in service.

```
# pppd call dialin
```

#### ATTENTION

If you hope to have auto dial-in service, you can respawn the dial-in service in `/etc/inittab`.

```
DA682:~# mount -o remount,rw /dev/hda1 /
DA682:~# echo "p0:2345:respawn:pppd call dialin" >>
/etc/inittab
DA682:~# umount /
```

## PPPoE

The following procedure is for setting up PPPoE:

1. Connect the DA-682-LX's LAN port to an ADSL modem with a cross-over cable, HUB, or switch.
2. Log in to the DA-682-LX as the root user.
3. Edit the file `/etc/ppp/chap-secrets` and add the following:  
`"username@hinet.net" * "password" *`

```
# Secrets for authentication using CHAP
# client      server  secret          IP addresses

# PPPOE example, if you want to use it, you need to unmark it
and modify it
"username@hinet.net" *      "password"      *
```

`username@hinet.net` is the username obtained from the ISP to log in to the ISP account.

`password` is the corresponding password for the account.

4. Edit the file `/etc/ppp/pap-secrets` and add the following:  
`"username@hinet.net" * "password" *`

```
# ATTENTION: The definitions here can allow users to login
without a
# password if you don't use the login option of pppd! The
mgetty Debian
# package already provides this option; make sure you don't
change that.

# INBOUND connections

# Every regular user can use PPP and has to use passwords
from /etc/passwd
*      hostname      " "      *
"username@hinet.net" *      "password"      *

# UserIDs that cannot use PPP at all. Check your /etc/passwd
and add any
# other accounts that should not be able to use pppd!
guest  hostname      " * "    -
master hostname      " * "    -
root   hostname      " * "    -
support hostname      " * "    -
stats  hostname      " * "    -

# OUTBOUND connections
```

`username@hinet.net` is the username obtained from the ISP to log in to the ISP account.

`password` is the corresponding password for the account.

5. Edit the file `/etc/ppp/options` and add the following line:  
**plugin rp-pppoe**

```
# received. Note: it is not advisable to use this option
with the persist
# option without the demand option. If the active-filter
option is given,
# data packets which are rejected by the specified activity
filter also
# count as the link being idle.
#idle <n>

# Specifies how many seconds to wait before re-initiating the
link after
# it terminates. This option only has any effect if the
persist or demand
# option is used. The holdoff period is not applied if the
link was
# terminated because it was idle.
#holdoff <n>

# Wait for up n milliseconds after the connect script
finishes for a valid
# PPP packet from the peer. At the end of this time, or when
a valid PPP
# packet is received from the peer, pppd will commence
negotiation by
# sending its first LCP packet. The default value is 1000 (1
second).
# This wait period only applies if the connect or pty option
is used.
#connect-delay <n>

# Load the pppoe plugin
plugin rp-pppoe.so

# ---<End of File>---
```

6. If you use LAN1 to connect to the ADSL modem, add file `/etc/ppp/options.eth0`. If you use LAN2 to connect to the ADSL modem, then add `/etc/ppp/options.eth1`, etc.

```
name username@hinet.net
mtu 1492
mru 1492
defaultroute
noipdefault
~
~
"/etc/ppp/options.eth0" 5 lines, 67 characters
```

Type your username (the one you set in the `/etc/ppp/pap-secrets` and `/etc/ppp/chap-secrets` files) after the **name** option. You may add other options as desired.

### 7. Set up DNS.

If you are using DNS servers supplied by your ISP, edit the file `/etc/resolv.conf` by adding the following lines of code:

```
nameserver ip_addr_of_first_dns_server
nameserver ip_addr_of_second_dns_server
```

For example:

```
nameserver 168.95.1.1
nameserver 139.175.10.20
```

```
DA682:/etc# cat resolv.conf
#
# resolv.conf This file is the resolver configuration file
# See resolver(5).
#
#nameserver 192.168.1.16
nameserver 168.95.1.1
nameserver 139.175.10.20
nameserver 140.115.1.31
nameserver 140.115.236.10
DA682:/etc#
```

### 8. Use the following command to create a `pppoe` connection:

```
#pppd eth0
```

The ADSL modem is connected to the `LAN1` port, which is named `eth0`. If the ADSL modem is connected to `LAN2`, use `eth1`, etc.

### 9. Type `#ifconfig ppp0` to check if the connection is OK. If the connection is OK, you should see the IP address of `ppp0`. Use `#ping` to test the IP address.

```
ppp0      Link encap Point-to-Point Protocol
          inet addr 192.76.32.3      P-t-P 129.67.1.165  Mask
          255.255.255.0
          UP POINTOPOINT RUNNING  MTU 1500  Metric 1
          RX packets 33 errors 0 dropped 0 overrun 0
          TX packets 42 errors 0 dropped 0 overrun 0
```

### 10. If you want to disconnect it, use the `kill` command to kill the `pppd` process.

## NFS (Network File System) Client

The Network File System (NFS) is used to mount a disk partition on a remote machine (as if it were on a local hard drive), allowing fast, seamless sharing of files across a network. NFS allows users to develop applications for the DA-682-LX without worrying about the amount of disk space that will be available. The DA-682-LX supports only NFS client protocol.

**ATTENTION**

Click on the following links for more information about NFS.

<http://www.tldp.org/HOWTO/NFS-HOWTO/index.html>  
<http://nfs.sourceforge.net/nfs-howto/client.html>

The following procedures illustrate how to mount a remote NFS Server.

1. Scan the NFS Server's shared directory.  
**#showmount -e HOST**  
showmount: Show the mount information of an NFS Server  
-e: Show the NFS Server's export list.  
HOST: IP address or DNS address
2. Establish a mount point on the NFS Client site.  
**#mkdir -p /home/nfs/public**
3. Mount the remote directory to a local directory.  
**#mount -t nfs 192.168.3.100/home/public /home/nfs/public**

This is where 192.168.3.100 is the example IP address of the NFS server.

## SNMP (Simple Network Management Protocol)

The DA-682-LX comes with the SNMP V1 (Simple Network Management Protocol) agent software pre-installed. It supports RFC1317 **RS-232 like group** and **RFC 1213 MIB-II**. The following shows example shows an SNMP agent responding to a query from the SNMP browser on the host site:

```
***** SNMP QUERY STARTED *****

- <http://nfs.sourceforge.net/nfs-howto/client.html>

## OpenVPN

OpenVPN provides two types of tunnels for users to implement VPNS: **Routed IP Tunnels** and **Bridged Ethernet Tunnels**.

An Ethernet bridge is used to connect different Ethernet networks together. The Ethernets are bundled into one bigger, "logical" Ethernet. Each Ethernet corresponds to one physical interface (or port) that is connected to the bridge.

On each OpenVPN machine, you should carry out configurations in the `/etc/openvpn` directory, where script files and key files reside. Once established, all operations will be performed in that directory.

### Ethernet Bridging for Private Networks on Different Subnets

1. Set up four machines, as shown in the following diagram.

Host A represents the machine that belongs to OpenVPN A, and Host B represents the machine that belongs to OpenVPN B. The two remote subnets are configured for a different range of IP addresses. When this configuration is moved to a public network, the external interfaces of the OpenVPN machines should be configured for static IPs, or connected to another device (such as a firewall or DSL box) first.

2. Generate a preset shared key by typing the command:  
`# openvpn --genkey --secret secrouter.key`
3. Copy the file that is generated to the OpenVPN machine:  
`# scp /etc/openvpn/secrouter.key 192.168.8.174:/etc/openvpn`

**ATTENTION**

A preshared key is located at `/etc/openvpn/secrouter.key`. You can use it for testing purposes. We suggest creating a new key for non-testing purpose.

4. On machine OpenVPN A, modify the remote address in the configuration file `/etc/openvpn/tap0-br.conf`.

```
# point to the peer
remote 192.168.8.174
dev tap0
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
up /etc/openvpn/tap0-br.sh
#comp-lzo
```

5. Next, modify the routing table in the `/etc/openvpn/tap0-br.sh` script file.

```
#-----Start-----
#!/bin/sh
# value after "-net" is the subnet behind the remote peer
route add -net 192.168.4.0 netmask 255.255.255.0 dev br0
#-----end-----
```

And then configure the bridge interface in `/etc/openvpn/bridge`.

```
#!/bin/bash
# Create global variables
# Define Bridge Interface
br="br0"
# Define list of TAP interfaces to be bridged,
# for example tap="tap0 tap1 tap2".
tap="tap0"
# Define physical ethernet interface to be bridged
# with TAP interface(s) above.
eth="eth1"
eth_ip="192.168.8.173"
eth_netmask="255.255.255.0"
eth_broadcast="192.168.8.255"
#gw="192.168.8.174"
...
```

Start the bridge script file to configure the bridge interface.

```
# /etc/openvpn/bridge restart
```

6. On machine OpenVPN B, modify the remote address in configuration file `/etc/openvpn/tap0-br.conf`.

```
# point to the peer
remote 192.168.8.173
dev tap0
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
up /etc/openvpn/tap0-br.sh
#comp-lzo
```

7. Next modify the routing table in `/etc/openvpn/tap0-br.sh` script file.

```
#-----Start-----
-----
#!/bin/sh
# value after "-net" is the subnet behind the remote peer
route add -net 192.168.2.0 netmask 255.255.255.0 dev br0
#----- end -----
-----
```

And then configure the bridge interface in `/etc/openvpn/bridge`.

```
#!/bin/bash
# Create global variables
# Define Bridge Interface
br="br0"
# Define list of TAP interfaces to be bridged,
# for example tap="tap0 tap1 tap2".
tap="tap0"
# Define physical ethernet interface to be bridged
# with TAP interface(s) above.
eth="eth1"
eth_ip="192.168.8.174"
eth_netmask="255.255.255.0"
eth_broadcast="192.168.8.255"
#gw="192.168.8.173"
...
```

Start the bridge script file to configure the bridge interface.

```
# /etc/openvpn/bridge restart
```

#### ATTENTION

Select cipher and authentication algorithms by specifying **cipher** and **auth**. To see which algorithms are available, type:

```
# openvpn --show-ciphers
# openvpn --show-auths
```

8. Start both OpenVPN peers on machine OpenVPN A and OpenVPN B.  

```
# openvpn --config /etc/openvpn/tap0-br.conf&
```

If you see the line **Peer Connection Initiated with 192.168.8.173:5000** on each machine, the connection between OpenVPN machines has been established successfully on UDP port 5000.

#### ATTENTION

You can create link symbols to start the OpenVPN service at boot time:

```
# ln -sf /etc/init.d/openvpn /etc/rc2.d/S16openvpn
```

To stop the service, you should create these links:

```
# ln -sf /etc/init.d/openvpn /etc/rc0.d/K80openvpn
# ln -sf /etc/init.d/openvpn /etc/rc6.d/K80openvpn
```

9. On each OpenVPN machine, check the routing table by typing the command **# route**

Destination	Gateway	Genmsk	Flags	Metric	Ref
192.168.5.0	0.0.0.0	255.255.255.0	U	0	0 0
Use Iface eth2					
192.168.4.0	0.0.0.0	255.255.255.0	U	0	0 0
br0					
192.168.3.0	0.0.0.0	255.255.255.0	U	0	0 0
eth0					
192.168.30.0	0.0.0.0	255.255.255.0	U	0	0 0
eth3					
192.168.8.0	0.0.0.0	255.255.255.0	U	0	0 0
br0					

Interface **eth1** and device **tap0** both connect to the bridging interface, and the virtual device **tun** sits on top of **tap0**. This ensures that all traffic coming to this bridge from internal networks connected to interface **eth1** write to the TAP/TUN device that the OpenVPN program monitors. Once the OpenVPN program detects traffic on the virtual device, it sends the traffic to its peer.

10. To create an indirect connection to Host B from Host A, you need to add the following routing item:

```
# route add -net 192.168.4.0 netmask 255.255.255.0 dev eth0
```

To create an indirect connection to Host A from Host B, you need to add the following routing item:

```
# route add -net 192.168.2.0 netmask 255.255.255.0 dev eth0
```

Now ping Host B from Host A by typing:

```
# ping 192.168.4.174
```

A successful ping indicates that you have created a VPN system that only allows authorized users from one internal network to access users at the remote site. For this system, all data is transmitted by UDP packets on port 5000 between OpenVPN peers.

11. To shut down OpenVPN programs, type the command:

```
# killall -TERM openvpn
```

## Ethernet Bridging for Private Networks on the Same Subnet

1. Set up four machines, as shown in the following diagram.

2. The configuration procedure is almost the same as for the previous example. The only difference is that you will need to comment out the parameter **up** in **/etc/openvpn/tap0-br.conf** of OpenVPN A and **/etc/openvpn/tap0-br.conf** of OpenVPN B.

```
# point to the peer
remote 192.168.8.174
dev tap0
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
#up /etc/openvpn/tap0-br.sh
#comp-lzo
```

## Routed IP

1. Set up four machines, as shown in the following diagram.

2. On machine OpenVPN A, modify the remote address in configuration file `/etc/openvpn/tun.conf`.

```
# point to the peer
remote 192.168.8.174
dev tun
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
ifconfig 192.168.2.173 192.168.4.174
up /etc/openvpn/tun.sh
```

3. Next, modify the routing table in script file `/etc/openvpn/tun.sh`.

```
#-----Start-----
#!/bin/sh
# value after "-net" is the subnet behind the remote peer
route add -net 192.168.2.0 netmask 255.255.255.0 gw $5
#-----end-----
```

4. On machine OpenVPN B, modify the remote address in configuration file `/etc/openvpn/tun.conf`.

```
# point to the peer
remote 192.168.8.173
dev tun
secret /etc/openvpn/secrouter.key
cipher DES-EDE3-CBC
auth MD5
tun-mtu 1500
tun-mtu-extra 64
ping 40
ifconfig 192.168.4.174 192.168.2.173
up /etc/openvpn/tun.sh
```

And then modify the routing table in script file `/etc/openvpn/tun.sh`.

```
#-----Start-----
#!/bin/sh
# value after "-net" is the subnet behind the remote peer
route add -net 192.168.2.0 netmask 255.255.255.0 gw $5
#-----end-----
```

The first argument of parameter **ifconfig** is the local internal interface and the second argument is the internal interface at the remote peer.

**\$5** is the argument that the OpenVPN program passes to the script file. Its value is the second argument of **ifconfig** in the configuration file.

5. Check the routing table after you run the OpenVPN programs, by typing the command `# route`.

Destination	Gateway	Genmsk	Flags	Metric
192.168.4.174	*	255.255.255.255	UH	0
0 0	tun0			
192.168.4.0	192.168.4.174	255.255.255.0	UG	0
0 0	tun0			
192.168.2.0	*	255.255.255.0	U	0
0 0	eth1			
192.168.8.0	*	255.255.255.0	U	0
0 0	eth0			

# 4

## System Recovery

---

The DA-682-LX is installed with the Embedded Linux operating system, which is located in the Flash DOM (CompactFlash card) shipped with the DA-682-LX computer. Although it happens rarely, you may find on occasion that operating system files and/or the disk file system are damaged. This chapter describes how to recover the Linux operating system.

This chapter covers the following topics:

- Recovery Environment**
- Recovery Procedure**

## Recovery Environment

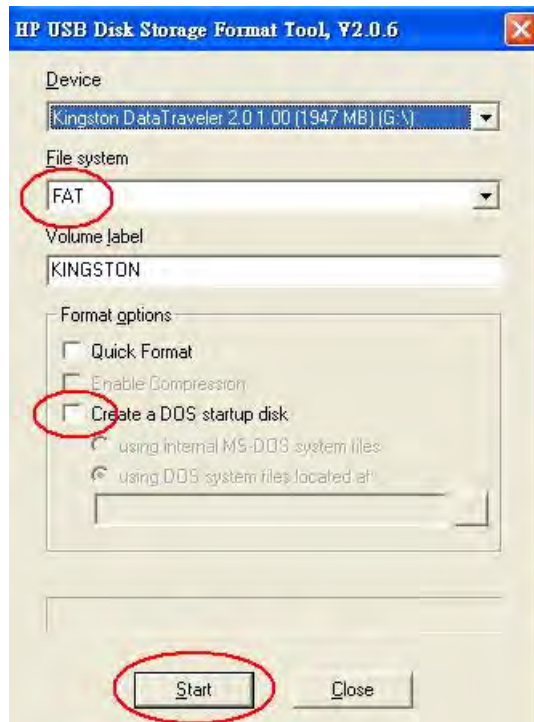

The recovery environment includes the DA-682-LX embedded computer and a bootable USB disk with the recovery programs and system image file.

## Recovery Procedure

### Step 1: Format an Empty USB Disk.

- a. Prepare a USB disk that has at least a 256 MB capacity.
- b. Format your USB disk with the **HP USB Disk Format Tool**. Open the utility and select the device and FAT file system. You need empty disk only. **DO NOT** check the option **Create a DOS startup disk**.
- c. Click **Start**.

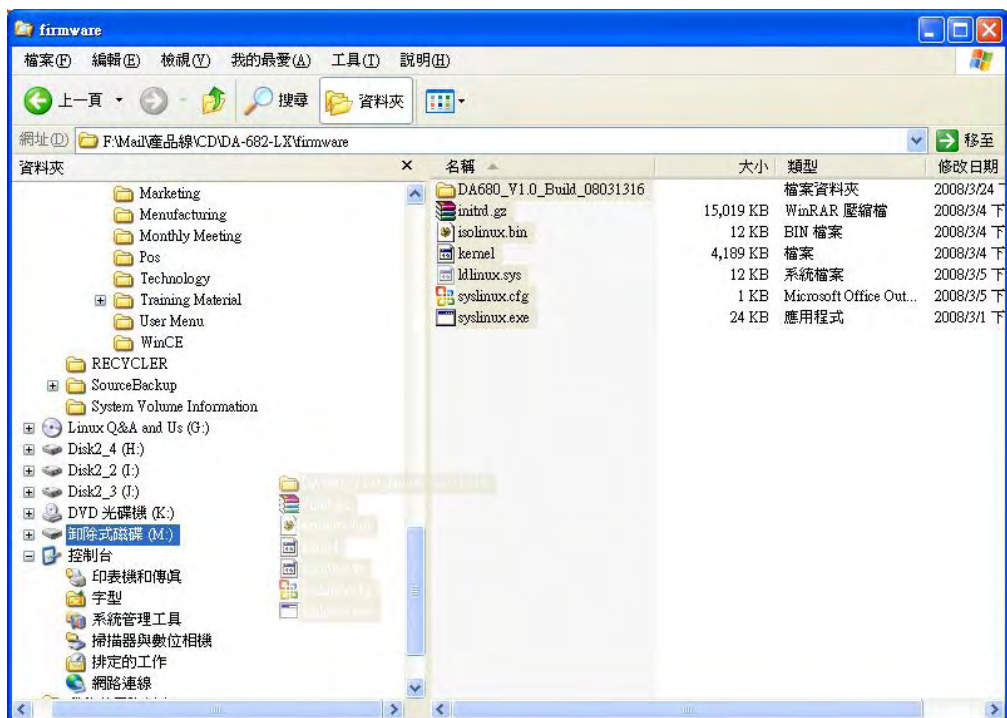

**ATTENTION**

The HP USB Disk Storage Format Tool can be downloaded from many web sites. Do a search on **HP USB Disk Storage Format Tool** from any search engine to locate the tool.

**Step 2: Create a Linux Bootable USB Disk.**

- a. You can find the **firmware** directory in the Recovery CD shipped with the DA-682-LX computer.
- b. Configure Windows Explorer to show hidden files (including protected operating system files).
- c. Copy all files in the **firmware** directory to the root directory of your USB disk.

- d. Open a DOS prompt and type **M:\syslinux.exe M:** to create a bootable Linux disk. In this example, M: is the USB Disk drive number.

**Step 3: Set up the BIOS to Boot from a USB Disk.**

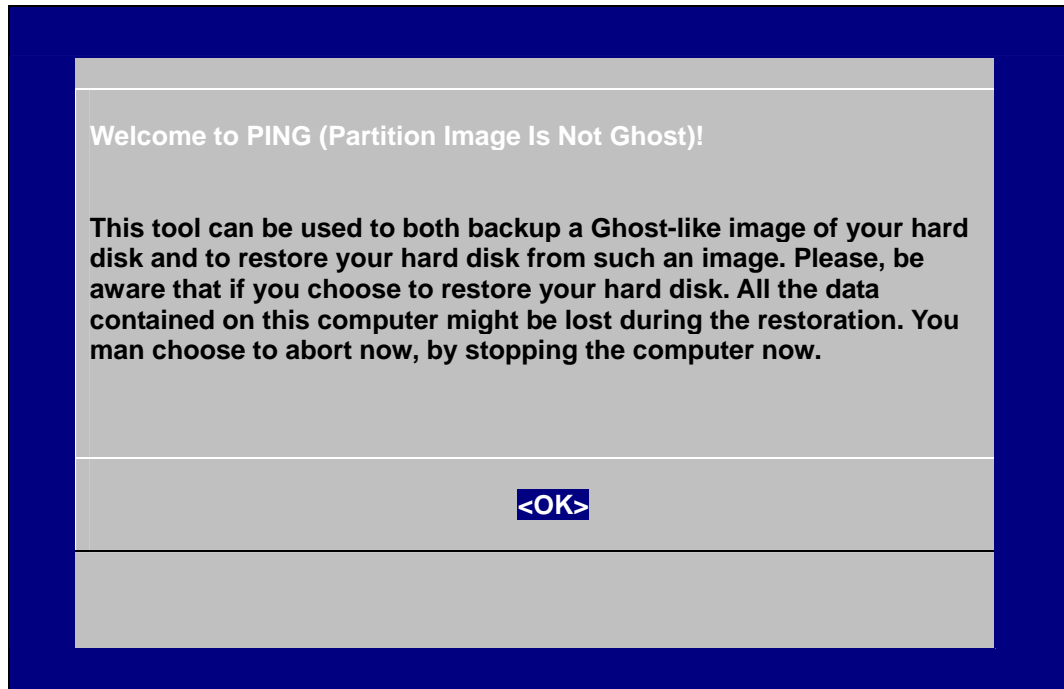

- a. Insert the USB disk.
- b. Power on and press **DEL** to enter the bios setup menu.
- c. Select **Advanced** → **Hard Disk Boot Priority** and then press **Enter**.
- d. From the setup menu, use “↑” or “↓” to select the USB device
- e. Press “+” to move the selection up to the first priority, and press **Esc** to exit the setup menu.
- f. Make sure the first boot device is **Hard Disk**. If not, press **Enter** to change it.
- g. Select **Exit** → **Save & Exit Setup** and then press **Enter**.
- h. Choose **Y** to save to the CMOS and then exit.

<p>↑↓:Move PU/PD/+/-:Change Priority F10:Save ESC:Exit</p> <p>F5:Previous Values F6:System Defaults F7:Turbo Defaults</p>	

**Step 4: Recover the Linux system from a USB Disk.**

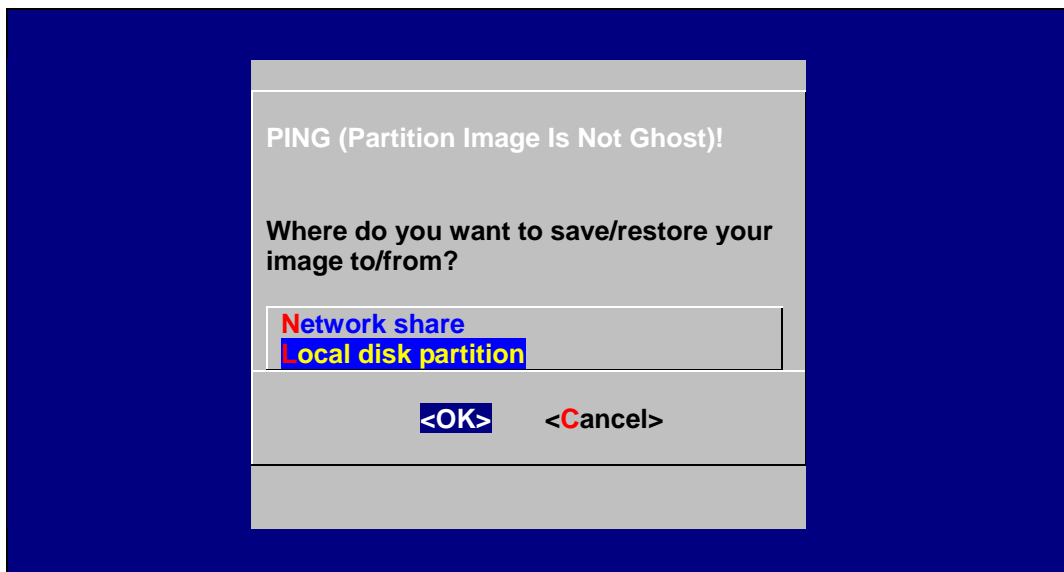

- a. If the BIOS setup is correct, it will boot from the USB disk. Follow the steps below to set up recovery parameters.

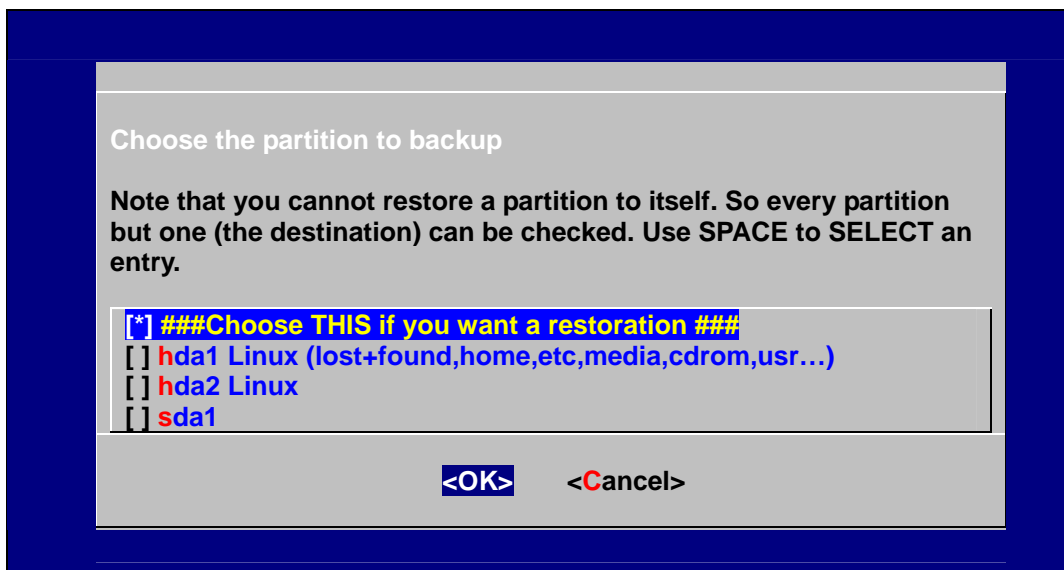

- b. Choose **OK** to go to the next step.
- c. Choose shut down the DA-680-LX when the restoration is finished.

- d. Choose restore image from **Local disk partition**.

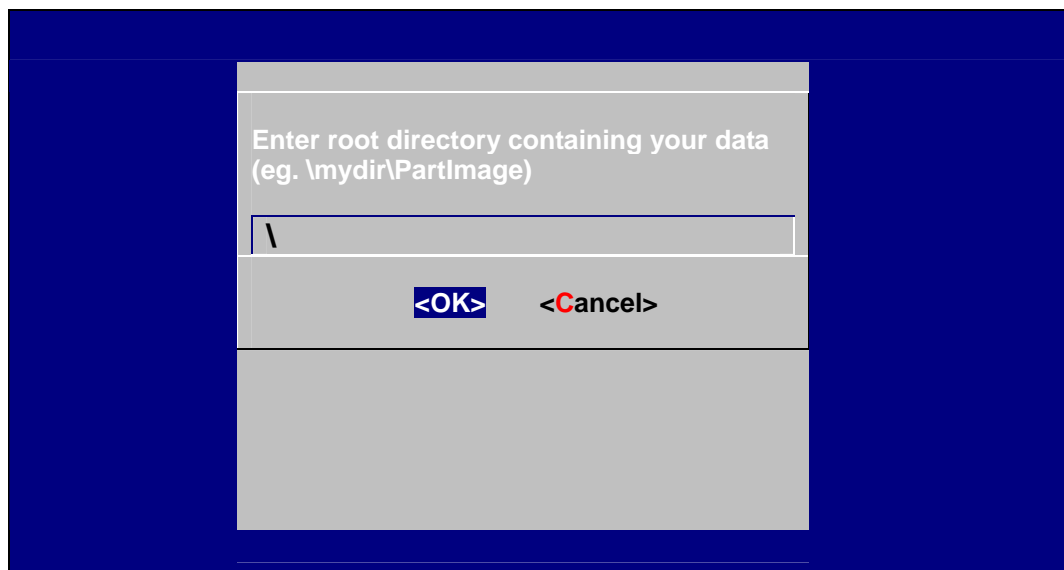

- e. Choose **### Choose THIS if you want a restoration ###**

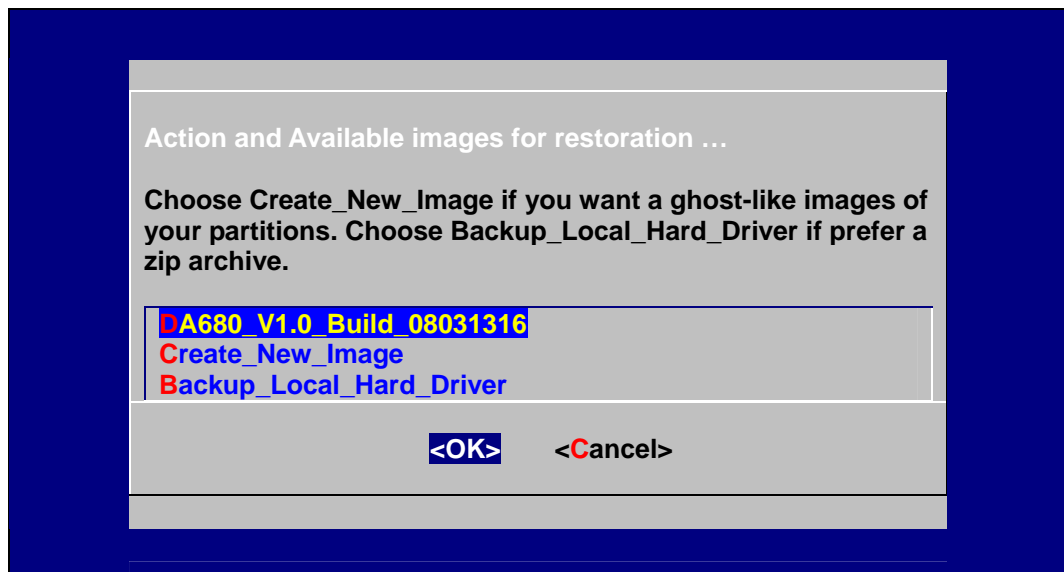

- f. Choose the restoration source device **sda1**.

- g. Enter “\” to choose the root directory of the restoration image.

- h. Choose **DA680\_V1.0\_Build\_08031316** for the restoration image.

- i. Choose **Yes** to start the restoration. After the restoration is finished, the system will halt and you will need to reboot to restart the restored system.

When operation is finished, turn off the computer and remove the USB disk.

#### ATTENTION

DO NOT turn off the power during system recovery, as the system may crash.

#### Step 5: Set up the BIOS back to boot from DOM or CompactFlash Disk.

- a. Power on and press **DEL** to enter the bios setup menu.

- b. Select **Advanced** → **Hard Disk Boot Priority** and then press **Enter**.
- c. From the setup menu, use “↑” or “↓” to select the DOM or CompactFlash device.
- d. Press “+” to move the selection up to the first priority, and press **Esc** to exit the setup menu.
- e. Select **Exit** → **Save & Exit Setup** and then press **Enter**.
- f. Choose **Y** to save to the CMOS and then exit.
- g. Wait a few minutes for the system to boot. When the recovery process is finished, you will again be able to see the Linux desktop.
