1. Introduction

UMC4 is a high performance USB interface card designed for Laser Marking System. The card supports digital galvo motor, compatible with XY2-100 protocol, and through DA2-16 daughter board can control analog galvo motor precisely. UMC4 built-in full offline marking functions, could access up to 16 files, each file contains up to 8 sets auto-text and 8 kinds of fonts. Through I/O signal or PLC human-machine interface, users could easily choose the file and start marking. The card also features complete rotary and mark-on-fly functions. Besides, it provides a variety of expanded boards for all kinds of connection requirements.

1-1 Specification

- ◆ Built-in DSP, marking computing do not occupy computer CPU time.
- ◆ Support one XY2-100 digital control signal output, 10 μ s cycle update galvo motor position.
- ◆ FPK, PPK, R05 first pulse suppression.
- ◆ Two 10-bits analog control signals.
- ◆ PWM maximum output frequency is 10MHz, minimum pulse width is 0.08 μ s.
- ◆ Support offline marking, could access 16 files each contains 8 sets auto-text and 8 kinds of fonts.
- ◆ One RS232 Communication Port for PLC communication.
- ◆ Support one encoder input for mark-on-fly function.
- ◆ Support 1-way pulse/direction or CW/CCW step/servo motor control signals, the maximum output frequency is 2MHz.
- ◆ Contain expansion connectors for connecting with a variety of daughter boards.
- ◆ Support Windows XP/Vista/Windows 7.

3. Installation and Cable Connection

3-1 UMC4 Installation

If your computer is not installed MM-SA software yet, please install the MM-SA first.

During MM-SA installation, system will run "UMC4-USB Driver Setup" automatically.

While "UMC4-USB Driver Setup" is executing, please press "Continue Anyway" button. This step may need to repeat 3 times.

After the installation completed, you could plug-in power of UMC4 and connect to computer via USB cable.

Normally, Windows system will appear a message " Found New Hardware UMC4-USB LASER MARKING CONTROL CARD".

Please press "Next" under the recommended setting.

Wait for wizard searching the driver,

After system founded UMC4 Driver, please press "Continue Anyway".

After driver installed, please press "Finish".

When the message "Your new hardware is installed and ready to use" appeared you could use UMC4 now.

If UMC4 installed properly, you could see the UMC4 device information appeared in Device Manager, as below:

3-2 XY2-100 Digital Scanner

Currently common seen digital galvanometer could divide into the following 2 types:

3-2-1 Type 1: With one D-SUB 25Pin connector ◦

3-2-2 Type 2: With D-SUB 25Pin connector + D-SUB 9Pin connector ◦

Notice:

- UMC4P1 is corresponding to digital galvanometer D-SUB25Pin. User could easily connect them by 25-pin 1 to 1 cable; however, if using type 1 galvanometer, user has to wire to power source from the cable.
- For the power source: User has to wire all pins of them, which means has to wire 3 pins of the +VCC, 3 pins of the -VCC, and 3 pins of the GND. **Only wire to 1 pin of +VCC, 1 pin of -VCC, or 1 pin of GND is forbidden.**

3-3 Pulse/Direction Signal Connection

According to the different types of Motor Driver, there are three ways of connection between Motor Driver and UMC4's P4 connectors.

3-3-1 Differential Signal

3-3-2 Common Anode TTL

3-3-3 Common Cathode TTL

3-4 Axis Control Signal Connection

3-4-1 Common Cathode Sensor(NPN)

3-4-2 Common Anode Sensor(PNP)

3-5 TTL Signal Connection

TTL signal is connected by one to one as below.

3-6 Encoder Signal Connection

3-7 Photo Couple Signal Connection

3-7-1 OPTO IN Connection

3-7-2 OPTO Out Connection

PS: The Max. current for Relay is 50 mA

3-8 START & STOP Signal Connection

3-8-1 Connect with general buttons

Note : Please set Common Cathode for HWConfig, Please refer to [3-8 HWConfig Setting Description](#).

3-8-2 Connect with sensors

a. For Common Cathode Sensor(NPN), short circuit the sensor output with GND.

Note : Please set Common Cathode for HWConfig, Please refer to [3-8 HWConfig Setting Description](#).

b. For Common Anode Sensor(PNP), short circuit the sensor output with Vcc.

Note : Please set Common Cathode for HWConfig, Please refer to [3-8 HWConfig Setting Description](#).

3-8-3 Input TTL signal

Note : Please set Common Cathode for HWConfig, Please refer to [3-8 HWConfig Setting Description](#).

Setting TTL signal with P2, Check for reverse.

Setting photo couple phase with P4, Check for reverse.

Selecting FPK or R05 Out(Applies Old Card IP1.2.1), The new card changed JP1 setting.

Setting Limit + - with P4 IN3 、IN4, Check for Limit+ - 、InPosition with P4 IN2.

Setting motion with P4, Selecting X 、Y 、Z 、R axis, By default the R axis.

4. Others

4-1 Clock

UMC4 is equipped with clock counter, capable to mark current date and time.

4-1-1 Hardware Configuration

- a. J7 is needed to connect with +1.5V~+5V battery. Without battery, the current date and time will be erased as long as UMC4 been cut-off power.
- b. Lifetime of Carbon-zinc battery is approximated 3 years.

Note: Even UMC4 is plug in the power, the battery is still consumed by minimum current.

4-1-2 Software Configuration (Time Reflash)

- a. Date and time will be updated to computer's current time when MM-SA is executing.
- b. Could be configured through PLC human-machine interface.

4-2Offline Marking Signal Time Series

7-2-3 JF1 (INPUT): TTL Input Port

When there is no any connection to TTL input, the program receives 0 value; while if input 0V, the program will read 0, if input 5V, the program will read 1. You must consider about the noise issue. The pin assignment of JF1 connector is compatible to the general purpose input daughter boards such as PCLD-782 of Advantech Co., Ltd. or the DB-16P of ICPDAS Co., Ltd. Using these kinds of daughter boards can isolate power source while provide protection and easy cable connections.

7-2-4 JF2(OUTPUT): TTL Output Port

As for the output of TTL, when an output is set as inactive in the software; the output voltage is 0V. When an output is set as active in the software; the output voltage is 5V. The pin assignment of JF2 connector is compatible to the general purpose relay output boards such as PCLD-885 of Advantech Co., Ltd. or the DB-16R of ICPDAS Co., Ltd. Using these kinds of daughter boards can isolate external power and drive the peripheral devices more powerfully, it provides benefits of protection and easy cable connections.

7-3 Cable Connection

7-3-1 Pulse/Direction Signal Connection

According to the different types of Motor Driver, there are three ways of connection between Motor Driver and UMC4_B_Motion's P2 ~ P4 connectors.

7-3-1-1 Different Signal

7-3-1-2 Common Anode TTL

7-3-1-3 Common Cathode TTL

7-3-2 Connect with sensors

7-3-2-1 Common Cathode Sensor (NPN)

7-3-2-2 Common Anode Sensor (PNP)

7-3-3 Encoder Signal Connection

7-3-4 TTL Signal Connection (JF1、JF2)

7-3-5 SPI STATUS Signal Connection (J6、J7)

7-3-5-1 Use internal power

7-3-5-2 Use external power

PS : SPI suggest external power is +5V, and series connect to 4.7k Ω . Please refer to SPI User`s manual.

8 OMRON Laser

8-1 Drivers Setting

OMRON_Fiber.cfg : OMRON RS232 connect to computer COM port.

OMRON_Fiber(DIRCTRL).cfg : OMRON RS232 connect to UMC4 Port J14.

8-2 Cable Connection

UMC4 P2 (D-SUB 15M HIGH DENSITY)		OMRON I/O Port (D-SUB 15M)	
6	LASER ON	5	LASER ON H
15	GND	6	LASER ON L
10	LAMP	7	LD ON H
15	GND	8	LD ON L

While use "OMRON_Fiber.cfg", connection is according to following definition:

PC RS232 (D-SUB 9M)		OMRON (D-SUB 9F)	
2	RX (Receive)	3	TX (Transmit)
3	TX (Transmit)	2	RX (Receive)
5	GND	5	GND

While use "OMRON_Fiber(DIRCTRL).cfg", connection is according to following definition:

UMC4 J14 (Wafer 3Pin)			OMRON (D-SUB 9F)	
	1	TX (Transmit)	2	RX (Receive)
	2	RX (Receive)	3	TX (Transmit)
	3	GND	5	GND

9 Using RS-232

9-1 What is RS-232

RS-232 is a kind of serial port. Common type of RS-232 connector is 9 pin D-Sub.

Some kinds of laser types needed to control by RS-232 port for tuning laser parameter, such as power percentage, frequency...etc.

9-2 Setting to use RS-232 to control laser

Take SPI G4 HS laser controlled by RS-232 as example. After user has executed \MarkingMate\DM.exe , chosen UMC4 at Driver Name column, and picked SPI_fiber_RS232_G4_HS.cfg at Mode column, to apply the setting by clicking OK. The location of cfg file is \MarkingMate\Drivers\UMC4\cfg\ . Refer to the following picture:

Open the given file by favorite text editor. There should be two instructions under [ENV] sector, such as RS232=1 and COMPORT=XXX. RS232=1 means control laser by RS-232. XXX within COMPORT=XXX means the using Com Port number. Default value is 1 which means using COM port 1 to control laser. Manually change this value to assign other port if necessary.

Appendix1: Various Laser Setting Modes

TYPE 1 : CO2 Mode

TYPE2 : YAG 1、2、3 Mode

TYPE 3 : R05 Mode

Appendix2 : How to Connect with PLC

UMC4 provides a RS232 (P3) port for PLC connection. PLC communication protocol is Mitsubishi FX series.

RS232 communication parameters:

Baud	115200 BPS
Parity Check	Even
Data Bit	8
Stop Bit	1
Flow Control	none

The connection diagram of UMC4, PLC, and Laser is as below:
