1 About this guide

This guide tells you how to install Sophos Anti-Virus on standalone and networked UNIX and Linux computers.

You can find details of all configuration options in the man pages and the *Sophos Anti-Virus for UNIX and Linux user manual* for version 4.

To install Sophos Anti-Virus so that it is updated automatically by Sophos Enterprise Console, see the *Sophos Enterprise Console startup guide for Linux, NetWare, and UNIX* instead of this guide.

Sophos documentation is published at <http://www.sophos.com/en-us/support/documentation/>.

2 System requirements

For system requirements, go to the system requirements page of the Sophos website (<http://www.sophos.com/en-us/products/all-system-requirements.aspx>).

3 About Sophos Anti-Virus for UNIX and Linux

3.1 What Sophos Anti-Virus does

Sophos Anti-Virus detects and deals with viruses (including worms and Trojans) on your UNIX or Linux computer. As well as being able to detect all UNIX and Linux viruses, it can also detect all other viruses that might be stored on your UNIX or Linux computer and transferred to other computers. It does this by scanning your computer.

3.2 How Sophos Anti-Virus protects your computer

Sophos Anti-Virus enables you to run an *on-demand scan*. An on-demand scan is a scan that you initiate. You can scan anything from a single file to everything on your computer that you have permission to read. You can either manually run an on-demand scan or schedule it to run unattended.

4 Installing Sophos Anti-Virus on a standalone computer

4.1 Download Sophos Anti-Virus

1. Log in to <http://www.sophos.com/en-us/Sophos/Support/Downloads.aspx> with your MySophos username and password.
2. Go to the standalone installer web page for UNIX (unmanaged), which includes both UNIX and Linux installers.
3. On the web page that is displayed, download the Sophos Anti-Virus version 4 tarball for your platform to a temporary directory, for example `/tmp`.

4.2 Extract the installation files

1. Change to the temporary directory to which you downloaded the Sophos Anti-Virus tarball.
2. Untar the tarball to the temporary directory:

```
tar -xzf tarball
```

where *tarball* is the tarball filename.

A directory `sav-install` is created in the temporary directory, which contains the extracted installation files.

4.3 Run the installation script

To perform this procedure, you must be logged on to the computer as root.

1. Change to the directory `sav-install`.

2. Run the installation script:

```
./install.sh
```

A warning about the environment variable MANPATH might be displayed. You can safely ignore this warning, as the installation is performed correctly.

By default, the script copies:

- The **sweep** program to `/usr/local/bin`.
- The shared library to `/usr/local/lib`.
- Virus data to `/usr/local/sav`.
- The manual page to `/usr/local/man`.

Note: You can specify the files that are installed and the directories to which they're installed by running the script with various options. For more information, run the script with the option **-h**.

4.4 Check environment variables

You need to ensure that your system's environment variables include the directories that Sophos Anti-Virus uses.

1. If you are running the sh, ksh or bash shell, open `/etc/profile` for editing.

If you are running the csh or tcsh shell, open `/etc/login` for editing.

Note: If you do not have a login script or profile, carry out the following steps at the command prompt. You must do this every time that you restart the computer.

2. Check that the environment variables include the directories that Sophos Anti-Virus uses:

PATH should include `/usr/local/bin`

MANPATH should include `/usr/local/man`

LD_LIBRARY_PATH should include `/usr/local/lib`

Note: On AIX, the library environment variable is LIBPATH, and on HP-UX it is SHLIB_PATH.

3. If the environment variables do not include these directories, add them as follows. Do not change any of the existing settings.

If you are running the sh, ksh or bash shell, type:

```
PATH=$PATH:/usr/local/bin
```

```
export PATH
```

```
MANPATH=$MANPATH:/usr/local/man
```

```
export MANPATH
```

```
LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/lib
```

```
export LD_LIBRARY_PATH
```

If you are running the csh or tcsh shell, type:

```
setenv PATH values:/usr/local/bin
```

```
setenv MANPATH values:/usr/local/man
```

```
setenv LD_LIBRARY_PATH values:/usr/local/lib
```

where *values* are the existing settings.

Note: On some systems, for example FreeBSD and Linux, you can enable Sophos Anti-Virus to use the Sophos Anti-Virus shared libraries by running **ldconfig**. This might require editing of `/etc/ld.so.conf`.

4. Save the login script or profile.

4.5 Add the latest virus data

To detect viruses that have been discovered since your version of Sophos Anti-Virus was compiled, you must add the latest virus data. This is in the form of *IDE files*. An IDE file is a file that enables Sophos Anti-Virus to detect and disinfect a particular virus.

1. Go to <http://www.sophos.com/downloads/ide/>.
2. Download the compressed IDEs file for your version of Sophos Anti-Virus.
3. Extract the IDEs to the directory `/usr/local/sav`.

Note: If you specified a different directory for virus data when you ran the installation script, you must extract the IDEs to that directory instead.

5 Run an on-demand scan of the computer

Having just installed Sophos Anti-Virus, we recommend that you scan the whole computer for viruses, especially if it's a server and you want to minimize the possibility of spreading viruses to the other computers. To do this, you run an *on-demand scan*.

- To run an on-demand scan of the computer, type:
`savscan /sweep /`

6 What happens if viruses are detected

If an on-demand scan detects a virus, by default Sophos Anti-Virus displays a command-line alert. It reports the virus on the line which starts with >>> followed by either Virus or Virus Fragment:

```
SWEEP virus detection utility
Version 4.79.0 [Linux/Intel]
Virus data version 4.79, July 2012
Includes detection for 3759929 viruses, Trojans and worms
Copyright (c) 1989-2012 Sophos Group. All rights reserved.

System time 13:43:32, System date 20 July 2012

IDE directory is: /usr/savides/

Using IDE file nyrate-d.ide
. . . . .
Using IDE file injec-lz.ide

Quick Scanning

>>> Virus 'EICAR-AV-Test' found in file /usr/mydirectory/eicar.src

33 files scanned in 2 seconds.
1 virus was discovered.
1 file out of 33 was infected.
Please send infected samples to Sophos for analysis.
For advice consult www.sophos.com or email support@sophos.com
End of Sweep.
```

For information about cleaning up viruses, see the *Sophos Anti-Virus for UNIX and Linux user manual* for version 4.

7 Updating Sophos Anti-Virus

To enable Sophos Anti-Virus to detect all the latest viruses, you must update it:

- Each month, when we release the new version of Sophos Anti-Virus.
- When a significant new virus emerges.

7.1 Updating Sophos Anti-Virus each month

Sophos releases a new version of Sophos Anti-Virus each month, according to the schedule on http://www.sophos.com/downloads/release_dates/.

7.1.1 Clear old virus data

- Delete all `*.ide` files from the directory `/usr/local/sav`.

Note: If you specified a different directory for virus data when you ran the installation script, you must delete the `*.ide` files from that directory instead.

7.1.2 Download Sophos Anti-Virus

1. Log in to <http://www.sophos.com/en-us/Sophos/Support/Downloads.aspx> with your MySophos username and password.
2. Go to the standalone installer web page for UNIX (unmanaged), which includes both UNIX and Linux installers.
3. On the web page that is displayed, download the Sophos Anti-Virus version 4 tarball for your platform to a temporary directory, for example `/tmp`.

7.1.3 Extract the installation files

1. Change to the temporary directory to which you downloaded the Sophos Anti-Virus tarball.
2. Untar the tarball to the temporary directory:

```
tar -xzf tarball
```

where *tarball* is the tarball filename.

A directory `sav-install` is created in the temporary directory, which contains the extracted installation files.

7.1.4 Run the installation script

To perform this procedure, you must be logged on to the computer as root.

1. Change to the directory `sav-install`.
2. Run the installation script:
`./install.sh`

A warning about the environment variable `MANPATH` might be displayed. You can safely ignore this warning, as the installation is performed correctly.

By default, the script copies:

- The **sweep** program to `/usr/local/bin`.
- The shared library to `/usr/local/lib`.
- Virus data to `/usr/local/sav`.
- The manual page to `/usr/local/man`.

Note: You can specify the files that are installed and the directories to which they're installed by running the script with various options. For more information, run the script with the option `-h`.

7.1.5 Add the latest virus data

To detect viruses that have been discovered since your version of Sophos Anti-Virus was compiled, you must add the latest virus data. This is in the form of *IDE files*. An IDE file is a file that enables Sophos Anti-Virus to detect and disinfect a particular virus.

1. Go to <http://www.sophos.com/downloads/ide/>.
2. Download the compressed IDEs file for your version of Sophos Anti-Virus.
3. Extract the IDEs to the directory `/usr/local/sav`.

Note: If you specified a different directory for virus data when you ran the installation script, you must extract the IDEs to that directory instead.

7.2 Update Sophos Anti-Virus when a significant new virus emerges

You can receive email notifications about new viruses by registering at <http://www.sophos.com/en-us/about-us/email-notifications.aspx>.

To update Sophos Anti-Virus when a significant new virus emerges:

1. Go to <http://www.sophos.com/downloads/ide/>.
2. Download the compressed IDEs file for your version of Sophos Anti-Virus.

3. Extract the IDEs to the directory `/usr/local/sav`.

Note: If you specified a different directory for virus data when you ran the installation script, you must extract the IDEs to that directory instead.

8 Remove Sophos Anti-Virus

To perform this procedure, you must be logged on to the computer as root.

All directories below refer to the installation defaults. If you specified different directories when you ran the installation script, you must apply these instructions to those directories instead.

1. Delete the **sweep** program: `/usr/local/bin/sweep`.
2. Delete the shared library: `/usr/local/lib/libsavi.*`.
3. Delete the virus data directory: `/usr/local/sav`.
4. Delete the configuration file: `/etc/sav.conf`.
5. Delete the manual page: `/usr/local/man/man1/sweep.1`.

Note: On SCO systems, delete `/usr/local/man/man.1/sweep.1` instead.

9 Appendix: Install Sophos Anti-Virus on networked computers

This procedure assumes that there is a trust relationship between the computers.

To perform this procedure, you must be logged on to the computer as root.

If you have multiple, networked UNIX or Linux computers, you may want to install and update Sophos Anti-Virus from a central directory, rather than carrying out installation at each computer separately.

To install Sophos Anti-Virus on networked computers:

1. On one of the computers, create a directory that is accessible by all the other computers.
2. Download Sophos Anti-Virus to this directory, by following the steps in [Download Sophos Anti-Virus](#) (section 4.1).
Repeat these steps for all the different platforms on your network.
3. Extract the installation files to this directory, by following the steps in [Extract the installation files](#) (section 4.2).

If you have more than one platform on your network, extract the files into separate subdirectories.

4. Change to the directory `sav-install`.
5. Use `ssh` to run the installation script on each computer from the shared directory:
ssh -l *username* *hostname* / .install.sh

where *username* is your user ID and *hostname* is the name of the computer on which you want to install Sophos Anti-Virus. You can put this command into a script to install Sophos Anti-Virus on all computers that share the same platform.

Note: You can specify the files that are installed and the directories to which they're installed by running the script with various options. For more information, run the script with the option `-h`.

If you have more than one platform on your network, ensure that you run the installation script from the correct set of installation files for each platform.

On older UNIX systems, `ssh` might not be available. You can use `rsh` instead, although it is less secure.

6. If you want to check the environment variables on each computer, follow the steps in [Check environment variables](#) (section 4.4) for each computer.
7. If you want to ensure each computer is able to detect viruses that have been discovered since your version of Sophos Anti-Virus was compiled, follow the steps in [Add the latest virus data](#) (section 4.5) for each computer.

10 Technical support

You can find technical support for Sophos products in any of these ways:

- Visit the SophosTalk community at community.sophos.com/ and search for other users who are experiencing the same problem.
- Visit the Sophos support knowledgebase at www.sophos.com/en-us/support.aspx.
- Download the product documentation at www.sophos.com/en-us/support/documentation/.
- Send an email to support@sophos.com, including your Sophos software version number(s), operating system(s) and patch level(s), and the text of any error messages.

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

Original SSLeay license

Copyright © 1995–1998 Eric Young (eay@cryptsoft.com) All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com). The implementation was written so as to conform with Netscape's SSL.

This library is free for commercial and non-commercial use as long as the following conditions are adhered to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young's, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgement:

“This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)”

The word “cryptographic” can be left out if the routines from the library being used are not cryptographic related :-).

4. If you include any Windows specific code (or a derivative thereof) from the apps directory (application code) you must include an acknowledgement:

“This product includes software written by Tim Hudson (tjh@cryptsoft.com)”

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY

OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The license and distribution terms for any publically available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License.]

UnRAR

The source code of UnRAR utility is freeware. This means:

1. All copyrights to RAR and the utility UnRAR are exclusively owned by the author - Alexander Roshal.

2. The UnRAR sources may be used in any software to handle RAR archives without limitations free of charge, but cannot be used to re-create the RAR compression algorithm, which is proprietary. Distribution of modified UnRAR sources in separate form or as a part of other software is permitted, provided that it is clearly stated in the documentation and source comments that the code may not be used to develop a RAR (WinRAR) compatible archiver.
3. The UnRAR utility may be freely distributed. It is allowed to distribute UnRAR inside of other software packages.
4. THE RAR ARCHIVER AND THE UnRAR UTILITY ARE DISTRIBUTED "AS IS". NO WARRANTY OF ANY KIND IS EXPRESSED OR IMPLIED. YOU USE AT YOUR OWN RISK. THE AUTHOR WILL NOT BE LIABLE FOR DATA LOSS, DAMAGES, LOSS OF PROFITS OR ANY OTHER KIND OF LOSS WHILE USING OR MISUSING THIS SOFTWARE.
5. Installing and using the UnRAR utility signifies acceptance of these terms and conditions of the license.
6. If you don't agree with terms of the license you must remove UnRAR files from your storage devices and cease to use the utility.

Thank you for your interest in RAR and UnRAR.

Alexander L. Roshal
