1. Remote View introduction

Remote View is an application running under Windows NT4.0, Windows 2000/XP/2003, used for monitoring device equipped with USHA (abstraction of <u>UPS SNMP/H</u>TTP <u>A</u>dapter) and inSentery on Internet through SNMP protocol. Therefore you must install SNMP protocol and start SNMP service in your system before using Remote View. Remote View can manage up to 1024 devices simultaneously and the hierarchy structure can have up to 8 levels.

Remote View is the client software running on NMS (Network Management System). Users are provided with tree-view and list-view (Icon style and Report style) to monitor device in this software. When trap happens, icon will change to different colors according to the severity level, sending email to special address which has been set in E-mail Configuration dialog window, calling a cellphone number which has been set in Short Message Service Configuration dialog window to send the trap message.

2. Remote View Installation

3. Remote View Function Introduction

1) Menu-File serials

a. New

This command is used for creating a new map file. When click it, a new map file is created, and a list view window is added. On this basis, you can add group and device, and do other edit operations to form a proper map file you want.

b. Open

This command is used for open an existed map file. When click it, a standard file-open dialog will pop-up, select one map file and click button "open", then this map file will be opened by Remote View.

*Attention: only map file can be opened by Remote View. If file's type is not correct, there may be error messages or AP will close. If AP close don't worry, restart it.

c. Close

Use this command to close a map file. With this command, all list-view windows will close and tree-view will be blank. If you have created a new map file or made changes to the existed map file, before close, it will pop a message box to let decide whether to save.

d. Save

If you create a new file or made changes to the existed file, you can use this command to save file. If create a new file, a standard file-save dialog will popup, input file name, file will be saved. If file has existed, changes will be saved directly.

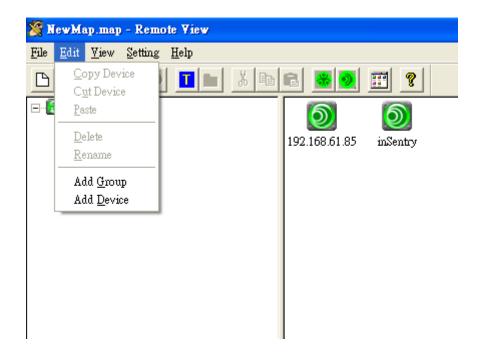

e. Save as

If you want to save a file by another file name, use this command. When click this menu, a standard file-save-as dialog will popup, input file name, then click "save" button, it will be OK.

f. Exit

Use this command to close AP. If you have created a new map file or made changes to the existed map file, before close, will pop a message box to let decide whether to save.

2) Menu-Edit serials

a. Copy device

This command and command paste provide an approach which end-user can copy and paste one or more devices from one group to another group. The device has been selected in the list-view. This command is used with paste in couples.

b. Cut device

This command is a standard copy & paste windows command. Use this command can cut a device and paste it to another group.

c. Paste

This is a standard edit command. If you have executed cut or copy command, it will be active, click main menu or right click in the client region of list-view window, paste operation will execute. Device will be pasted to the list-view window which has input focus.

d. Delete

These are standard edit commands. Before use this command, please select a group or device in list view window first. You can use this command from the main menu or right click on the group or device icon in the tree-view or list-view.

e. Rename

With this command, you can rename a group or device. Select a group or device icon, click main menu or right click on the icon in the tree-view or list view and then you can change the group or device name.

* Attention: Name's max character length will be 16.

f. Add Group

This command will add a new group to the list-view window. Default name is "Group1", you can change it by "Rename" command.

* Attention: Because the max depth of tree structure is 8, so if the total depth is above 8, this function will be disabled.
