

# StrataLink<sup>®</sup> 24

24 GHz All-Outdoor 750 Mbps FDD Point to Point License-Free Microwave System  
Model: SL-24,SL-24-X, SL-24-E, SL-24-EX

# User Manual

## Revision History

Revision	Revision Date	Description
1.0	31 Mar 2013	Initial Release
1.1	8 April 2013	Updated QoS related sections, typographical errors throughout
2.2	17 May 2014	Update document to reflect Model SL-24-E, -EX features: <ul style="list-style-type: none"><li>- AES-256 Encryption (option)</li><li>- Large Packet Buffer</li><li>- Simultaneous use of both Ethernet ports for traffic</li><li>- Port VLAN membership</li><li>- 8 QoS Queues</li><li>- IEEE1588V2 Transparent Clock</li><li>- DHCP</li><li>- NTP</li><li>- Syslog Server</li></ul> Add -N models with expanded frequency range for Taiwan.

## ***Introduction***

Thank you for purchasing the StrataLink 24 unlicensed point to point microwave system. This manual is designed to provide guidance on the configuration, installation, and usage of the advanced features of the system. For a condensed version covering basic setup and installation, please refer to the Quick Start Guide and related application notes.

The StrataLink 24 is a high performance, highly integrated unlicensed 24 GHz Microwave transmission system for transporting Ethernet traffic. A single link comprised of two radio units features up to 761 Mbps Full Duplex Layer 2 capacity.

## ***System Components***

The basic link consists of the following items:

2 each all outdoor radio model SL-24 or SL-24-E

2 each Dish Antenna model AD24G-xx-xx

2 each PoE Injector model POE-GIGE-48 (required only if Power over Ethernet is used)

2 each Power Supply model PSUPPLY-WM-48-L

Additional items may be needed depending on the link configuration. A List of the most common part numbers used for the system is given in Table 1.

Part Number	Description
TLSSL-24	StrataLink <sup>®</sup> 24 US/IC system, 24.05-24.25 GHz Version 1
TLSSL-24-E	StrataLink <sup>®</sup> 24 US/IC system, 24.05-24.25 GHz Version 2
TLSSL-24-X	StrataLink <sup>®</sup> 24 US/IC system, 24.05-24.25 GHz XPIC Version 1
TLSSL-24-EX	StrataLink <sup>®</sup> 24 US/IC system, 24.05-24.25 GHz XPIC Version 2
SL-24	StrataLink <sup>®</sup> 24 All Outdoor Unit, US/IC 24.05-24.25 GHz Version 1
SL-24-E	StrataLink <sup>®</sup> 24 All Outdoor Unit, US/IC 24.05 -24.25 GHz Version 2
SL-24-E-N	StrataLink <sup>®</sup> 24 All Outdoor Unit, NCC 24.00 -24.25 GHz Version 2
SL-24-X	StrataLink <sup>®</sup> 24 All Outdoor Unit, US/IC 24.05-24.25 GHz XPIC Version 1
SL-24-EX	StrataLink <sup>®</sup> 24 All Outdoor Unit, US/IC 24.05 -24.25 GHz XPIC Version 2
SL-24-EX-N	StrataLink <sup>®</sup> 24 All Outdoor Unit, NCC 24.00 -24.25 GHz XPIC Version 2
PSUPPLY-WM-48-L	-48 Volt Universal Wall Mount power supply with PoE
POE-GIGE-48	PoE injector/ Surge Suppressor for ApexPlus/StrataLink Family
CBLDAT-RSSI	BNC-M to Banana plug cable for RSSI voltage measurement
PLAKIT-MM-9	PLA kit - (2ea MM SFP modules and 1 ea 9 ft Armored Fiber cable) – 2 required per link
CBLDAT-XPIC-9	XPIC Coaxial Cable set (2ea 9 ft cables) – 2 required per link
SL-KEY-300	Software Key to enable 300 Mbps Capacity for one pair of radios
SL-KEY-400	Software Key to enable 400 Mbps Capacity for one pair of radios
SL-KEY-MAX	Software Key to enable 761 Mbps Capacity for one pair of radios
SL-KEY-A256	Software Key to enable AES 256 for one pair of radios (-E models only)
SFP-Console	Serial Console SFP Module with DB9 Male Serial Interface
SFP-GigE-C	SFP 1000BaseT Copper RJ45
SFP-GigE-C-1	SFP 100/1000BaseT Copper RJ45
SFP-GigE-S	SFP Fiber Single Mode Module
SFP-GigE-M	SFP Fiber Multi Mode
AD23G-1-T2	Antenna, 36 dBi 1 ft/ 30cm, Freq:21.20-24.25GHz
AD23G-2-T2	Antenna, 41 dBi 2 ft/ 60cm, Freq:21.20-24.25GHz
AD23G-3-T2	Antenna, 44.5 dBi 3 ft/ 90cm, Freq:21.20-24.25GHz

Table 1: StrataLink<sup>®</sup> 24 Part Numbers

## ***System Overview***

The StrataLink<sup>®</sup> 24 is an ultra high performance license free all outdoor point-to-point wireless microwave system designed for Carrier, Enterprise, and Service Provider networks using worldwide unlicensed 24.00 to 24.25 GHz spectrum. Key features include:

- 1) Up to 761 Mbps full duplex Layer 2 Ethernet throughput in a 60 MHz channel using multi-layer header compression.
- 2) Frequency agility which allows co-location of multiple systems on the same tower.
- 3) MultiLayer Header Compression increases small packet capacity dramatically by replacing MAC, IP, VLAN, TCP and UDP headers with small tags during transmission over the air.
- 4) XPIC Version has support for up to 1.5 Gbps full duplex throughput in a 60 MHz channel with the addition of another unit.
- 5) Spectral efficiency up to 25 bits/Hz with 1024QAM modulation in an XPIC configuration. Up to 12.5 bits/Hz without XPIC.
- 6) Physical Link Aggregation (PLA) to support XPIC and 2+0 operation working in conjunction with ACM – not dependent on multiple traffic flows like LACP.
- 7) Hitless advanced ACM with 9 levels to provide higher capacity in degraded channel conditions.
- 8) IEEE1588v2 timing over packet support (Transparent Clock AND fixed latency) (SL-24-E, SL-24-EX)
- 9) Low latency and jitter in all ACM modes
- 10) 8 Queue Diffserv, VLAN QoS with 4 strict/DWRR scheduling algorithm options. (4 queues in SL-24, SL-24-X)
- 11) AES256 Encryption with optional license key (SL-24-E, SL-24-EX)
- 12) Up to 8 Mbyte packet buffer to absorb bursty traffic and increase TCP performance over high latency networks (SL-24-E, SL-24-EX)
- 13) Spectrum Survey tool for identifying interference from other transmitters in the area.

The system includes both 10/100/1000BaseT and Fiber interfaces, with in band or out of band management.

The StrataLink 24 was created to allow the highest performance possible in the 24 GHz band with the highest level of integration, increasing MTBF and lowering power consumption. The system also has custom channel assignment, multiple channel bandwidth options, and is quickly deployed and easily setup. The all-outdoor unit attaches directly to the high performance antenna using 4 latches, with only a single Ethernet cable required to carry management, traffic, and power to the network.

A link consists of two **identical** units, one transmitting on Vertical polarization and one transmitting on Horizontal polarization. This arrangement allows for the most flexibility in the field and for sparing since there are no special sub-bands or low / high transmit model. Each end of the link is the same. A block diagram of the default link configuration is shown below.

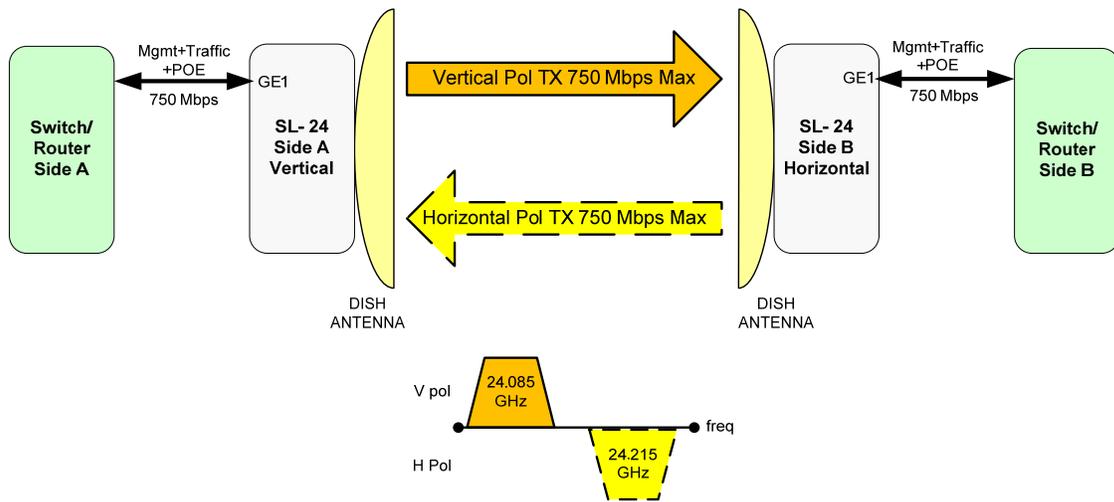

Figure 1 Default Link Configuration

The StrataLink<sup>®</sup> 24 is a Frequency Division Duplex (FDD) radio which provides low latency of less than 300 microseconds ( $\mu$ s), over 1 million packets per second, and up to 761 Mbps of full duplex capacity depending on the packet size. Standard features include Quality-of-Service (QoS) traffic prioritization to ensure that critical traffic gets through, as well as Adaptive Coding and Modulation (ACM) to improve performance during weather related signal degradation.

StrataLink<sup>®</sup> 24 supports either direct -48 Volt DC power or power over Ethernet using a PoE injector device provided by Trango connected to the built in RJ45 connector on the radio.

Functional block diagrams of the digital and RF portions of the system are shown below.

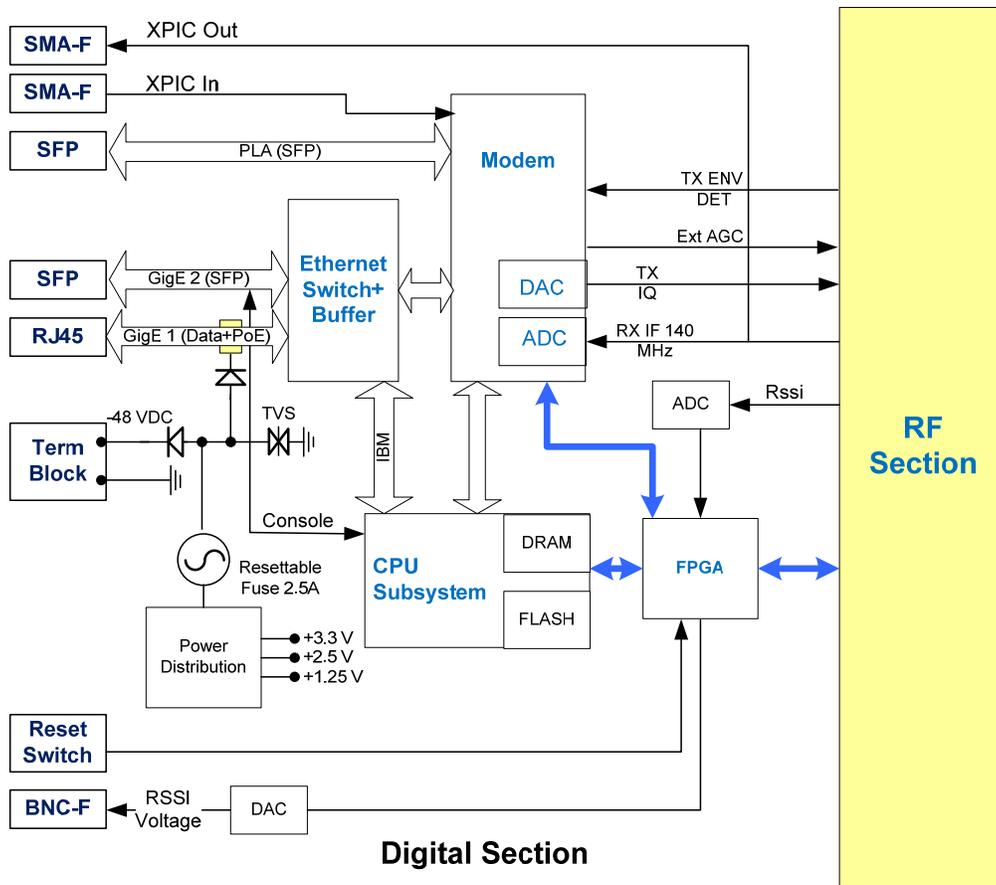

Figure 2 Digital Section Functional Block Diagram

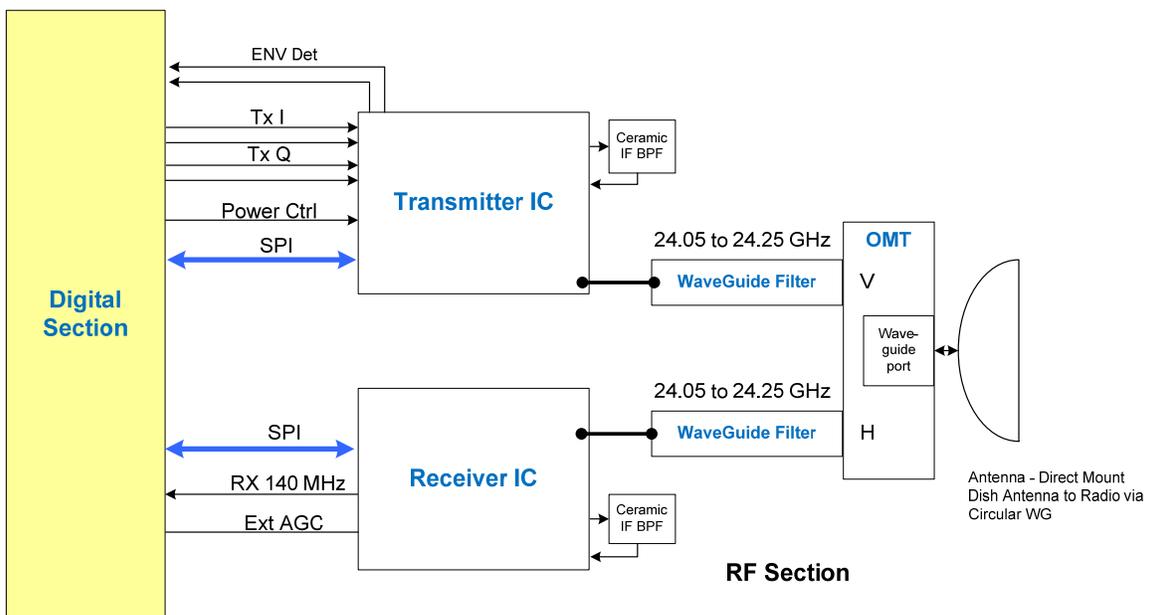

Figure 3 RF Section Functional Block Diagram

## Ports and Indicators

Below is a picture showing the main interfaces of the SL-24 after removing the port cover (loosen the two captive screws)

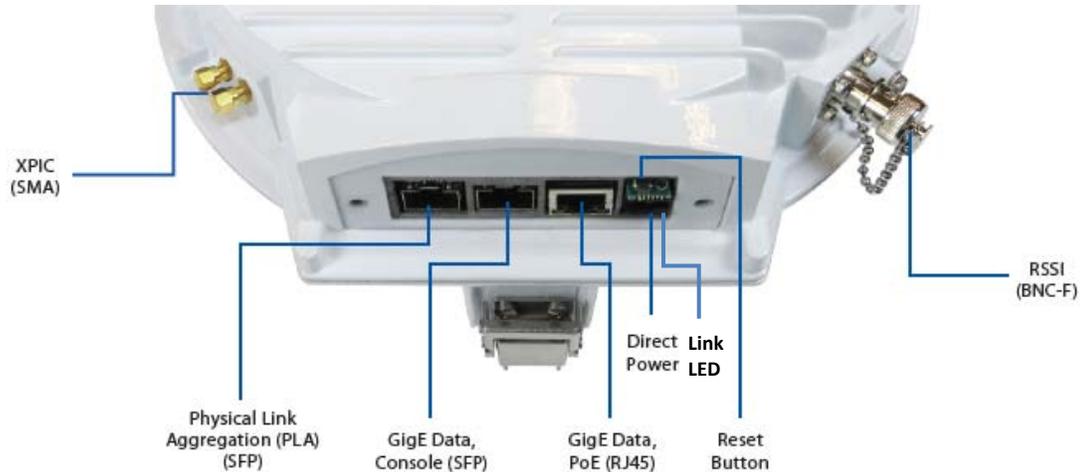

Figure 4 Interface Panel

**GigE Data RJ45 (GE1)** - Interface for Traffic and/or Management. Autonegotiate 10/100/1000 BaseT. This port also supports PoE operation using the PoE-Gige-48 Power injector. This is the default traffic and management port

**GigE Data SFP (GE2)** - Interface for Traffic and/or Management. 1000 BaseT Only. **NOTE: DO NOT CONNECT PoE POWERED CABLE TO THIS PORT AS THE SFP MODULE WILL BE DAMAGED.** SFP modules supported are:

- a. SFP-GigE-C – Copper RJ45 module to support 1000BaseT
- b. SFP-GigE-S – Single Mode Fiber for long haul
- c. SFP-GigE-M– Multimode Fiber for short haul

With the optional **SFP-Console** module this port can be directly connected to a PC Serial port.

**PLA Port (SFP)** – The PLA SFP Port is a dedicated 1000BaseT or LC fiber Ethernet connection used for Physical Link Aggregation. This port is used to connect a master and slave IDU to each other using multimode fiber (**PLAKIT-M-9** required). This port is only used in a PLA-2+0 or PLA-XPIC configuration. **NOTE: DO NOT CONNECT PoE POWERED CABLE TO THIS PORT AS THE SFP MODULE WILL BE DAMAGED.**

**Direct Power** – Terminal Block for applying direct -48 VDC power to the unit. When used in conjunction with the PoE on GE1, whichever voltage is higher will be used, supporting backup power configurations.

**BNC** – Output of DC voltage proportional to the RSSI level. The chart below gives the voltage vs RSL. The voltage is updated 2 times per second.

*The BNC Voltage = 0.1 + 0.04 x (90 + RSL) Volts, where RSL = -90 to -20 dBm*

RSL(dBm)	-90	-85	-80	-75	-70	-65	-60	-55	-50	-45	-40	-35	-30	-25	-20
BNC Voltage (V)	0.10	0.30	0.50	0.70	0.90	1.10	1.30	1.50	1.70	1.90	2.10	2.30	2.50	2.70	2.90

**Reset Button** – The Reset button operates as follows:

- 1) Hold for more than 2 seconds, but less than 6 seconds:
  - a. The IP address will be reset to default to allow access in the event of a forgotten password or IP address.
  - b. The CLI management passwords will be reset to default
  - c. The Web interface passwords will be reset to default.
  - d. The SNMP read/write/trap community strings will be set to defaults.
  - e. The CLI prompt will be reset.
  - f. The unit WILL REBOOT automatically.
  
- 2) Hold for more than 6 seconds:
  - a. The system configuration will be reset to the factory default, which includes:
    - i. Radio settings
    - ii. Port Settings
    - iii. QoS Settings, VLANs
    - iv. Unit ID
  - b. The items in (1) above will NOT be reset.
  - c. The unit WILL REBOOT automatically.

**Link LED** – LED is solid green on when linked with the far end unit, and flashing when not linked. LED will be on solid at system power up for approximately two minutes regardless of link status to indicate power is applied.

**XPIC** – Input/Output coaxial connection to second radio (–X and –EX models only) – required only for XPIC operation – CBLDAT-XPIC-9 kit also required. When XPIC is not in use ensure that the caps remain installed. For non XPIC models do not remove the hex bolts as this will expose the unit to possible water damage and require a non-warranty repair.

## **Antenna Connection**

The StrataLink 24 utilizes a slip fit connection that makes installation simple. The unit is designed to mount to a circular waveguide antenna which may be 1, 2, or 3 foot in diameter.

## **Power Supply**

Trango can provide power supplies for rack mount and desktop applications. The PSUPPLY-1U-48 is a rack mount power supply with 6.5 Amp capacity that can support multiple co-located StrataLink 24 units. The PSUPPLY-WM-48 and PSUPPLY-WP-48-L are wall mount power supplies with 2.3 and 1.66 Amp capacities, respectively, and are only recommended for a single StrataLink 24 unit. The power supply should be kept in a weatherproof, temperature controlled environment within the operating temp of 0 to 40 deg C.

## **Direct Power Option**

The StrataLink 24 can be direct powered using a -48 Volt DC source with a terminal block connection at the unit. The length of the cable varies on the gauge of the wire being used, but in general longer distances can be achieved than using the PoE option since the voltage drop is less. As long as the minimum voltage is maintained at the StrataLink 24 unit, the system will operate. This option is also preferred for applications using fiber for the data.

## **Power Over Ethernet (PoE) Option**

With the PSUPPLY-WP-48-L and/or PoE-GigE-48 PoE injector, the StrataLink 24 can be powered over the same Cat5e/Cat6 Shielded Twisted Pair (STP) that is used for the Main data/management connection connected to the built in RJ45 port (GE1). Both surge suppression and power are provided with a single PoE-GigE-48 device. Note that all 8 wires are used for -48 VDC and the ground return is carried on the cable shield, so Shielded Twisted Pair (STP) Cat6 or Cat 5e must be used. It is highly recommended that the cable drain wire be soldered to the connector shield.

## **License Free Operation with no sub-banding or Hi/Low models**

The system is designed to be compliant with FCC Part 15.249 and Canada RSS-210 unlicensed regulations and can be installed immediately. Due to the cross polarized design, a link consists of two identical radio units, one transmitting on vertical polarization and the other transmitting on horizontal polarization. The operator simply ensures that the TX and RX frequencies match, then installs and aligns.

## Traffic Capacity

With QAM1024 modulation in a 56/60 MHz channel, the link can support capacities up to 761 Mbps full duplex for 64 Byte packets and 486 Mbps for 1518 byte packets and higher. These numbers are based on a single VLAN with IPv4 traffic and Header Compression enabled. With PLA and XPIC full Gigabit speeds can be supported regardless of packet size. Aggregate numbers, which are sometimes used for comparison, are twice the numbers shown above.

# Link Management

The StrataLink 24 can be managed through web, Command Line Interface, Console Port, or SNMP as described below:

## Graphical User Interface (GUI):

**Web Browser:** Remote access via in band and out of band methods with view/configuration level access (single user + password).

The StrataLink 24 is compatible with any standard web browser such as Internet Explorer, Chrome, Firefox, and Safari.

The Link Setup web pages allow the following items to be set, saved and viewed:

### Set and saved

- Transmit Frequency
- Channel Bandwidth and Modulation Range
- Transmit Power level
- Turn Transmitter On
- IP address and subnet, IBM on/off, IBM VLAN
- Management Port (GE1 or GE2)
- GPS Coordinates for graphing
- Date and Time
- Port Enable and Disable
- Port Priority
- Port Rate Limit
- PLA Type
- QoS Settings including packet buffer size
- VLAN membership by port

Additional Web pages provide advanced setup of the various features and provide detailed monitoring and troubleshooting. For a more detailed description of the web interface, please see [Appendix C - Web Interface Guide](#)

## Command Line Interfaces

**SSH** – Encrypted remote access via in band and out of band methods with separate view and configuration level access (password protected).

**Telnet** – Remote access via in band and out of band methods with separate view and configuration level access (password protected).

**Console** – Local Access using a serial cable for bench configuration with separate view and configuration level access (password protected).

For a detailed description of the commands available, please see [Appendix D - Command Line Interface Guide](#)

## **SNMP Management**

Remote control and monitoring via in-band and out-of band methods using any third party Network Management Software (NMS).

Standard MIB II System Level and Enterprise MIB Blocks are supported with monitoring for all major link health and traffic related metrics.

For a detailed description of the SNMP Object IDs available, please see [Appendix E - SNMP Object ID \(OID\) Guide](#).

SNMP Traps may be set up to allow monitoring of various parameter thresholds with any third party Trap Management software. Multiple IP addresses can be assigned to all traps.

# Radio Traffic/Management Configurations

The radio unit has two ports that can be configured for In-band management (IBM) or Out of band management (OBM) depending on the preference of the user. The Block Diagrams below show the flow of both payload and management traffic for the four options as it enters the radio unit from the network or radio side:

## IBM with GE1 (RJ45)

This is the default Configuration using the built In RJ45 for both service and management traffic. GE2 is available for traffic. See the Figure below:

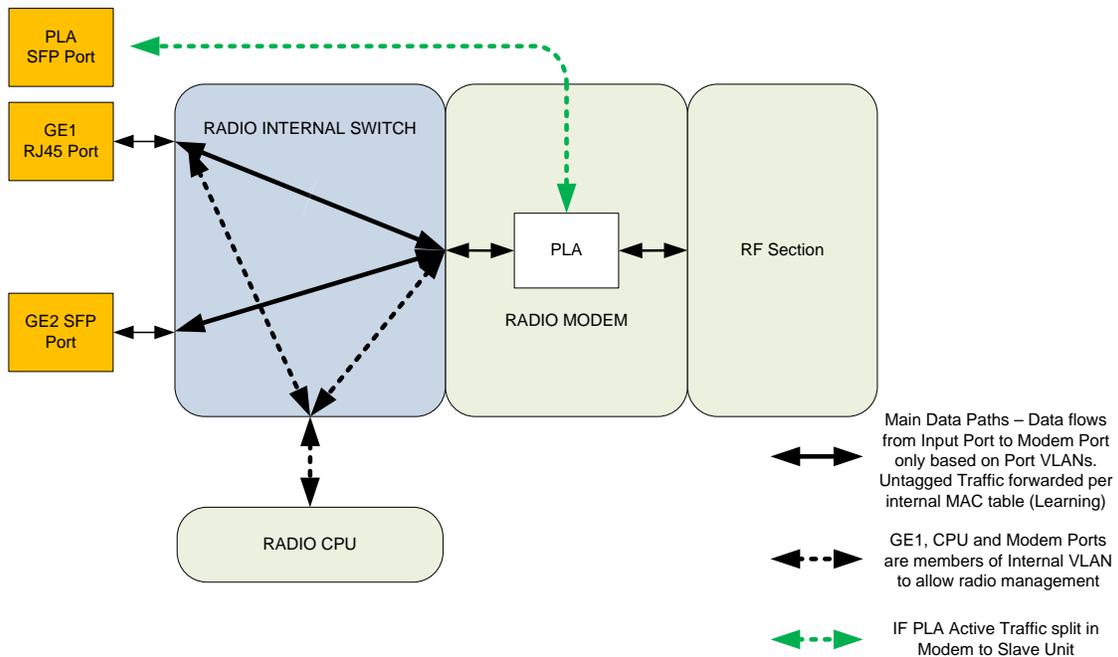

Figure 5 Management Configuration - IBM using GE1

## IBM with GE2 (SFP)

In this configuration both service and management traffic is on GE2 (SFP). GE1 is available for user data only. See the Figure below:

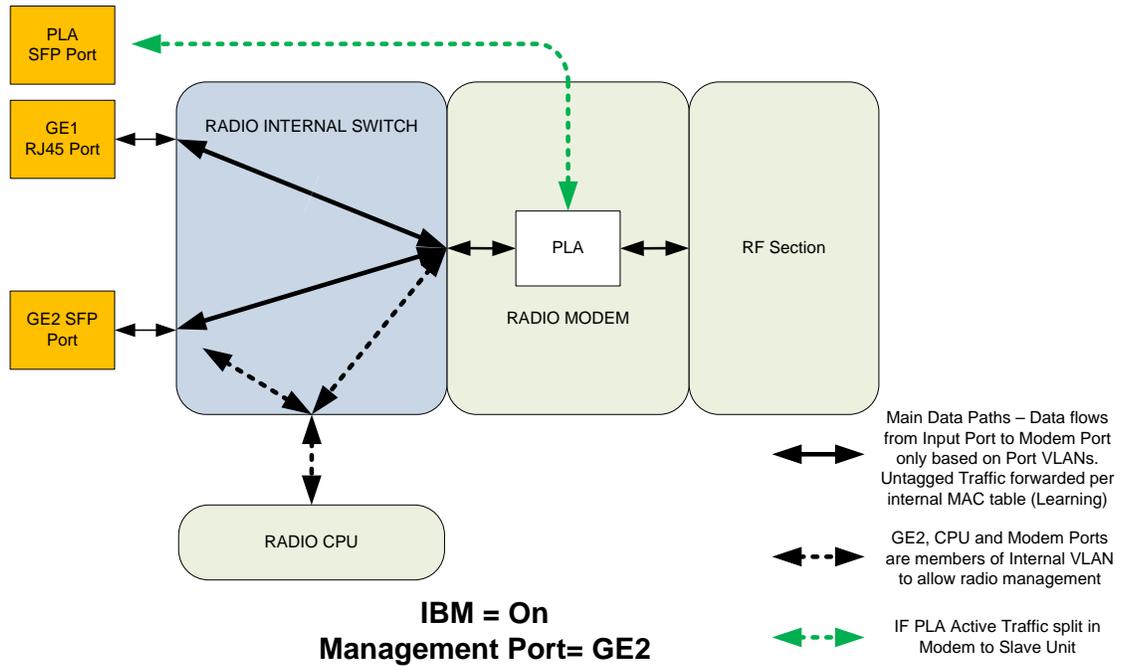

Figure 6 Management Configuration - IBM using GE2

## Traffic on GE1(RJ45) and OBM on GE2 (SFP)

In this configuration traffic is on GE1 and management is on GE2. See the Figure below:

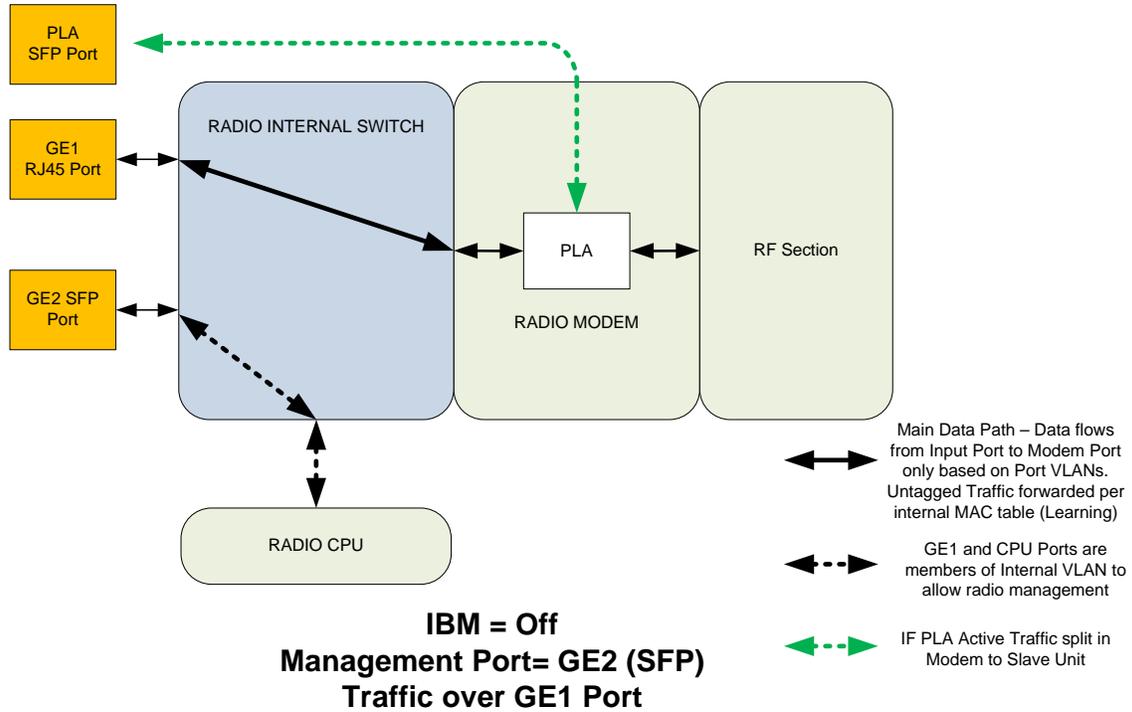

Figure 7 Management Configuration - OBM using GE2

## Traffic on GE2 (SFP) and OBM on GE1(RJ45)

In this configuration traffic is on GE2 and OBM is on GE1. See the Figure below:

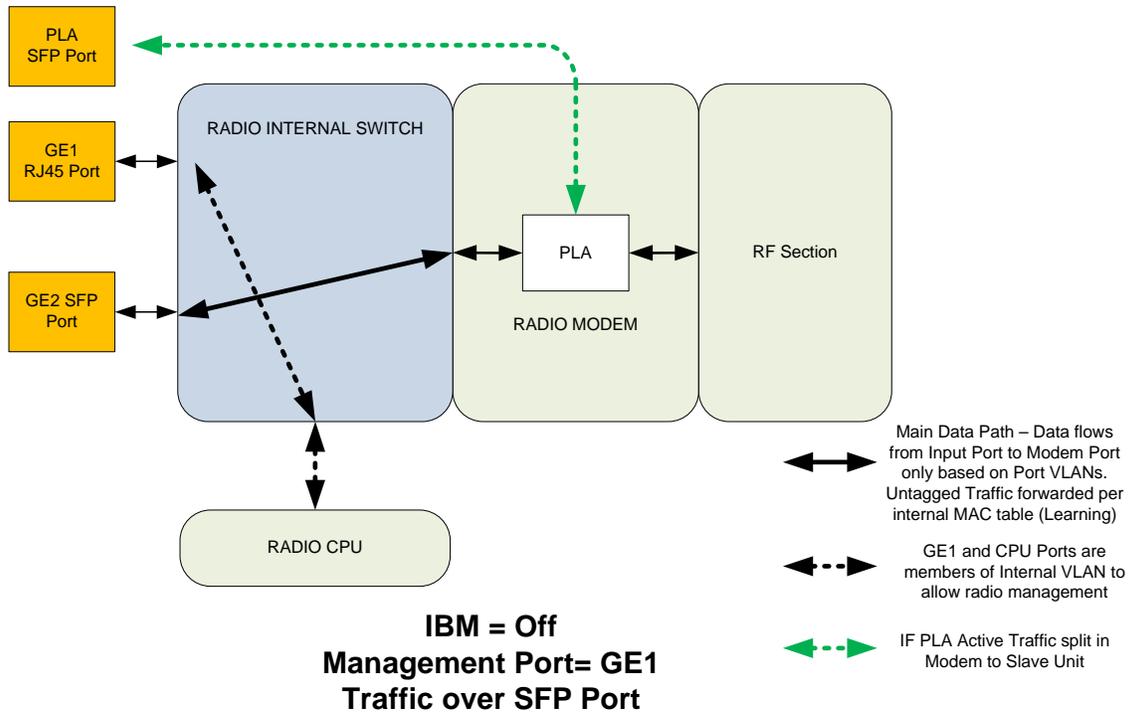

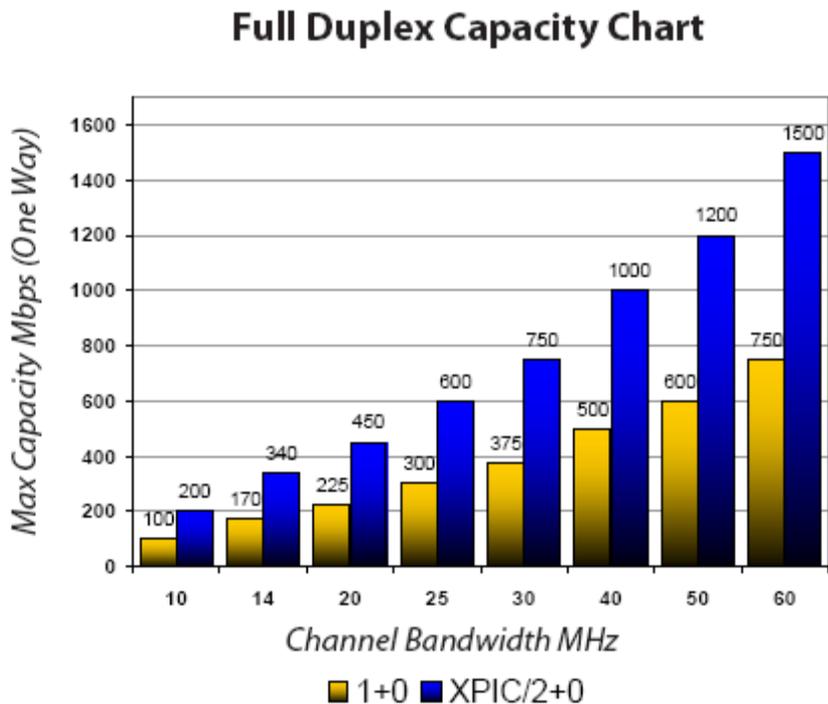

Figure 8 Management Configuration - OBM using GE1

## Features Detailed Description

This section describes the key features of the system and explains the related commands required for implementation on the link. Additional information is provided in the [Appendix E -Command Line Interface \(CLI\) Guide](#) and the [Appendix C - Web Browser Guide](#).

### Traffic Capacity /Capacity License Key

With QAM1024 modulation in a 60 MHz channel, the link can support capacities up to 750 Mbps full duplex or 1.5 Gbps aggregate, including the Multilayer Header compression. Header compression is always active unless disabled by the user. The chart below shows the capacity of the StrataLink 24 for the available channel sizes

\* The numbers shown above are for full duplex. Aggregate capacities are double.

Figure 9 Capacity vs Channel Size Chart

No restrictions are put on the channel size or modulation levels that can be set by the user, however the capacity is restricted based on the license key installed.

The base model comes with **200** Mbps full duplex license and there are upgrade keys available that can open the entire 750 Mbps capacity:

**SL-Key-300:**

Description: Unlocks throughput capacity from 200 up to 300 Mbps Full Duplex payload (300 Mbps each direction) – Covers one link – (2 license keys provided)

**SL-Key-400:**

Description: Unlocks throughput capacity from 200 up to 400 Mbps Full Duplex payload (400 Mbps each direction) – Covers one link – (2 license keys provided)

**SL-Key-MAX:**

Description: Unlocks throughput capacity up to Maximum capacity Full Duplex payload (Approx. 750 Mbps each direction) – Covers one link – (2 license keys provided)

Note that each license key is tied to the serial number of the unit for which it is issued and cannot be reassigned to another unit.

**Setup via Web:**

- 1) Login to Web Config Mode– Advanced Settings/License Keys
- 2) Select the key from the dropdown
- 3) Enter the key (copy and paste ok) in the text box
- 4) Click the Submit button (Save changes not required)
- 5) New Capacity License is now active

**Setup via CLI:**

- 1) Log in to Config Node
- 2) Run *license\_capacity* command to activate license
- 3) Run *reset\_license\_key* to remove license key and return to default capacity.

## AES-256 Encryption

Stratalink 24 models SL-24-E and SL-24-EX support optional AES-256 bulk payload data encryption over the air using CFB-128 Advanced Encryption Standard (AES). A separate license key is required to enable the encryption function, and matching Pre-shared Keys (PSK) must be entered by the user on each end of the link before traffic will pass.

PSKs are encrypted inside the radio unit and will not be displayed during entry or after they are entered, so ensure that the keys are written down and safeguarded during setup.

**Please note that after enabling encryption or changing the speed while encryption is enabled, the user must save the changes and reboot the system for the changes to become effective.**

By default encryption is not enabled. The **SL-Key-A256** must be entered using the CLI or Web interface. Note that each encryption license key is tied to the serial number of the unit for which it is issued and cannot be reassigned to another unit, so ensure that the correct license key is used on the matching radio unit.

### Setup via Web:

- 1) Login to Web Config Mode– Advanced Settings/License Keys
- 2) Select the key from the dropdown
- 3) Enter the key (copy and paste ok) in the text box
- 4) Click the Submit button (Save changes not required)
- 5) Repeat steps 1-4 for the second radio unit.
- 6) New Capacity License is now active, and a box now appears allowing entry of the PSK.
- 7) Enter PSK up to 32 ASCII characters. Click the Submit button. Repeat for second radio.
- 8) Click the Save Changes button to save changes to FLASH.
- 9) Click the Reboot button
- 10) Repeat steps 8-9 for second radio unit
- 11) Link will restart with encryption enabled.

### Setup via CLI:

- 1) Log in to Config Node
- 2) Run `license_encryption` command to activate encryption
- 3) Run `enc psk <preshaed key>` command to enter a shared key of 20-32 ASCII characters in length
- 4) Run `enc enable on` command to enable encryption.
- 5) Run `config save` command to save changes to FLASH.
- 6) Repeat steps 1-5 on second radio unit.
- 7) Run `reboot` command on both radio units.
- 8) Link will restart with encryption enabled.

## Custom Transmit/Receive Frequency and Duplex Spacing

The 24 GHz unlicensed spectrum is typically very clear due to the narrow antenna beamwidths required. However, if co-located systems on the same or nearby path are required, it helps to have frequency agility. The StrataLink 24 allows custom frequency duplex settings to allow the user to avoid interference that might be present.

Based on the channel size, the minimum duplex spacing can be customized per the chart below. See [Appendix B- Recommended Operating Frequencies](#) for channel plans by bandwidth.

The chart below shows a summary of the Center Frequencies allowed and the recommended Frequency Duplex and range of operation (US/Canada only).

Channel Width	Rec. Duplex	Freq Duplex Range	Center Freq Range (GHz)
10 MHz	100 MHz	90-190 MHz	24.055- 24.245
14 MHz	100 MHz	90-183 MHz	24.058- 24.241
20 MHz	100 MHz	90-180 MHz	24.060- 24.240
25 MHz	100 MHz	90-177 MHz	24.064- 24.237
30 MHz	100 MHz	90-168 MHz	24.066- 24.234
40 MHz	100 MHz	90-158 MHz	24.071- 24.229
50 MHz	100 MHz	90-150 MHz	24.075- 24.225
60 MHz	130 MHz	120-134 MHz	24.081 - 24.215

Table 2 Transmit Frequency Limits

**IMPORTANT: When changing frequency on an active link, the link will be lost. Always change the far end of the link first to avoid losing connection to the radio. When in doubt, use the *reload in x* command to schedule the system to return to the last known good configuration after x minutes**

### Setup via Web:

- 1) Login to Web Config Mode on far end radio – Link Setup>Link page
- 2) Select the desired Tx Frequency in 1 MHz increments
- 3) Select the Desired T/R Spacing in 1 MHz increments
- 4) Click the Submit button
- 5) Repeat steps 1-4 for the local radio
- 6) Verify the link is locked by observing the status at the top of the web page.
- 7) Click the Save Changes button on both ends of the link to make the change permanent.

### Setup via CLI:

- 1) Log in to Config Node on far end radio

- 2) Run *freq\_duplex <TR spacing>* command to set the desired T/R spacing.
- 3) Run *freq <tx freq>* command and enter the desired transmit frequency – This will change both the transmit and receive frequency.
- 4) Repeat Steps 1-3 for local radio – Transmit freq on local radio should be the same as the Receive freq on the remote radio.
- 5) Verify the link is locked by running *linktest* command on both radios
- 6) Run *config save* command to make changes permanent.

## Speed Profile Setup (Modulation/Channel Bandwidth)

The user has control of both the channel bandwidth used by the system and the modulation levels used by the system. The main command used to control these parameters is the *speed* command.

For flexibility in terms of system gain and link capacity, a wide range of channel sizes is supported. Channel bandwidth options are 10, 14, 20, 25, 30, 40, 50 and 60 Mhz. Wider channels allow higher traffic capacities at the expense of receive sensitivity, while smaller channels provide lower capacities with higher system gain and better co-location performance. The chart below shows the number of non-overlapping channels that can be co-located on the same path (US/Canada).

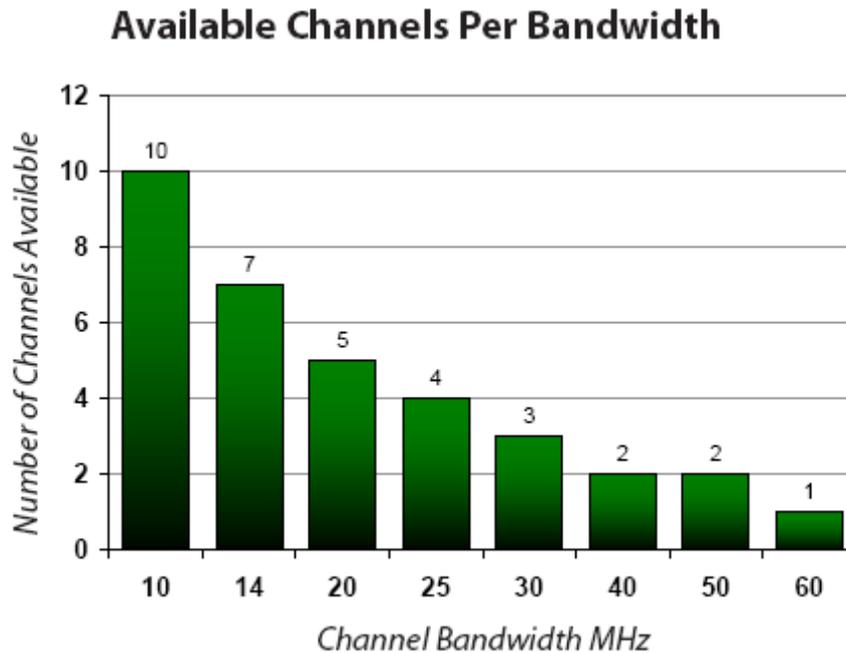

Figure 10 Non-Overlapping channels vs Channel Size

Modulation options are QAM1024, QAM512, QAM256, QAM128, QAM64, QAM32, QAM16, 8PSK, and QPSK. Higher modulation levels provide more radio link capacity at the expense of receive sensitivity while lower levels provide lower capacity and better receive sensitivity.

In addition to setting the bandwidth and modulation, setting a min and max modulation that are different will activate the AACM feature. AACM will operate automatically within the limits specified based on the signal quality which is measured by the modem. Typically for best overall performance the user would select QPSK as the min mod and QAM1024 as the highest modulation. In longer links the radio may not have enough signal strength to achieve 1024 QAM – In this case setting the max modulation to the maximum achievable is recommended. If the min and max mod levels are the same,

effectively AACM is disabled and the link will unlock if the MSE drops below a level not sustainable for that modulation.

#### Setup via Web:

- 1) Login to Web Config Mode on far end radio – Link Setup>Link page.
- 2) Select the desired Current Channel BW from the drop down.
- 3) Select the Min Modulation from the dropdown menu.
- 4) Select the Max Modulation from the dropdown menu.
- 5) Click the Submit button.
- 6) Repeat steps 1-4 for the local radio. The settings must match the far end radio.
- 7) Verify that the link is locked by observing the status at the top of the web page.
- 8) Click the Save Changes button on both ends of the link to make the change permanent.
- 9) If encryption is enabled, the radio must be rebooted using the *reboot* button.

#### Setup via CLI:

- 1) Log in to Config Node on far end radio.
- 2) Run *speed <bw> <max mod> <min mod>* command to set the desired channel bandwidth, max mod, and min mod.

Command Detail: *speed <bw> <max mod> <min mod>* where <bw> = 10, 14, 20, 25, 30, 40, 50, 60 ; <mod\_min > and <mod\_max> = QPSK, 8PSK, 16QAM, 32QAM, 64QAM, 128QAM, 256QAM, 512QAM, 1024QAM.

- 3) Repeat Steps 1-2 for local radio – The settings must match the far end radio.
- 4) Verify the link is locked by running *linktest* command on both radios
- 5) Run *config save* command on both radios to make changes permanent.
- 6) If encryption is enabled, the radio must be rebooted using the *reboot* command.

## Advanced Adaptive Coding and Modulation (AACM)

Advanced Adaptive Coding and Modulation provides error-free hitless changing of the modulation level for a fixed channel width to allow the link to be maintained during weather related fading, interference, or other channel degradation that leads to poor signal quality. Instead of the link dropping and no traffic passing, the link will be maintained with a lower capacity until the channel degradation is removed, at which time the link will return to the normal modulation level.

The StrataLink 24 supports the following nine modulation levels for all channel bandwidths to provide for graceful downshifting as fading conditions change:

- QAM1024
- QAM512
- QAM256
- QAM128
- QAM64
- QAM32
- QAM16
- 8PSK
- QPSK

The transitions between modulation levels are controlled by two sets of thresholds, degrade and improve. Hysteresis is built into these thresholds to prevent cycling between levels, and each transition is made without dropping packets since both ends of the link coordinate the transition automatically.

Quality of Service works in conjunction with the AACM function to ensure that higher priority traffic classes will be passed and lower priority traffic classes will be reduced in capacity or dropped as the radio capacity drops during the fade.

The user can set both a maximum and minimum modulation level which the radio will operate within. Both sides of the link should have the same min and max modulation levels for proper operation. Typically it is best to always use QPSK as the minimum modulation level to maintain the link during deep fading.

The AACM feature is automatically enabled when the speed profile is setup with min and max modulation levels that are not the same, and a link is established.

The Figure below shows the AACM in action.

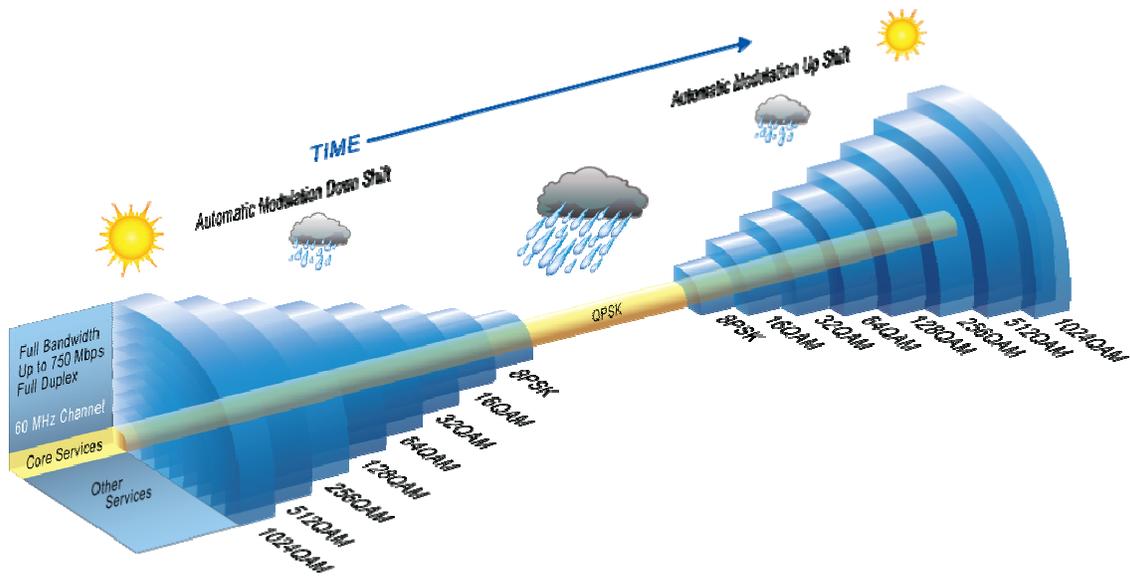

Figure 11 Advanced ACM

**Setup via Web/CLI: See Speed Profile Setup**

## VLAN Traffic Support

The radio unit ports can support single and double tagged VLAN traffic based on user entered VLAN IDs per port. Operators must add the VLAN membership by port to each unit. Adding a VLAN ID to a port adds both the data port (GE1 or GE2) and the modem port as members of that VLAN. Valid VLAN IDs are from 2-4085

As a result, traffic with a matching VLAN entering the port will be forwarded to the modem and transmitted out the radio. In order for the traffic to exit a port on the far end, the user must enter the same VLAN ID into the far end unit as well. For double tagged traffic only the S-Tag (Outer VLAN) ID needs to be entered.

No VLANs are entered into the system at time of shipment and must be added by the operator. VLANs may be removed later if desired.

For double tagged traffic only the S-Tag (Outer VLAN) ID needs to be entered.

**Do not use VLAN 1 tagged traffic as VLAN 1 is reserved for internal switch use for untagged traffic.**

### Setup via Web:

- 1) Login to Web Config Mode on far end Radio – Link Setup>VLAN page.
- 2) Select the desired port to add the VLAN membership.
- 3) Enter the Lower and Upper Limits of the VLANs desired. If only one VLAN is required enter that VLAN ID for both upper and lower.
- 4) Click the Submit button
- 5) Repeat steps 1-7 for the local Radio.
- 6) Ensure cables are connected properly.
- 7) Verify traffic flows when frames with the matching VLAN enter the traffic port for which VLANs were just entered
- 8) Click the Save Changes button on both ends of the link to make the change permanent.

### Setup via CLI:

- 1) Log in to Config Node on the far end Radio
- 2) Add VLANs desired for on a port by port basis using the *vlan\_add* or *vlan\_add\_range* commands. For example, add VLAN 1001 to GE1 by running the *vlan\_add 1 1001* command.
- 3) Repeat steps 1-2 for the local Radio.
- 4) Ensure cables are connected properly.
- 5) Verify traffic flows when frames with the matching VLAN enter the traffic port for which VLANs were just entered
- 6) Run the *config save* command on both ends of the link to make the change permanent.

## Multilayer Header Compression

With dynamic multilayer header compression, over 750 Mbps capacity can be achieved without the dependency on traffic payload. Up to 2048 unique headers are stored in a database on each radio, and as traffic enters the radio the Ethernet header is replaced with a 2 or 4 byte tag. The tag is re-mapped to the correct Ethernet header on the far end of the link. For unique flows over 2048, the traffic is sent uncompressed. The system has automatic ageout which will ensure that the header compression is being used for the most active flows.

The following header combinations are compressed by the system:

- L2 (MAC)
- IPV4
- VLAN
- VLAN+IPV4
- VLAN+IPV4+UDP
- VLAN+IPV4+TCP (Version 2 Hardware)
- IPV6
- VLAN+IPV6
- VLAN+IPV6+UDP
- VLAN+IPV6+TCP (Version 2 Hardware)

The performance of the Header Compression is not dependent on the content of the packets, but rather on the packet size. For small packets, the L2 capacity increase is significant since so much of the packet is comprised of header information. For larger packets the improvement will be less since the header portions are a smaller percentage of the overall packet.

Statistics are available to show the effectiveness of the Header Compression Engines. There are two engines used for compressing the streams, one primarily for L2 portion of the header, and another for the L3-L4 portions of the header.

A higher percentage indicates better compression effectiveness. For a single stream of IPV4 with UDP the percentage can be as high as 60%.

The diagram below shows the compressed packet for transmission over the air.

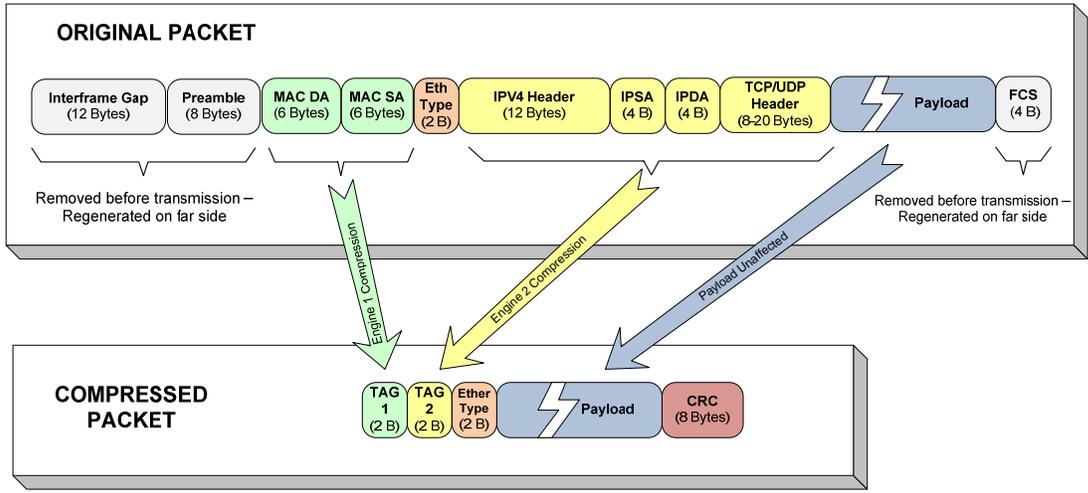

Figure 12 Header Compression Packet Structure

The chart below shows examples of the capacities achievable over a single StrataLink 24 system running 60 MHz channel with 1024 QAM modulation. All capacities shown are layer 2. Layer 1 Unidirectional capacities are as high as 1 Gbps

Capacity Range 1560-64 byte packets (Mbps)

Channel Width (MHz)	QPSK	8PSK	16 QAM	32 QAM	64 QAM	128 QAM	256 QAM	512 QAM	1024 QAM
10	15-23	23-35	30-46	37-57	46-71	53-82	60-92	68-105	NA
14	22-34	34-52	45-69	55-85	67-103	78-120	88-136	100-154	113-174
20	31-48	47-72	63-97	78-120	96-148	111-171	126-194	143-220	162-249
25	39-60	60-92	80-123	99-152	120-185	140-216	160-246	182-280	206-317
30	47-72	71-109	95-146	118-182	142-219	167-257	192-296	218-336	247-380
40	63-97	96-147	128-197	159-245	192-296	225-347	256-394	291-448	329-507
50	78-120	118-181	157-242	195-300	238-367	277-427	318-490	361-556	407-627
60	94-144	141-217	189-290	234-361	287-441	333-514	391-602	431-664	490-754

\* The numbers shown above are for full duplex. Aggregate capacities are double. Throughput measured at layer 2 with a single VLAN tag.

Table 3 Capacity vs Modulation and Channel Size

IPV6 traffic can benefit greatly from Header Compression due to the larger size of the source and destination fields. Below is a comparison of traffic capacity using a 60 MHz channel running a modulation of 1024QAM for different traffic types.

Packet Type	L2 Packet Size	L2 Uni Capacity (Mbps)	L2 BiDir Capacity (Mbps)	Uni PPS	BiDir PPS	HC Gain (%)
ETH only	64	493	986	963285	1926570	19
ETH+IPV4	64	637	1274	1244233	2488466	42
ETH+VLAN +IPV4	68	677	1354	1244233	2488466	45
ETH+VLAN +IPV4+UDP	72	726	1452	1260401	2520802	51
ETH+IPV6	84	726	1452	1080291	2160582	58
ETH+VLAN +IPV6	90	764	1528	1061391	2122782	59
ETH+VLAN +IPV6+UDP	92	768	1536	1043104	2086208	64

Table 4 Max Capacity with Header Compression

**Setup via Web:**

- 1) Header Compression cannot be enabled or disabled from the web. See CLI setup below
- 2) To view the current status and statistics of Header Compression go to the System Status> Link Status Page and view the Header Comp Stats section

**Setup via CLI:**

- 1) Log in to Config Node
- 2) Run *hc\_enable on* command to activate header compression
- 3) Run *hc\_enable off* command to deactivate header compression
- 4) Run *hc\_stats* command to observe the statistics of the header compression engines

## Physical Link Aggregation

Physical Link Aggregation (PLA) allows two StrataLink 24 Links to be aggregated together with a single traffic port on the master radio link, eliminating the need for external link aggregation switches to achieve full Gigabit performance for all packet sizes. PLA has a significant advantage over traditional 802.3ad LACP because:

- PLA Master can sense AACM shifts in both master and slave links and will not send more traffic than each link can support.
- PLA Master can split a single Layer 2 traffic flow across two links. Packets are identified with a sequence number to maintain correct ordering when they are recombined at the far end master unit.
- PLA can protect against a full failure of the slave link and a limited failure of the master link.

**NOTE:** PLA must be used with out of band management (OBM) only, since traffic passing through the PLA cable from Master to the Slave unit does not traverse the Slave internal switch fabric.

Two antennas at each end of the link are required for PLA operation. The diagram below shows the basic configuration for PLA.

# StrataLink 24

## 900+ Mbps PLA - 50 MHz Channels

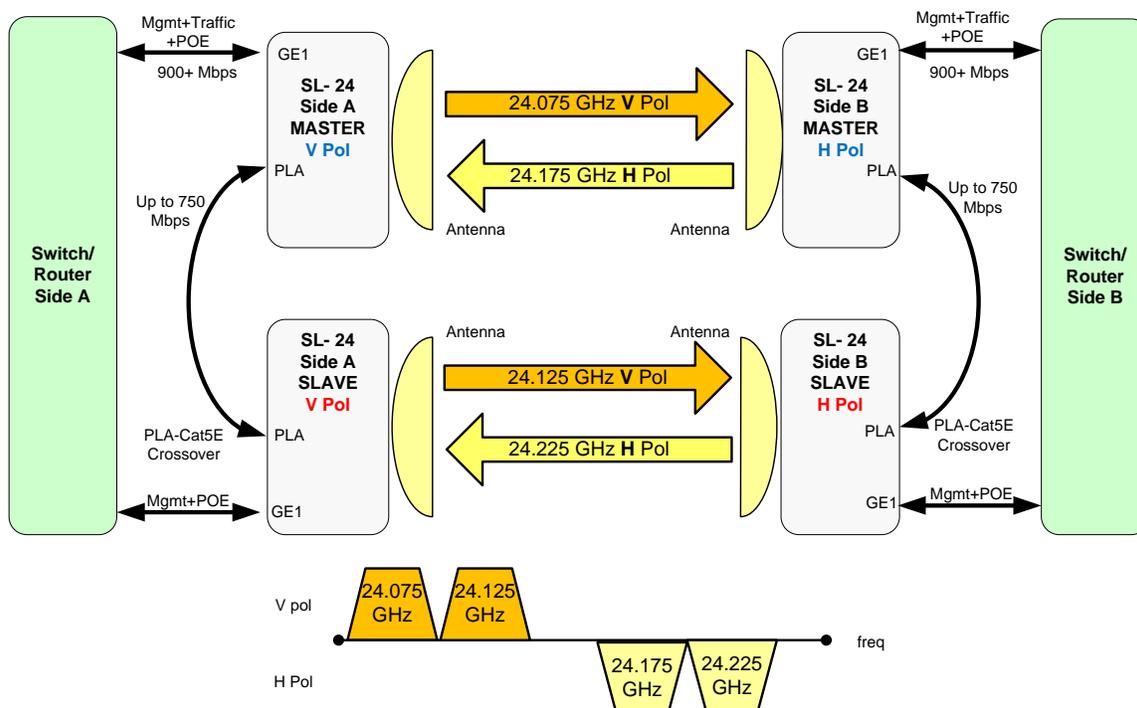

Figure 13 PLA Block Diagram

When running PLA on two channels, each link should be aligned and optimized while the other link is off.

Spacing between the two radio units co-located on the same structure can be minimal. For increased resistance to multipath, the units can be separated as much as 10 feet. The two radio paths must be of identical length and the PLA cable lengths matched at each end for best performance.

### Setup via Web:

- 1) Login to Web Config Mode on far end Master radio – Link Setup>Ports page.
- 2) Select PLA Type = Master from the drop down menu.
- 3) Click the Submit button.
- 4) Repeat steps 1-3 for the local Master radio.
- 5) Login to Web Config Mode on far end Slave radio – Link Setup>Ports page.
- 6) Select PLA Type = Slave from the drop down menu.
- 7) Click the Submit button.
- 8) Repeat steps 5-7 for the local Slave Radio.
- 9) Ensure cables are connected properly.
- 10) Verify PLA Status shows correctly on Link Setup>Ports Page.

- 11) Click the Save Changes button on both ends of the link to make the change permanent.

#### Setup via CLI:

- 1) Log in to Config Node on far end radio Master.
- 2) Run *pla\_type master* command to enable Master mode.
- 3) Repeat steps 1-3 for the local end Master radio.
- 4) Log in to Config Node on far end radio Slave.
- 5) Run *pla\_type slave* command to enable Slave mode.
- 6) Repeat steps 4 and 5 for the local end Slave radio.
- 7) Ensure cables are connected properly.
- 8) Run *pla\_stats* command to view the status of the PLA on all 4 radios. The normal operation should show PLA mode On, RX and TX states= both, and AIS=normal, and Cable Down = up.
- 9) All traffic counters will show only on the Master units except for OBM.
- 10) Verify the link is locked by running *linktest* command on both radios.
- 11) Run *config save* command to make changes permanent on all 4 radios.

## XPIC

XPIC allows using two StrataLink Radios on the same transmit channel, with each one transmitting on a different polarization. Two coaxial cables (CBLDAT-XPIC-9) are connected between the radios on each end of the link to improve the cross polarization performance of each link.

XPIC can be used in conjunction with PLA or as two independent links carrying isolated streams. In either case the spectral efficiency is doubled. Both versions are shown below.

Two antennas at each end of the link are required for XPIC operation.

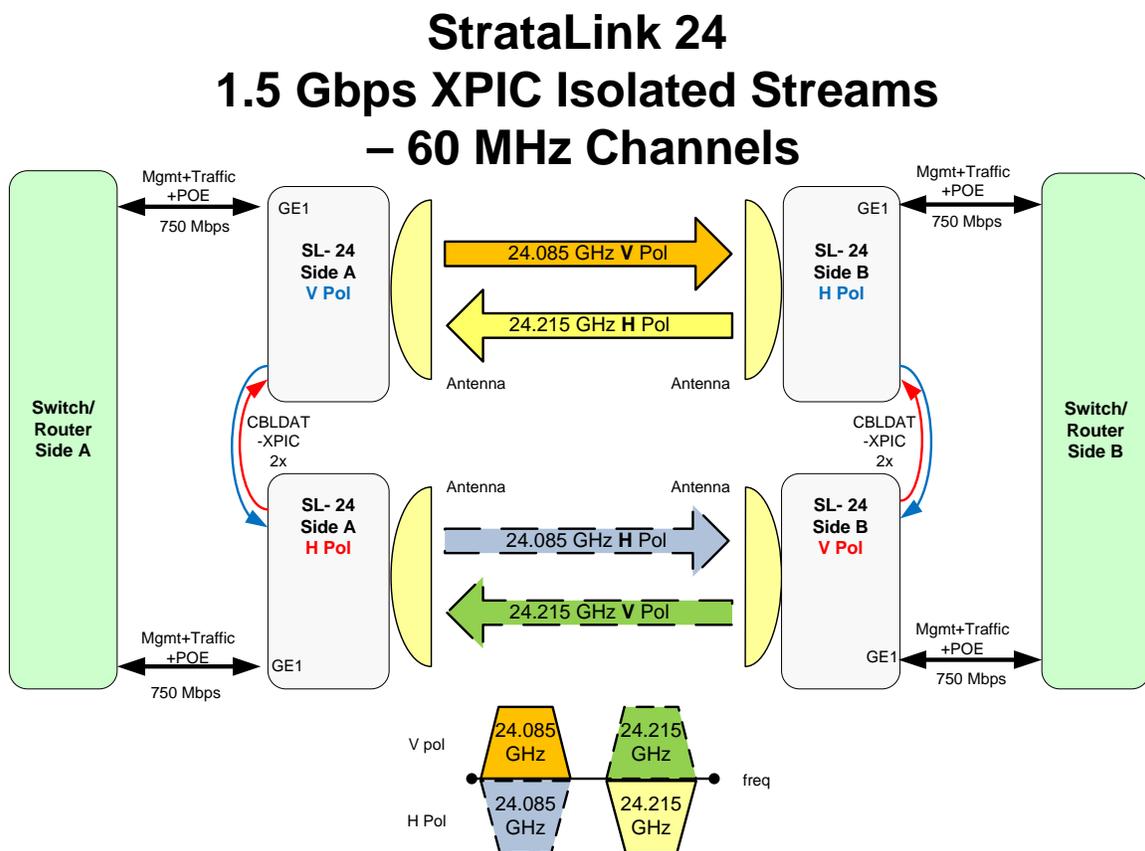

Figure 14 XPIC Block Diagram

# StrataLink 24

## 1 Gbps XPIC with PLA – 60 MHz Channels

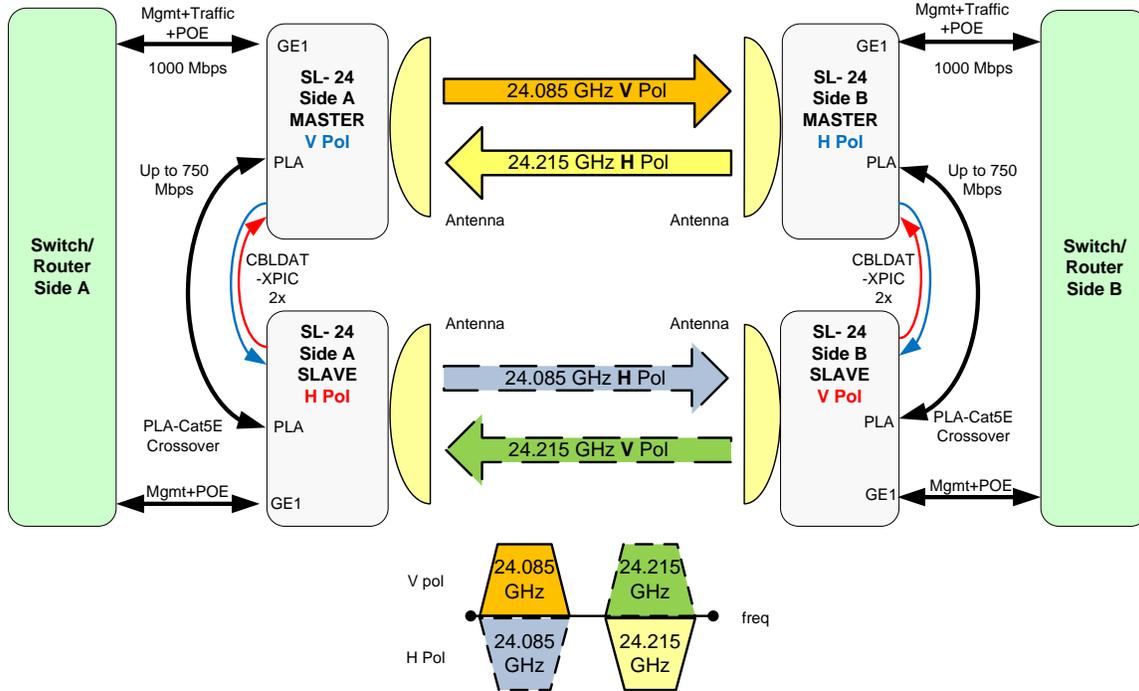

Figure 15 XPIC with PLA Block Diagram

When running XPIC, each link should be aligned and optimized while the other link is off.

Physical spacing between the two radio units co-located on the same structure can be minimal. For increased resistance to multipath, the units can be separated as much as 10 feet. When using XPIC with PLA, the two radio paths must be of identical length and the cable lengths matched at each end for best performance.

The setup instructions below cover XPIC only. IF PLA is used with XPIC, set up XPIC first, then set up PLA per the PLA setup instructions.

### Setup via Web:

- 1) Establish each link individually with the other link off and record the RSSI and MSE
- 2) Connect Coaxial Cables per diagram.
- 3) Turn Master Units on first, then Slave units. Observe the degradation in MSE due to cross polarization.

- 4) Login to Web Config Mode on one of the Side B Master radio – Advanced Setting>XPIC/PLA page
- 5) Select the Transmitter polarization (H or V)
- 6) Select XPIC “On” radio button.
- 7) Click the Apply Changes button.
- 8) Repeat steps 4-7 for the other 3 radios, starting with the Side A Master Unit, then Side B Slave, then Side A Slave. **Pay careful attention to the polarizations set since they must match the diagram.**
- 9) Verify Link Status is locked for all 4 radios and the MSE and modulation are the same as when each link was running independently with XPIC off. The MSE should improve when XPIC is enabled, and the instantaneous BER should be 0.
- 10) Click the Save Changes button on both ends of the link to make the change permanent.

#### Setup via CLI:

- 1) Establish each link individually with the other link off and record the RSSI and MSE
- 2) Connect Coaxial Cables per diagram.
- 3) Turn both links on and observe the degradation in MSE due to cross polarization
- 4) Log in to Config Node on the Side B Master.
- 5) Run the *xplic hv <h/v>* command for the Side B Master, indicating the actual transmit polarization.
- 6) Run *xplic\_enable on* command to enable XPIC mode on both units.
- 7) Repeat steps 4-6 for the other 3 radios, starting with the Side A Master Unit, then Side B Slave, then Side A Slave. **Pay careful attention to the polarizations set since they must match the diagram.**
- 8) Run *xplic\_stats* command to check XPIC statistics
- 11) Verify the link is locked and the MSE is the same as previously when the links were running independently with XPIC off by running *linktest* command on all radios. The MSE should improve when XPIC is enabled, and the instantaneous BER should be 0.
- 12) Run *config save* command to make changes permanent.

## QoS (Quality of Service)

The StrataLink internal switch performs QoS on all incoming packets to allow the operator to give priority to certain traffic types. The following fields are used to sort the incoming traffic into 8 queues:

- Layer 2 using the COS bits in the VLAN tag on incoming Ethernet traffic (Tagged traffic only).
- Layer 3 Diffserv (DSCP) using the Differentiated services field in IP packets. The DSCP mapping can be controlled on a port by port basis from CLI or Web.
- Port Priority for untagged traffic.

For QoS to work, incoming traffic must be either Tagged with a VLAN with the COS bits set, or an IP packet with the DS or IP precedence bits set. This is done external to the radio unit using a switch or application to set the priority tag or DS field.

Once the tagged traffic with COS/DSCP priority bits set arrives at the radio Ethernet port, the internal switch will perform prioritization on the traffic by mapping each packet to one of 8 queues. These 8 queues make up the green packet buffer, which is emptied into a single data pipe going into the modem and packets then transmitted over the air. The size of the buffer is controlled by the green buffer setting.

The scheduling of the queue traffic into the modem data pipe can be Strict Priority (SP) Mode, Weighted Round Robin (WRR) Mode, or a combination of SP and WRR as follows:

- 1) All Queues Strict
- 2) All Queues WRR
- 3) Queues 6 and 7 Strict, Queues 0-5 WRR
- 4) Queue 4-7 Strict, Queues 0-3 WRR

If no QoS is desired then the user can simply map all priorities to Queue 0. All packets will be treated equally regardless of the other QoS settings with the exception of IEEE1588 packets which are always treated as high priority over all other packets.

### ***All Strict Mode***

Strict QoS Mode follows the logic rule below:

**Queue 7 > Queue 6 > Queue 5 > Queue 4 > Queue 3 > Queue 2 > Queue 1 > Queue 0**

When this mode is selected, the scheduler will empty Queue 7 before sending any Queue 6 packets across the link, and if both Queue 7 and Queue 6 are empty then Queue 5 packets will be sent, etc. Note that while strict priority ensures that **ALL** high priority traffic will go through (up to max burst size and link capacity limits), it may block lower priority traffic or increase the latency significantly for lower priority packets during traffic congestion.

### ***Weighted Round Robin (WRR) Mode***

In WRR QoS Modes, the method of emptying the queues is designed to let at least some of the traffic through for all queues, where the amount is control by weighting of the individual queues. To accomplish this, weights are assigned directly to the Queues. Each weight represents the number of packets that will be transferred out from the queue for each round through the Queues that are included in the WRR algorithm.

Queue 0 → Weight = 1  
Queue 1 → Weight = 3  
Queue 2 → Weight = 6  
Queue 3 → Weight = 9  
Queue 4 → Weight = 12  
Queue 5 → Weight = 15  
Queue 6 → Weight = 18  
Queue 7 → Weight = 21

When Strict mode is used the weights are ignored.

Higher weights translate to proportionally more throughput than lower weights. In the default configuration, most or all of the traffic will pass for Queue 7 but some will still pass for Queue 0. The behavior is the same for VLAN tagged traffic or Diffserv traffic. For Diffserv, the DSCP field in the IP packet will contain a number from 0-63 in the Type of Service (TOS) field, which can be mapped to a priority level, which is subsequently mapped to a queue.

### ***Queue 7 through 4 Strict, Queues 0 through 3 WRR (Default)***

When this mode is selected, the scheduler will treat Queues 7 through 4 with the strict algorithm, and if any bandwidth is remaining after all Queues 7 through 4 are empty, the WRR algorithm will be used to move packets from Queues 0 through 3.

In this mode only weights for Queues 0 through 3 apply - the weights for Queues 4 through 7 do not apply since these queues are in strict mode.

### ***Queue 7 and 6 Strict, Queues 0 through 5 WRR***

When this mode is selected, the scheduler will treat Queues 7 and 6 with the strict algorithm, and if any bandwidth is remaining after all Queues 7 and 6 are empty, the WRR algorithm will be used to move packets from Queues 0 through 5.

In this mode only weights for Queues 0 through 5 apply - the weights for Queues 6 and 7 do not apply since these queues are in strict mode.

### ***Mapping VLAN tag COS bits to a Queue***

The default priority mapping is as follows:

**COS priority 0 → Queue 0, Lowest Priority Queue**  
**COS priority 1 → Queue 1**  
**COS priority 2 → Queue 2**  
**COS priority 3 → Queue 3**  
**COS priority 4 → Queue 4**  
**COS priority 5 → Queue 5**  
**COS priority 6 → Queue 6**  
**COS priority 7 → Queue 7, Highest Priority Queue**

These default mappings can be changed with the **qos** command, allowing the packets to be mapped into any one of the 4 queues based on the COS bit in the VLAN tag. Different priority tags may be mapped into the same queue if desired. For DSCP tagged traffic, the DSCP field can be mapped to one of the 7 priorities which is in turn mapped to one of the 7 queues.

### ***Mapping Diffserv Traffic to a Queue***

For Layer 3 IP packets, traffic with marked traffic Differentiated Services (DS) fields can be prioritized by the internal switch. DSCP Code Points (0-63) are mapped to a Priority Level (0-7), which is in turn mapped to a Queue

For Diffserv, the default mappings for all ports are as follows:

**DSCP 1 to 9 → Priority 0 → Queue 0**  
**DSCP 10 to 19 → Priority 1 → Queue 1**  
**DSCP 20 to 29 → Priority 2 → Queue 2**  
**DSCP 30 to 39 → Priority 3 → Queue 3**  
**DSCP 40 to 45 → Priority 4 → Queue 4**  
**DSCP 46 to 49 → Priority 5 → Queue 5**  
**DSCP 50 to 55 → Priority 6 → Queue 6**  
**DSCP 56 to 63 → Priority 7 → Queue 7**

DSCP must be enabled to enforce QoS using DSCP.

#### **Setup via Web:**

- 1) Login to Web Config Mode - Link Setup>QOS page on far side radio.

- 2) Select All Strict , All WRR, Strict Q6/Q7, or Strict Q4-7mode from the drop down menu.
- 3) If remapping of L2 VLAN Priority field is desired, change the Queue numbers assigned to the PRI values. Queue 7 is always emptied first for strict mode, then Queue 6,5, and 4, etc..
- 4) If WRR, Strict Q6/Q7, or Strict Q4-7mode is selected and weights need to be changed from default, enter the new weights in the box (range = 1 to 49).
- 5) For Diffserv to Priority mappings, adjust the mappings for each code point used by selecting the Priority from the drop down menu.
- 6) If Diffserv classification is desired, select the *qos dscp\_enable on* command. Otherwise VLAN tag priority will be used.
- 7) Click on the Apply Changes button after all changes are made.
- 8) Repeat steps 1-5 for the near side radio if desired.
- 9) Verify traffic passes as expected.
- 10) Click the Save Changes button on both ends of the link to make the change permanent.

#### Setup via CLI:

- 1) Log in to Config Node on the far end radio.
- 2) Run *qos mode<0-3>* command to select mode (default is 2 - Q4/7 Strict).
- 3) If remapping of L2 VLAN Priority field is desired, change the queue numbers assigned to the PRI fields by running the *qos\_cos\_que <pri> <queue>* command. Queue 7 is always emptied first for strict mode, then Queue 6, 5, and 4, etc.
- 4) If WRR mode is selected and weights need to be changed from default, enter the new weights (range=1 to 49) using the *qos weight <queue> <weight>* command.
- 5) For Diffserv to Priority/Queue mappings, run the *qos dscp\_source <DSCP> <pri>* command for each DSCP code point that will be used.
- 6) If Diffserv classification is desired, run the *qos dscp\_enable on* command. Otherwise VLAN tag priority will be used.
- 7) Repeat steps 1-5 for the near side radio if desired.
- 8) Verify traffic passes as expected.
- 9) Run *config save* command to make changes permanent on both radios.

## Site Survey (Spectrum Analyzer Function)

This feature allows the user to check the spectrum utilization for the entire 24.05 to 24.25 GHz band. The result displays the peak and average power over a time interval using the 10 MHz bandwidth. The measurements are stepped at the 10 MHz spacing.

The user may specify the number of cycles that are run, where 1 cycle = 1 scan through all the frequencies. Each cycle takes about 2 minutes. The transmitter is disabled while the test is running so the link will be broken during the test. After the test the link will resume and the peak and average results will be displayed.

There are 20 center frequency points that are used for the survey. A running average (blue) and running max value (yellow) are tracked for each point. Upon completion of all cycles, the table is displayed on the CLI and a graph is displayed on the web.

Since the RSSI is calibrated down to about -85 dBm, clear spectrum will be represented as all blue bars even at about -85 dBm.

An example of spectrum that is not clear is shown below. Keep in mind that the survey tool is not as accurate as a spectrum analyzer since the resolution bandwidth is approximately 35 MHz. This tool is intended as a way to identify only whether the spectrum is clear or not. In this example the spectrum is clear above 24175 MHz.

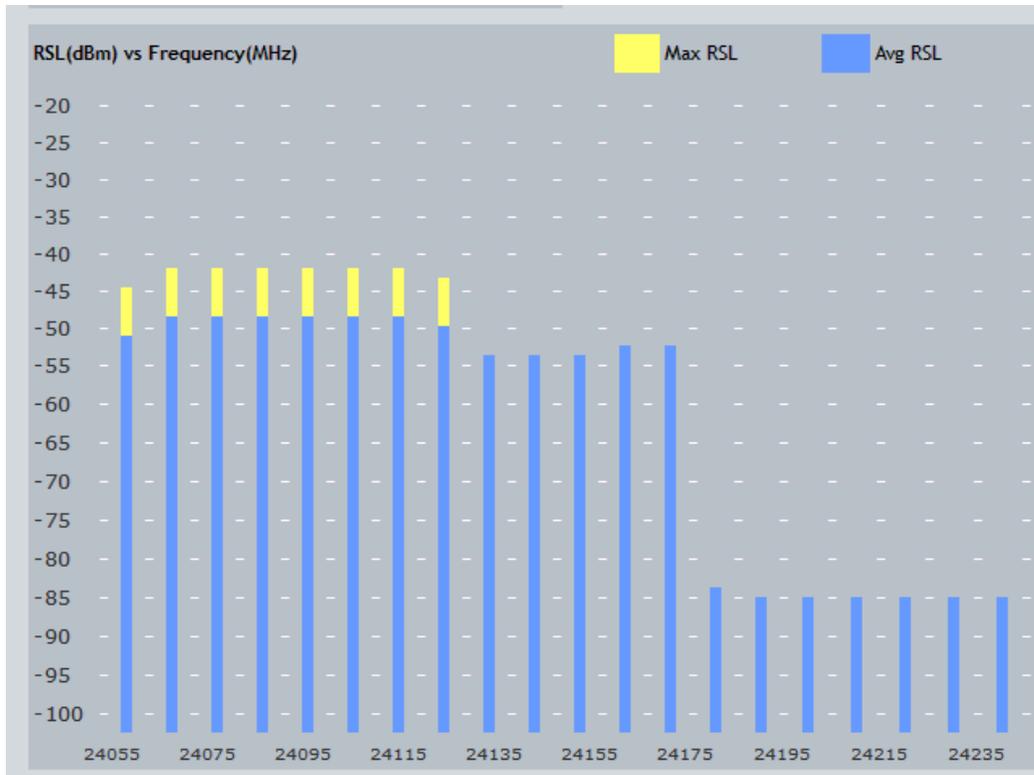

Figure 16 Site Survey Tool Example

### Setup via Web:

- 1) Login to Web Config Mode - Survey>Survey page on radio.
- 2) Enter the number of iterations desired in the text box. **Each iteration will take approximately 2-3 minutes so plan accordingly.**
- 3) Click Submit button to conduct the survey - Note that link will be broken .
- 4) View the display.
- 5) After completion of the survey, verify the link returned to normal operation by observing the local and remote status at the top of the web page – The link should return to the state it was in prior to the survey.

### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run `survey <iterations>` command to conduct the spectrum survey. **Each iteration will take approximately 2-3 minutes so plan accordingly.**
- 3) Observe the results shown in text format.
- 4) After completion of the survey, verify the link returned to normal operation by running `linktest` command.

## Opmode (Transmitter On/Off Control)

User can turn the transmitter on and off with the *opmode* command. If a reboot to the radio occurs, the transmitter will automatically turn back on if the *opmode* was on during the last config save . During TX frequency changes, the transmitter will be briefly turned off before setting the new frequency to prevent spectral splatter to adjacent channels. When the transmitter is turned off, the PLL will show as unlocked.

### Setup via Web:

- 1) Login to Web Config Mode - Link Setup>Link page on radio.
- 2) Click on the Transmitter On or Off radio button.
- 3) Click Apply Changes button to make the change- Note that if either transmitter is turned off the link will be broken and connectivity may be lost.
- 4) Verify desired result.
- 5) Click Save Changes button to make change permanent.

### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run *opmode <on/off>* command to turn transmitter on or off.
- 3) Verify desired result.
- 4) Run *config save* command to make changes permanent.

## Rapid Port Shutdown (RPS)

To support external switches using Spanning Tree or facilitate faster routing convergence after topology changes, the physical ports can be configured to shutdown simultaneously on both ends of the link upon user selectable events on either end of the link. The traffic ports on both ends of the link will be shut down for 30 seconds to allow L2/L3 tree protocols to reroute traffic. After the 30 seconds expires, the ports will be re-enabled to allow management of the radios. RPS is selected as a threshold action, tied to any one or more of the following events:

- 1) RSSI out of range
- 2) MSE out of range
- 3) BER exceeds MAX value
- 4) System Temperature out of range
- 5) In port Utilization exceeds MAX value
- 6) Out Port Utilization MAX value
- 7) Link Down

It is recommended that as a minimum RPS be triggered with the Link Down event due to the fast response time and since it represents a true loss of traffic across the link. The other thresholds are polled and may result in a RPS delay of up to 30 seconds.

When using RPS, it is highly recommended that the operator enable ACM by setting the min modulation to QPSK with the *speed* command. This will ensure the highest fade margin, reducing potential for link loss and subsequent rerouting during weather related events.

#### Setup via Web:

- 1) Login to Web Config Mode - Advanced Setting>Threshold page on radio.
- 2) Click on the RPS check box for the events that RPS should trigger on.
- 3) Review the threshold settings and change if necessary.
- 4) Click Apply Changes button to make the change.
- 5) Click Save Changes button to make change permanent.

#### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run *threshold action 8 2* command to enable RPS for Link loss. Other options are available for to activate RPS. – See the CLI Guide for more info.
- 3) Verify desired result.
- 4) Run *config save* command to make changes permanent.

## Threshold Settings

The user can set actions to occur upon threshold violations for critical link parameters.

Thresholds for the following parameters can be configured:

- 1) RSSI
- 2) MSE
- 3) BER
- 4) System Temp
- 5) In Port utilization
- 6) Out port Utilization
- 7) Link Down

All variables are monitored at a 30 second interval by the system with the exception of the Link Down threshold which will cause a threshold violation immediately.

The following actions can be configured as a result of a threshold violation:

- 1) No action – Syslog entries will still be made
- 2) SNMP Trap sent to all active SNMP Manager IP addresses.
- 3) Rapid Port Shutdown on local dataport – no traffic will be forwarded for 30 seconds.

#### Setup via Web:

- 1) Login to Web Config Mode - Advanced Setting>Threshold page on radio.
- 2) Review the threshold settings and change if necessary.

- 3) Click on the “trap” and/or “RPS” action check box for the events that should trigger any action.
- 4) Click Submit button to make the change.  
If “trap” was selected as an action, Login to Web Config Mode - Advanced Setting>SNMP page on radio. If trap was not selected as an action then proceed to Step 8.
- 5) Enter at least one IP address for the SNMP Trap Manager that will receive the traps.
- 6) Click the “enable” radio button for each SNMP manager.
- 7) Click Apply Changes button to make the changes.
- 8) Click Save Changes button to make change permanent .

#### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run *threshold action <0-8> <0-2>* command to set an action for the events that should trigger any action. (see CLI guide for detail)
- 3) If “trap” was selected as an action, run the *trap ip <1-5> <IP address>* command to set the SNMP Trap Manager IP address. Up to 5 trap managers can be set up.
- 4) If trap was not selected as an action then proceed to Step 6.
- 5) Run the *trap enable <1-5>* command to activate the individual trap IP address.
- 6) Run *config save* command to make changes permanent.

## Port Rate Limiting (Ingress)

The port rate limiting feature is used to restrict the ingress traffic rate on a specific Ethernet port. This is useful for Service Level Agreements (SLAs) to end users.

For example, if the Ethernet port line rate is 1000BaseT, and the RF channel capacity is 500 Mbps, setting GE1 max rate to 125 Mbps will prevent any more than 125 Mbps of traffic from being forwarded to the modem port.

#### Setup via Web:

- 1) Login to Web Config Mode - Link Setup>Ports page on radio.
- 2) Modify the Max Rate box to set the maximum ingress bit rate of the selected port.
- 3) Click Apply Changes button to make the changes.
- 4) Click Save Changes button to make change permanent

#### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run *port eth <1-2> maxrate <max rate in mbps>* command to set the maximum ingress bit rate for the selected port.
- 3) Run *config save* command to make changes permanent.

Note: The procedure must be done on both radios to limit traffic both directions

## Status Snapshot

Upon successful configuration of the link, the user can save all critical parameters of the link such as RSSI, MSE, TX power, siglevel diagnostics, and system information to be recalled at a later date and compared to current conditions. This feature is a useful troubleshooting tool to isolate changes to a link that may affect performance over time.

### Setup via Web:

- 1) Login to Web Config Mode - Diagnostics>Status Display page on radio.
- 2) Click on the Status Save Button at the bottom of the page to save the current state of the radio to FLASH.
- 3) At a later date, to compare the current state of the radio to the state of the radio when the status save button was clicked, click the submit button at the top of the Status Display page.
- 4) View the comparison of the each parameter and note changes.
- 5) Click the Screen Clear button if desired.

### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run *status save* command to set the maximum ingress bit rate for the selected port.
- 3) At a later date, run *status compare* command to compare the current state of the radio to the state of the radio when the status save command was last run.
- 4) View the comparison of the each parameter and note changes.

## Management Services

The user can enable or disable the Telnet, TFTP, HTTP, and SNMP daemons to restrict access to the radio unit.

### Default Settings

*Telnet enabled*

*TFTP disabled*

*HTTP enabled*

*SNMP enabled*

### Setup via Web

- 1) No changes to the services are allowed via the web.

### Setup via CLI:

- 1) Log in to Config Node on the radio.

- 2) Run *tftpd <on/off>* command to enable/disable the TFTP server.
- 3) Run *telnetd <on/off>* command to enable/disable the telnet server.
- 4) Run *httpd <on/off>* command to enable/disable the web server.
- 5) Run *snmpd <on/off>* command to enable/disable the SNMP server. If disabled, the Web interface will also be lost since the Web server uses SNMP OIDs to retrieve information.
- 6) Run *config save* command to make changes permanent.

## Firmware Update

Remote update of the system firmware is available via TFTP or FTP. The TFTP daemon must be enabled if TFTP is used to update the system.

*bootimage upgrade* – upgrades the flash memory with the new software following TFTP or FTP of new firmware into the system. A system reboot is required after performing this command to load the new firmware

Before beginning the update procedure, be certain that all required files have been downloaded to an easily accessible directory on your local hard drive.

## Upgrade Procedure -TFTP

ALWAYS CONSULT THE UPGRADE INSTRUCTIONS THAT ARE INCLUDED WITH A NEW FIRMWARE RELEASE AS CERTAIN FILES MAY NOT BE REQUIRED FOR AN UPGRADE.

- 1) Place the firmware files in an easily accessible directory path on your computer.
- 2) Telnet into the radio. The figures use the default IP address; you must use the correct IP address for the StrataLink.
- 3) At the login enter your username and password. The username is “**admin**” and default password is “**trango**”
- 4) Enter config node by typing “**config**” and entering the write access password. The default config node password is “**trango**”
- 5) Enable the tftp daemon by running the *tftpd on* command at the prompt.
- 6) Open a MS-DOS prompt (or other CLI interface) window and access the directory that you extracted the firmware files.

```
C:\CD Firmware
C:\Firmware
```

- 7) Using windows TFTP command line tool, we will upload the firmware file. The tftp syntax and an example are below.

Note that TFTP is not installed automatically on all versions of Windows. It may need to be installed or a third party program such as tftpd32.

```
TFTP [-i] host [GET | PUT] source [destination]
```

```
C:\firmware>tftp -i 192.168.100.100 put sl24v101.tar.gz
Transfer successful: 1951744 bytes in 15 seconds, 130116 bytes/s
```

- 8) Once the file has been transferred successfully, log back into the unit and apply the updates into the FLASH memory using the *bootimage upgrade* command from the config mode. Do not unplug the radio during the time the flash is being updated or the FLASH may become corrupted.

- 9) A reboot of the radio is required to load the new image after upgrade using the *reboot* command. Make sure the *bootimage upgrade* command completed successfully before rebooting or repowering the unit.

The upgrade time varies depending upon the images and the size of the image.

The firmware can be verified by logging into the radio via the CLI through the *version* command or Web browser version page under the Firmware Version section.

The Current firmware is the currently running firmware. The firmware which was replaced will be listed under the Previous Images heading.

## Upgrade Procedure -FTP

To perform the firmware upgrade using FTP, use the *ftp* command to load the images into memory, then the *bootimage upgrade* commands just as with the TFTP method. The FTP method is much faster and has built in error checking.

All that is needed is the IP address of the ftp server, a username/password, and the filename to be uploaded. The new file to be uploaded should be placed on the server. The ftp server will prompt for the password before allowing access.

- 1) Put the new software files on the ftp server using the ftp put command from a local computer (these commands are not done from the Trango equipment).

```
ftp> put <source file> <destination>:
```

The <source file> will be the filename only. The <destination> will include both path and file name.

- 2) After putting the file onto the server, log into the StrataLink and run the *ftp* command from the command line as follows to open access to the server:

```
ftp <server_ip> <user_name>
```

```
password: xxxxxxx
```

If prompted for the password multiple times, check the connectivity to the server by pinging the FTP server IP address from the debug prompt.

- 3) Next , get the file from the FTP server by typing the get command from the ftp prompt.

```
ftp> get <file_name>
```

- 4) Logout of the ftp session

```
ftp> logout
```

- 5) Run the *bootimage upgrade* command.

## IP Configuration

The user can set the IP address and subnet mask for out of band (OBM) and in-band management (IBM). Only valid IP addresses are accepted. The IP address can be reset to the default setting of 192.168.100.100 via an external button on the unit or a separate command.

IBM can be done through any Ethernet port with or without a specific VLAN assigned. The QoS features will allow prioritization of management traffic to prevent loss of connectivity during traffic overload conditions when a VLAN with high priority tag is used to manage the link.

The default gateway is configurable

### **Default Setting**

*IP address: 192.168.100.100 or 192.168.100.101*

*IBM enable on*

### **Setup via Web:**

- 1) Login to Web Config Mode - Link Setup>Link page on radio.
- 2) Enter the desired IP address in the text box.
- 3) Enter the desired Netmask in the text box.
- 4) Enter the desired Gateway in the text box.
- 5) Click Apply Changes button to make the change - Note that connectivity will be lost until connecting using the new IP address.

### **Setup via CLI:**

- 1) Log in to Config Node on the radio.
- 2) Run *ipconfig gateway <gateway ip address>* command to change the gateway address.
- 3) Run *ipconfig ip <ip address> <netmask>* command to change the IP address and netmask. - Note that connectivity will be lost until connecting using the new IP address.
- 4) No save is required.

## **GPS Coordinates**

Allows entering/saving the GPS Coordinates manually to assist in plotting the endpoints of each link on third party management software link SNMP managers and Google Earth/Maps.

### **Setup via Web:**

- 1) Login to Web Config Mode - Link Setup>Link page on radio
- 2) Enter the desired Latitude in the text box. The default format is X 00 00.00 where X is N or S. Other formats may be used since this is a text field.
- 3) Enter the desired Longitude in the text box. The default format is Y 00 00.00 where Y is E or W. Other formats may be used since this is a text field.
- 4) Click Submit button to make the change.
- 5) Click the Save Changes button to make the change permanent.

### **Setup via CLI:**

- 1) Log in to Config Node on the radio.
- 2) Run `gps_lat <Latitude>` command to change the latitude. The default format is X 00 00.00 where X is N or S. Other formats may be used since this is a text field.
- 3) Run `gps_long <Longitude>` command to change the longitude. The default format is Y 00 00.00 where Y is E or W. Other formats may be used since this is a text field.
- 4) Run `config save` command to make changes permanent.

## Ethernet Port Settings

The input Ethernet ports can be configured independently to match the network. The default settings are recommended for most situations and no changes need to be made. No modification of the PLA port is allowed since it is dedicated for use between two radio units only. The following parameters can be modified:

- 1) The Ethernet ports GE1 and GE2 can be configured to be autonegotiate or fixed.
- 2) The GE1 and GE2 ports can be disabled.
- 3) The speed and duplex can be changed if Autonegotiate is disabled, however, note that the SFP ports are fixed Gigabit and cannot be set to lower physical speeds.
- 4) Port priority can be assigned to place untagged traffic into one of the QoS Queues.
- 5) The ingress rate can be limited if desired using the port `eth <1|2> maxrate` command.
- 6) Pause frames can be enabled on the port for traffic flow when connected at Gigabit speeds.

### Default Settings for GE1 and GE2

*Port Enable= On*

*Autonegotiate=On*

*Priority = 0*

*Max Rate = 1000*

### Setup via Web:

- 1) Login to Web Config Mode - Link Setup>Ports page on radio.
- 2) To disable Autonegotiate, select Disable from the “Auto Nego” drop down menu, then select the Apply Changes button. The Duplex and Speed drop down boxes will become available.

- 3) To disable a port, select Disable from the “Enable” drop down menu, then select the Apply Changes button. Disabling may result in a lost connection to the radio unit.
- 4) Select the Duplex and Speed desired from the drop down boxes, then click the Apply Changes button to activate. (Autonegotiate must be off).
- 5) To change the Max rate, enter the rate in Mbps into the text box and click the Apply Changes button to activate.
- 6) To change Port Priority, select the Priority level from the drop down and click the Apply Changes button to activate.
- 7) Click the Save Changes button to make the change permanent.

#### Setup via CLI:

- 1) Log in to Config Node on the radio.
- 2) Run `port eth <1/2> auto_negotiate <on/off>` command to enable or disable autonegotiation for the port.
- 3) Run `port eth <1/2> enable <on/off>` command to enable or disable the port. Disabling may result in a lost connection to the radio unit.
- 4) Run `port eth <1/2> duplex <half/full>` command to change the duplex. (Autonegotiate must be off).
- 5) Run `port eth <1/2> maxrate <0-1000>` command to limit the ingress rate on the port selected.
- 6) Run `port eth <1/2> pause <on/off>` command to enable/disable the pause feature for the port selected.
- 7) Run `port eth <1/2> priority <0-7>` command to enable prioritization of untagged traffic on the port selected.
- 8) Verify the desired results.
- 9) Run `config save` command to make changes permanent.

## ***Link Planning***

This section describes the process that occurs before installing and setting up a StrataLink 24 system.

### **Path Planning**

The StrataLink 24 is an unlicensed device and as such is free from the coordination and licensing requirements that accompany licensed microwave equipment. Since the StrataLink does use the 24 GHz spectrum, care must be taken to ensure a reliable link.

To ensure success, a path analysis should be done for each link that is being considered. Antenna heights, system gain, rain region and terrain data are evaluated to determine the reliability of the link over time and changing weather.

Trango will run path analysis for its customers using industry standard software, evaluate different equipment options to achieve the customer goals.

A Link Planning App called PathCheck is also available from Trango for basic analysis of potential paths including terrain profile and rain effects.

### **Site Selection**

After the Planning phase is complete, it is essential that the proposed site be physically evaluated by the operator to ensure that no buildings or vegetation has crossed into the Fresnel zone that would affect operational reliability.

It is not uncommon for tall buildings to be located in what would otherwise be a perfect non blocked line of sight path based on terrain data, but too often this is discovered when the installation is being performed.

The site must also be evaluated for power and shelter provisions.

Contact Trango for more information on the above topics.

## ***Installation***

This section describes the installation to ensure that the StrataLink radio units are correctly installed. Failure to follow these procedures may result in damage to the equipment and void the factory warranty.

### **Safety**

Installing microwave equipment can be dangerous. Please take the following precautions when installing or performing maintenance on the equipment.

**Equipment Protrusions:** The equipment has been designed to be free of unnecessary protrusions or sharp surfaces that may catch or otherwise cause injury during handling. However, always take care when working on or around the equipment.

**Laser and Fiber Optic Cable Hazards:** Trango fiber optic SFP Module transmitters are IEC60825-1 / 21CFR1040-1 Class I compliant and present no danger to personnel in normal use. However: Do not look into active unterminated optical ports or fibers. If visual inspection is required ensure the equipment is turned off or, if a fiber cable, disconnect the far end. Follow the manufacturer's instructions when using an optical test set. Incorrect calibration or control settings could result in hazardous levels of radiation. Protect/cover unconnected optical fiber connectors with dust caps. Place all optical fiber cuttings in a suitable container for safe disposal. Bare fibers and fiber scraps can easily penetrate the skin and eyes.

**Lifting Equipment:** Be careful when hoisting or lifting the ODU or its antenna during installation or maintenance. The StrataLink unit is nominally 10 lbs. However, antennas with their mounting hardware can weigh in excess of 100 kg (220 lb) and require specialized lifting equipment and an operator trained and certified in its use.

**Protection from RF Burns:** StrataLink radios do not generate RF fields intense enough to cause RF burns, however, installers/operators should comply with the following cautions:

- 1) It is hazardous to look into or stand in front of an active antenna aperture. Do not stand in front of or look into an antenna without first ensuring the associated transmitter or transmitters are switched off.
- 2) Do not look into the waveguide port of an ODU when the radio is active.

**Protection from RF Burns - Tower Site:** When the StrataLink radio unit is to be installed where existing antennas are located, avoid exposure to potentially harmful levels of RF radiation from these antennas by:

- 1) Determining the RF exposure risk. If necessary ask the structure/tower owner or operator. When necessary, wear a protective suit or have the transmitter(s) switched off for the duration of the installation.
- 2) Do not stand in front of or look into any antennas.

**Safety Warnings:** When a practice or procedure poses implied or potential harm to the user or to the radio equipment, a warning is included in this manual.

**Airflow Requirements:** Installations must be made so the airflow required for safe and correct operation of Trango equipment is not compromised. For the StrataLink, unobstructed air passage must be maintained to all sides of the unit.

**Circuit Overloading:** When connecting the StrataLink, determine the effect this will have on the power supply, circuit protection devices, and supply wiring. Check StrataLink power consumption specifications and the supply capability of the power supply system. This check of capacity must extend to the dc power supply and not just to an intermediate connection point.

**Power Supply/Adapter Earthing:** -48 V power AC-DC Power adapter mains side are typically connected to ground via the third prong on the AC power cord. Some adapters have the positive DC output terminal also connected to ground which is OK, or both output terminals isolated to allow the user to determine if -48 or +48 volts is to be used.

**Be certain that the power supply used does not have the DC output side negative rail (-) grounded to prevent damage to the Radio or the PoE injector.**

**Electrostatic Discharge (ESD):** ESD can damage electronic components. Even if components remain functional, ESD can cause latent damage and/or premature failure. Always wear proper ESD grounding straps when handling or touching any PCB assemblies. Connect your ESD grounding strap to the ground connector on the ODU or PoE units as applicable

**Fiber Optic Cables:** Handle optical fibers with care. Keep them in a safe and secure location during installation. Do not attempt to bend them beyond their minimum bend radius. Protect/cover unconnected optical fiber connectors with dust caps.

**Ground Connections:** Reliable grounding of the system must be maintained. Refer to instructions in this manual for grounding of the ODU, ODU cable, lightning surge suppressor, and IDU.

**Lightning Surge Suppressor:** StrataLink Ethernet cables should be fitted with surge suppressors to prevent damage to equipment. Contact Trango for further details.

**Mains Power Supply Routing:** StrataLink DC power, Ethernet data and management cables are not to be routed with any AC mains power lines. They are also to be kept away from any power lines which cross them.

**Ambient Temperature:** The ambient temperature range for the StrataLink is -40° to +55° Celsius. To ensure operation and to maximize long term component reliability, ambient temperatures must not be exceeded. Operational specification compliance is not guaranteed for temperatures outside this range.

**Mechanical Loading:** When installing the StrataLink unit and antenna/remote mount on a tower mount or building, ensure the mount is securely anchored first and can support the full load of the radio unit and antenna. Ensure that the additional loading of an StrataLink unit will not cause any reduction in the mechanical stability of the mount.

**Power Supply Connection:** The StrataLink radio has the positive pin on its dc power supply connector connected directly to the chassis, which is in turn connected directly to the earth ground through the tower leg. StrataLink radios must be used with a -48 Volt DC power supply which has a positive earth; the power supply earth conductor is the positive supply to the radio or PoE injector.

- 1) There must be no switching or disconnecting devices in this earth conductor between the dc power supply and the point of connection to an StrataLink system.
- 2) The power supply must be located in the same premises as the StrataLink system.
- 3) All Ethernet cabling which is carrying power to the StrataLink radio unit from the PoE injector must be 24 AWG solid strand Cat 5e or Cat 6 Shielded Twisted Pair (STP) cable with all 8 conductors terminated using shielded connectors with a solid connection made between the cable and connector ground.

**Power Supply Disconnect:** An appropriate power supply disconnect device should be provided as part of the building installation.

**Rack Mount Temperature Considerations:** If the StrataLink PoE unit is installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient. The maximum ambient temperature of +55°Celsius applies to the immediate operating environment surrounding the PoE unit, which, if installed in a rack, is the ambient within the rack.

**Restricted Access:** The StrataLink system should be installed in restricted access sites. The PoE unit and associated power supply should also be installed in restricted areas, such as dedicated equipment rooms, closets, cabinets, or the like. Access to the tower and radio/antenna location should be restricted.

**Note:** For USA: In restricted access areas install the StrataLink system in accordance with articles 110-26 and 110-27 of the **2002 National Electrical Code ANSI/NFPA 70**.

## Basic Link Setup

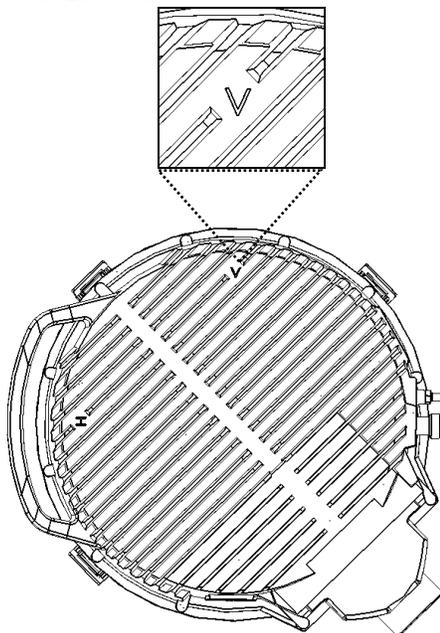

The StrataLink 24 comes preconfigured to link up as soon as power is applied. It is highly recommended that the link be bench tested first before field installation. The section below covers the basics steps for setting up the link. Detailed information on field installation is in the Detailed Field Installation Section.

### BENCH TEST:

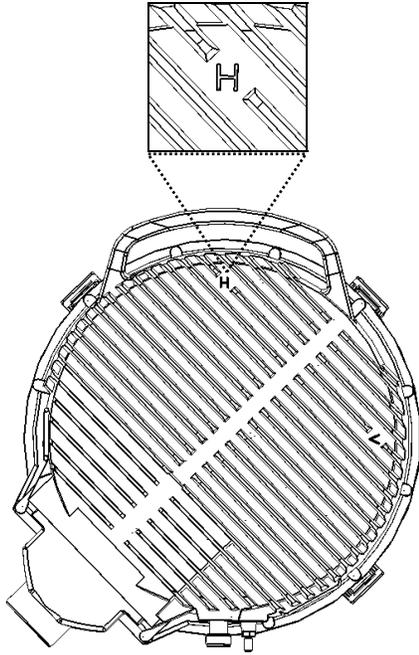

- 1) Apply power using the PoE or with direct power (-48VDC).
- 2) Log into each unit using a browser, SSH or telnet ,with the default IP addresses of 192.168.100.100/192.168.100.101 with the following user/passwords:
  - a. View node user: **admin** password: **trango**
  - b. Config node: user: **config** password: **trango**
- 3) Units should link if waveguide ports are oriented toward each other.
- 4) Adjust the transmit power as appropriate. **For FCC Compliance, it is the responsibility of the installer to set the transmitter power at or below -3 dBm to meet the field strength limits of FCC Part 15.249.**
- 5) Save changes.
- 6) Change the IP address to the desired IP address and submit. Radio connection will be lost until new IP address is used.

### FIELD INSTALL:

- 1) Install the antennas onto the mounting pole at each end of the link and visually align them toward each other.
- 2) Latch one StrataLink 24 unit to the back of the antenna with “V” indicator at the top - This unit will be transmitting Vertical Polarization and receiving Horizontal Polarization.

- 3) Latch the other StrataLink 24 unit to the far end antenna with the “H” indicator at the top – This unit will be transmitting Horizontal Polarization and receiving Vertical Polarization.

- 4) Power up the radios using PoE or with direct power (-48VDC)
- 5) Align the radios using the BNC RSSI output to obtain the expected RSL.
- 6) The Link LED, located near the direct power input connector, should light up solid green on both ends after both units are running for 3 minutes.

## ***Detailed Field Installation***

The standard procedure for installing the equipment in the field is as follows:

- 1) Antenna Installation
- 2) Power Supply and PoE (optional) Installation
- 3) Run Ethernet and Power Cable
- 4) Install radio onto antenna at both ends and connect cables
- 5) Antenna Alignment
- 6) Proceed to commissioning.

**CAUTION:** StrataLink has no user serviceable parts. Only factory certified personnel should make any changes or repairs to the units.

The following tools are required for installation:

Adjustable Open Ended Wrench  
Ethernet Cat5e cable crimp tool  
#2 Flat screwdriver  
#2 Philips Head screwdriver  
Stranded 18 AWG wire for power connection  
Stranded 12 AWG wire for StrataLink ground connections  
Wire Insulation strippers for ground and power wire  
Terminal crimpers for ground and power wire

## Antenna Installation

Antennas are typically installed and are coarse aligned without the radio either visually or with third party equipment. Alternatively, some operators prefer to install the radio equipment onto the antenna prior to installing the antenna on the rooftop or tower.

Consult the AD24G-XX-XX antenna manual for the antenna being used for detailed installation instructions.

## Power Supply and PoE Installation

The StrataLink requires a -48 Volt power supply. Trango recommends the -48 VDC universal wall mount power supply, 1.6 A (part# P-SUPPLY-WM-48-L). This power supply can support one StrataLink unit. The power supply should be mounted in a weather protected location close to the main ground. See the Cabling/Grounding Diagram for more information.

Figure 17 Wall Mount Power Supply

Each unit is supplied with a locking two position terminal block that plugs into the StrataLink main access panel or into the POE Injector. The wiring of the pluggable terminal block should be done as shown below.

The cabling used should be either coaxial (shown) or two wires of a size no smaller than 18 AWG. If individual wires are used, the wires should be twisted together to reduce susceptibility to noise. At least one turn per inch is recommended.

**NOTE: Ensure that only a -48 Volt Supply is used and that the wiring is correct. If a +48 VDC supply is used and the Earth ground is wired to the negative terminal shown in the figure, permanent damage to the unit may occur.**

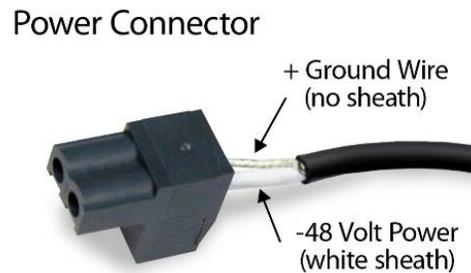

Figure 18 -48 VDC Power Connector using coaxial cable

In the figures above, the Power can be connected in two ways, **Power-over-Ethernet** or **Direct DC Power** as described in the sections below.

## Running Cable

Running the cables depends on the type of installation. In most cases PoE based installation is used, but the power can be directly connected to the unit as a backup or in the case of running long lengths of fiber to the radio unit.

## PoE Based Installation

This section covers installation when powering the unit through Power Over Ethernet (PoE) using a single Cat5e or Cat6 Shielded Twisted Pair (STP) Cable used for management and user traffic. The POE-GIGE-48 is shown in the Figure below:

Figure 19 POE-GIGE-48

The **PoE Power Injector (POE-GIGE-48)** should be connected to the built in copper Ethernet port only. Either crossover or straight through cable can be used depending on the connection:

1. **Connecting to a Computer:** Always use a shielded *Cross-Over* Ethernet cable when connecting the out-of-band Management Port to a COMPUTER
2. **Connecting to another Network Device:** Always use a shielded *Straight-Through* cable when connecting the Data Port to a HUB, SWITCH, or ROUTER

#### **IMPORTANT INFORMATION ON PoE**

- 1) The PoE is non-standard and will not support 802.3af due to the high current requirements of the radio unit.
- 2) The total length of the Ethernet cabling from network switch to StrataLink unit cannot exceed 250 feet/75 meters. This length is the sum of the length of cable from the PoE injector to the StrataLink unit + the length of cable from the PoE Injector to the network switch.
- 3) Since the PoE Requires **ALL 8 conductors AND the shield** which acts as the ground, it is critical that:
  - a. ONLY shielded Twisted Pair (STP) Cat5e or Cat6 cabling be used.
  - b. Shielded connectors are used with the shield crimped properly to the cable shield wire, or preferably soldered.
  - c. All 8 conductors are wired.

**If any of the above conditions are not met the PoE function may not work correctly!**

The wiring for basic PoE installation using the POE-GIGE-48 is shown below. The powered cable must only be connected to the built in RJ45 connector on the radio.

**Do not connect ANY cables from the PoE-GIGE-48 to any SFP module on the radio or the SFP module will be damaged.**

The Management side of the POE-GIGE-48 is not used for StrataLink 24.

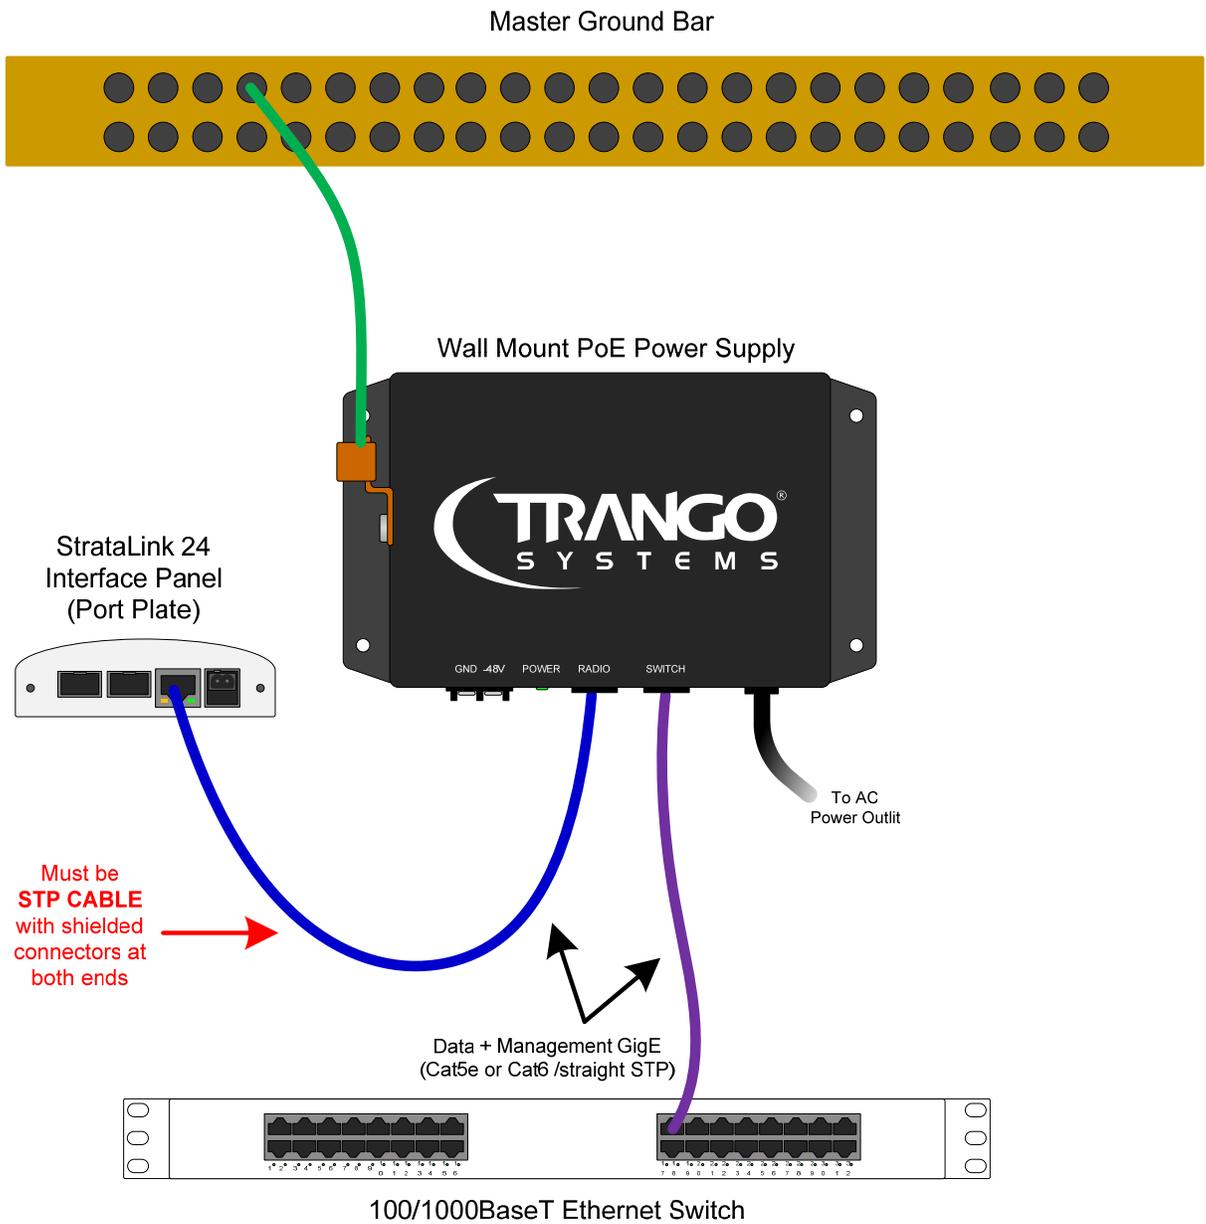

Figure 21 PoE Wiring WITHOUT Surge Suppression

## Direct Power Based Installation

This section covers installation when powering the unit through the direct -48 Volt DC port and using the Copper or Fiber traffic interfaces is desired.

The primary benefit of direct power is that no surge suppression is required on the traffic interface since it is fiber and the distance to the network can be longer due to the long lengths supported by the fiber and direct power wiring. The 100 meter limitation still applies for any copper Ethernet cabling.

For long runs of Power, coaxial cable is recommended in conjunction with surge suppressors to reduce the risk of voltage spikes causing damage to network equipment.

The Direct Power Input on the front panel is shown below. The pre-assembled terminal block plug should be attached until the plug snaps into place.

Figure 22 Direct Power Connector

## Cable/Grounding Diagram

The diagram below shows the cable wiring for PoE based installations. Grounding of Ethernet cable should be done at the base of the tower using the Terminal Block on the PoE Injector/Surge Suppressor Box. This applies to direct power or PoE powered installations using copper Ethernet. The surge suppression built into the PoE- GigE-48 will help protect network equipment inside the shelter from damage.

A Ground wire of AWG 12 or larger should be used and grounded to an Earth grounded tower leg or Bus Bar before entry into the shelter. The figure below shows the overall ground design.

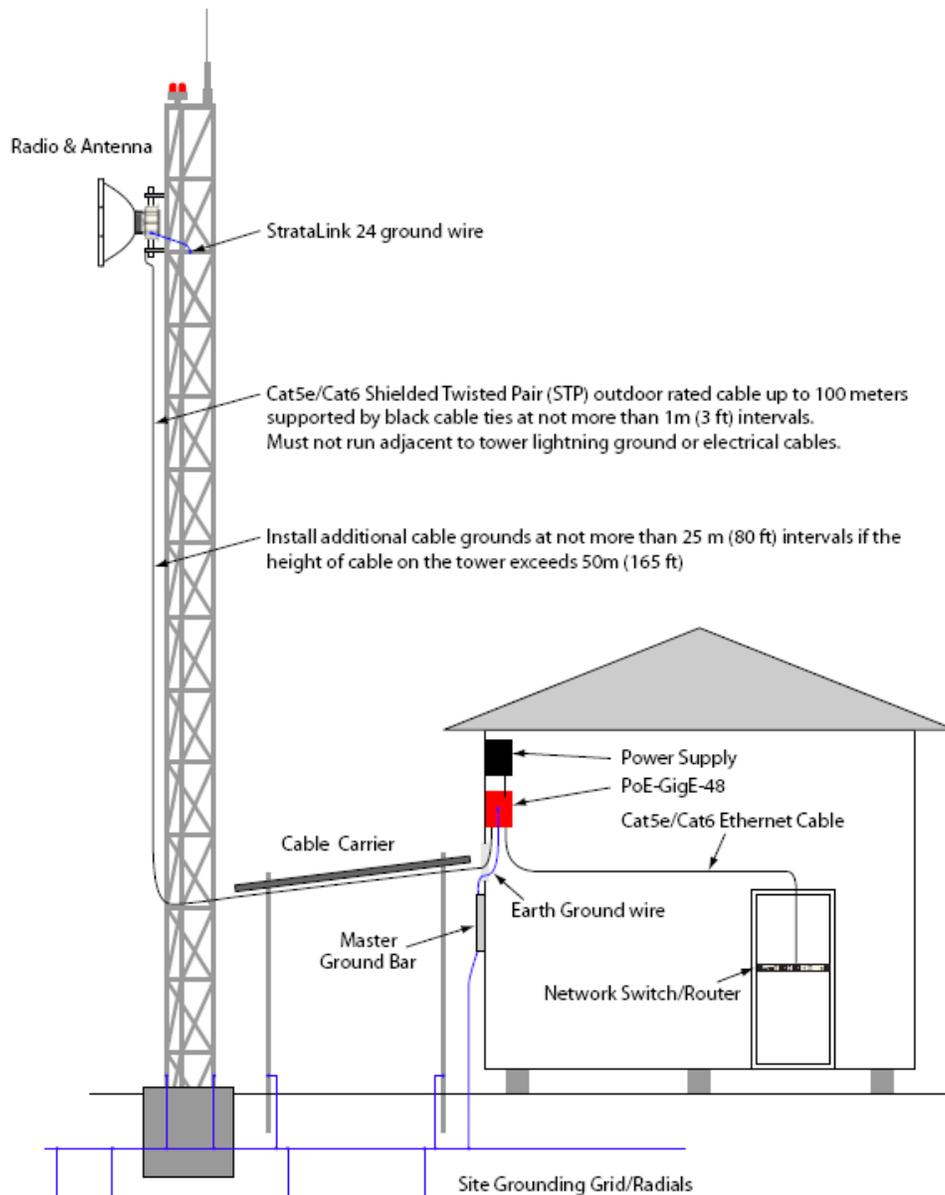

Figure 23 PoE Based Cable/Grounding Diagram

## Radio Installation onto Antenna

After the cables have been run the StrataLink radio can be installed. The StrataLink utilizes a slip fit connection that makes installation simple. The radios are designed to mount to the AD24G-xx-xx series of antennas.

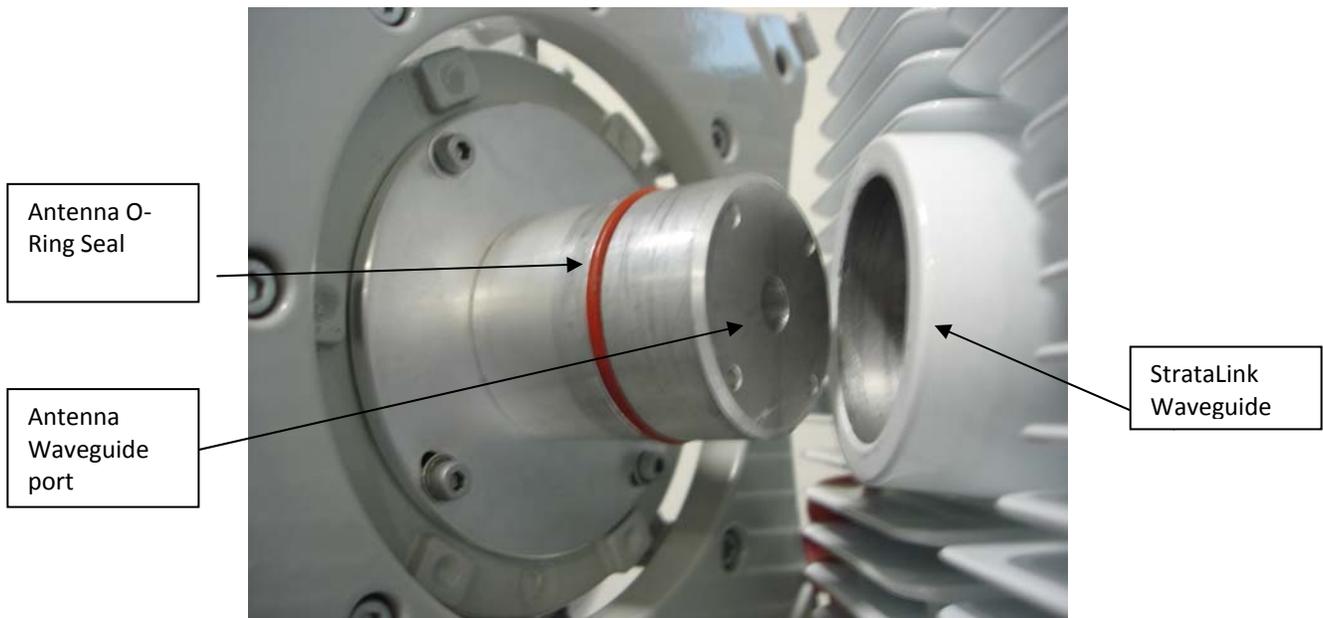

Figure 24 Antenna to StrataLink Slip Fit Waveguide connection

After installing and securing the antenna the StrataLink unit can be installed directly on the back of the unit. On one end of the Link the “V” indicator on the unit must be at the top and on the other end of the link the “H” indicator must be located at the top since one path is transmitting a Vertical polarized signal and the other path is transmitting a Horizontally polarized signal.

**Polarization Indicators** – The letters “H” and “V” are die cast on the StrataLink housing perimeter to assist in mounting the unit to the antenna in the correct polarization. The letter that is at the top will always indicate the antenna polarization used for transmit.

“V”  
polarization  
indicator

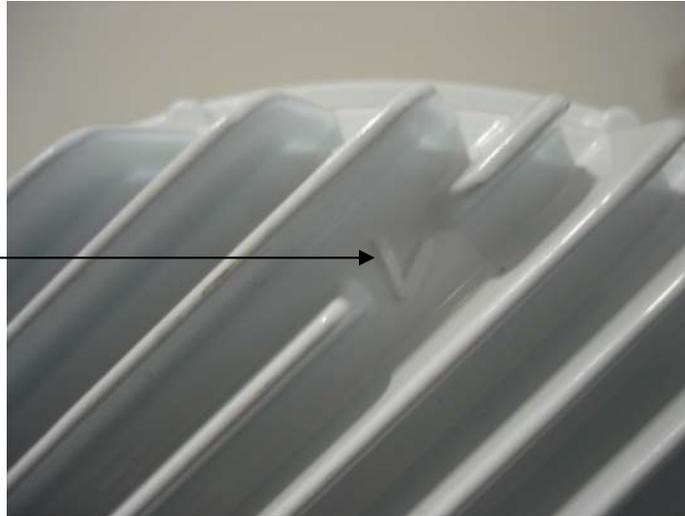

Figure 25 Polarization Indicator

Cover the antenna O-ring with silicone grease per the Antenna manual. Failure to do this may result in a damaged O-ring and subsequent damage to the antenna or radio.

Gently slide the StrataLink unit onto the antenna and clip the four spring loaded latches to the antenna clips as shown below. The latches should be very snug and “click” into place. If there is difficulty closing the latches, then check the waveguide for debris or foreign matter around the perimeter.

Secure the latches eyelets with locks if desired.

Latch with  
Eyelet

Figure 26 Mounting Latches

## Cable Connection and Sealing

StrataLink is supplied with the following components to seal the cable entry port from weather.

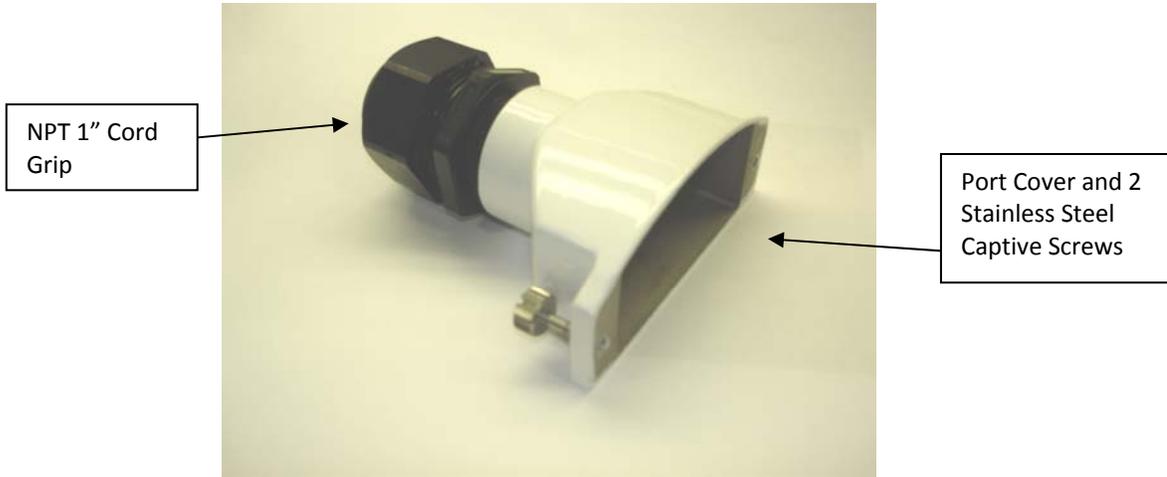

Figure 27 Port Sealing Components

Run the unterminated STP through the Cord Grip holes and then terminate the cables with the RJ45 Shielded plugs such as those supplied with the POE-GIGE-48.

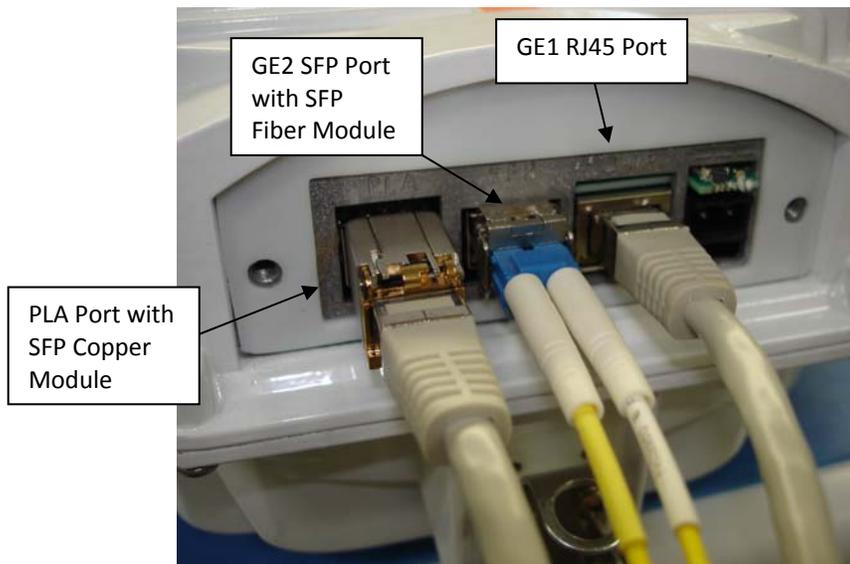

Figure 28 STP and Fiber Cables installed on Unit

Tighten the two port cover screws using a flathead screwdriver. The screws should be tightened to 8 lb-in to ensure sealing pressure on the silicone gasket around the ports inside.

Figure 29 Port Cover/Cord Grip Installed

Attach the NPT 1" Cord Grip and tighten until the cables are held tight. Teflon tape may be used on the threads but is not necessary.

Figure 30 Cord Grip Tightened (Single Cable Install)

The Radio ground lug is shown below. Use the StrataLink ground wire kit to attach this point to the grounded tower leg where the unit is installed.

Figure 31 Ground Lug and RSSI BNC on StrataLink

## Antenna Alignment

After Basic Setup of the link, the antennas can be aligned.

Aligning narrow beam width (< 2°) over long distances can be a difficult process without the proper equipment, patience, and a careful process.

Using a GPS compass and the Path Analysis to establish a crude azimuth and elevation, the installation crew can mount the Antenna Assembly on the supporting structures at each end of the link. Once the antennas are installed and a rough antenna alignment has been established, the fine alignment process can begin at one end of the link (typically the site with the smaller antenna).

Once one side is aligned to achieve best RSSI, MSE, and BER then the operator can adjust the other side to improve the link. Alignment is best done using the voltage measured at the BNC connector on the Radio.

Run the **linktest** command while aligning the antenna and look for the MSE to improve (a higher negative number) while adjusting. When the lock status changes to 1, you may fine tune the alignment with the LED display

### Antenna Alignment Procedure

1. Ensure that both sides of the link have the correct transmit and receive frequencies, matching speed settings, and the transmitters are both on.
2. StrataLink 24 is a cross-polarized system. Verify that one Radio units are mounted with the “V” Polarity indicator at the 12 O’Clock position and the other with the “H” Polarity indicator at the 12 O’clock position.
3. Verify the Transmitter Power Level is set to the nominal level at which the link will be operated.
4. Connect a Multimeter to the Radio BNC connector using the CBLDAT-RSSI cable.
5. Record the voltage present at the BNC connector and carefully adjust the antenna until the voltage matches or is as close as possible to the voltage corresponding to the expected RSL pre the chart below. *The BNC Voltage =  $0.1 + 0.04 \times (90 + RSL)$  Volts, where RSL = -90 to -20 dBm*
6. Once satisfied with the RSSI reading, verify the Green Lock LED near the power connector is on solid and tighten down the antenna in the optimum position. The RSSI should remain the same after all bolts are tightened.

7. Replace the sealing cap on the BNC connector and tighten until it clicks into place.

RSL(dBm)	-90	-85	-80	-75	-70	-65	-60	-55	-50	-45	-40	-35	-30	-25	-20
BNC Voltage (V)	0.10	0.30	0.50	0.70	0.90	1.10	1.30	1.50	1.70	1.90	2.10	2.30	2.50	2.70	2.90

Table 5 RSSI to Voltage Conversion

To remotely monitor the progress of the alignment, a second person on the ground may login to the end of the link that is being aligned and run *linktest 99* command from the CLI while adjusting the antenna(s). This is not required but can be helpful since verbal callouts of the current RSSI can be made by the second person.

# Appendix A- Product Specifications

## Dimensions and Weight

Parameter	Specification
Size	10.5 x 10.5 x 4.1 in
Weight	<10 lbs

## Environmental

Parameter	Specification
Operating Temperature Range	-40 deg C to +65 deg C - Functional -40 deg C to +55 deg C - Spec Compliant
Storage Temperature	-40 deg C to +75 deg C
Humidity	100% Condensing

## Emissions

Parameter	Specification
FCC Conducted Emissions	FCC 15.107 (a) Class "B"
FCC Radiated Emissions	FCC 15.109 (a) Class "A"

## Wireless Compliance

Parameter	Specification
USA (FCC)	CFR47 Part 15.249 (24 GHz Point to Point Device) CFR47 Part 15 Class A unintentional radiator
Canada	RSS 210 (Annex 12)
Taiwan (NCC)	LP-0002

## Wireless Parameters

Parameter	Specification
Frequency Range	24.05 to 24.25 GHz (FCC and IC models) 24.0 to 24.25 GHz (Taiwan models)
Channel Sizes Supported	10 , 14, 20, 25, 30, 40, 50, 60 MHz
Modulation Levels	QAM1024, QAM512, QAM256, QAM128, QAM64, QAM32, QAM16, 8PSK, QPSK
Transmit RF power output	FCC: Approx +33 dBm EIRP with 1 foot antenna Industry Canada: Conducted + 0 dBm for all antenna sizes
Transmitter Power Accuracy	+/- 2 dB
Transmitter Frequency Accuracy	+/- 7 ppm
Transmitter Center Frequency Synthesizer step size	1 MHz
Transmitter Output Power (Muted )	< -50 dBm
Adaptive Modulation Type	Error Free, Hitless through each transition

## Radio Sensitivity

Receive Sensitivity In dBm									
Channel Width (MHz)	QPSK	8PSK	QAM						
			16	32	64	128	256	512	1024
10	-92.0	-87.0	-84.0	-80.0	-77.6	-74.5	-71.5	-68.1	NA
14	-88.5	-85.3	-82.3	-78.3	-75.9	-72.8	-69.8	-66.4	-62.9
20	-87.0	-83.8	-80.8	-76.8	-74.4	-71.3	-68.3	-64.9	-61.4
25	-86.1	-83.1	-80.0	-76.0	-73.4	-70.3	-67.3	-63.9	-60.4
30	-85.3	-82.1	-79.1	-75.1	-72.7	-69.6	-66.6	-63.2	-59.7
40	-84.0	-80.8	-77.8	-73.8	-71.4	-68.3	-65.3	-61.9	-58.4
50	-83.1	-79.8	-76.9	-72.9	-70.5	-67.4	-64.4	-61.0	-57.5
60	-82.0	-78.3	-76.3	-72.3	-69.9	-66.8	-63.8	-60.4	-56.9

## Power

Parameter	Specification
Input Voltage Range (Direct)	-40 to -72 VDC
Input Voltage Range (PoE)	-43 to -50 VDC (At PoE-GigE-48 Power input)
Power Consumption	< 40Watts (SL-24, SL-24-X) <36 Watts (SL-24-E, SL-24-EX)

## User Interfaces

Description	Specification
Ethernet Traffic Ports and/or In Band Management (IBM)	ETH1: RJ45 - 10/100/1000BaseT ETH2: SFP - 1000BaseT for SFP Module: SFP-GigE-C (1000BaseT) SFP-GigE-S (1000BaseLX Single Mode Fiber) SFP-GigE-M (1000BaseLX Multimode Fiber)
PLA Port	ETH3: SFP - 1000BaseT for SFP Module
Direct Power	2 Position Latching screw terminal Block
RSSI Alignment	BNC-Female (CBLDAT-RSSI recommended)
Reset IP/Config	Momentary Push Button
Antenna	Slip-Fit Circular Waveguide

## Ethernet Parameters

Parameter	Specification
Packet Size	64-9600 Bytes, IPV4, IPV6
Max Capacity	L1: 1000 Mbps (64 byte IPV4 with 1 VLAN tag) L2: 761.9 Mbps (64 byte IPV4 with 1 VLAN tag)
Data Latency	< 300 uS for 64 byte packets, Max capacity (per RFC2544 store and forward)
QoS	802.1p Port Prioritization VLAN Priority for tagged packets: 4 Classes of Service (SL-24, SL-24-X) 8 Classes of Service (SL-24-E, SL-24-EX)  Scheduler: WRR, Strict, or Combined
RSTP Support	Rapid Port Shutdown (RPS) both ends of link within 50 mSec of link drop

### MAX Ethernet Capacity by channel size

BW (MHz)	QPSK	8PSK	16 QAM	32 QAM	64 QAM	128 QAM	256 QAM	512 QAM	1024 QAM
10	18	28	28	57	72	84	90	102	NA
14	34	53	70	84	102	120	137	156	174
20	48	73	96	120	150	173	198	222	251
25	61	90	126	150	186	216	251	282	323
30	73	108	144	186	222	257	300	342	383
40	96	150	198	246	300	353	401	456	515
50	120	180	246	305	371	431	497	569	641
60	144	222	294	366	450	522	612	678	726

### Max Channel Bandwidth & Capacity including Header Compression

(72 Byte IPV4 UDP packets with One VLAN tag)

## ***Appendix B - Recommended Operating Frequencies***

The T/R Spacings and Center Frequencies in this section are designed for the maximum number of co-located links. If multiple links are not collocated or interference is not present then the default T/R spacing of 130 MHz is sufficient for all channel sizes.

## Appendix C- Web Interface Guide

This guide details the web browser operation of the StrataLink 24 Radio and shows screen captures of each page for both View and Config Modes. It is divided into two sections:

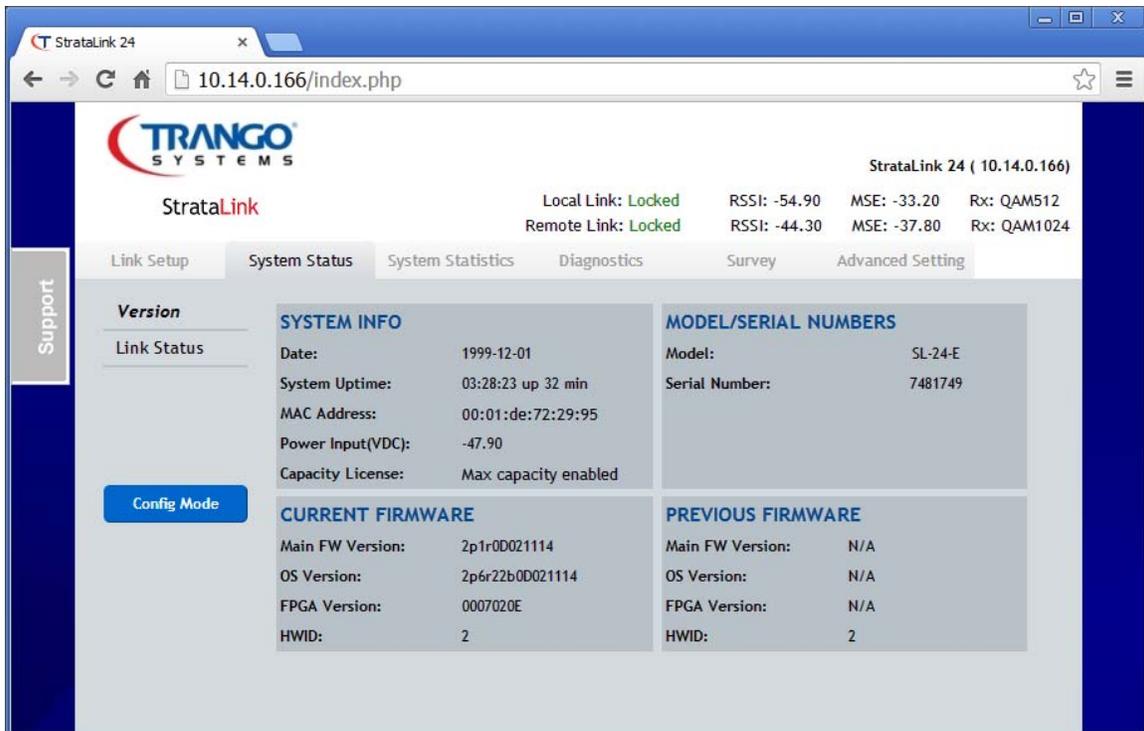

- 1) Basic Web Interface Operation
- 2) Web Page Details

### Basic Web Browser Operation

Enter the Web GUI by typing the IP address of the radio unit in any standard web browser bar, and when prompted for a user id and password, set user name = **admin** and Password = **trango** then press the **log in** button as shown below:

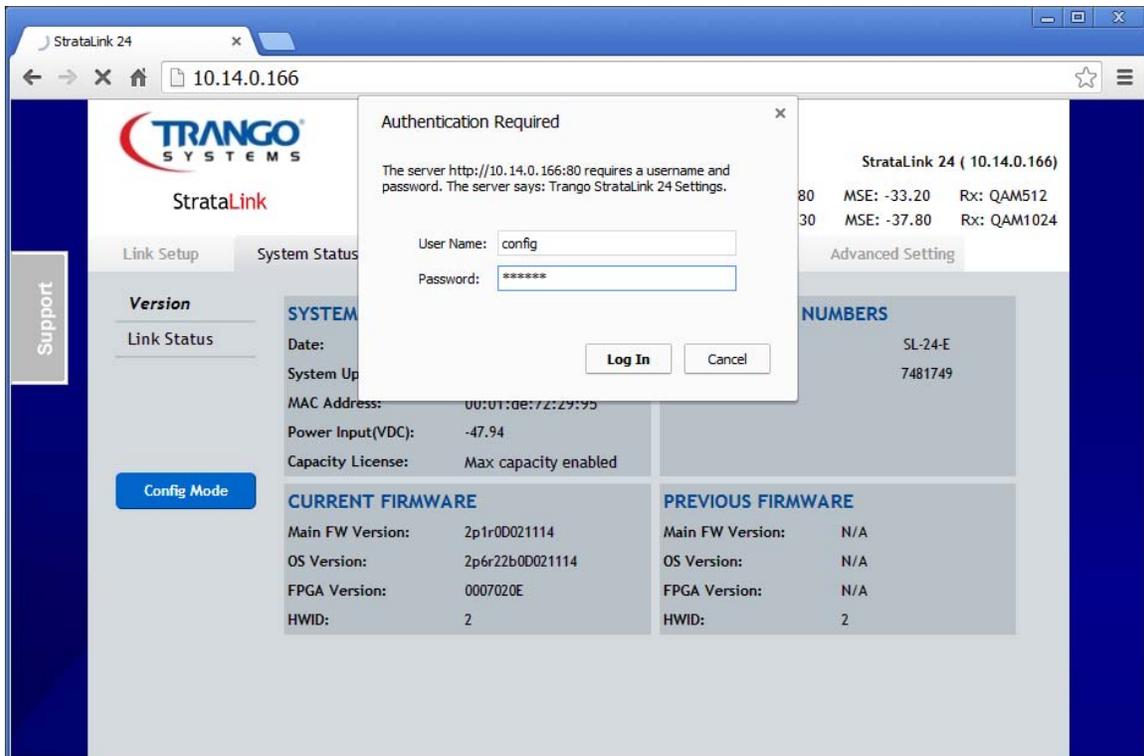

The first page that will appear is the **System Status>Version** Page which contains various information about the radio unit as shown below:

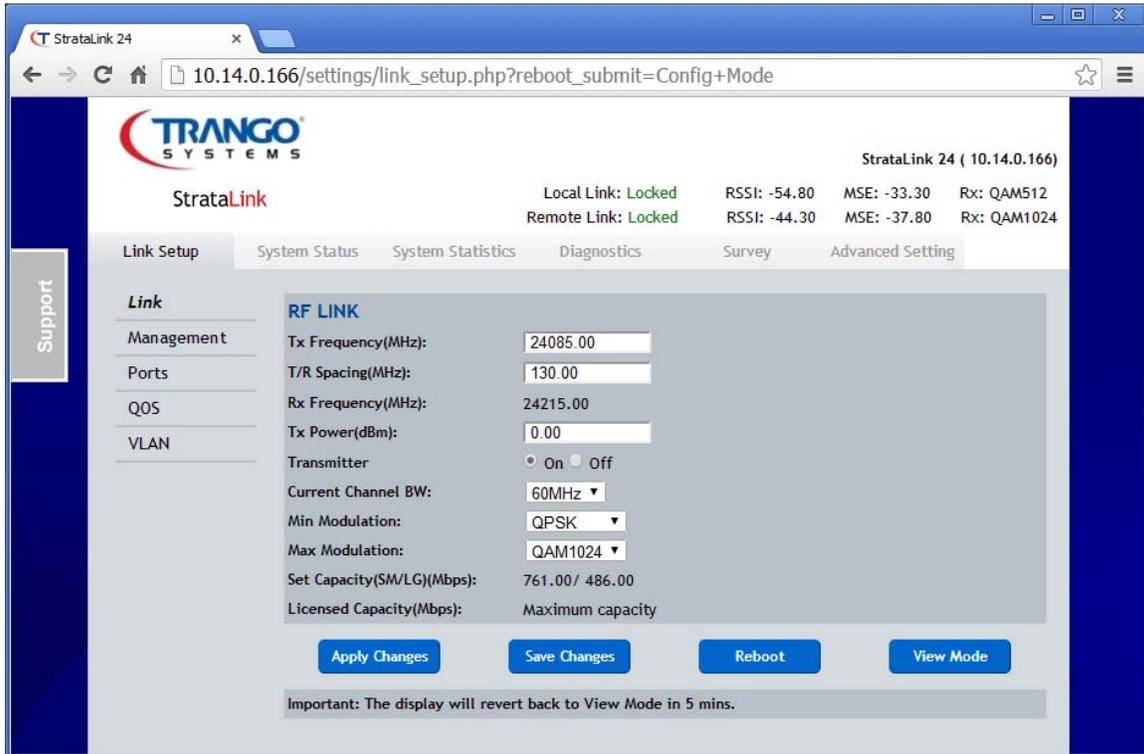

When first entering the web browser the user will be in View Mode, which allows only viewing of the current settings and statistics.

To make basic changes on the Radio, click the Config Mode button tab which will bring up the config login screen as shown below. To login to the Config Node, set user name = **config** and Password = **trango** then press the **log in** button as shown below:

Once in Config mode the following page will appear:

Link Setup is the main page that is used to set up basic operation of the radio. Key points applicable to this page and most other pages in Config Mode are:

- 1) **Status Section** – Indicates the local and remote link lock status, RSSI, MSE, and receive Modulation level. This is the main indicator of link quality and is on every web page. It is updated every 20 seconds.
- 2) **Apply Changes Button** – After changes have been entered, this button will make the changes to the system active, but not save the changes to FLASH memory. If a reboot is done after clicking on Apply, the system will revert to the last saved state.
- 3) **Save Changes Button**– After changes have been applied and verified , clicking on Save Changes will save all changes made from all pages into the FLASH memory so that upon a reboot the new settings take effect.
- 4) **Reboot** – Reboots the radio and restores the saved system settings. If reboot is done on an active link, traffic will be interrupted for approximately 2 minutes.
- 5) **View Mode** – Returns the user to View mode. The system will automatically log the user out of Config mode after 5 minutes of no activity to prevent accidental changes. To prevent unauthorized access, it is recommended to close the web browser after all changes have been made.

- 6) **Support Tab** – This tab will take the user to the Trango web site to allow searching for resources to assist in troubleshooting or other topics.

## Web Page Details

This section shows each web page and points out important aspects of each. Some pages have both View and Config Modes and only the Config Modes are shown here.

### Link Setup>Link

The screenshot displays the web interface for a StrataLink 24 device. The browser address bar shows the URL `10.14.0.164/settings/link_setup.php`. The page header includes the Trango Systems logo and the device name "StrataLink 24 ( 10.14.0.164)". A navigation menu at the top contains "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". A vertical "Support" button is located on the left side. The main content area is titled "RF LINK" and contains the following configuration fields:

Tx Frequency(MHz):	24085.00
T/R Spacing(MHz):	130.00
Rx Frequency(MHz):	24215.00
Tx Power(dBm):	0.00
Transmitter:	<input type="radio"/> On <input type="radio"/> Off
Current Channel BW:	60MHz
Min Modulation:	QPSK
Max Modulation:	QAM1024
Set Capacity(SM/LG)(Mbps):	761.00 / 486.00
Licensed Capacity(Mbps):	Maximum capacity

At the bottom of the configuration area, there are four buttons: "Apply Changes", "Save Changes", "Reboot", and "View Mode". Below these buttons, a warning message states: "Important: The display will revert back to View Mode in 5 mins."

## Link Setup>Management

The screenshot shows the StrataLink 24 Management page in a web browser. The browser address bar shows the URL `10.14.0.97/settings/mgmt.php`. The page header includes the Trango Systems logo and the device name `StrataLink 24 (10.14.0.97)`. The page is divided into several sections: **Link Setup**, **System Status**, **System Statistics**, **Diagnostics**, **Survey**, and **Advanced Setting**. The **Link Setup** section is active, and the **MANAGEMENT** tab is selected. The management parameters are as follows:

Parameter	Value
DHCP Enable:	<input type="radio"/> On <input checked="" type="radio"/> Off
IP Address:	10.14.0.97
Netmask:	255.255.254.0
Gateway:	10.14.0.1
Management Port:	<input checked="" type="radio"/> GE1 <input type="radio"/> GE2
IBM Vlan ID:	100
IBM Tagging:	<input type="radio"/> On <input checked="" type="radio"/> Off
IBM Enable:	<input type="radio"/> On <input checked="" type="radio"/> Off
Latitude:	N 00 00.00
Longitude:	S 00 00.00
Unit ID:	StrataLink 24
NTP Enable:	<input type="radio"/> On <input checked="" type="radio"/> Off
NTP Time Zone:	7
DNS IP:	10.12.200.2
NTP Server IP:	198.60.73.8
NTP Server Name:	3.pool.ntp.org

At the bottom of the management section, there are four buttons: **Apply Changes**, **Save Changes**, **Reboot**, and **View Mode**. Below the buttons, there is a note: "Time Zone: Enter offset to GMT. For e.g. enter -8 for 'GMT-08:00' hrs. Important: The display will revert back to View Mode in 5 mins."

This page is where IP address, Netmask and Gateway are entered, along with other management parameters and the date.

## Link Setup>Ports

The screenshot shows the web interface for a StrataLink 24 device. The browser address bar shows the URL `10.14.0.164/settings/eth_setting.php`. The page title is "StrataLink 24 ( 10.14.0.164)".

At the top right, there is a status summary:

Local Link: <b>Locked</b>	RSSI: -42.60	MSE: -35.90	Rx: QAM1024
Remote Link: <b>Locked</b>	RSSI: -36.30	MSE: -37.90	Rx: QAM1024

The main navigation tabs are: Link Setup, System Status, System Statistics, Diagnostics, Survey, and Advanced Setting. The "Link Setup" tab is active.

On the left side, there is a vertical "Support" button and a list of menu items: Link, Management, Ports, QOS, and VLAN. The "Ports" menu item is highlighted.

The main content area shows configuration options for two ports: GE1(RJ45) and GE2(SFP). The settings are as follows:

Setting	GE1(RJ45)	GE2(SFP)
Status:	On	Off
Enable:	Enable	Enable
Auto Nego:	Enable	On
Duplex:	Full	Full
Speed:	1000	1000
Priority:	0	0
Max Rate(Mbps):	1000	1000

Below these settings, there is a section for PLA(SFP) with a "Type" dropdown menu set to "Off".

At the bottom of the configuration area, there are four buttons: "Apply Changes", "Save Changes", "Reboot", and "View Mode".

An important note at the bottom states: "Important: The display will revert back to View Mode in 5 mins."

## Link Setup>VLAN

The screenshot displays the StrataLink 24 web interface for VLAN configuration. The browser address bar shows the URL `10.14.0.164/settings/vlan_setting.php`. The page header includes the Trango Systems logo and the device name `StrataLink 24 ( 10.14.0.164)`. System status information is shown as follows:

Local Link: <b>Locked</b>	RSSI: -42.70	MSE: -36.10	Rx: QAM1024
Remote Link: <b>Locked</b>	RSSI: -36.30	MSE: -38.20	Rx: QAM1024

The navigation menu includes: Link Setup, System Status, System Statistics, Diagnostics, Survey, and Advanced Setting. The left sidebar contains: Link, Management, Ports, QoS, and **VLAN**. The main configuration area includes:

- PORT:** GE1
- Lower Limit:** 0
- Upper Limit:** 0
- VLAN Add:** 0
- VLAN Remove:** 0
- VLAN Info:**

```
ETH 1: 1,  
ETH 2: 1, 1001,
```

At the bottom, there are five buttons: **Apply Changes**, **Vlan Clear**, **Save Changes**, **Reboot**, and **View Mode**. A warning message states: **Important: The display will revert back to View Mode in 5 mins.**

## System Status >Version

The screenshot shows the StrataLink 24 web interface. The browser address bar shows the URL `10.14.0.97/settings/version.php`. The page header includes the Trango Systems logo and the text "StrataLink 24 ( 10.14.0.97)". Below the header, there are navigation tabs: "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". The "System Status" tab is selected, and the "Version" sub-tab is active. The main content area is divided into four sections:

- SYSTEM INFO**:
  - Date: 2014-05-13
  - System Uptime: 20:05:17 up 6 days
  - MAC Address: 00:01:de:72:29:c8
  - Power Input(VDC): -50.08
  - Capacity License: Max capacity enabled
- MODEL/SERIAL NUMBERS**:
  - Model: SL-24-E
  - Serial Number: 7481800
- CURRENT FIRMWARE**:
  - Main FW Version: 2p2r0D050114
  - OS Version: 2p6r22b0D050114
  - FPGA Version: 0023040E
  - HWID: 2
- PREVIOUS FIRMWARE**:
  - Main FW Version: 2p2r0D042914
  - OS Version: 2p6r22b0D042914
  - FPGA Version: 0023040E
  - HWID: 2

At the top right of the main content area, there are link status indicators: "Local Link: Locked", "Remote Link: Locked", "RSSI: -31.30", "RSSI: -49.60", "MSE: -36.80", "MSE: -35.90", "Rx: QAM1024", and "Rx: QAM1024". A "View Mode" button is located below the "SYSTEM INFO" section.

## System Statistics>Eth Stats

The screenshot shows the StrataLink 24 web interface. The browser address bar displays '10.14.0.97/settings/port\_stat.php'. The page title is 'StrataLink 24 (10.14.0.97)'. The interface includes a navigation menu with options: Link Setup, System Status, System Statistics (selected), Diagnostics, Survey, and Advanced Setting. The 'Eth Stats' section is active, showing statistics for two ports: GE1(RJ45) and GE2(SFP). A 'View Mode' button is visible on the left, and a 'Clear' button is at the bottom of the statistics table.

## System Statistics>Qos/RF Stats

The screenshot shows the StrataLink 24 web interface. The browser address bar displays the URL `10.14.0.97/settings/qos_rf_stat.php`. The page header includes the Trango Systems logo and the text "StrataLink 24 ( 10.14.0.97)". Below the header, there is a navigation menu with tabs for "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". The "System Statistics" tab is active. The main content area is titled "QoS/RF Stats" and contains a table with columns "IN" and "OUT". The table is divided into "QOS COUNTERS" and "RF COUNTERS". The "QOS COUNTERS" section shows "Total Drop Pkts:" with values "-" for IN and "0" for OUT. The "RF COUNTERS" section shows "RF Octets:", "RF Pkts:", "Port Rate(Mbps):", and "Port Util(%):" with values "0" for all metrics in both IN and OUT columns. There are "View Mode" and "Clear" buttons on the page.

	IN	OUT
<b>QOS COUNTERS</b>		
Total Drop Pkts:	-	0
<b>RF COUNTERS</b>		
RF Octets:	0	0
RF Pkts:	0	0
Port Rate(Mbps):	0	0
Port Util(%):	0	0

## Diagnostics>Options

The screenshot shows a web browser window with the URL `10.14.0.97/settings/loopback.php`. The page header includes the Trango Systems logo and the text "StrataLink 24 ( 10.14.0.97)". Below the header, there is a navigation menu with tabs for "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". The "Diagnostics" tab is active, and the "Options" sub-tab is selected. The "Options" section contains the following settings:

- Syslog Level:**  Alert(1)  Error(3)  Warn(4)  Notice(5)  Info(6)
- Syslog Timer:**  mins
- System Reboot In:**  mins

At the bottom of the options section, there are five buttons: "Apply Changes", "Save Changes", "Reload Cancel", "Reboot", and "View Mode".

## Diagnostics>Status Display

The screenshot shows the StrataLink 24 web interface. The browser address bar indicates the URL is 10.14.0.97/settings/status\_compare.php. The page header includes the Trango Systems logo and the text 'StrataLink 24 (10.14.0.97)'. Below the header, there are tabs for 'Link Setup', 'System Status', 'System Statistics', 'Diagnostics', 'Survey', and 'Advanced Setting'. The 'Diagnostics' tab is active. On the left side, there is a 'Support' button. The main content area has a 'Status Display' section with a 'Status Save' button and a 'Status Compare' button. The 'Status Compare' button is highlighted, and a comparison window is open. This window shows the following text:

```

Comparing the previously saved status (Mon May 5 19:24:31 MDT 2014)
With the current status (Mon May 12 20:08:36 MDT 2014)
Respective uptimes:
19:24:31 up 11 min, load average: 0.51, 0.58, 0.36
20:08:35 up 6 days, 3:19, load average: 0.76, 0.65, 0.58
  
```

Below the comparison text is a table comparing various system parameters between the 'Previous' and 'Current' states:

	Previous	Current
Config_Version	8	8
Frequency_Tx	24085.00	24085.00
Frequency_Rx	24215.00	24215.00
Frequency_Duplex	130.00	130.00
Tx_Power	0.00	0.00
Opmode	1	1
HC_Enable	1	1
PLA_Mode	0	0
XPIC_Enable	0	0
Data_Port	1	1
Speed_Mod_Max	8	8
Speed_Mod_Min	0	0
Speed_Bandwidth	17	17
ACM_Profile_Mask	511	511
IBM_Enable	0	0
IBM_Vlan_ID	100	100
IBM_Tagging	0	0
ETH1_Enable	1	1
ETH1_Auto_Nego	1	1
ETH1_Duplex	1	1
ETH1_Pause_Frame	0	0
ETH1_Speed	100	100

At the bottom of the comparison window, there is a 'Screen Clear' button.

## Diagnostics>Siglevel

The screenshot shows the StrataLink 24 web interface in a browser window. The address bar shows the URL `10.14.0.97/settings/siglevel.php`. The page header includes the Trango Systems logo and the text "StrataLink 24 ( 10.14.0.97)". Below the header, there are two rows of status information: "Local Link: Locked" and "Remote Link: Locked", followed by RSSI and MSE values for both local and remote links, and the modulation type "Rx: QAM1024". A navigation menu contains "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". The "Diagnostics" tab is active, and the "Siglevel" sub-tab is selected. On the left side, there is a vertical "Support" button. The main content area displays a list of diagnostic metrics with their corresponding values. A "Screen Clear" button is located at the top right of the metrics area.

Metric	Value
Normalized MSE Tenths:	-371
Radial MSE Tenths:	-370
LDPG Decoder Stress:	5110573
Ext AGC Register:	4095
Carrier Offset:	18780810
Rx Symbol Rate:	52000240
FEC Block Counter:	142208
FEC Uncorrected Block Counter:	0
LDPG Avg Iterations:	395811
Rx Total Bytes:	337032824
Rx Total Error Bytes:	0
Rx Total Error Bytes (working):	0

## Diagnostics>System Log

The screenshot displays the StrataLink 24 web interface. The browser address bar shows `10.14.0.97/settings/syslog.php`. The page title is "StrataLink 24 ( 10.14.0.97)". The interface includes a navigation menu with "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". The "Diagnostics" tab is active, showing "SYSLOG SERVER" settings. Under "SYSLOG SERVER", "Enable Logging" is set to "On", and the "Server IP" is "0.0.0.0". A "Setup Server" button is present. Below this is the "LOCAL SYSLOG" section, which contains a scrollable log window. The log window shows the following entries:

```

## Advanced Setting>SNMP

The screenshot displays the StrataLink 24 web interface for the 'Advanced Setting' page, specifically the 'SNMP' configuration section. The browser address bar shows '10.14.0.97/settings/snmp.php'. The page header includes the Trango Systems logo and the device name 'StrataLink 24 (10.14.0.97)'. A navigation menu at the top lists 'Link Setup', 'System Status', 'System Statistics', 'Diagnostics', 'Survey', and 'Advanced Setting'. A vertical 'Support' button is on the left. The main content area is titled 'SNMP' and contains the following settings:

- SNMP Daemon:  On  Off
- SNMP read-string: \*\*\*\*\*
- SNMP write-string: \*\*\*\*\*
- SNMP trap-string: \*\*\*\*\*
- Community string: Select string ▾ [input field]

	Enable	IP Address
SNMP Manager 1 IP:	<input type="radio"/> On <input checked="" type="radio"/> Off	0.0.0.0
SNMP Manager 2 IP:	<input type="radio"/> On <input checked="" type="radio"/> Off	0.0.0.0
SNMP Manager 3 IP:	<input type="radio"/> On <input checked="" type="radio"/> Off	0.0.0.0
SNMP Manager 4 IP:	<input type="radio"/> On <input checked="" type="radio"/> Off	0.0.0.0
SNMP Manager 5 IP:	<input type="radio"/> On <input checked="" type="radio"/> Off	0.0.0.0

At the bottom of the configuration area are four buttons: 'Apply Changes', 'Save Changes', 'Reboot', and 'View Mode'. Below these buttons is a warning message: 'Important: The display will revert back to View Mode in 5 mins.'

## Advanced Setting>License Keys

The screenshot shows the StrataLink 24 web interface. The browser address bar displays "10.14.0.164/settings/license.php". The page header includes the Trango Systems logo and the device name "StrataLink 24 (10.14.0.164)". System status information is shown: Local Link: Locked, Remote Link: Locked, RSSI: -42.70, -36.30, MSE: -35.90, -38.00, and Rx: QAM1024. The navigation menu includes Link Setup, System Status, System Statistics, Diagnostics, Survey, and Advanced Setting. The Advanced Setting page has a sidebar with options: Threshold, SNMP, License Keys (selected), XPIC, System Config, and Password. The License Keys section contains the following fields and controls:

- License Key: Select key (dropdown menu)
- Licensed Capacity(Mbps): Maximum capacity
- Encryption License: [Text input field]
- Encryption license enabled (checkbox)
- Encryption Enable: On (selected) / Off (radio buttons)
- Encryption Key: [Text input field] with a Show characters checkbox

At the bottom of the form are buttons for Apply Changes, Reset Key, Save Changes, Reboot, and View Mode. A warning message states: "Important: The display will revert back to View Mode in 5 mins."

Allows entering the capacity license keys and the AES 256 license keys.

The encryption Pre-shared Key (PSK) is entered here after the Encryption license key is activated. The PSK must be the same on both sides of the link.

## Advanced Setting>XPIC

The screenshot shows a web browser window with the URL `10.14.0.164/settings/xpic.php`. The page header includes the Trango Systems logo and the device name "StrataLink 24 (10.14.0.164)". A navigation menu at the top contains "Link Setup", "System Status", "System Statistics", "Diagnostics", "Survey", and "Advanced Setting". A vertical "Support" button is on the left. The main content area shows the "XPIC" setting, which is currently set to "Off". Below the setting are four buttons: "Apply Changes", "Save Changes", "Reboot", and "View Mode". A warning message states: "Important: The display will revert back to View Mode in 5 mins." The left sidebar contains a menu with "Threshold", "SNMP", "License Keys", "XPIC", "System Config", and "Password".

StrataLink 24 ( 10.14.0.164)			
Local Link: <b>Locked</b>	RSSI: -42.70	MSE: -36.10	Rx: QAM1024

Apply Changes Save Changes Reboot View Mode

Important: The display will revert back to View Mode in 5 mins.

## Advanced Setting> FTP

The screenshot shows the 'Advanced Setting' page for a StrataLink 24 device. The browser address bar shows '10.14.0.164/settings/ftp.php'. The page header includes the Trango Systems logo and the device name 'StrataLink 24 (10.14.0.164)'. A navigation menu at the top includes 'Link Setup', 'System Status', 'System Statistics', 'Diagnostics', 'Survey', and 'Advanced Setting'. A vertical 'Support' button is on the left. The main content area is titled 'FTP SERVER SETUP' and contains the following elements:

- Threshold** and **System Config** sections on the left sidebar.
- FTP SERVER SETUP** section with input fields for 'Server IP:', 'Username:', and 'Password:'. A 'Show characters' checkbox is also present.
- A 'Setup Server' button and a 'Check' button.
- A message: 'Server has not been setup. Please provide login information before executing file transfer.'
- CONFIG FILE IMPORT** section with a 'File name with path(Server):' input field and an 'Import' button. Below it is a 'Choose File' button and the text 'No file chosen'.
- CONFIG FILE EXPORT** section with a 'File name with path(Server):' input field and an 'Export' button.
- Explanatory text: 'Import configuration file from the server.' and 'Import configuration file from local machine.'
- Explanatory text: 'Export current configuration file to the server.'
- A note: 'The 'Check' button is used to verify the FTP connection.'
- An important note at the bottom: 'Important: The display will revert back to View Mode in 5 mins.'

This page allows setup of an FTP server which can be used to store configuration files from the radio after it has been set up. The local config file can be exported after the FTP server is set up. Also, config files that have been prepared by a text editor can be imported into the radio unit from the same server or the local computer.

Important: The display will revert back to View Mode in 5 mins.

This page is used to changed passwords only for the web. Passwords are not displayed unless the Show Characters checkbox is selected. It is recommended to write the passwords down and safeguard them as the system has no way to display the current passwords after they have been entered.

**NOTE: If passwords are forgotten, the passwords must be reset using the reset button on the radio unit.**

## ***Appendix D- Command Line Interface Guide***

See separate document LT-9063.

## ***Appendix E- SNMP OID Guide***

See separate file. This Appendix lists all the Object IDs for the SL-24 unit.

## ***Appendix F – Antenna Specifications***

### **AD23G-1-T2      1 Ft/0.3m Diam Dual Band 23/24 GHz Antenna**

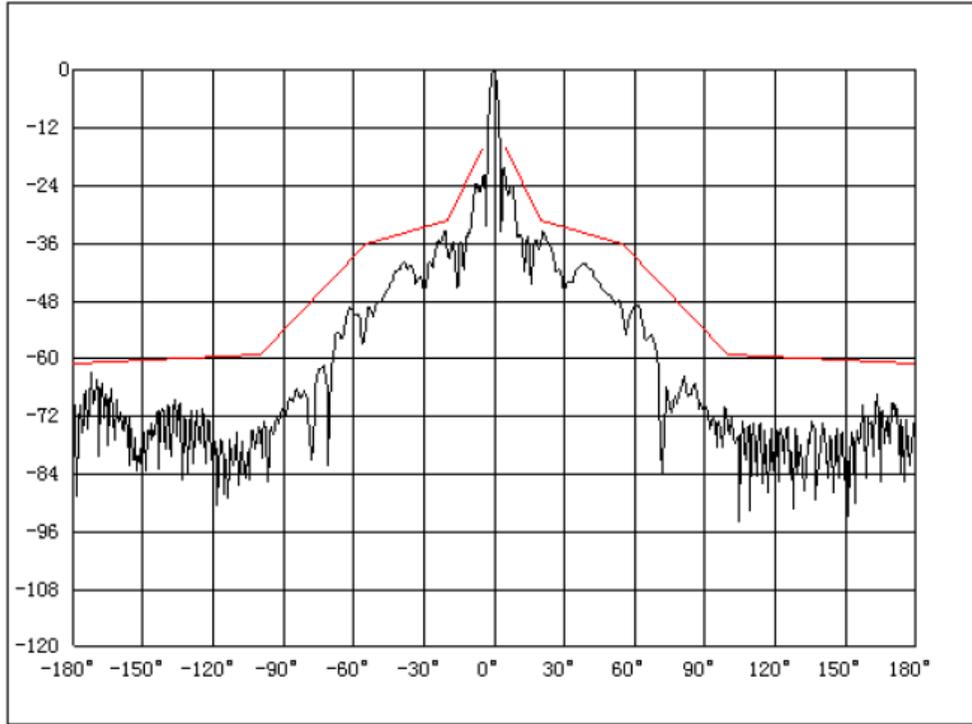

#### **ELECTRICAL**

Operating Frequency: 21.1-24.25 GHz  
Gain at 24.25 GHz: 36.1 dBi  
Gain at 24.0 GHz: 36.1 dBi  
Gain at 23.0 GHz: 35.4 dBi (For reference only)  
Gain at 21.1 GHz: 34.7 dBi (For reference only)  
Beamwidth: <2.6 degrees  
Front/Back Ratio: >62 dB  
XPD: > 30 dB  
Return Loss: 17.7 dB (VSWR < 1.3)  
Regulatory: ETSI EN 302 217-4-2 V1.5.1 Range 4, Class 3

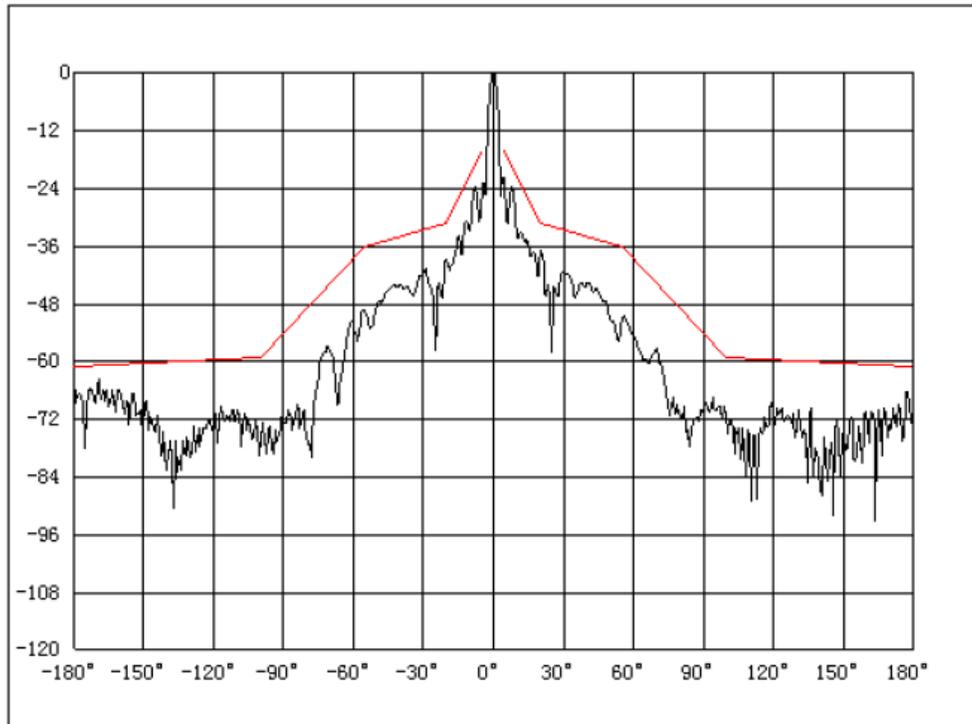

#### **MECHANICAL**

Diameter: 1.23 ft / 375 mm  
Weight: 6.9 kg / 15.2 lbs including mount  
Material: Aluminum with polymer radome  
Pole Diameter: 51 mm to 114 mm  
Elevation Angle Adjust: +/- 25 Deg Coarse, +/- 15 Deg Fine  
Azimuth Angle Adjust: +/- 15 Deg Fine  
Wind load: 108 Km/hr (operating), 241 Km/hr (max)  
Ice Load: 25.4 mm  
Operational Temperature: -45 to +65 Deg C  
Axial Force: 407 N  
Side Force: 201 N  
Twisting Moment: 168 N-m  
Finish: Powder coat Cool Grey  
Radio Mount: Slip-fit with 4 Strikes  
Shipping Size: 500x450x320 mm  
Shipping Weight: 8.7 kg / 19.2 lbs

## AD23G-2-T2

## 2 Ft/0.6m Diam Dual Band 23/24 GHz Antenna

### ELECTRICAL

Operating Frequency: 21.1-24.25 GHz

Gain at 24.25 GHz: 41.2 dBi

Gain at 24.0 GHz: 41.1 dBi

Gain at 23.0 GHz: 40.6 dBi(For reference only)

Gain at 21.1 GHz: 40.0 dBi (For reference only)

Beamwidth: 1.6 degrees

Front/Back Ratio: >67 dB

XPD: > 30 dB

Return Loss: 15.5 dB (VSWR < 1.4)

Regulatory: ETSI EN 302 217-4-2 V1.5.1 Range 4, Class 3

### MECHANICAL

Diameter: 2.15 ft. / 660 mm

Weight: 9 kg /19.8 lbs including mount

Material: Aluminum with polymer radome

Pole Diameter: 51 mm to 114 mm

Elevation Angle Adjust: +/- 25 Deg Coarse, +/- 15 Deg Fine

Azimuth Angle Adjust: +/- 15 Deg Fine

Wind load: 108 Km/hr (operating), 241 Km/hr (max)

Ice Load: 25.4 mm

Operational Temperature: -45 to +65 Deg C

Axial Force: 1218 N

Side Force: 601 N

Twisting Moment: 505 N-m

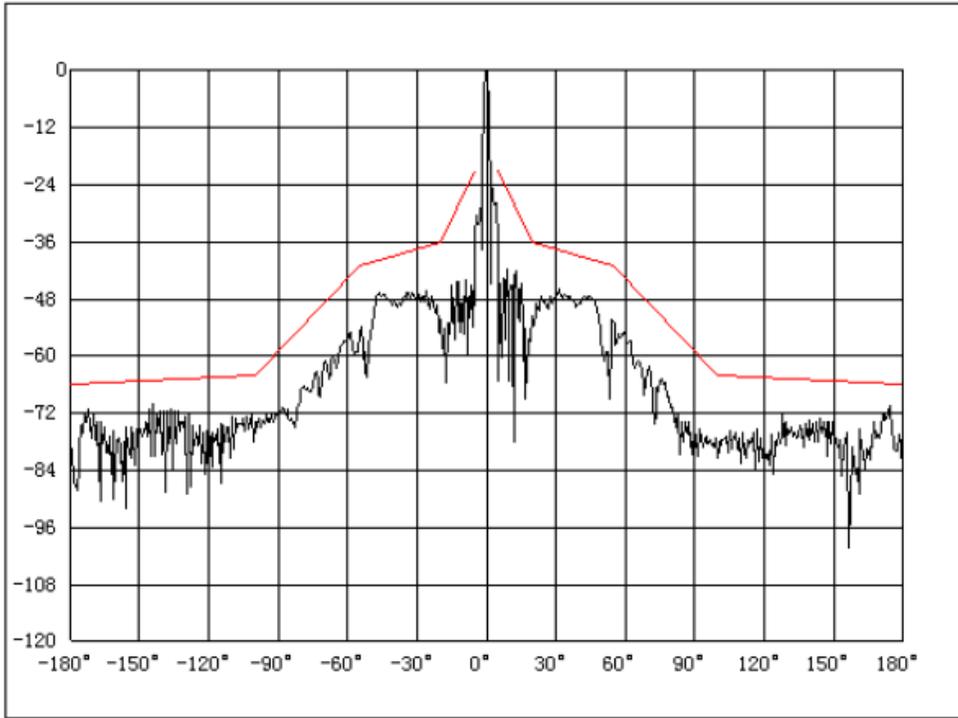

Finish: Powdercoat Cool Grey

Radio Mount: Slip-fit with 4 Strikes

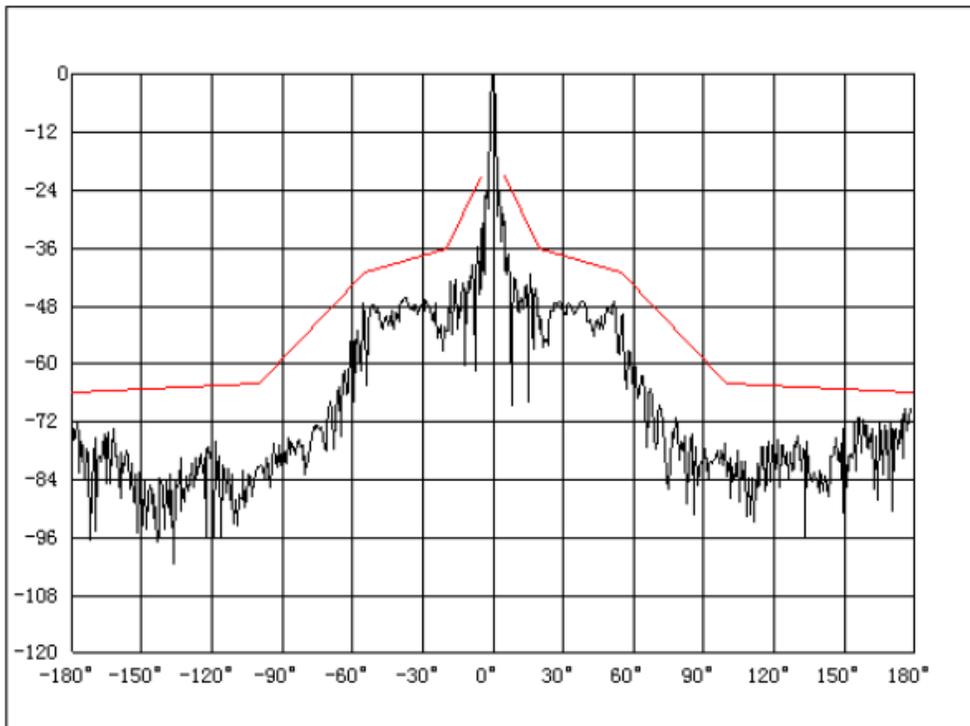

Shipping Size: 750x750x440 mm

Shipping Weight: 14.8 kg / 32.6 lbs

## AD23G-3-T2

## 3 Ft/0.9m Diam Dual Band 23/24 GHz Antenna

### ELECTRICAL

Operating Frequency: 21.1-24.25 GHz

Gain at 24.25 GHz: 44.7 dBi

Gain at 24.0 GHz: 44.6 dBi

Gain at 23.0 GHz: 44 dBi (For reference only)

Gain at 21.1 GHz: 43.4 dBi (For reference only)

Beamwidth: 0.9 degrees

Front/Back Ratio: >70 dB

XPD: > 30 dB

Return Loss: 16.5 dB (VSWR < 1.35)

Regulatory: ETSI EN 302 217-4-2 V1.5.1 Range 4, Class 3

### MECHANICAL

Diameter: 3.35 ft / 1.02 m

Weight: 26 kg/ 57.3 lbs including mount

Material: Aluminum with polymer radome

Pole Diameter: 51 mm to 114 mm

Elevation Angle Adjust: +/- 10 Deg Fine

Azimuth Angle Adjust: +/- 10 Deg Fine

Wind load: 108 Km/hr (operating), 241 Km/hr (max)

Ice Load: 25.4 mm

Operational Temperature: -45 to +65 Deg C

Axial Force: 2605 N

Side Force: 1286N

Ice Load: 25 mm

Operational Temperature: -45 to +65 Deg C

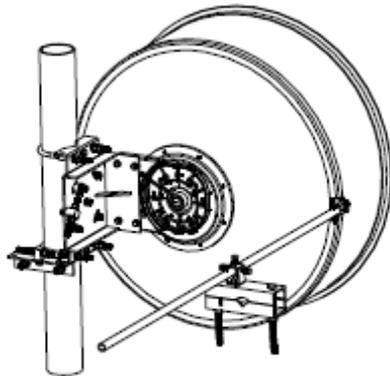

Twisting Moment: 1130 N-m

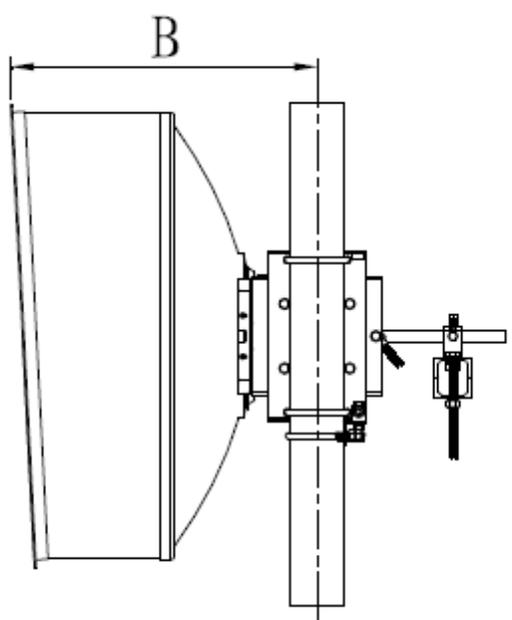

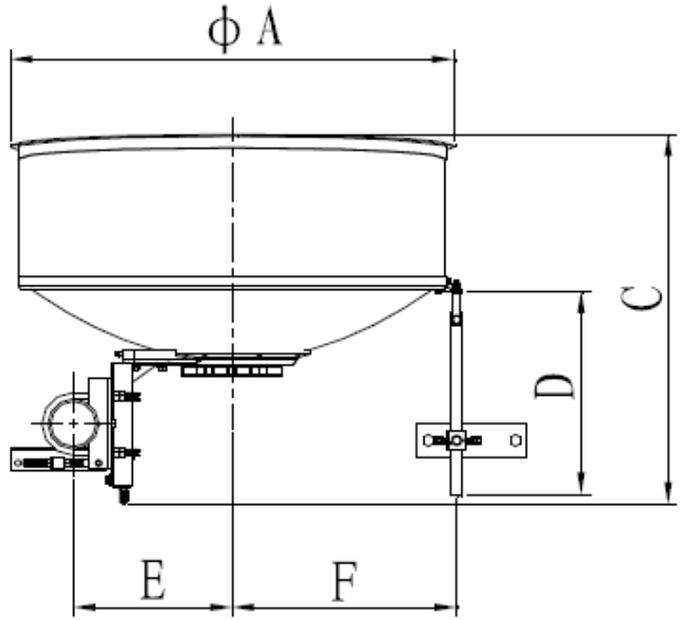

Finish: Powder coat Cool Grey

Radio Mount: Slip-fit with 4 Strikes

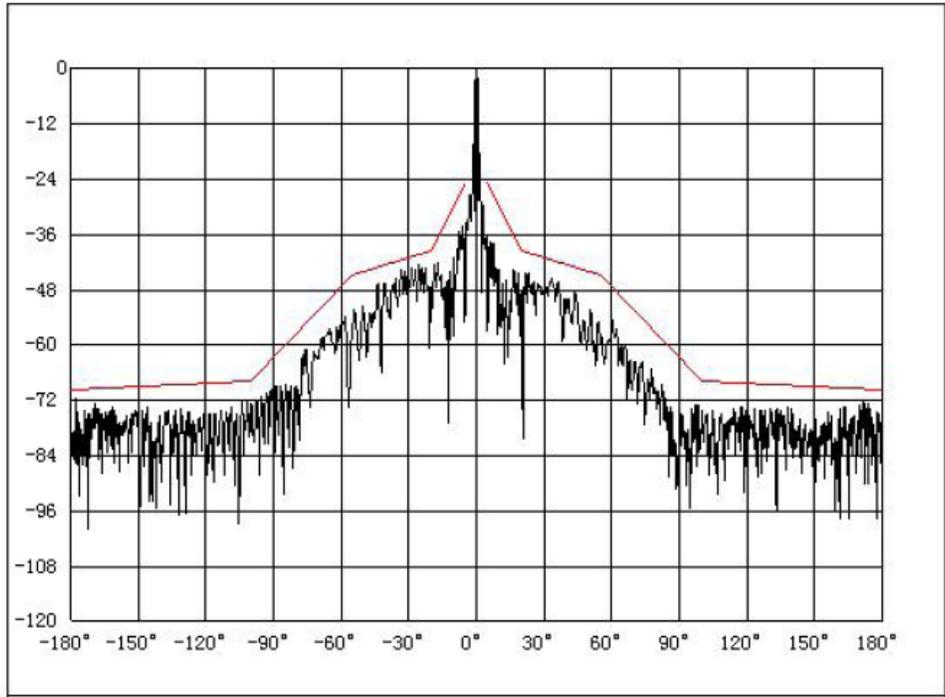

Shipping Size: 1130 mm x 1130 mm x 450 mm

Shipping Weight: 50.5 kg/111.3 lbs

## AD24G-1-U2      1 Ft/0.3m Diam 24 GHz Antenna

### ELECTRICAL

Operating Frequency: 24.05-24.3 GHz

Low Band Gain: 33.9 dBi

Mid Band Gain: 34.4 dBi

High Band Gain: 34.8 dBi

Beamwidth: 3.1 degrees

Front/Back Ratio: >51 dB

XPD: > 30 dB

Return Loss: 17.7 dB

### MECHANICAL

Diameter: 26.14 in. / 644mm

Weight: TBD

Material: Aluminum with polymer radome

Pole Diameter: 60mm to 115 mm

Elevation Angle Adjust: +/- 25 Deg

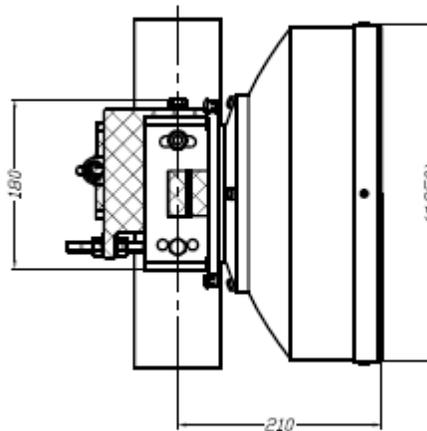

Azimuth Angle Adjust: +/- 10 Deg

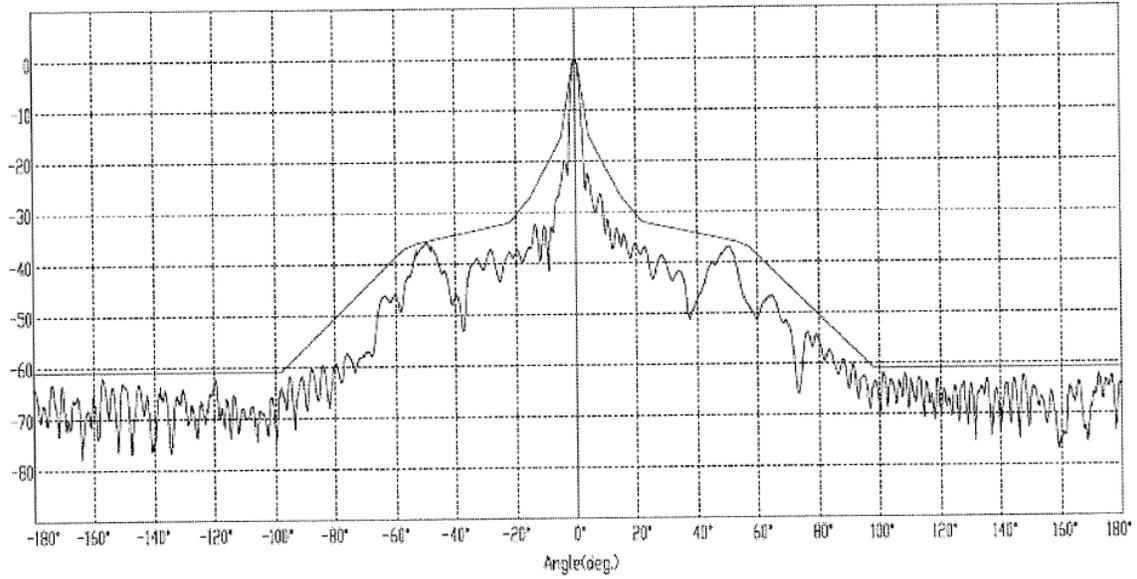

Wing load: 125 Km/hr (operating), 250 Km/hr (max)

Finish: Corro-coat PE71-190Z Powder coat

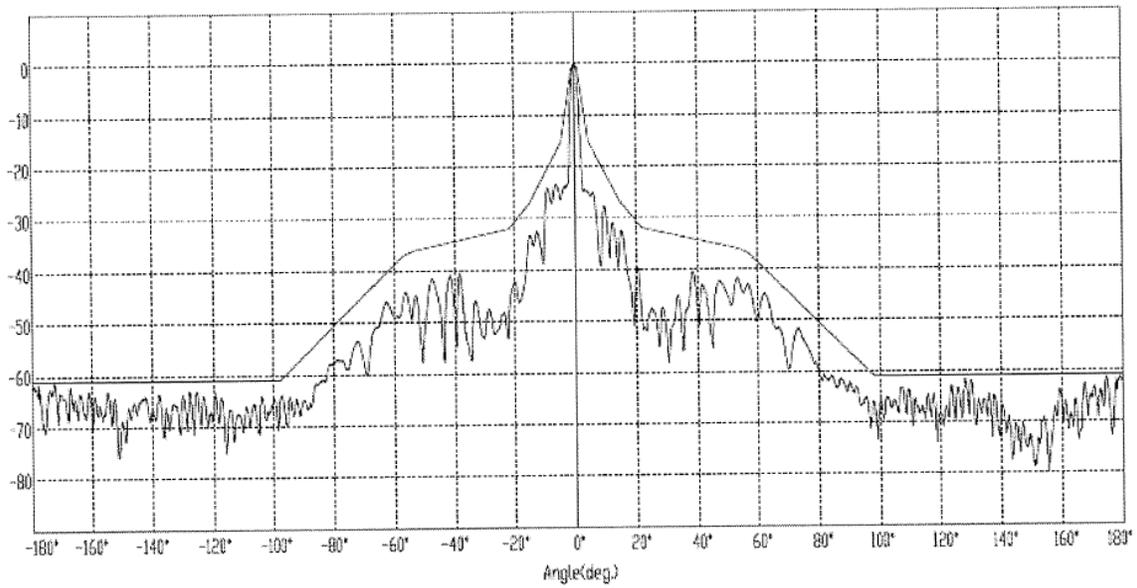

Radio Mount: Slip-fit with 4 Strikes

Shipping Dims: 400 x 350 x 400 mm

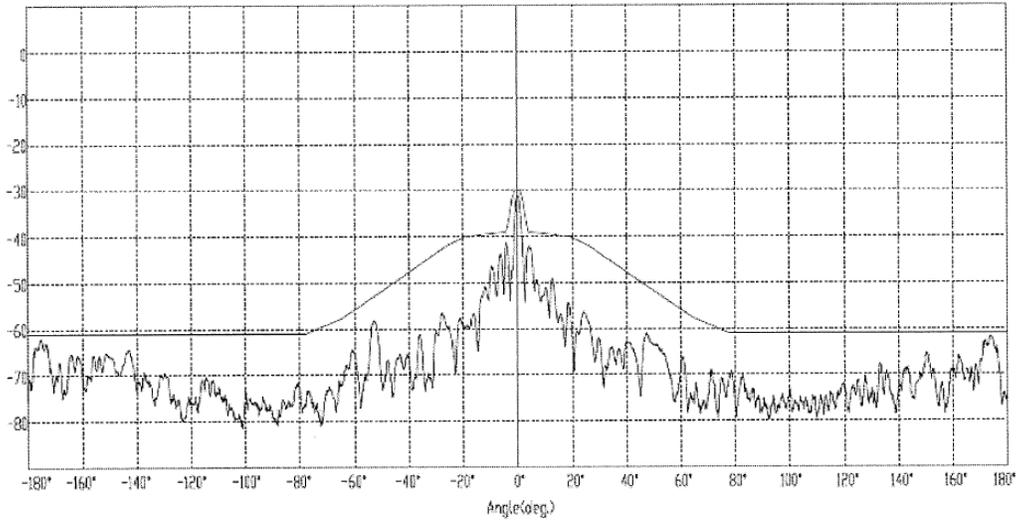

**H Pol Pattern AD24G-1-U2**

**V Pol Pattern AD24G-1-U2**

Cross Pol Pattern AD24G-1-U2

## AD24G-2-U2      2 Ft/0.6m Diam 24 GHz Antenna

### ELECTRICAL

Operating Frequency: 24.05-24.3 GHz

Low Band Gain: 39.9 dBi

Mid Band Gain: 40.4 dBi

High Band Gain: 40.8 dBi

Beamwidth: 1.6 degrees

Front/Back Ratio: >66 dB

XPD: > 30 dB

Return Loss: 17.7 dB

### MECHANICAL

Diameter: 13.78 in. / 350 mm

Weight: 15 kg

Material: Aluminum with polymer radome

Pole Diameter: 60mm to 115 mm

Elevation Angle Adjust: +/- 25 Deg

Azimuth Angle Adjust: +/- 10 Deg

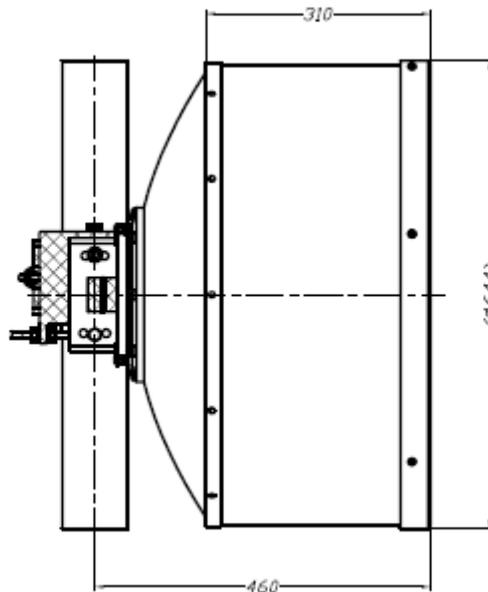

Wing load: 125 Km/hr (operating), 250 Km/hr (max)

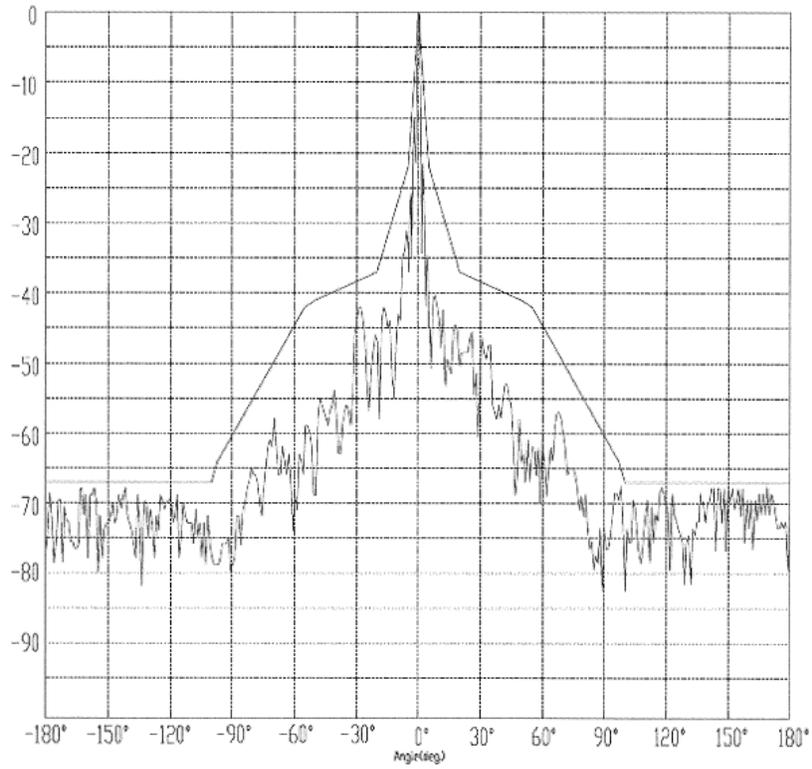

Finish: Corro-coat PE71-190Z Powder coat

Radio Mount: Slip-fit with 4 Strikes

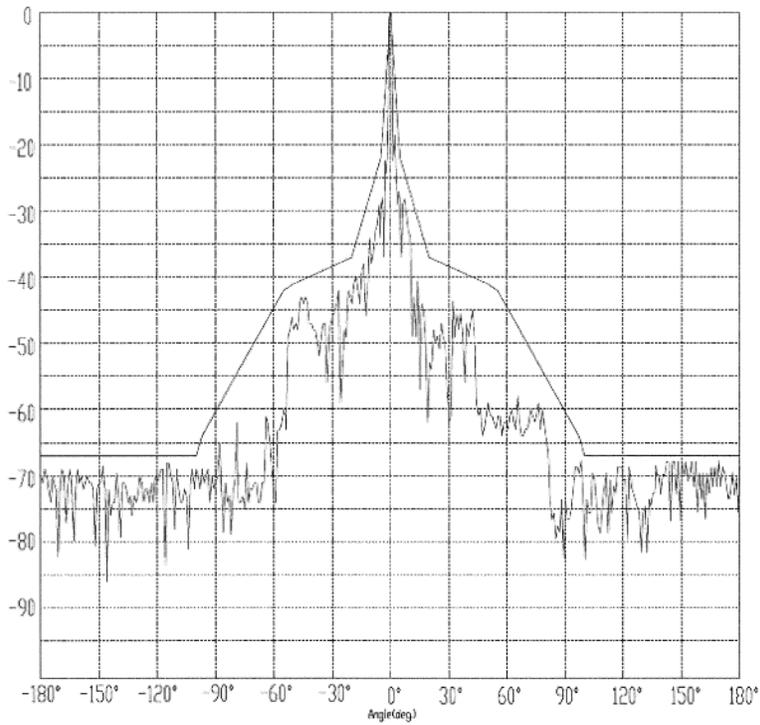

Shipping Dims: 750 x 750 x 600 mm

Shipping Weight: 19 kg

Cross Pol Pattern AD24G-2-U2

# COMPLIANCE

## FCC

### FCC ID: NCY-SL24

The StrataLink 24 System is used for point-to-point operation only, and requires professional installation due to FCC limits on radiated output power.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference,
- (2) This device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with these instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in any particular installation. Operation of this equipment in a residential area is likely to cause harmful interference in which case the use will be required to correct the interference at his own expense.

#### **WARNING:**

Intentional or unintentional changes or modifications must not be made unless under the express consent of the party responsible for compliance. Any such modifications could void the user's authority to operate the equipment and will void the manufacturer's warranty. To comply with RF exposure requirements, the following antenna installation and device operating configurations must be satisfied. The antenna for this unit must be fixed and mounted on outdoor permanent structures with a separation distance of at least two meters from all persons. Furthermore, it must not be co-located or operating in conjunction with any other antenna or transmitter.

## Industry Canada

### IC: 2945A-SL24

This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

*Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes : (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.*

This Class A digital apparatus complies with Canadian ICES-003.

*Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.*

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

*Les changements ou modifications non approuvés expressément par la partie responsable de la conformité pourrait annuler l'autorité de l'utilisateur à faire fonctionner l'équipement.*

## **RF Exposure Warning**

The antennas used for this transmitter must be installed to provide a separation distance of at least 2 meters from all persons and must not be located or operating in conjunction with any other antenna or transmitter except as listed for this products certification..

This device has been designed to operate with the following antennas:

Trango Systems: AD24G-1-T2: 1 foot diameter – 36.1 dBi Dish  
Trango Systems: AD24G-1-U2: 1 foot diameter – 34 dBi Dish  
Trango Systems: AD24G-2-T2: 2foot diameter – 41 dBi Dish  
Trango Systems: AD24G-2-U2: 2 foot diameter – 40 dBi Dish  
Trango Systems: AD24G-3-T2: 3 foot diameter – 44.5 dBi Dish
