SAFETY INSTRUCTIONS

"DANGER", "WARNING" and "CAUTION" notices appear throughout this manual. It is the responsibility of the installer of the equipment to read, understand and follow these notices. If you have any questions regarding these safety instructions, please contact a FURUNO agent or dealer.

DANGER

This notice indicates a potentially hazardous situation which, if not avoided, will result in death or serious injury.

WARNING

This notice indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION

This notice indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury, or property damage.

WARNING

Only qualified personnel should work inside the equipment.

This equipment uses high voltage electricity which can shock, burn, or cause death.

Turn off the power at the ship's mains switchboard before beginning the installation. Post a warning sign near the switchboard to ensure that the power will not be applied while the equipment is being installed.

Serious injury or death can result if the power is not turned off, or is applied while the equipment is being installed.

CAUTION

Ground the equipment.

Ungrounded equipment can give off or receive electro-magnetic interference or cause electrical shock.

Confirm that the power supply voltage is compatible with the voltage rating of the equipment.

Connection to the wrong power supply can cause fire or equipment damage. The voltage rating appears on the label at the rear of the equipment.

Observe the following compass safe distances to prevent interference to a magnetic compass:

	Standard compass (m)	Steering compass (m)
Main display DS-300	0.75	0.50
Operation panel DS-301	0.2	0.2
Processor unit DS-310	1.3	1.0
Digital indicator DS-350	0.3	0.2
Digital indicator DS-351	0.4	0.3
Distribution unit DS-370	0.9	0.7
Analog indicator DS-381/382	0.7	0.6

CHAPTER 1. GENERAL

The Furuno model DS-30 Doppler Sonar provides accurate measurement of the fore/aft and port/starboard speed of vessels. It mainly consists of display unit, processor unit, junction box, transceiver unit and transducer (hull unit).

NOTICE

Do not apply paint, anti-corrosive sealant or contact spray to coating or plastic parts of the equipment.

Those items contain organic solvents that can damage coating and plastic parts, especially plastic connectors.

1.1. Selecting Mounting Location

1.1.1 Transducer (Hull Unit)

The performance of the DS-30 is directly related to the mounting location of the transducer. Especially air bubbles and turbulence caused by movement of the ship and interference from other acoustic equipment seriously degrade performance. The mounting location should, therefore, be determined carefully, keeping the following factors in mind.

1) Air Bubbles

Since the transducer of the DS-30 is installed flush with the ship's hull bottom, it is susceptible to air bubbles which flow below the hull bottom. Select a location where air bubbles created at ship's bow do not go down to the mounting location. When the ship has a bulbous bow, install the transducer in it or just behind it. However, when the ship makes a voyage in high latitude area breaking through ice flows, avoid the location where broken ice flows may strike the location. The DS-30 is used not only for ocean going navigation but also for docking to loading/unloading facilities, at which the bow and side thrusters are used. The transducer should be separated at least 4 or 5 meters from them.

NOTE: In extremely shallow harbors with soft bottom, whirls created by ship's movement cause air bubbles and also bottom materials to be stirred, which may make the use of DS-30 impossible.

2) Cavitation

Dents on ship's bottom cause whirls behind them and may sometimes cause cavitation which adversely affects the performance of the transducer, especially when the ship moves at a high speed.

The welded portion between the transducer casing and the ship's hull should therefore be finished as smooth as possible.

3) Variation of Draft Level

When the ship travels unloaded, the draft level goes low and air bubbles are apt to be pushed down to the transducer location. This occurs especially when the water level is lower than the center line of the bulbous bow. It is recommended to load a proper amount of ballast not only for the DS-30 but also for safety of navigation.

4) Interference of Other Ultrasonic Equipment

If integer multiple of the transmission frequency of other ultrasonic equipment is within 440 ± 8 kHz, interference may occur. Select a location at least 1 m away from the transducer of the ultrasonic equipment and change, if possible, the direction of its transmission beam so that the beam may not cross the beam of DS-30.

5) Installation in Dangerous Place

Do not install the transducer in the oil tank, oil room, LPG gas room and freezing room.

6) Maintenance Space

The transducer is detachable/replaceable in the water from outside the ship.

1.1.2 Other Indoor Units

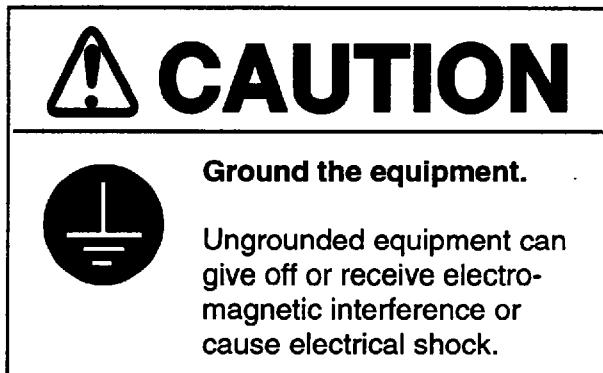

All units are designed and constructed to withstand humidity and corrosive atmosphere common to a vessel. However certain guidelines must be observed to ensure continued operation. When selecting a mounting location, keep the following points in mind.

- 1) Avoid place subject to high temperature/humidity. This includes heat emitting apparatuses and sunshine.
- 2) Avoid places subject to sea splash. Sea splashes most assuredly damage the sensitive components inside units.
- 3) Locate the units where they will not become soiled easily. Never locate it near exhaust pipes.
- 4) Select a place where vibration is minimal.
- 5) Select a place with sufficient ventilation.

1.2. Grounding

All units use pulse signals. Thus, insufficient grounding of the units may cause interference to other electronic equipment on board such as radio direction finder and radio receivers. To minimize unwanted radio radiation, perform the cabling and grounding works with due consideration of the following remarks.

- 1) Do not run cables near radio apparatuses. Do not also run them near or in contact with the cables of radio apparatuses.
- 2) Make cable run as short as possible, taking the shortest route.
- 3) Ground all units by using a copper strap.
- 4) To connect the copper strap to a copper plate, use silver solder or solder cream to ensure solid connection.

CHAPTER 2. MOUNTING

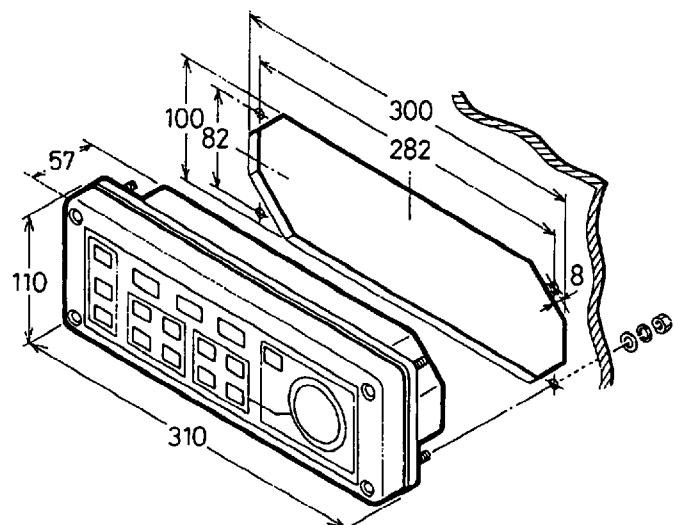

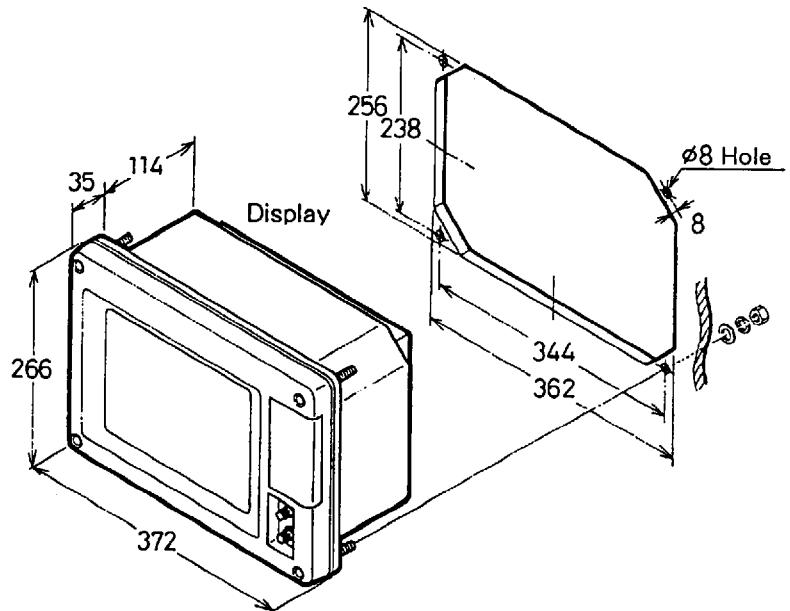

2.1. Main Display and Operation Panel

Select mounting locations taking the following points into account.

- 1) Select a place where operating personnel are able to control the units easily while observing the area surrounding the vessel.
- 2) Select a place not exposed to direct sunlight, water splashes and hot air.

2.1.1. Standard Mounting

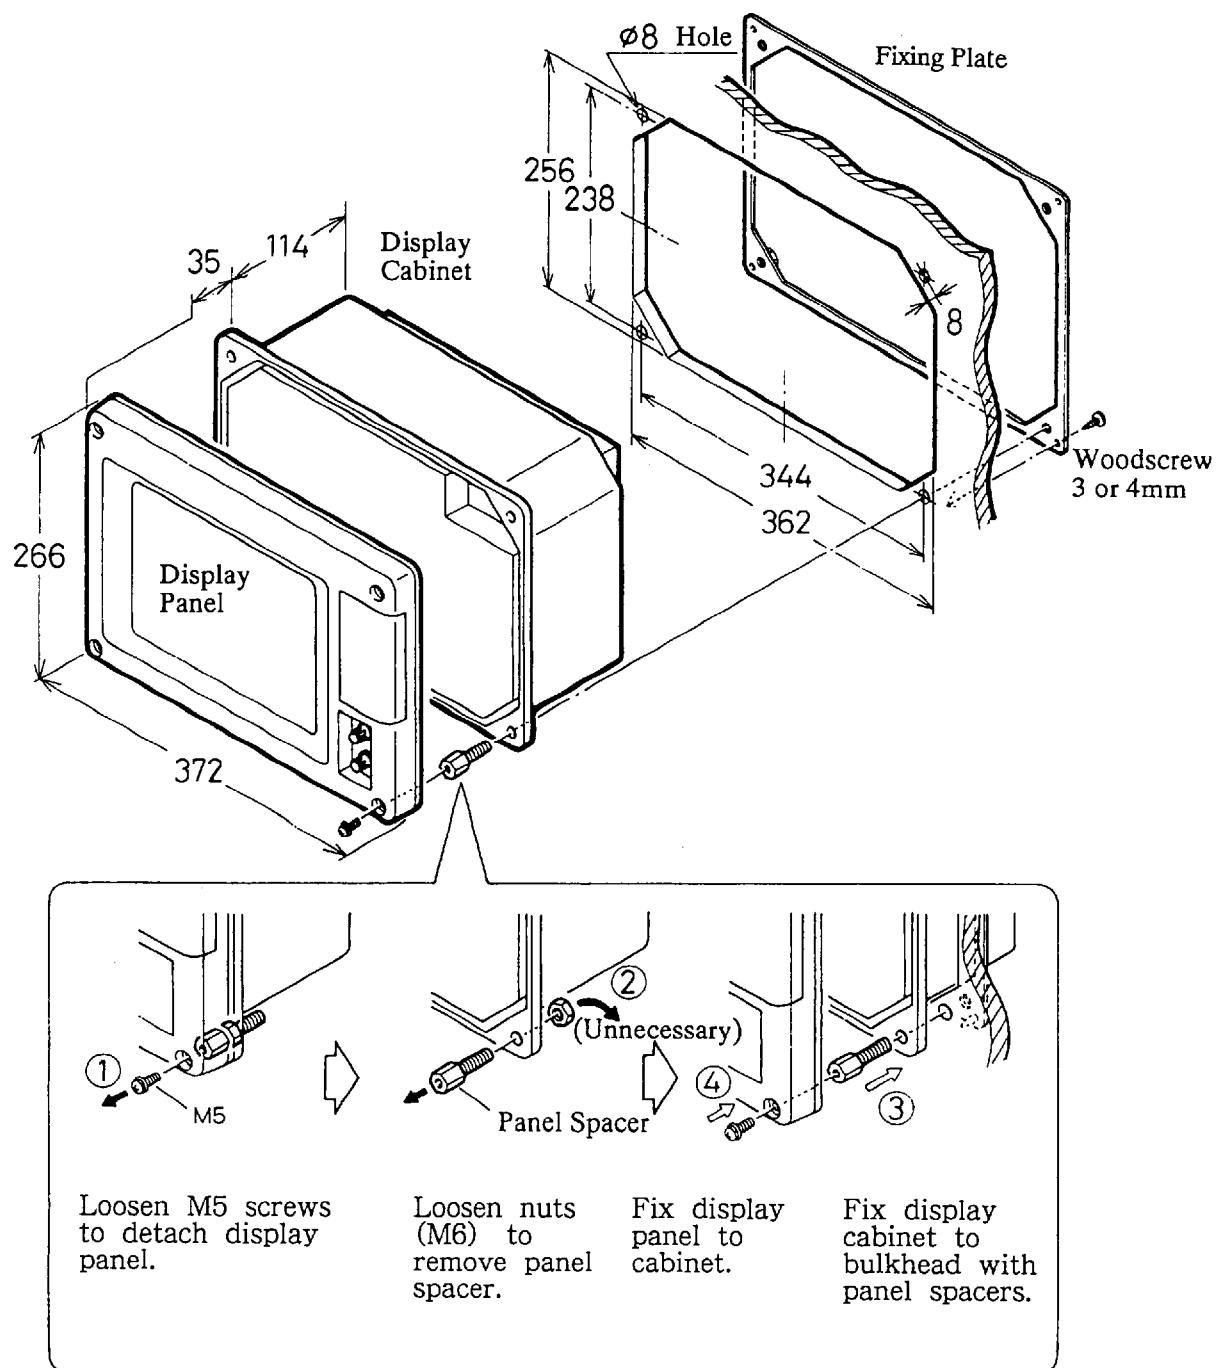

1. Cut out the bulkhead and drill fixing holes as shown at right. Reinforce if necessary the bulkhead since the display unit weighs 10 kg approximately.
2. Four mounting bolts (M6) are factory-fitted at the back of the front panel. Fit them into the fixing holes and push in the unit.
3. Fix the unit by tightening the bolts with nuts (M6) fitted from the back of the bulkhead.

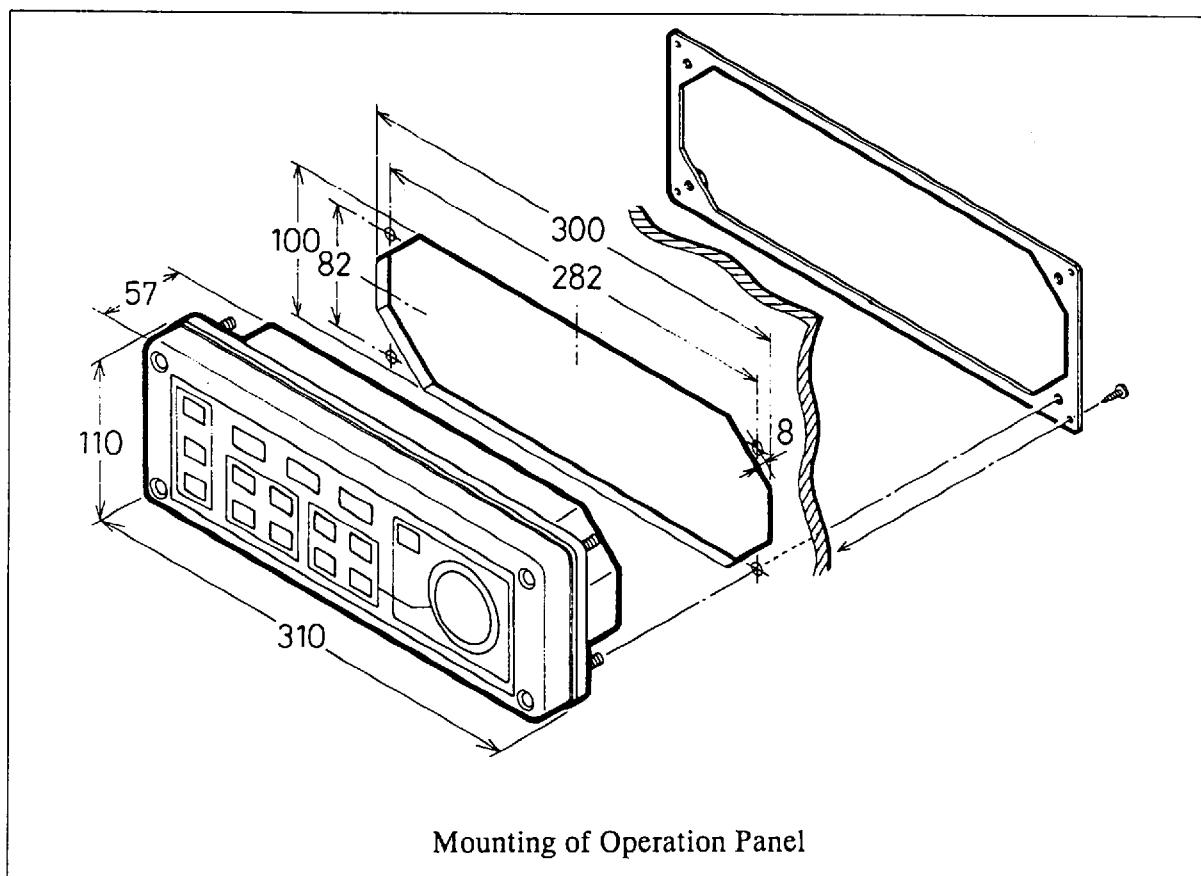

2.1.2. Mounting with Fixing Plate

When it is difficult to fit nuts from back of the bulkhead, use the fixing plate. The fixing plate is optional supply.

1. Cut out the bulkhead with dimensions shown in the figure below. (For those for the operation panel, refer to the next page.) Reinforce if necessary the bulkhead to withstand weight 10 kg of the display unit.
2. Detach the display panel from the cabinet by loosening screws (M5) at the four corners of the display panel. (① in the figure)
3. Remove nuts which fix the panel spacers at the four corners of the cabinet. The nuts removed are unnecessary. (② in the figure)

4. Attach the fixing plate to the back of the bulkhead by using woodscrews (3 or 4 mm). When space is insufficient to use woodscrews and a screwdriver, use glue or vinyl tape to temporarily attach the fixing plate.
5. Fit the display unit to the cutout hole and insert the four panel spacers through the holes on display cabinet, bulkhead and mount plate. Then tighten the panel spacers securely to fix the cabinet.
6. Fix the display panel to the cabinet as before by using four screws (M5).

2.2. Processor Unit

Select a mounting location taking the following points into account.

- 1) Since the unit generates heat, select a well ventilated location with low humidity.
- 2) The unit can be bulkhead or floor mounted. When mounting on the bulkhead, reinforce the mounting location to withstand the unit weight of 40 kg.

2.2.1. Mounting Procedure

1. Fix four stud bolts on the selected location at intervals shown on the outline drawing. The bolt should stick out by 20 cm from the bulkhead (or floor).
2. Fit the mounting holes on the unit to the bolts and tighten the bolts by using nuts (M10).

2.3. Transceiver Unit

Select a mounting location, taking the following points into account.

- 1) Since the unit generates heat, select a well ventilated location with low humidity.
- 2) The unit can be bulkhead or floor mounted. When mounting on the bulkhead, reinforce the mounting location to withstand against the unit weight of 14 kg.

2.3.1 Mounting Procedure

1. Fix four mounting bolts on the selected location at intervals shown on the outline drawing so that bolt thread sticks out by 20 cm from the bulkhead (or floor).
2. Fit the mounting holes on the unit to the bolts and tighten the bolts by using nuts (M10).

2.4. Junction Box (Option)

The junction box can be floor or bulkhead mounted provided that the mounting location is strong enough to withstand the weight of 5 kg.

2.4.1. Mounting Procedure

1. Drill mounting holes on the mounting location, referring to the outline drawing.
2. Insert four bolts (M6x40) into mounting holes on the junction box and the mounting location.

3. Fix the junction box by tightening the bolts with nuts placed from back of the installation location.

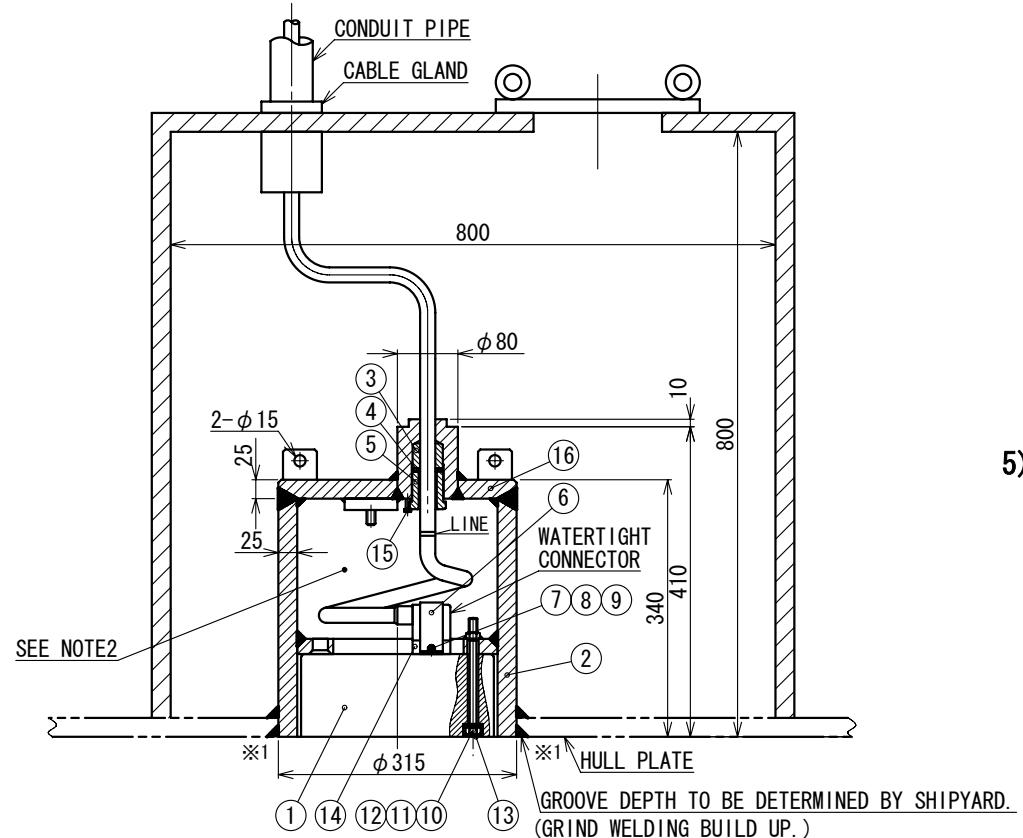

2.5. Transducer (Hull Unit)

For transducer /casing DS-330/311, refer to the installation instructions on page 2-5.

For gate value seachest DS-335, refer to the installation instructions on page D-9. Note that the spacer and upper plate should be oriented to the ship's bow.

HULL UNIT INSTALLATION

A

B

1) CHECKING MATERIAL AND THICKNESS OF TRANSDUCER CASING

Before starting the installation work, check that the transducer casing is of a material approved by ship classification society concerned and with a thickness not thinner than the hull plate. The standard tank supplied by FURUNO is of material KSTPG370 (KSTPG38, KST138), approved by ship Classification Society of Japan, with a thickness of 25 mm.

C

2) DETERMINING INSTALLATION SITE

Select the installation site referring to the recommended sites described in the installation instructions.

For ships prone to collect air bubbles under the hull bottom, consult your local FURUNO office or agent for advice.

D

3) CONSTRUCTING WATERPROOF COMPARTMENT FOR TRANSDUCER CASING

The compartment for the transducer casing is not compulsory required by law because the transducer casing is waterproof. However it is recommended to construct it for safety. Dimensions shown above are only for reference; shipyard may change as required. Since the transducer is detachable/replaceable in water from outside the ship, maintenance space is not required inside the compartment.

4) WELDING CASING

a) Fore/aft marks are engraved on the casing. Align them with ship's fore-aft line.

b) Orientation and leveling errors can be offset on the data offset menu in the display unit. Install the casing as follows.

Fore-aft orientation: Align the bow mark on the casing with ship's fore-aft line to an accuracy within 1 degree.

Leveling: Install the casing so that the top face of the casing is horizontal during navigation. Measure leveling accuracy with a level meter, after the ship is launched.

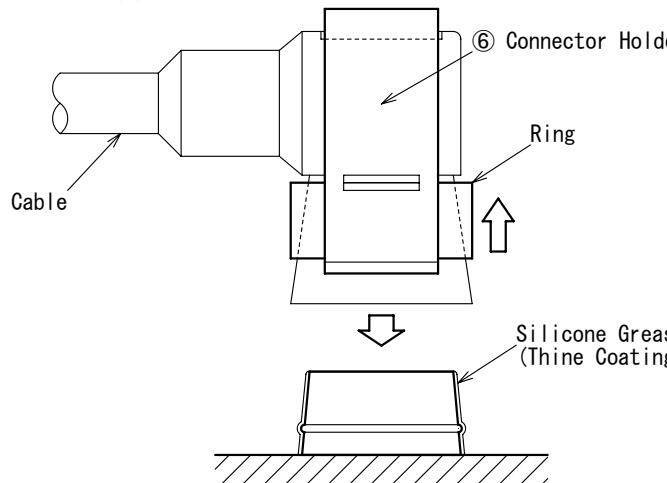

c) Detach transducer (1), cable, cable gland (5) and gasket (3) before welding the casing.

d) Welding method for casing and ship's hull should be determined by the shipyard. Weld reinforcement ribs to the casing if the shipyard considers them necessary.

e) Remove welding build up between the casing and the ship's hull (part marked $\times 1$ in the drawing) with a grinder, for a flat finish.

5) FIXING/CONNECTING TRANSDUCER CABLE

- Lead the transducer cable into the casing up to the white line mark on the cable and tighten the cable gland with the cable gland spanner supplied.
- Install locking bolt (15) after the cable gland is tightened.
- Remove dirt and apply silicone grease onto the side of receptacle on the transducer before plugging the watertight connector.
- To plug in the watertight connector, pull up the ring and insert the connector into the receptacle, and then fix the connector holder (6) with hex nut (7).

6) FIXING TRANSDUCER

Twisting the cable (namely, rotating the transducer by about one turn), align the bow mark on the transducer with ship's bow and fix the transducer by using hex bolt (10). After apply silicone sealant to bolt-head, put bolt cap (13) onto it.

7) CABLING

Lay the cable from the casing to the transceiver unit inside a conduit pipe and fill the conduit pipe with sand or other appropriate materials to prevent cable vibration.

8) PAINTING

Shop primer coating (Epcor Zinc Rich Primer B) has been applied to the casing. Paint both inner and outer surfaces on the casing with the paint used for top coating of the ship's hull bottom.

NOTE 1: The transducer surface is coated with anti-fouling paint Marine Star 20. Do not coat it by other type of paint.

9) TESTING AFTER INSTALLATION

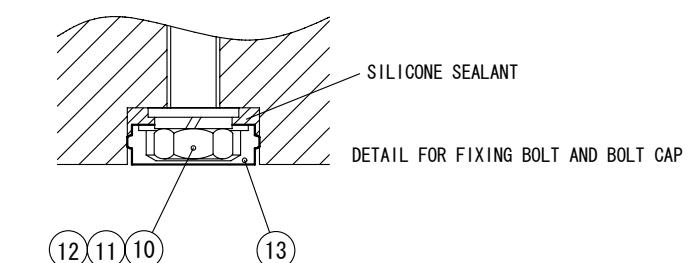

Confirm the ohm value of terminals on the transducer.

A digital ohmmeter is recommended.

Do not use a megohmmeter.

TYPE OF SIGNAL	TEST POINT	STANDARD(Ω)
BEAM 1 (BLK)	TB #1 (RED) - #2 (BLK)	0.5~3.0
BEAM 2 (RED)	TB #4 (RED) - #5 (BLK)	0.5~3.0
BEAM 3 (GRN)	TB #7 (RED) - #8 (BLK)	0.5~3.0
TEMP SENSOR 1	TB #10 (YEL) - #11 (WHT)	450~550
TEMP SENSOR 2	TB #13 (BLU) - #14 (GRY)	450~550

NOTE 2: The inside of transducer tank (16) and bolt(10)-thru hole will be filled with water. It has no problem.

DRAWN Jul. 26 '06 T. YAMASAKI	CHECKED Jul. 26 '06 T. TAKENO	APPROVED Jul. 27 '06 T. Matsuguchi	SCALE MASS kg	TITLE DS-330/331
		DS-30		NAME HULL UNIT
				INSTALLATION PROCEDURE
				REMARKS

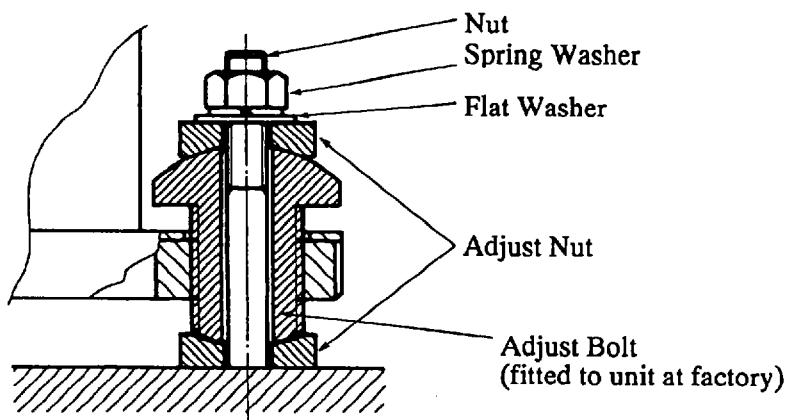

DWG No. E7236-Y10- J

2.6. Rate-of-Turn Gyro Unit (Option)

The rate-of-turn gyro unit should be installed, in a location with minimal vibration, so that the sensor inside the unit is level to within $\pm 1^\circ$; error of up to $\pm 2^\circ$ can be corrected. There is no designation for orientation of the unit. Select the location considering that the cable for connection with the processor unit is 5m long.

2.6.1. Mounting Procedure

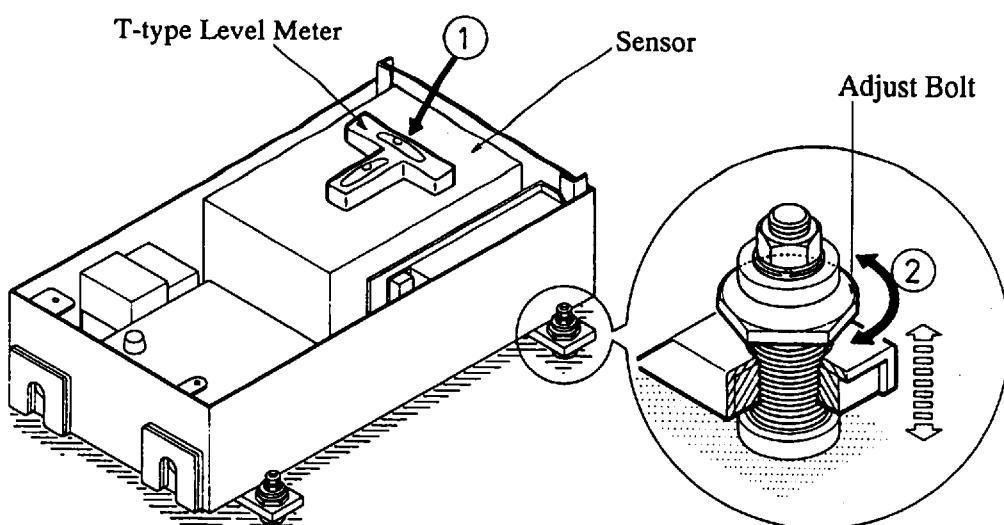

1. Fix four stud bolts on the selected location at intervals shown in the outline drawing.
2. Fix the unit by using adjust nuts, flat washers, spring washers and nuts supplied as installation materials as shown below.

2.6.2. Leveling Adjustment

This adjustment should be performed while the ship is in dry-dock where it has no heeling and trimming inclinations.

1. Place a T-type level meter on top of the sensor to measure longitudinal and transverse inclination.
2. For leveling the sensor, turn the adjust-bolts.

Error of Rate-of-Turn Gyro

The rate-of-turn gyro detects angular velocity of ship's motion, which sometimes contains the following errors.

Attitude Error

If the rate-of-turn gyro is not installed on the level or if the ship trims or heels, the angular velocity detected becomes $V_t \times \cos\theta$, where V_t is the true angular velocity and θ is the inclination angle of the rate-of-turn gyro from the horizontal plane.

Motion Error

If the static attitude of the rate-of-turn gyro is level, the ship's rolling and pitching cause no error. However, if the ship has a trim which causes static inclination of the rate-of-turn gyro, an error occurs by ship's rolling. The error is given by $V_r \times \sin \lambda$, where V_r is the angular velocity of rolling and " λ " is the trim angle.

Latitude Error

Error caused by earth's rotation depends on latitude.

If latitude is expressed by " α " and earth's rotation angular velocity by Ω , then error ω_E caused by earth's rotation is

$$\omega_E = \Omega \times \sin \alpha$$

Error by Vibration and Shock

Shock and vibration in longitudinal, transverse and vertical directions do not cause error in gyro output if it's intensity is within the gyro specifications. However, note that actual shock and vibration contain angular velocity components which cause error. When the unit is installed in the bridge, the error may be negligible.

Note: The life of the sensor in the Rate-of-Turn Gyro is approx. 17,000 hours. When the elapsed time shown on the hour meter in the Rate-of-Turn Gyro, exceeds 17,000 hours, replace the sensor.

CHAPTER 3. WIRING

3.1. Precautions for Cable Installation

3.1.1. Cable between hull unit (transducer) and transceiver

This cable carries very weak signals with amplitude of less than 0.1uV which are easily interfered by noise. **Dedicate conduit exclusively for this cable.** For the conduit which runs vertically, fill it with sand or other appropriate materials to prevent cable vibration.

3.1.2. Cable between transceiver unit and processor unit (via junction box)

These cables carry echo signals with amplitudes of greater than 0.1 mV which can be interfered by noise from high electric power cables. Do not run them in a conduit together with the following cables.

- 1) Cable carrying more than few kilowatts power to fluctuating loads.
- 2) Cable carrying switching waves generated by thyristor, etc.
- 3) Transmission antenna cable of radio equipment.

Also observe the guidelines for “Other cables of DS-30”, described below.

3.1.3. Other cables of DS-30

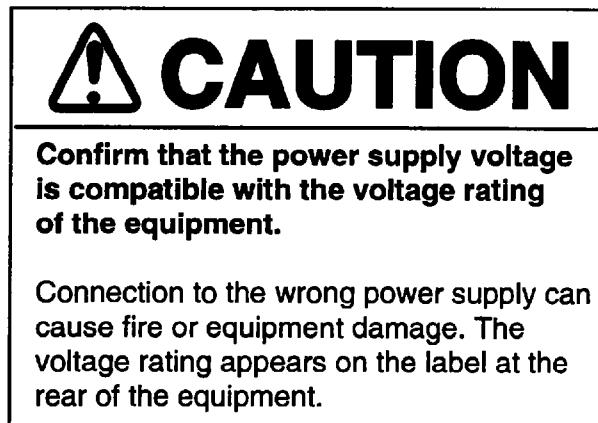

Observe the following guidelines to prevent noise, interference problem.

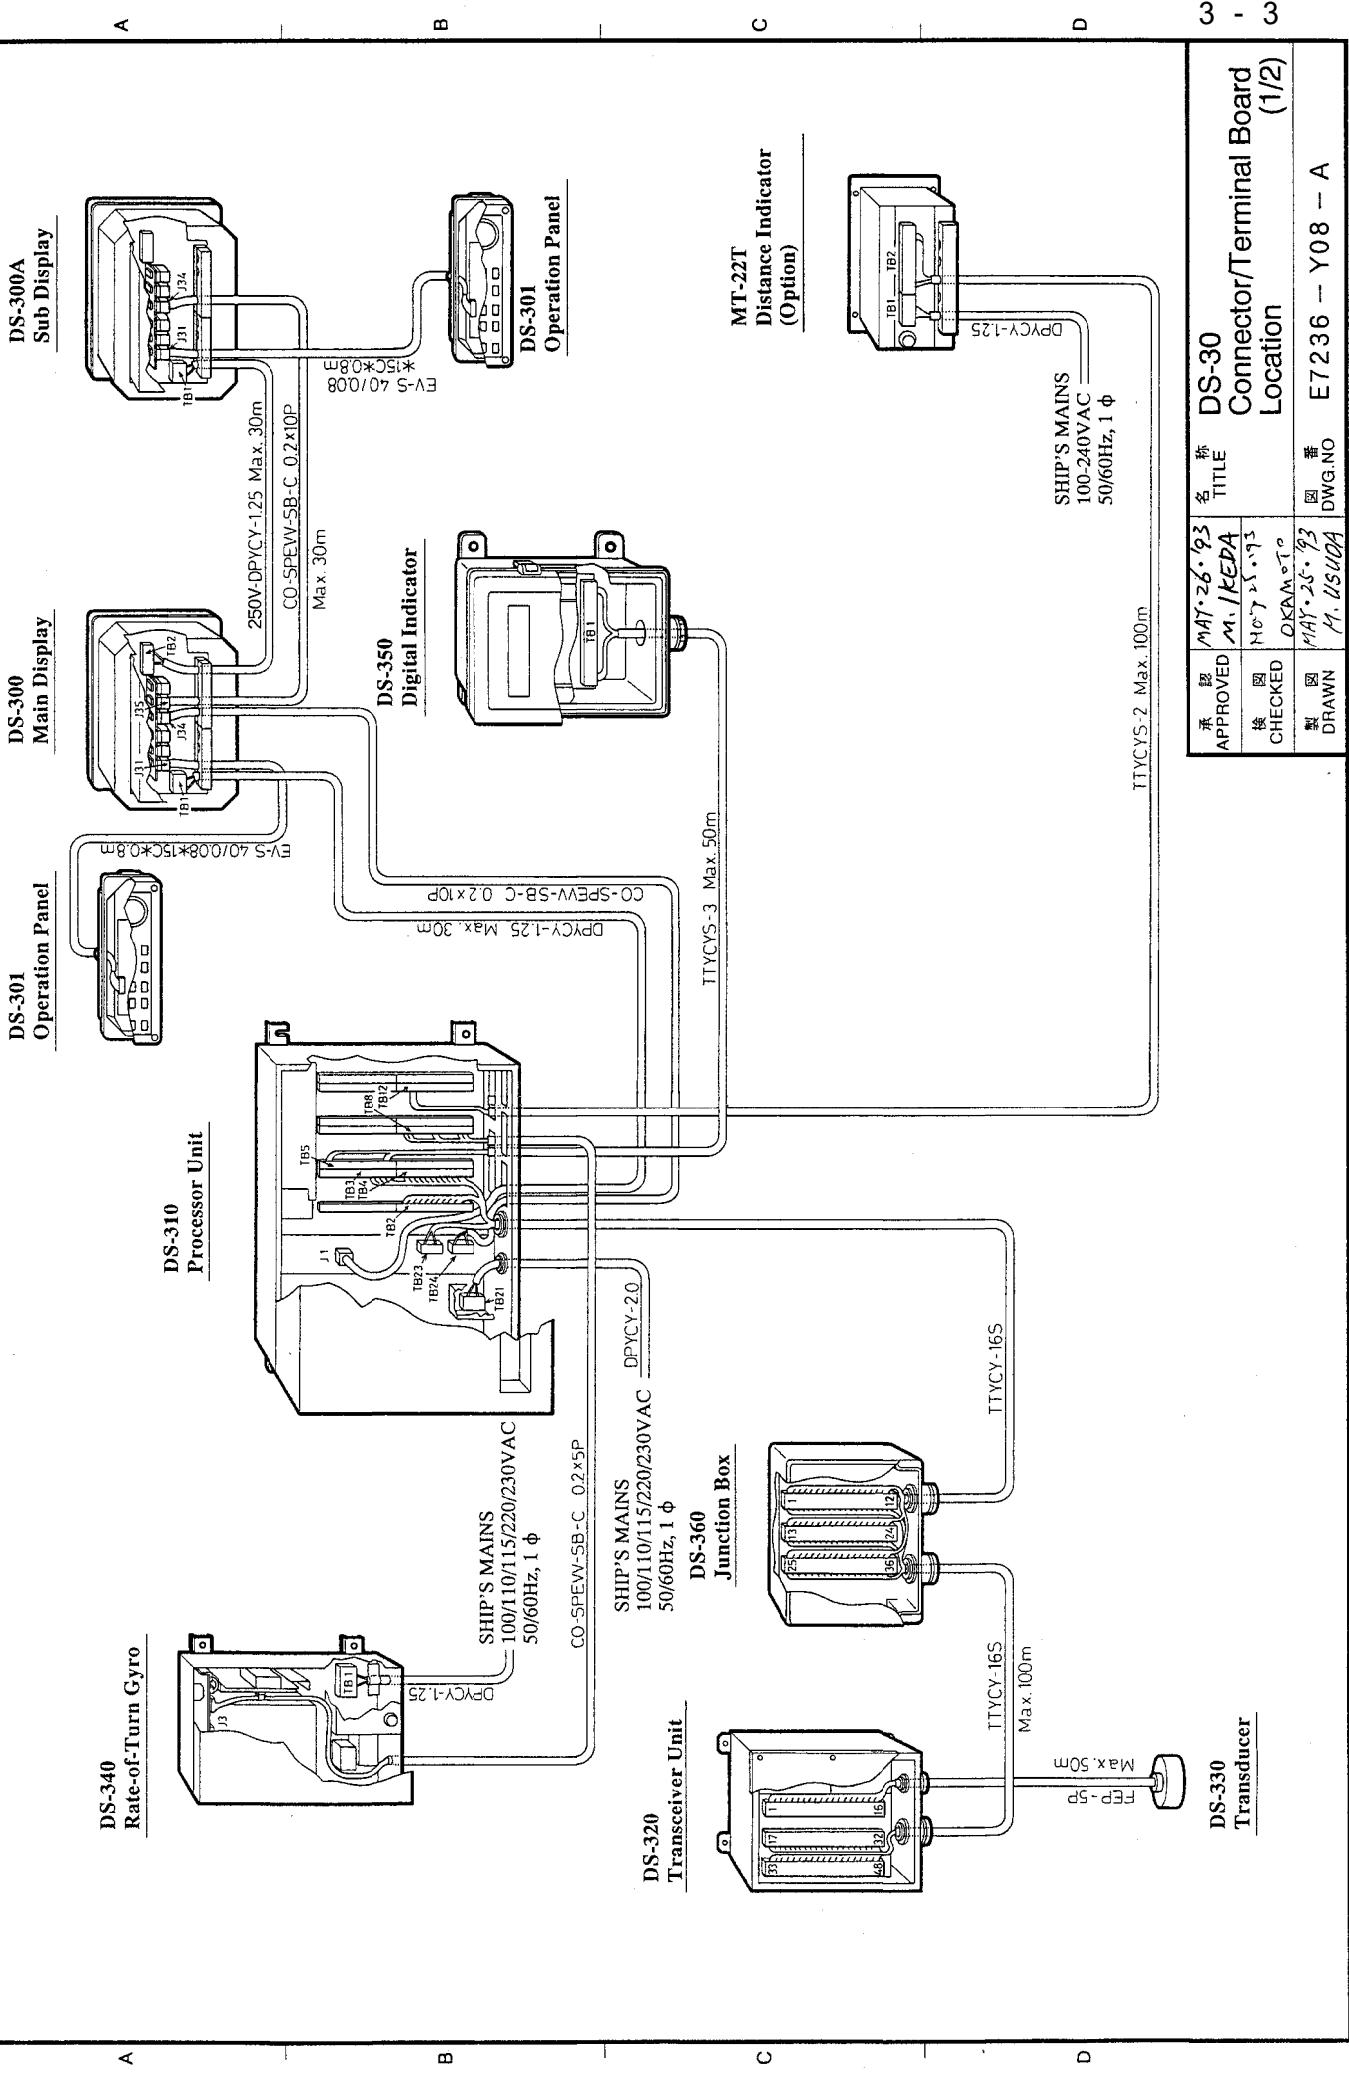

- 1) When the cables run in parallel with power cables, separate them 40 cm at minimum.
- 2) When the cables run in non-metallic conduit or duct behind a bulkhead, use an armored cable without protective covering and ground it every 50 cm.

3.2. Cable Specification

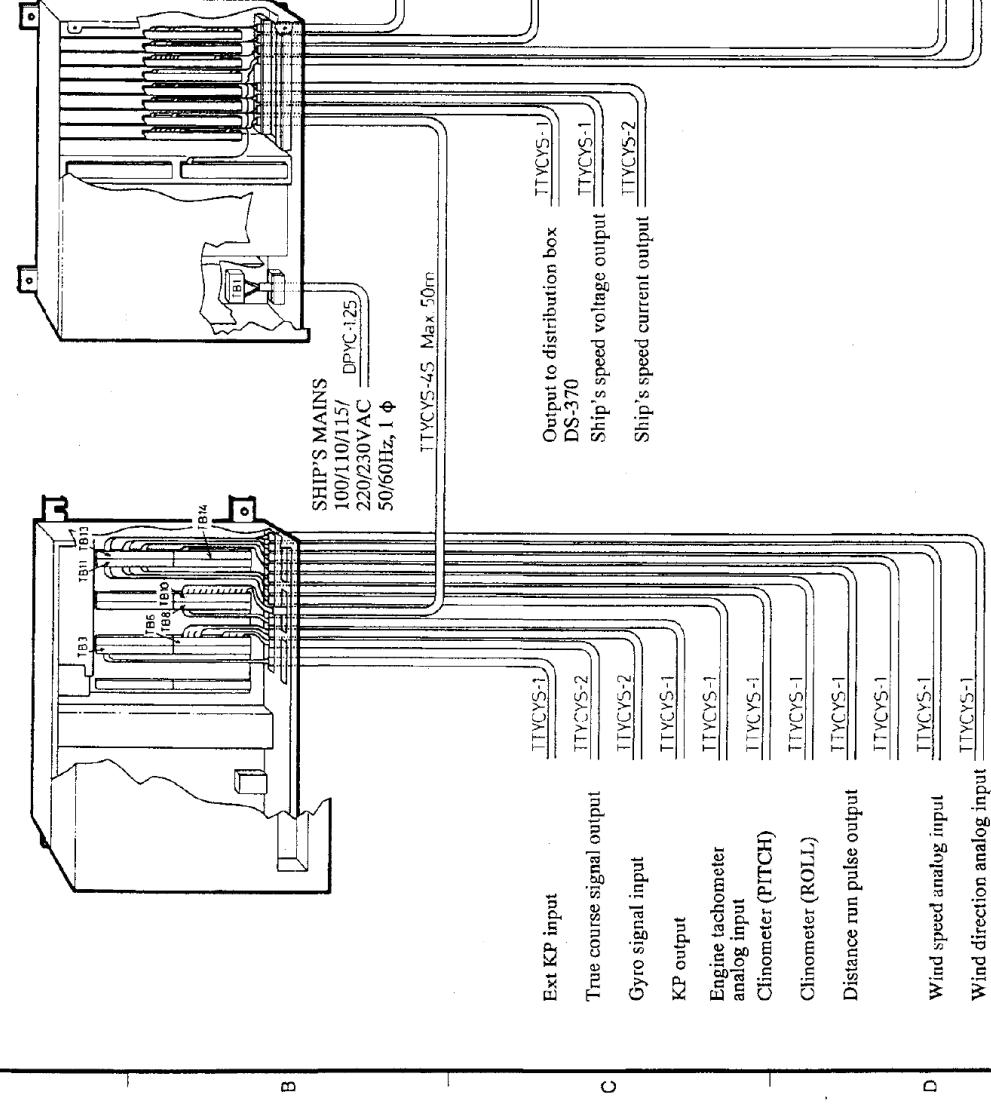

When the cables shown in the interconnection diagrams are not available, use their equivalent referring to the table below.

Cable Type	No. of Cores	Core size (mm)	Insulator Type	Shield Type	Armor	Outer Covering	Overall Diameter

3.3. Cable Fabrication

3.3.1. Transducer Cable

3.3.2. Cables between Transceiver Unit/Junction Box/Processor Unit (TTYCY-16S)

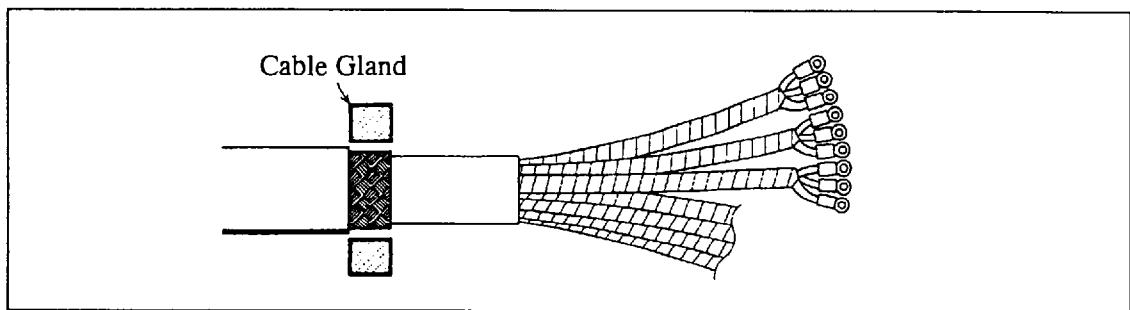

1) Transceiver Unit/Junction Box Side

Note: Do not undo the shield at the entrance into the unit. Noise induction through unshielded wires cause equipment malfunction.

2) Processor Unit Side

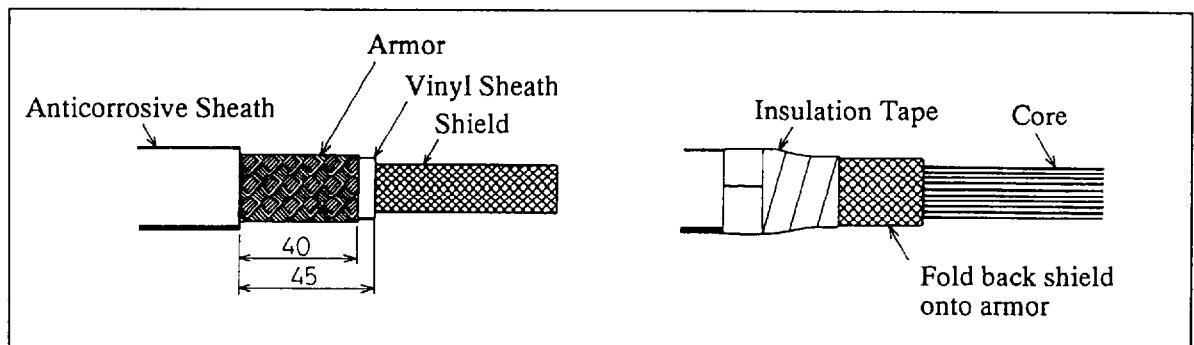

Fabricate the wires and shield in the same way as the transceiver unit/junction box sides. For the cable armor, remove paint and ground it through the cable clamp.

3.3.3. Cables between Processor Unit/Main Display Unit/Sub Display Unit (CO-SPEVV-SB-C 0.2x10P)

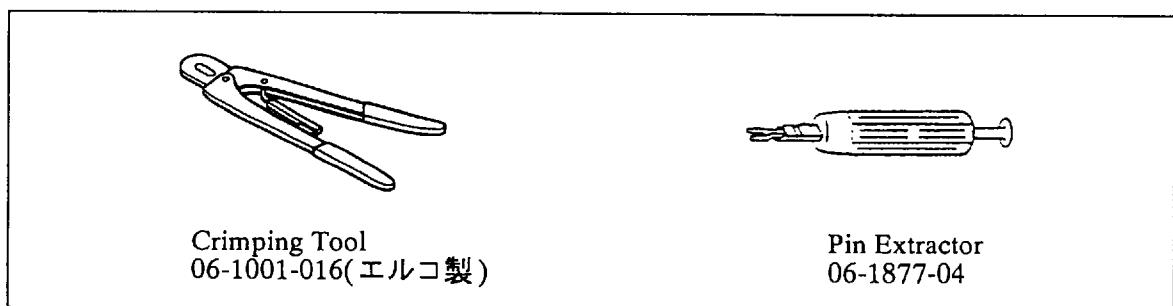

Connect the 20p connector as follows.

1) Cable Fabrication

2) Crimping Tool and Crimping Method

A special crimping tool is necessary for connection of wires to the contact pins of 38P connector 00-8016-038-000-751. Also a pin extractor should be used to push out the contact pin from the connector body. The following describes how to crimp and extract the contact.

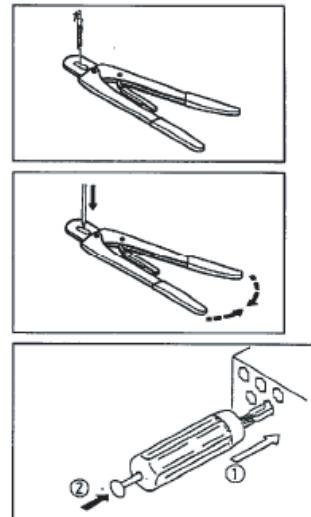

Crimping Tool
06-1001-016(エルコ製)

Pin Extractor
06-1877-04

3) Wire Crimping Procedure

1. Strip the vinyl sheath of the wire to expose the core by 3mm to 4mm.
2. Hold the crimping tool horizontally and insert the contact pin with its slit faced downward into the crimp hole on the crimping tool.
3. Insert the wire onto the contact pin and squeeze the handle until the ratchet releases. Note that the wire should be inserted deep enough until its end comes in contact with the stopper plate of the crimping tool. After crimping, pull the wire to make sure that it is securely fixed.

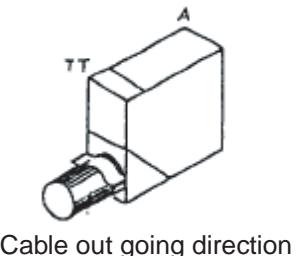

4) Inserting Contact Pin into Connector Housing

The connect pins fitted to wires should be inserted into the connector housing referring to the interconnection diagram.

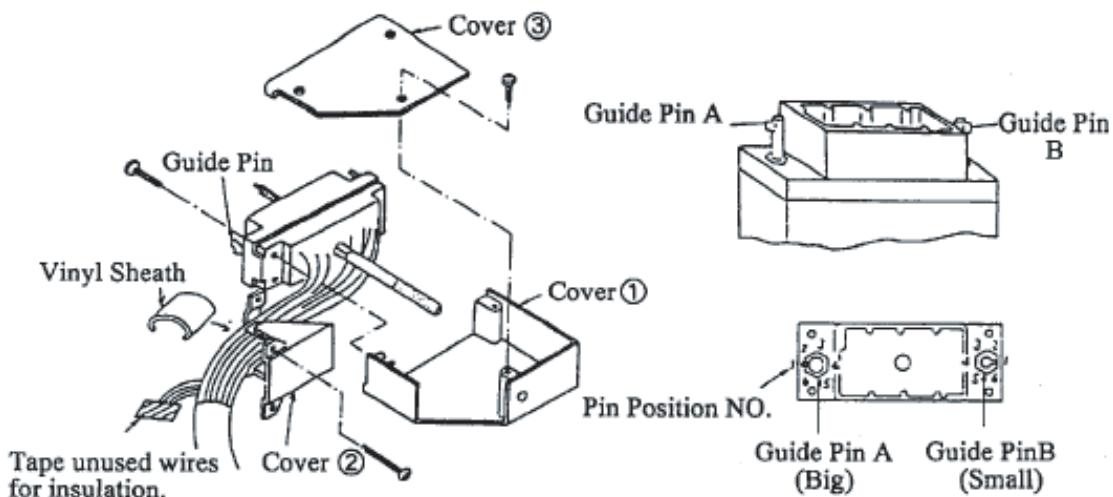

5) Procedure to Extract Contact Pin

When a contact pin is inserted into an incorrect hole on the connector body, take it out by using the pin extractor.

1. Push the pin extractor into the pin hole from the side opposite to the pin inserting side.
2. Push in the head of the pin extractor, and the contact pin is unlocked and pushed out.

6) Assembling Connector Housing

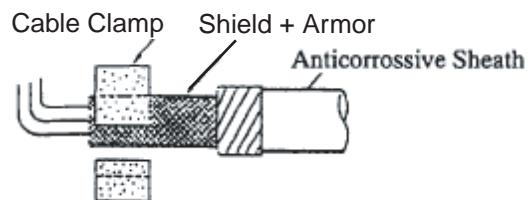

1. Fix the cover ①, paying attention to the cable outgoing direction.
2. Dress the wires and put covers ② and ③ on.
3. Use a fragment of cable sheath to fix the wires with the connector clamp.
4. Cut the unused wires to proper length and wrap their ends with vinyl tape.

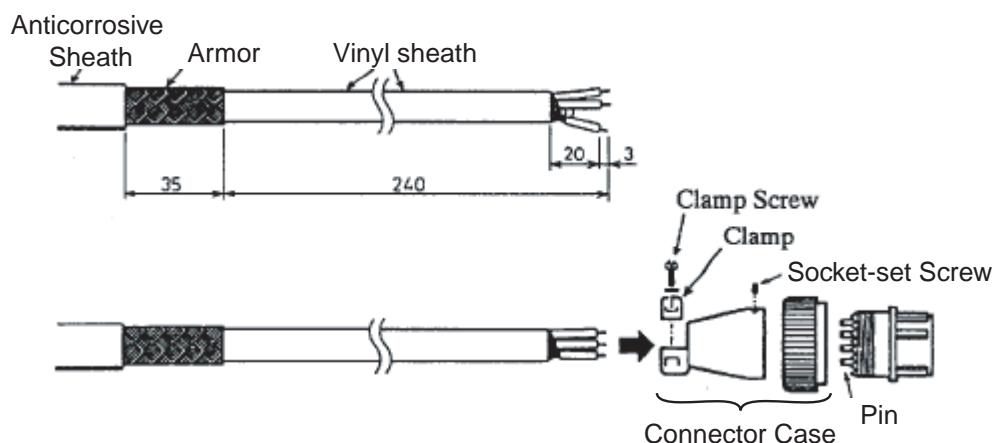

Note) Covers ①, ② and ③ are not fitted on the connectors connected to the main and sub display units.

7) Clamping Cable

Clamp the shield and armor of the cable with cable clamp.

3.3.4 CIF/NMEA Data Signal Cable (CO-SPEVV-SB-C 0.2X5P)

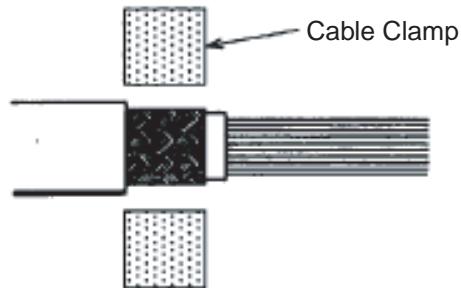

3.3.5 Other Cables

All other cables are connected to terminal boards. Fabricate their ends as follows.

1) Cable Armor

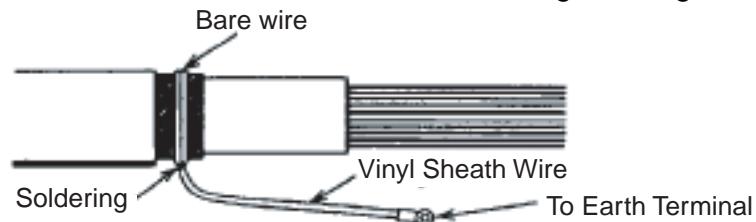

<For cables led in through cable clamp>

Expose the armor and clamp it with the cable clamp.

<For cables led in through cable gland>

Solder a vinyl sheath wire to the armor and connect it to the grounding terminal.

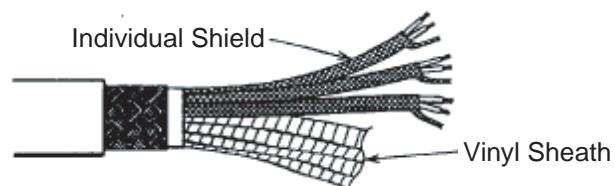

2) Cable Shield

<For individual shield>

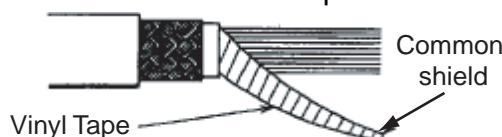

Undo individual shields only near at the terminal boards to which the wires are connected.

Further, tape shields for insulation.

<For common shield>

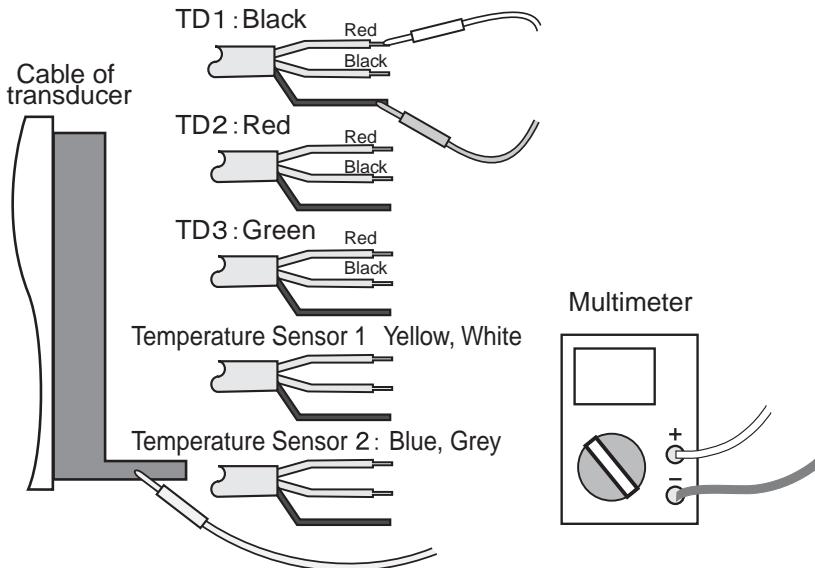

Undo common shield at entrance of the unit and tape it for insulation.

3.3.6 Insulation of cables for transducer

Insulation check

1. Remove all cores and shields of the transducer from the terminal board. All wires of the transducer are open.
2. Set the multimeter to the maximum resistance range and measure the resistance between each transducer line (TD1, TD2, TD3) and individual or common shield.

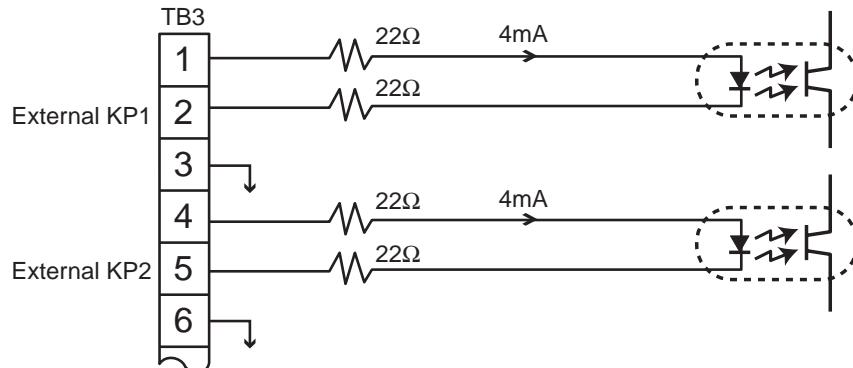

Measurement places		Insulation resistance value
- polarity lead	- polarity lead	
Red wire of black sheath	Shield in black sheath	
Red wire of black sheath	Common shield	
Red wire of red sheath	Shield in red sheath	Digital multimeter: More than 10MΩ
Red wire of red sheath	Common shield	Analog multimeter: Needle does not swing.
Red wire of green sheath	Shield in green sheath	
Red wire of green sheath	Common shield	

Note) If rating is not met a location, suspect faulty insulation. Replace a new one.

3.4 Remarks on Connection of Other Equipment

3.4.1 KP input Signal for Interference Rejection

When a TX trigger pulse (Keying Pulse) is connected from other acoustic equipment which gives interference to DS-30, note the following.

1) Interference Rejection Signal Input Circuit

Two input ports are provided in the processor unit for connection of KP for interference rejection. Use any one of them.

2) Current Requirement

Recommended current is 4 mA while the circuit operates normally at 2 mA to 20 mA. Adjust output resistance for the recommended current.

3.4.2 NMEA/CIF Signal I/O Circuit

The I/O circuit for NMEA or CIF format data has the configuration shown below, where CIF is Furuno standard data format.

Maximum allowable current in NMEA output is 25 mA and recommended current is 10 mA. When terminating the line by a photo-coupler for a current loop configuration, take suitable means at the signal receiving side to limit the current. If, for example, forward voltage drop in the photo-coupler is 2.2V:

$$[4.8 - 2.2\text{ (V)}]/[10(\text{mA})] - 227\text{ (\Omega)} = 33\text{ (\Omega)}$$

therefore, 33 ohm resistor should be inserted in series in the line.

3.4.3 Requirement of Wind Direction and Speed Signal

The wind meter that outputs following dc voltages can be connected.

- Wind direction: 0 to 1 Vdc for direction of 0° to 540°
- Wind speed: 0 to 1 Vdc for speed of 0 to 60 m/sec

3.4.4 Requirement in Engine Revolution Speed Signal

The engine tachometer that outputs following dc voltage can be connected.

- 0 to 1 Vdc for revolution speed of 0 to full scale.

3.4.5. Connection of Gyrocompass Signal (RS-232C/RS-422)

1) Specification of Gyrocompass Signal

DS-30 permits to connect the gyrocompass signal to AUX 1 port (J4) in the processor unit only when the digital gyro data conforms to the specifications shown below. In other cases, connect it to the port alloacted exclusively to gyrocompass via the Furuno A/D Converter AD-100.

Communication Method: RS-232C/RS-422

Data Transmission: Serial asynchronous form

Baud Rate: 600/1200/2400/4800/9600 bauds

Data Interval: 1 ms to 25 ms

Data Format: Type (1), (2) or (3)

Type (1)			Type (2)		
No.	Data	Description	No.	Data	Description
1	<CR>	Header	1	n	x100°
2	n	x10°	2	n	x10°
3	n	x1°	3	n	x1°
4	n	x0.1°	4	n	x1/6°
5	n	x0.01°	5	n	Do not care.
6	n		6	LF	Line feed

Type (3)					
Start bit: 1 bit Data bit: 8 bits Stop bit: 2 bits Parity bit: None					
No.	Data	Description	No.	Data	Description
1	<\$>		12	<, >	Polarity; Plus: space, Minus: -
2	<H>		13	SP/-	
3	<E>		14	n	x1°/sec
4	<H>		15	n	0.1°/sec Rate of turn
5	<R>	Do not care.	16	n	0.01°/sec
6	<C>	Line feed	17	<*>	Check sum delimiter
7	n	x100°	18	α	Checksum
8	n	x10°	19	β	Checksum
9	n	x1°	20	<CR>	Carriage return
10	n	x0.1°	21	<LF>	Line feed, Terminator
11	n	x0.01°			

NOTE: 1. Data should be in 7 bit ASCII code.

2. "n" shows a figure between 0 and 9.

3. The checksum is the 8 bit exclusive OR of all characters in the sentence but not including the "\$" and the "*" demiliters. The hexadecimal value of the most

significant and least significant 4 bits of the result are converted to two ASCII characters, which are transmitted as No. 18 and 19 data.

2) DIP Switch Setting

Set DIP switches on the MIF board in the processor unit as shown in the table.

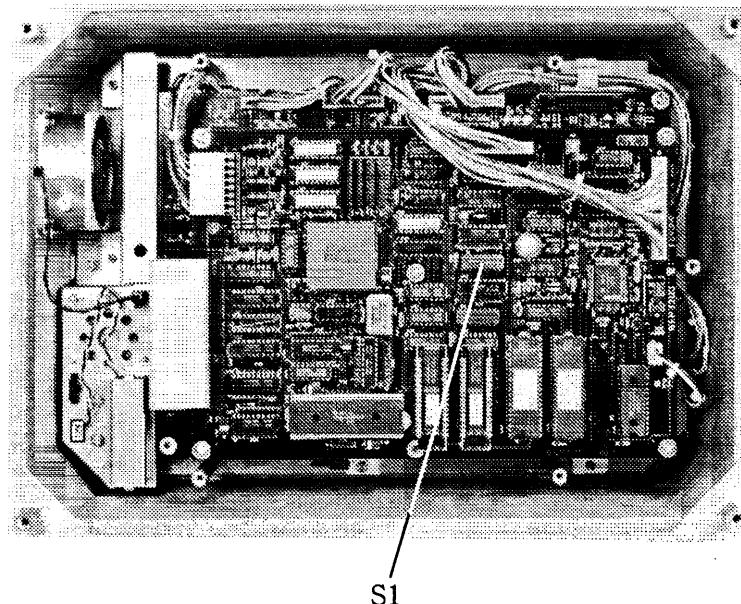

DIP Switch		Function	Setting															
S2	1 2	AUX 1 Port Baud Rate	<p>Set baud rate of gyro signal.</p> <table border="1"> <thead> <tr> <th>Baud Rate</th> <th>1</th> <th>2</th> </tr> </thead> <tbody> <tr> <td>9600</td> <td>OFF</td> <td>OFF</td> </tr> <tr> <td>4800</td> <td>OFF</td> <td>ON</td> </tr> <tr> <td>2400</td> <td>ON</td> <td>OFF</td> </tr> <tr> <td>1200</td> <td>ON</td> <td>ON</td> </tr> </tbody> </table>	Baud Rate	1	2	9600	OFF	OFF	4800	OFF	ON	2400	ON	OFF	1200	ON	ON

CHAPTER 4. POST-INSTALLATION SETTING

4.1. DIP Switch Setting

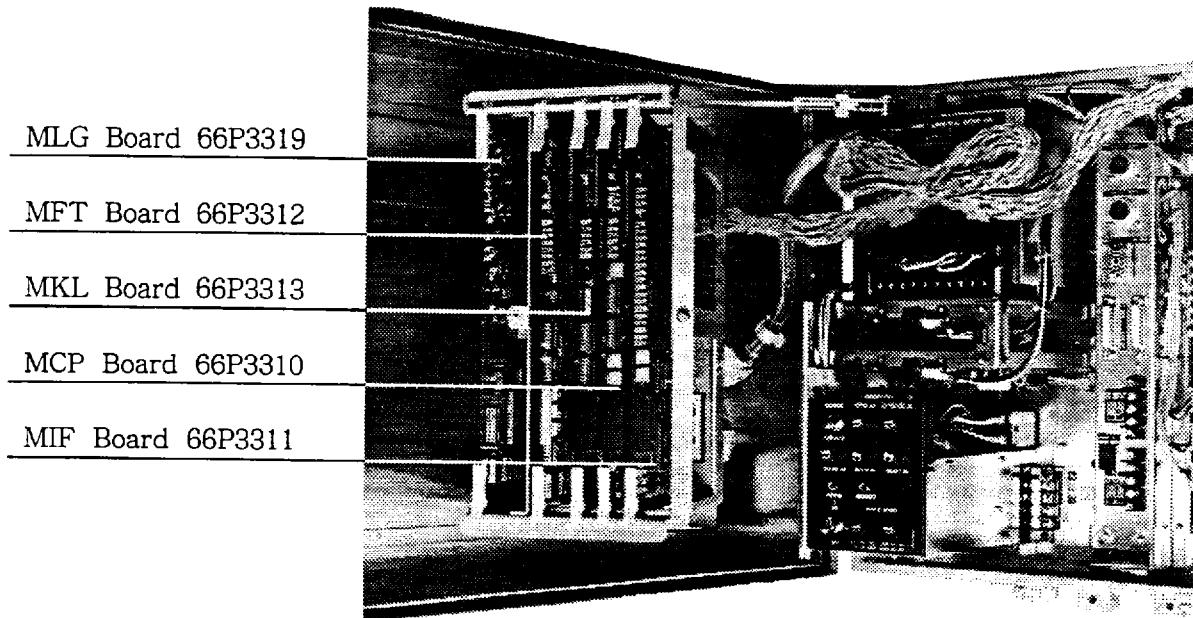

Check and if necessary change the DIP switch settings depending on the external equipment connected.

4.1.1. Display Unit

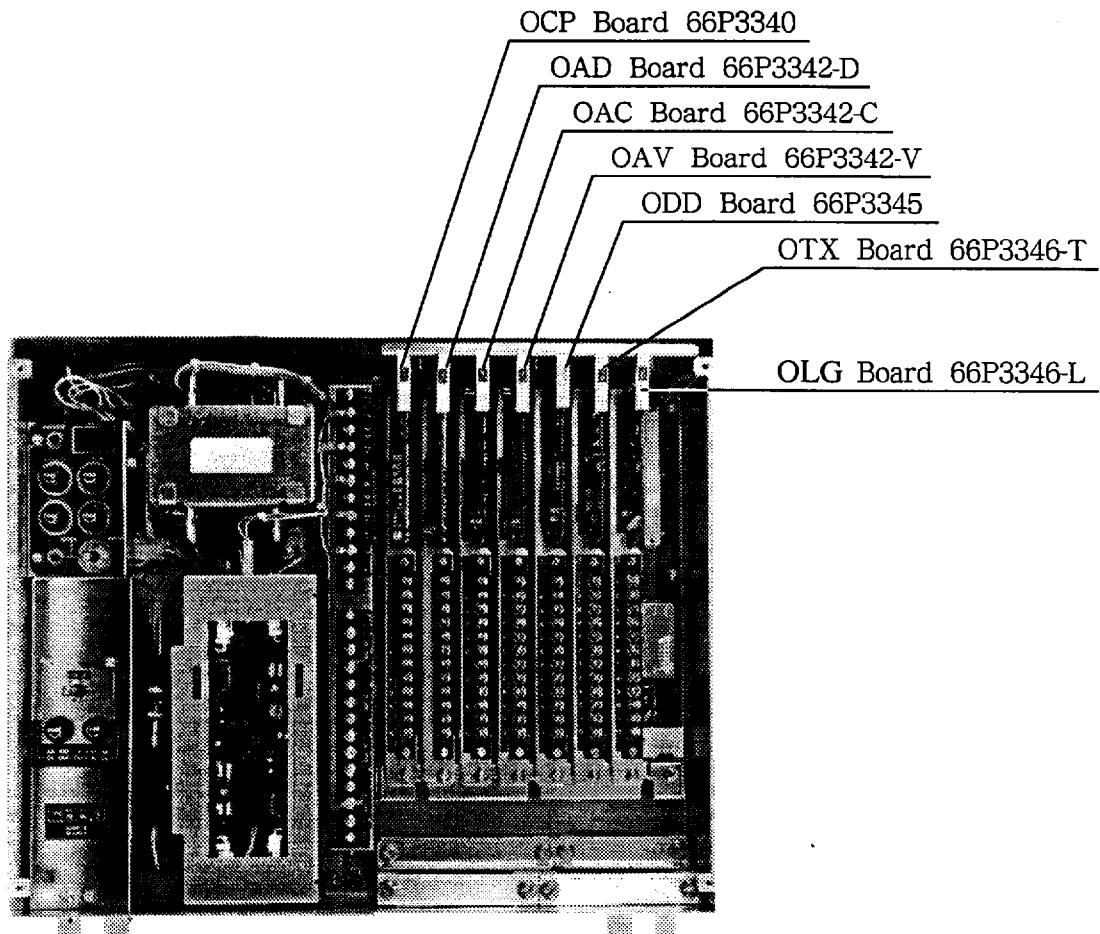

Board	DIP SW	Function	Setting										
LCP Board 66P3300	S1	1 Main/Sub Selection	OFF: Main Display DS-300 ON: Sub Display DS-300A										
		2 Language Selection	<table border="1"><tr><td>Language</td><td>2</td><td>3</td><td>4</td></tr><tr><td>Japanese</td><td>OFF</td><td>OFF</td><td>OFF</td></tr><tr><td>English</td><td>ON</td><td>ON</td><td>ON</td></tr></table>	Language	2	3	4	Japanese	OFF	OFF	OFF	English	ON
Language	2	3	4										
Japanese	OFF	OFF	OFF										
English	ON	ON	ON										
5 Indication of current direction	OFF: Coming direction ON: Going direction												
6 Time indication	OFF: Legacy indication ON: UTC indication when input GPS Signal												

4.1.2. Processor Unit

Board	DIP SW	Function	Setting												
MKL Board 66P3313	S1	1 2 Filter Parameter Setting	This determines the response speed of ship's speed reading against change of actual ship's speed. Normally it is set as shown in the table. Change the setting when the response seems slow. <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>Ship Size</td> <td>1</td> <td>2</td> </tr> <tr> <td>Large (300m or more)</td> <td>OFF</td> <td>OFF</td> </tr> <tr> <td>Medium (200m or more)</td> <td>OFF</td> <td>ON</td> </tr> <tr> <td>Small (100m or less)</td> <td>ON</td> <td>OFF</td> </tr> </table>	Ship Size	1	2	Large (300m or more)	OFF	OFF	Medium (200m or more)	OFF	ON	Small (100m or less)	ON	OFF
Ship Size	1	2													
Large (300m or more)	OFF	OFF													
Medium (200m or more)	OFF	ON													
Small (100m or less)	ON	OFF													
MCP Board 66P3310	S3	7 Interference Rejector 1	Set to ON when KP signal from other acoustic equipment is connected to TB3-#1/#2 in processor unit for interference rejection. OFF: Interference rejector 1 on (Factory setting) ON: Interference rejector off												
		8 Interference Rejector 2	Set to ON when KP signal from other acoustic equipment is connected to TB3-#4/#5 in processor unit for interference rejection. OFF: Interference rejector 2 on (Factory setting) ON: Interference rejector off												
MIF Board 66P3311	S5	0 to F Engine Revolution Speed Full Scale Setting	Set this item when the engine tachometer is connected. S5 is a DIP switch. Set it so that the full scale revolution (revolution for ±10V output) satisfies the following equation: $\text{Full scale revl. (rpm)} = (\text{S5 setting}) \times 10 + 50$ For example, if the full scale revolution is 70 rpm, set "2" and if 200 rpm, set "F".												

4.1.3. Distribution Unit

Quantity and type of boards to be incorporated change with equipment specifications.

Board	DIP SW	Function	Setting															
OAV Board 66P3342 -V	S1	1 2 Ship's Speed Voltage Output Selection	Select ship's speed versus voltage output characteristics according to specifications of external equipment connected to OAV board. <table border="1" style="margin-left: 20px;"> <tr> <th>Output</th><th>1</th><th>2</th></tr> <tr> <td>-10 to +40 kt = -2.50 to +10.0V</td><td>OFF</td><td>OFF</td></tr> <tr> <td>-10 to +30 kt = -3.33 to +10.0V</td><td>ON</td><td>OFF</td></tr> <tr> <td>-10 to +25 kt = -4.00 to +10.0V</td><td>OFF</td><td>ON</td></tr> <tr> <td>-10 to +20 kt = -5.00 to +10.0V</td><td>ON</td><td>ON</td></tr> </table>	Output	1	2	-10 to +40 kt = -2.50 to +10.0V	OFF	OFF	-10 to +30 kt = -3.33 to +10.0V	ON	OFF	-10 to +25 kt = -4.00 to +10.0V	OFF	ON	-10 to +20 kt = -5.00 to +10.0V	ON	ON
Output	1	2																
-10 to +40 kt = -2.50 to +10.0V	OFF	OFF																
-10 to +30 kt = -3.33 to +10.0V	ON	OFF																
-10 to +25 kt = -4.00 to +10.0V	OFF	ON																
-10 to +20 kt = -5.00 to +10.0V	ON	ON																
3 4 Ship's Speed Output Selection	Select type of ship's speed which is output from OAV board. <table border="1" style="margin-left: 20px;"> <tr> <th>Output</th><th>3</th><th>4</th></tr> <tr> <td>Fore-aft speed</td><td>OFF</td><td>OFF</td></tr> <tr> <td>Fore-aft speed in absolute value</td><td>ON</td><td>OFF</td></tr> <tr> <td>Vector speed</td><td>OFF</td><td>ON</td></tr> </table>	Output	3	4	Fore-aft speed	OFF	OFF	Fore-aft speed in absolute value	ON	OFF	Vector speed	OFF	ON

CI-370/377	ON	ON													

4.1.4. Digital Indicator DS-351 (option)

Refer to AP-7.

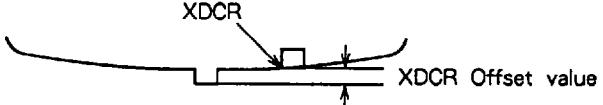

4.2. Setting Offset Data Menu

The offset data menu contains items for calibrating the DS-30 after it is installed on a ship. Unlock the menu and enter appropriate data.

OFFSET DATA		END
TRIM	:	+ 0.0°
HEEL	:	+ 0.0°
XDCR OFFSET	:	+ 0.0°
COMPASS CORR	:	+ 0.0°
R. O. T. ZERO	:	+ 0.0°/min
GND TRK SPD	:	+ 0.0%
WTR TRK SPD	:	+ 0.0%
UKC OFFSET	:	+ 0.0m
SPEED DIFF	:	EXECUTE ?

Factory setting in bold

Item	Description	Selection
Trim	Set ship's trim, that is, the relationship of the draft at bow and stern. Use "+" when the ship is down by the stern and "-" when it is down by the bow.	- 12.5 to + 12.5° 0.0°
Heel	Set ship's heel, that is, lateral inclination. Use "+" when the ship is up by the port and "-" when it is up by the starboard.	-12.5 to + 125° 0.0°
XDCR Offset	Set deviation angle of the transducer's fore-aft axis with reference to the ship's longitudinal axis. Use "+" when it is deviated to starboard side.	-12.5 to + 12.5° 0.0°
Compass Correction	Set a correction value to be applied to the heading sensor input to eliminate any constant deviation. Use "+" to add the correction value to the readout and "-" to subtract it from the readout. <i>NOTE: When the gyrocompass incorporates error correction function, do the correction at gyrocompass.</i>	-12.5 to + 12.5° 0.0°
R.O.T. (Rate Of Turn) Zero	Set a correction value if required for zero adjustment of the rate-of-turn gyro readout. Use "+" to add the correction value to the readout and "-" to subtract it. When the ship is at a perfect standstill and DS-30 has L/L data fed from nav-sensor, set a correction value which makes reading of ship's transverse speed zero. If DS-30 has no L/L data, the readout can not be corrected since the speed reading contains the latitude error (see page 2-7).	-12.5 to + 12.5°/min 0.0°/min

Item	Description	Selection
Ground Track Speed (GND TRK SPD)	Set a correction factor to be applied to the over-the-ground speed measured by DS-30. Use “+” to increase the readout and “-” to decrease it. Normally it is not necessary to set this item.	-12.5 to + 12.5% 0.0%
Water Track Speed (WTR TRK SPD)	Set a correction factor to be applied to the through-the-water speed measured by DS-30. Use “+” to increase the readout and “-” to decrease it. Normally it is not necessary to set this item.	-12.5 to + 12.5% 0.0%
UKC Offset	<p>Set a correction value to be applied to the under-keel clearance (UKC) measured by DS-30. Use “+” to add the correction value to the readout and “-” to subtract it.</p> <p>A “-” correction value is usually used when the transducer is installed off the keel as shown below.</p>  <p>A “+” correction value is used to measure water depth instead of the under-keel-clearance. In this case, ship's draft is applied as the correction value.</p> <p>In addition to above, if there is a difference between the under-keel clearances measured by DS-30 and echo sounder and you are sure that the value measured by echo sounder is accurate, the difference can be used as a correction value.</p>	-50.0 to + 50.0m 0.0m
Speed Difference	<p>Display the difference between the over-the-ground speed and heading measured by DS-30 and those derived from the external nav-sensor. The difference is displayed in parenthesis to the right of the correction values for the compass and the ground tracking speed.</p> <p><i>It takes a few minutes until the difference is displayed.</i></p>	EXECUTE

4.3. Setting System Menu

The system menu contains display unit preset menu, ship data menu and external sensor menu.

4.3.1. Opening System Menu

Turn on the unit while holding down the MENU key until a beep sound stops.

4.3.2. Closing System Menu

Turn off and then on the POWER switch.

4.3.3. Setting Display Unit Preset Menu

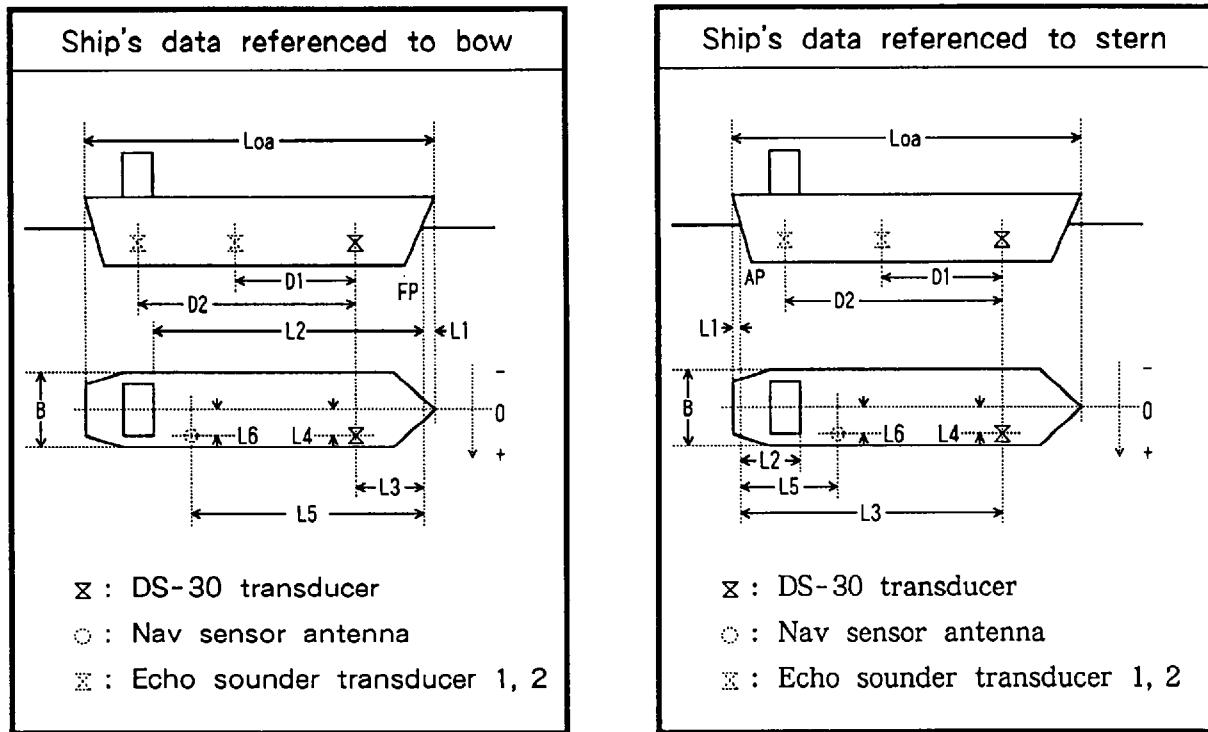

DISPLAY PRESET		END
CURSOR SPEED	:	Medium
DEPTH UNIT	:	m
DISTANCE RUN	:	kt
CURR SPEED	:	kt
WIND SPEED	:	m/s
SCALE UNIT	:	m

5.2. Self-check

The DS-30 has a self-check facility for general diagnosis of the major circuits. Execute the checks after all installation jobs are completed.

5.2.1. Procedure

1. Call up the main menu by pressing the MENU key.
2. Select the self-test item and press the MENU key. The sub-menu as shown below is displayed.

SELF-TEST		END
PANEL TEST	:	EXECUTE ?
SYSTEM TEST	:	EXECUTE ?
CONT. TEST	:	EXECUTE ?
TX/RX TEST	:	OFF
SET TEST SPD	:	0.0kt
SPD TEST ON	:	OFF

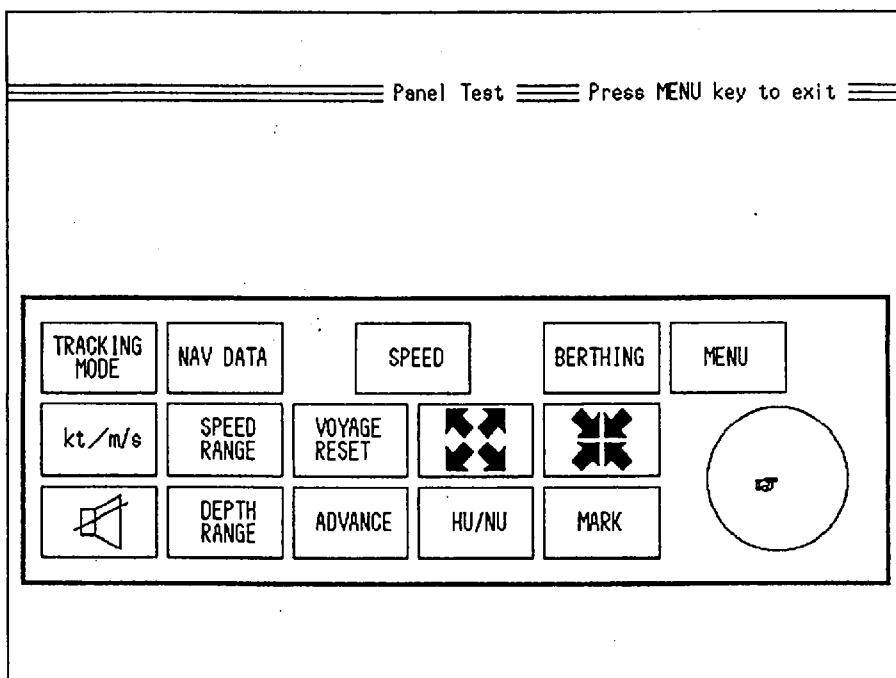

3. Select a self-test item to be executed and press the MENU key. As each self-test item is protected (locked), the following alert appears.

This item is locked.
Do you want to change setting?

4. Select "Yes" and press the MENU key twice, and the selected self-test is executed .

5.2.2. Panel Test

The panel test checks the operation panel keys for proper operation.

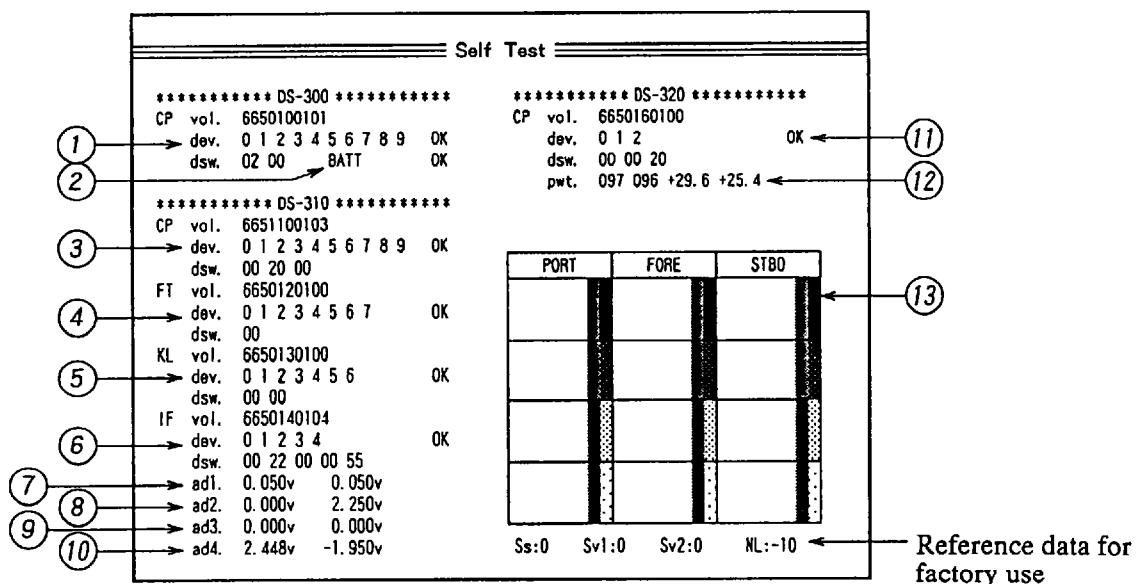

Press each key to see if the corresponding key mark on the screen is highlighted in reverse video. For the trackball, check that the hand pointer () on the screen moves within the circle as the trackball is operated.

To terminate the panel test press the MENU key.

5.2.3. Single Test

The single test executes the system check for one cycle displaying the test result for each item checked.

No.	Self-check Item	Description
1	Display Unit (DS-300) LCP Board Memory IC	<p>dev. 0 1 2 3 4 5 6 7 8 9 OK</p> <p>Memory ICs are checked. If all checked ICs are normal, "OK" is displayed. If a faulty IC is detected, "*" is displayed to the right of the number corresponding to the faulty IC. The numbers 0 to 9 represent the following ICs.</p> <p>0: EPROM 1: SRAM (Lower byte) 2: VRAM (Upper byte)) 3: Dual Port RAM 4: VRAM (D0 to D3 bits) 5: VRAM (D4 to D7 bits) 6: VRAM (D8 to D11) 7: VRAM (D12 to D15) 8: Color Pallet 9: EEPROM</p>
2	Display Unit (DS-300) LCP Board DIP Switch Setting Battery Voltage Back-up Data	<p>dsw. xx.xx BATT OK</p> <p>DIP SW S1, S2 setting Battery voltage and back-up data</p> <p>The result of battery voltage and back-up data check is displayed by three types of message: OK: Both battery voltage and back-up data are normal. WR: Battery voltage is low but back-up data is normal. NG: Back-up data is abnormal or data is not guaranteed.</p>

No.	Self-check Item	Description
3	Processor Unit (DS-310) MCP Board Memory IC	dev. 0 1 2 3 4 5 6 7 8 9 OK The following memory ICs are checked. 0: EPROM 1: PSRAM1 (Lower byte) 2: PSRAM2 (Upper byte) 3: PSRAM2 (Lower byte) 4: PSRAM2 (D0 to D3 bits) 5: SRAM (echo) 6: Dual Port RAM (MFT) 7: Dual Port RAM (MKL) 8: Color Pallet 9: EEPROM
4	Processor Unit (DS-310) MFT Board Memory IC	dev. 0 1 2 3 4 5 6 7 OK The following memory ICs are checked. The check result is displayed in the same way as item no 1. 0: EPROM 1: SRAM (D0 to D3) 2: SRAM (D4 to D7) 3: SRAM (D8 to D11) 4: SRAM (D12 to D15) 5: PSRAM (Lower byte) 6: PSRAM (Upper byte) 7: Dual Port RAM (MKL)
5	Processor Unit MKL Board Memory IC	dev. 0 1 2 3 4 5 6 OK The following memory ICs are checked. The check result is displayed in the same way as item no 1. 0: EPROM 1: SRAM 1(D0 to D7) 2: SRAM 2 (D7 to D15) 3: SRAM 2 (D0 to D7) 4: SRAM 2(D7 to D15) 5: Dual Port RAM 6: EEPROM
6	Processor Unit (DS-310) MIF Board Memory IC	dev. 0 1 2 3 4 OK The following memory ICs are checked. The check result is displayed in the same way as item no 1. 0: EPROM 1: SRAM 2: Dual Port RAM 3: Gyro Interface 4: A/D Converter
7	Processor Unit (DS-310) MIF Board AD Conversion Voltage	ad1. $\pm x.xxxxv$ $\pm x.xxxxv$ ↑ ↑ Wind direction Wind speed Readout changes as follows depending on wind direction/speed: 0 to 4.9V for wind direction 0 to 540° 0 to 4.9V for wind speed 0 to 60m
8	Processor Unit (DS-310) MIF Board A/D Conversion Voltage	ad2. $\pm x.xxxxv$ $\pm x.xxxxv$ ↑ ↑ Unused Engine tachometer -4.9V to +4.9V depending on engine revolution speed.
9	Processor Unit (DS-310) MIF Board A/D Conversion Voltage	ad3. $\pm x.xxxxv$ $\pm x.xxxxv$ ↑ ↑ Unused Unused
10	Processor Unit (DS-310) MIF Board A/D Conversion Voltage	ad4. $\pm x.xxxxv$ $\pm x.xxxxv$ ↑ ↑ Ship's mains Internal reference voltage (2.54V) Ship's mains: 2.445 to 2.500V Internal reference voltage: -1.950 to -2.000V
11	Transceiver Unit (DS-320) NCP Board Memory IC	dev. 0 1 2 OK The following memory ICs are checked. The check result is displayed in the same way as item no 1. 0: EPROM 1: SRAM 2: A/D Converter

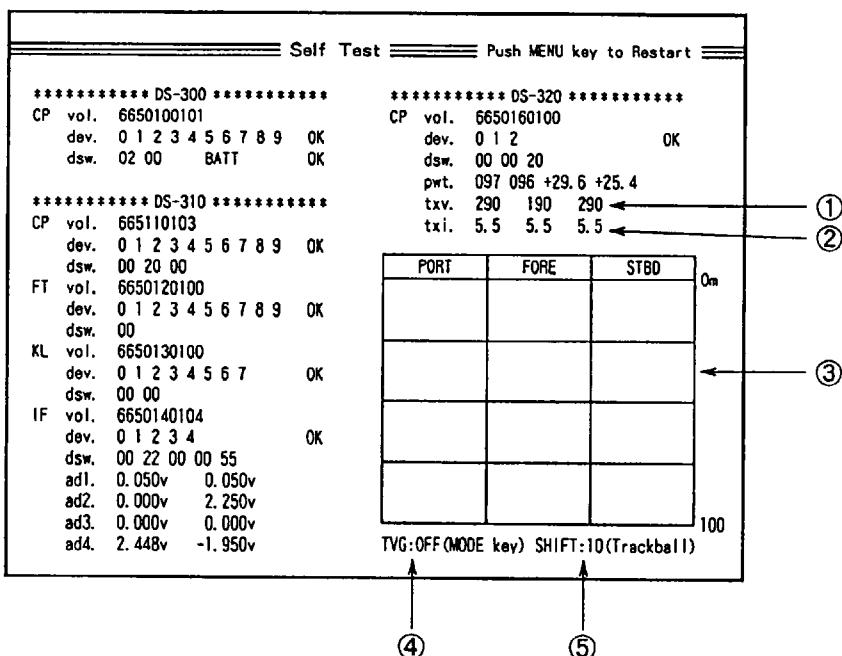

No.	Self-check Item	Description
12	Transceiver Unit (DS-320) NCP Board AD Conversion Value	pwt x x x x x x x x . x x x . x ↑ ↑ ↑ ↑ a b c d a) 100VAC: reading is 95 or 96 at 100VAC b) TX 100VDC: reading is 95 or 96 at 100VDC c) XDCR surface temp.: displays actual temperature d) XDCR mold material temp.: displays actual temperature
13	Color Pattern	Color test patterns are displayed. They are an orange bar and a 16-color bar which are alternately displayed, checking color generators in the display unit.

Note: 1 Number which follows "vol." is program number with least significant two digits showing version number.

2 Number which follows "dsw" is DIP switch setting.

5.2.4. Continuous Test

The continuous test executes the system check repeatedly. In addition to the check items of the single test, it displays the transmission voltage/current and received echoes for port, fore and starboard beams.

No.	Self-check Item	Description
1	TX Voltage	<p>txv. x x x . x x x . x x x . x</p> <p>↑ ↑ ↑ Fore Beam STBD Beam Port Beam</p> <p>TX voltage is normal if reading is more than 180 for all three beams.</p> <p>NOTE: Readings may fluctuate. Read a peak value.</p>
2	TX Current	<p>txi. x . x x x . x x x . x x</p> <p>↑ ↑ ↑ Fore Beam STBD Beam Port Beam</p> <p>TX current is normal if reading is more than 3.0A for all three beams.</p> <p>NOTE: Readings may fluctuate. Read a peak value.</p>
3	Received Echo	<p>Displays received echoes for fore, starboard and port beams. When speed readings are abnormal, check that there is no interruption of echoes due to aeration. Use DEPTH RANGE key to change the depth scale.</p>
4	TVG/ON/OFF	<p>TRACKING MODE key turns on/off the TVG (Time Varied Gain) which is applied to received echoes displayed in item 3. When TVG is ON, propagation attenuation of sound in water is compensated so that echoes from targets with the same property are displayed in the same intensity irrespective of depth where targets are located.</p>
5	SHIFT	<p>Shows gain for echoes displayed in item 3. Use the TRACKBALL to change the gain.</p>

5.2.5. TX/RX Test

The TX/RX test checks the transceiver circuit and the transducer for each beam.

When the speed readings measured by DS-30 are abnormal and echoes shown in the continuous test seem weak for a particular beam, the transceiver circuit or the transducer for that beam may be defective.

In beam FORE-AFT test, the ship's speed is measured by using the fore and starboard beams, without using the port beam. Likewise, in beam STBD-PORT test, the fore beam is not used, and in beam FORE-PORT test, the starboard beam.

If, for example, the speed readings are normal in beam FORE-STBD test but abnormal in beam STBD-PORT test and FORE-STBD tests, the transceiver or the transducer for the port beam is faulty.

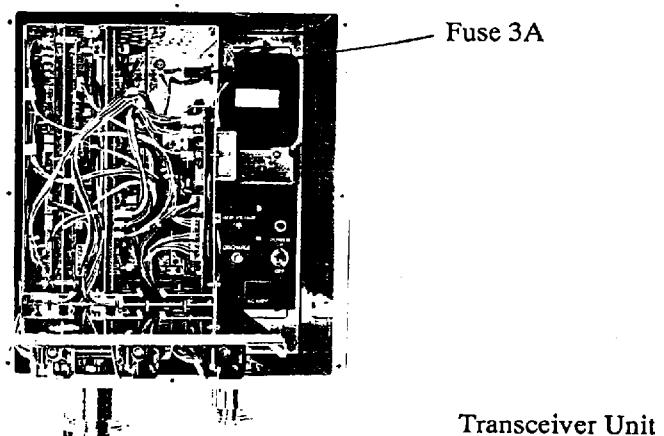

5.3. Checking External Noise and Interference

External noise level can be measured without transmission on the continuous check screen.

5.3.1. External Noise Check

1) Preparation

1. Remove 3A fuse in the transceiver unit..
2. Display the continuous check screen.
3. Set the TVG to OFF by operating the MODE key.
4. Set the depth range at maximum by operating the DEPTH RANGE key.

2) Check at Mooring

1. Adjust the SHIFT (echo gain) by operating the TRACKBALL and note the SHIFT reading when the color of noise in the echo data window changes from blue to the background color.
2. The reading is normally 7 or higher. If it is less than 7, noise is excessive.

3) Check at Cruising

1. With the SHIFT reading set at the value noted at "check at mooring", run the ship at various speeds.
2. Observe the echo test window for the three beams. Noise is displayed in one of the 16 colors shown below depending on its intensity, where the color changes by one gradation whenever noise level is doubled.

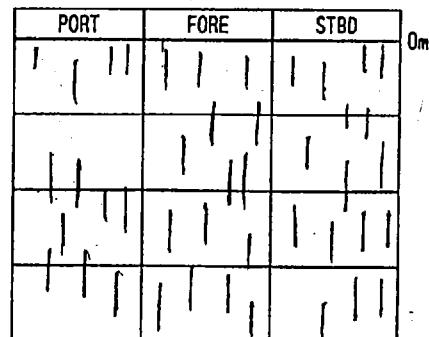

Black (lowest) → blue → light blue → cyan → light cyan → light green → green → yellow green → yellow-orange → orange → vermilion → red → reddish brown → brown → dark brown (highest)

3. Confirm that the noise level is almost even on all three beams and periodic pulse noise does not appear.
4. If the color changes more than 4 gradations compared to that at mooring, noise is excessive. In this case check the ground of each unit. (If the cruising noise is too heavy, you must consider transducer relocation.)

5.3.2. Interference Check

Perform this check at a location where the depth is greater than 50 meters (preferably about 100 meters) and no other ships are in the vicinity.

1. Set the SHIFT reading to the value noted at "Check at Mooring".
2. At a depth greater than 50 meters, operate other equipment one by one, observing the echo check window.
3. When there is interference, multiple strings are displayed as shown at right.
4. Put back the 3A fuse for normal operation.

Interference

5. Turn off all ultrasonic wave generating equipment (echo sounder, etc.).
6. Operate the DS-30 in the ground tracking mode. Confirm that the ship's speed and direction readout is accurate.
7. Observing the display, turn on and operate the ultrasonic wave generating equipment one by one with their output power and pulselength set to the maximum.
8. If the ship's speed and direction readout changes abnormally when some equipment is turned on and operated, that equipment is interfering with the DS-30.
5. The interference can be removed by connecting the transmission trigger pulse (KP) of the interfering equipment to the processor unit. See page 3-10.

表1 (Table1)

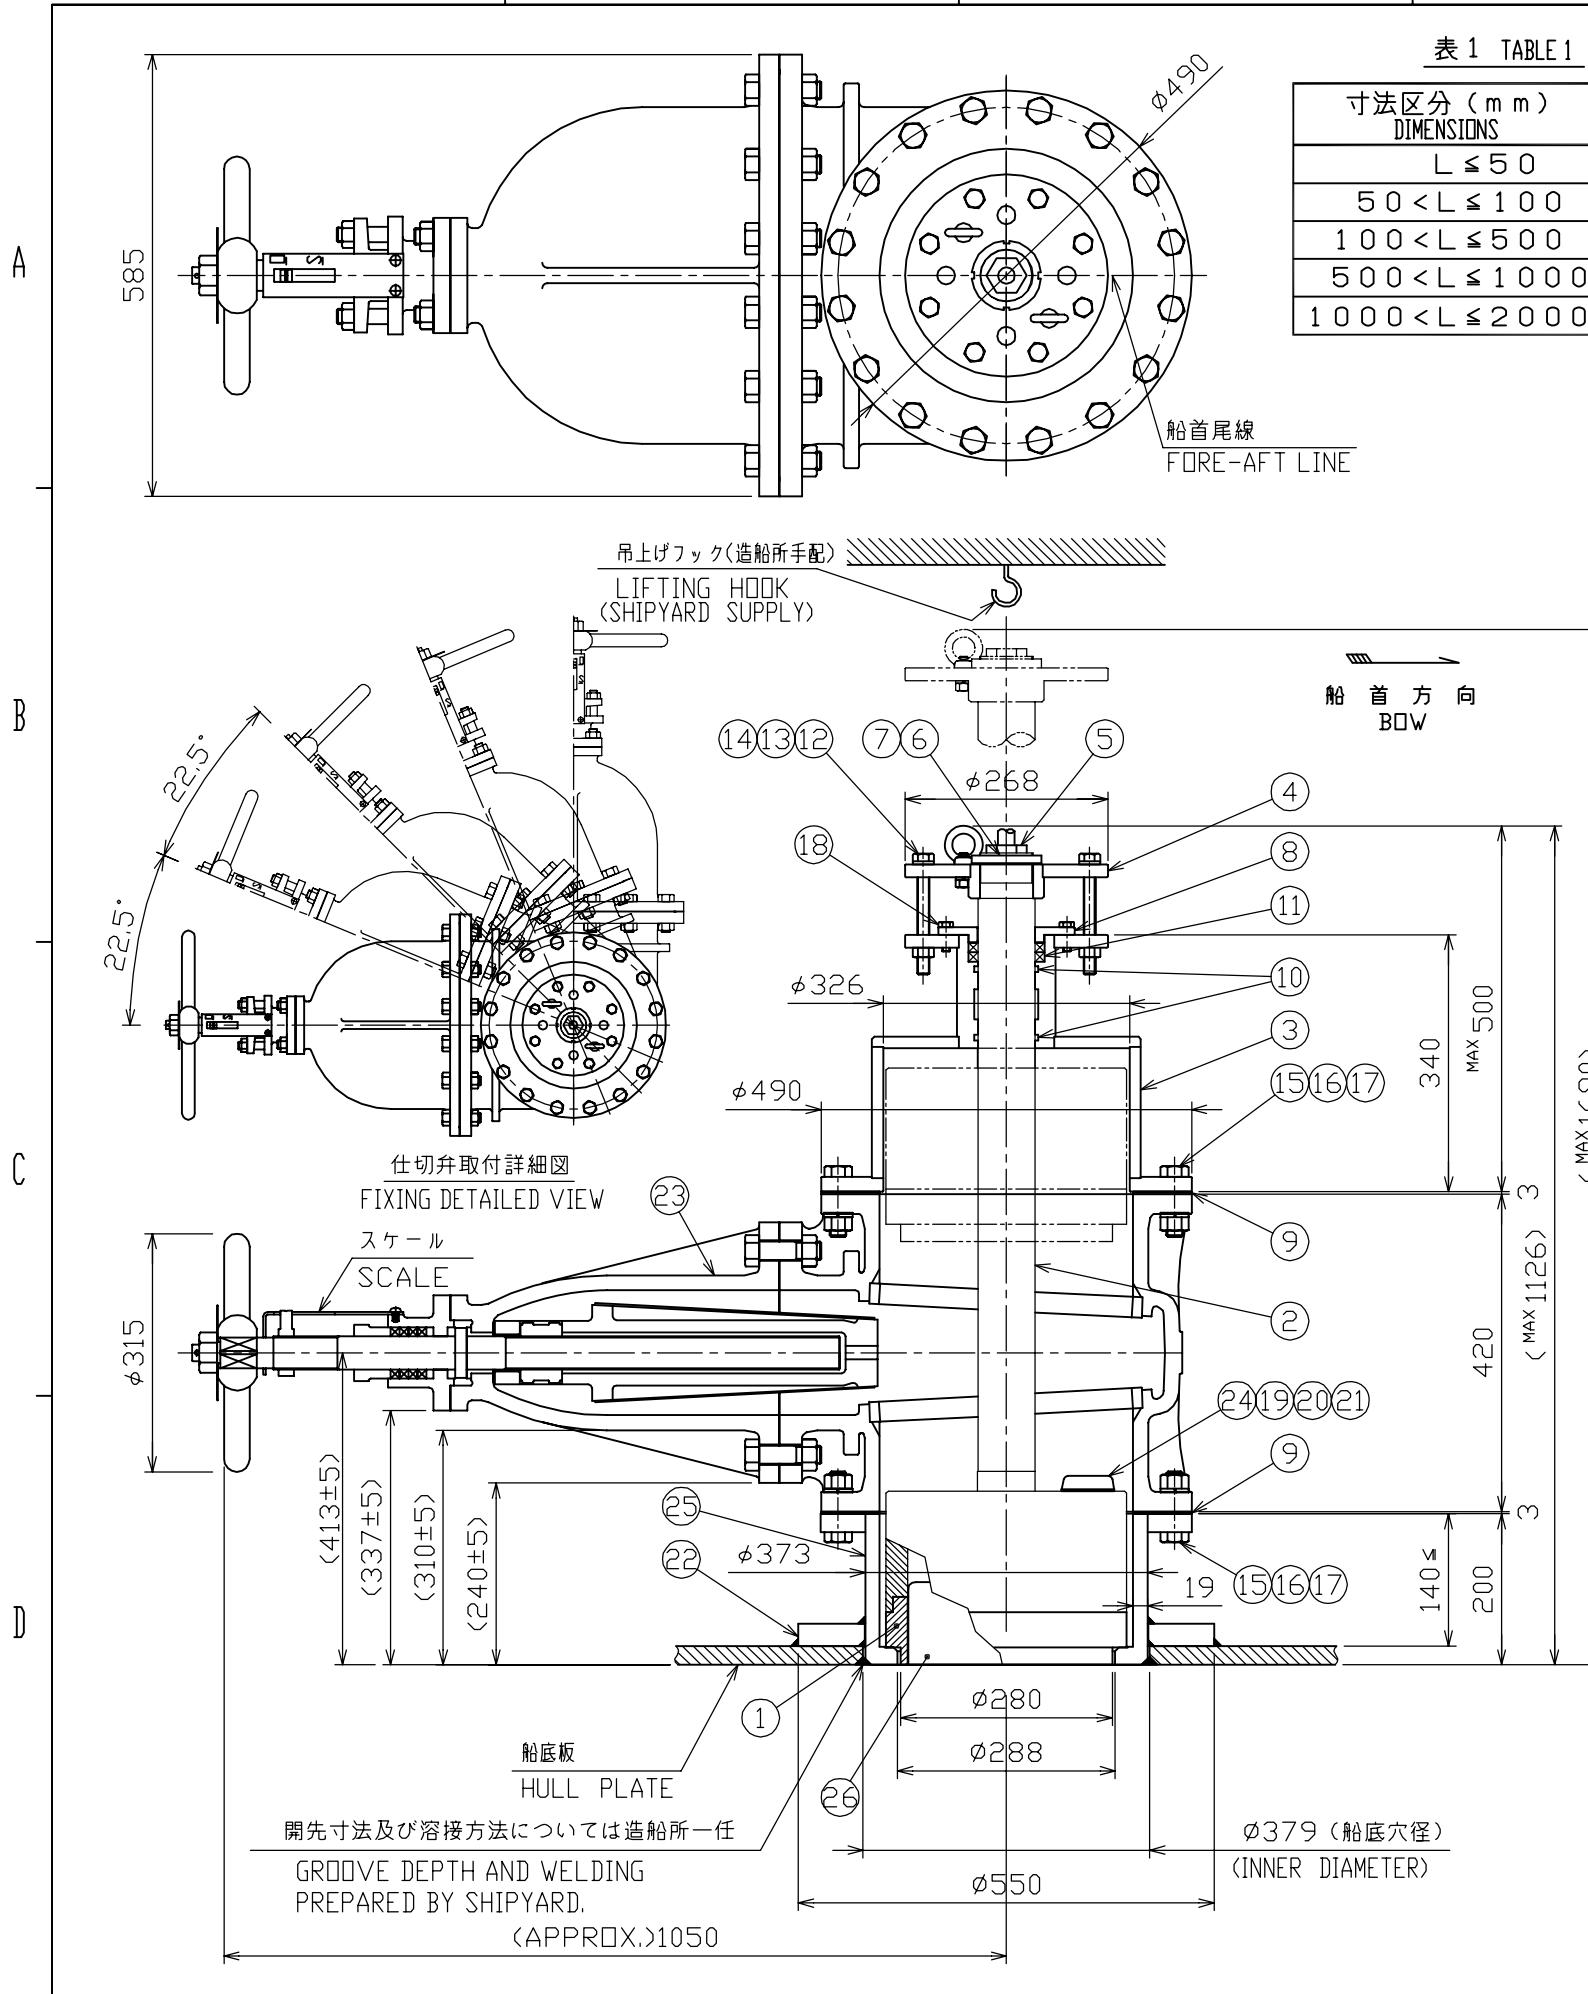

- 注記
1. 船底タンクの板厚は標準25mmです。それ以上の厚さが必要な場合は別途打合せ願います。
2. 船底タンクの材質はNK(日本海事協会)規格のKSTPG370およびKA材です。
3. 船底タンクを船底に溶接する際、船首船尾の方向の据付の誤差は±1°以内としてください。
また水平方向の取付はタンクのフランジが吃水線と±1°以内の誤差で平行になるようにしてください。
4. 指定外の寸法公差は表1の通りです。
5. ⑤のケーブルグランドは標準支給の予備品工具で締付けてください。

NOTES

1. STANDARD THICKNESS OF THE CASING IS 25mm. CONSULT WITH FURUNO WHEN THICKER ONE IS REQUIRED.
2. MATERIAL OF TANK MEETS NK (NIPPON KAIJI KYOUKAI) STANDARD KSTPG370 AND KA.
3. ORIENT BOW MARK OF THE CASING IN PARALLEL WITH SHIP'S FORE-AFT LINE AND THE TOP OF THE CASING IN PARALLEL WITH WATER-LINE TO AN ACCURACY OF 1 DEGREE OR BETTER.
4. TABLE 1 INDICATES TOLERANCE OF DIMENSIONS WHICH IS NOT SPECIFIED.
5. CABLE GLAND ⑤ CAN BE TIGHTENED BY THE TOOL SUPPLIED.

APPENDIX. LIST OF DIP SWITCH SETTING

DIP Switch Location

The DIP switches are located on the boards shown in the table below.

Unit	Board	DIP Switch
Display Unit DS-300	LCP Board	S1, S2
Processor Unit DS-310	MCP Board	S1, S2, S3, S4
	MFT Board	S1
	MKL Board	S1
	MIF Board	S1, S2, S3, S4, S5, S6
Transceiver Unit DS-320	NCP Board	S1, S2, S4, S5
Digital Indicator DS-351 (Option)	PCP Board	S1
Distribution Unit DS-370 (Option)	OCP Board	S1

Setting and Function of DIP Switch

(◎) : Do not change setting.

(○) : Change setting as required.

1) Display Unit

Board	Switch Setting			Function	Factory setting
LCP Board	S1	#1		OFF Mode selection: Main Display DS-300	
			ON	Ditto: Sub Display DS-300A	
		#2	#3	#4 Language selection	
		OFF	OFF	OFF Japanese	
		ON	ON	ON English	
		#5		OFF Indication of current: Coming direction	
			ON	ON Indication of current: Going direction	
		#6		OFF Time indication: Legacy	
			ON	ON Time indication: UTC when input GPS signal	
		#7, #8		Unused	
		#8		OFF High temperature alarm: Normal operation	○
			ON	Ditto: Test alarm	
		#1 to #7		Unused	

2) Processor Unit

Board	Switch Setting		Function	Factory Setting
MCP Board	S1	0	Monitor signal: Fore beam GEL	<input type="radio"/>
		1	Ditto : Fore beam EL	
		2	Ditto : Starboard beam GEL	
		3	Ditto : Starboard beam EL	
		4	Ditto : Port beam GEL	
		5	Ditto : Port beam EL	
		6	Ditto : TVG + external KP	
		7	Ditto : External KP	
		8 to F	Unused	
	GEL: Echo signal with TVG effected EL : Echo signal without TVG effected			
S2	#1	#2	Bottom tracking beam selection	
	OFF	OFF	Fore beam	<input type="radio"/>
	ON	OFF	Starboard beam	
	ON	OFF	Port beam	
	ON	ON	All beams	
	#3	OFF	TX pulselength in water tracking mode: Standard	<input type="radio"/>
		ON	Ditto : Long	
	#4	OFF	Automatic sound speed correction: On (Note 1)	<input type="radio"/>
		ON	Ditto : Off	
	#5	OFF	Angular speed latitude error correction: On (Note 2)	<input type="radio"/>
		ON	Ditto : Off	
	#6	OFF	Exponential smoothing: On (Note 3)	<input type="radio"/>
		ON	Ditto : Off	
	#7	OFF	Compass speed correction: On (Note 4)	<input type="radio"/>
		ON	Ditto : Off	
	#8	OFF	Ship's speed smoothing: Yes	<input type="radio"/>
		ON	Ditto : No	
NOTE		<ol style="list-style-type: none"> 1. Sound speed is corrected by water temperatrate DS-30 transducer measures. 2. Angular speed measured by rate-of-turn gyro contains an error specific to latitude. For example, the error converted to ship's speed is 0.02kt in transverse speed at north latitude 35°. DS-30 corrects this error by latitude data fed by nav-sensor. 3. Smoothing applied to ship's speed data output 4. Gyrocompass reading contains an error which is given as a function of ship's speed and latitude. DS-30 corrects this error referring to correction table in memory. Gyrocompasses installed on vessels of 500 tons or more may correct the error by themselves. In that case, do not set this item to ON. 		

Board	Switch Setting			Function	Factory Setting
MCP Board	S3	#1	OFF	Speed data from nav-sensor: Position fix	<input checked="" type="radio"/>
			ON	Ditto : Ship's speed	
	#2	OFF		GPS 0 kt: Unused for current reference calculation (When ship's speed measured by GPS is 0kt, current reference calculation is suspended, maintaining the previous result.)	<input checked="" type="radio"/>
			ON	Ditto : Used for current reference calculation	
	#3	#4		Position fix time interval (Interval at which ship's speed is calculated from position fix data fed by nav-sensor.)	
		OFF	OFF	1 minute	<input type="radio"/>
	OFF	ON		2 minutes	
		ON	OFF	5 minutes	
	ON	ON		10 minutes	
		#5	#6	Transceiver unit baud rate	
	OFF	OFF		9600	
		OFF	ON	4800	<input checked="" type="radio"/>
	ON	OFF		2400	
		ON	ON	1200	
	#7	OFF		Interference rejector 1: Off	<input type="radio"/>
		ON		Ditto : On	
	#8	OFF		Interference rejector 2: Off	<input type="radio"/>
		ON		Ditto : On	
MFT Board	S4	0		TVG curve selection: Auto (TVG curve is automatically adjusted based on water temperature measured by DS-30 transducer.)	<input checked="" type="radio"/>
		1		Ditto : Water temp 20°C or less	
		2		Ditto : Water temp 20°C to 25°C	
		3		Ditto : Water temp 25°C to 30°C	
		4 to F		Ditto : Water temp 30°C or above	
MKL Board	S1	#8	OFF	Continuous self-test (for factory use): Off	<input type="radio"/>
			ON	Ditto : On	
		#1 to #7		Unused	
MKL Board	S1	#1	#2	Filter parameter	
		OFF	OFF	For large ship (ROM table 1)	<input type="radio"/>
		OFF	ON	For medium ship (ROM table 2)	
		ON	OFF	For small ship (ROM table 3)	
		ON	ON	For factory use	
		3	OFF	Initializing E ² PROM: Yes	<input checked="" type="radio"/>
			ON	Ditto : No	
		#4	#5	Mode of output connector	
		OFF	-	Normal	<input checked="" type="radio"/>
		ON	OFF	Raw data output	
		ON	ON	Test data input (for factory use)	

Board	Switch Setting			Function		
MIF Board	S1	#1	OFF	NMEA Format, Baud rate: 4800bps	For Port1 J2	
		#1	ON	CIF Format, Baud rate: 4800bps		
		#2	OFF	Data-through off *1		
			ON	Data-through on *1		
		#3	OFF	NMEA ver. 1.5		
			ON	NMEA ver. 2.0		
		#4	OFF	Logpulse out at forward and backward		
			ON	Logpulse out at forward only		
	#5	Same as #1			For Port2 J3	
	#6	Same as #2				
	#7	Same as #3				
	#8	Not used				

*1 Data-through : Data from external sensor are output from the same port together with the data of DS-30.

Board	Switch Setting		Function	Factory Setting
MIF Board	S2	#1	#2	AUX port 1 baud rate
		OFF	OFF	9800 bauds
		OFF	ON	4800 bauds
		ON	OFF	2400 bauds
		ON	ON	1200 bauds
		#3	#4	AUX port 1 input data format
		OFF	OFF	Type 1
		OFF	ON	Type 2
		ON	-	Type 3
		#5	#6	AUX port 2 baud rate
		OFF	OFF	9600 (baud rate 1) or 600 bauds (baud rate 2)
		OFF	ON	4800 (baud rate 1) or 300 bauds (baud rate 2)
		ON	OFF	2400 (baud rate 1) or 300 bauds (baud rate 2)
		ON	ON	1200 (baud rate 1) or 300 bauds (baud rate 2)
		#7	#8	AUX port 2 input data format
		OFF	OFF	Wind direction/speed interface SC-D232S
		OFF	ON	NAV-PET (MDI-1)
		ON	-	Wind direction/speed interface N-162LV-M
	S3	Note	Baud rate 1 or 2 of AUX 2 port is selected with S4-#6.	
		#1	#2	Heading data input port selection
		OFF	OFF	Gyro port
		OFF	ON	AUX 1 port
		ON	OFF	AUX 2 port
		ON	ON	CIF/NMEA port 1/2
		#3	#4	Rate-of-turn data input port selection
		OFF	OFF	Rate-of-turn gyro (DS-340) port
		OFF	ON	AUX 1 port
		ON	-	AUX 2 port
		#5	#6	Wind direction/speed data input port selection
		OFF	OFF	Analog input port
		OFF	ON	CIF/NMEA port 1/2
		ON	-	AUX 2 port
		#7	OFF	Engine speed data input port : Analog port
		#8	ON	Ditto : AUX 2 port
			OFF	Unused
			ON	

Board	Switch Setting		Function	Factory setting
MIF Board	S4	#1	#2	Ship's speed for distance run pulse selection
		OFF	OFF	Speed over-the-ground & through-water & speed fed from nav sensor
		OFF	ON	Speed over-the-ground & through-water
		ON	-	Speed through-water
		#3	OFF	Type of ship's speed for distance run pulse: Vector
			ON	Ditto : Fore-aft
		#4	OFF	Bearing data output: True course
			ON	Ditto : Heading
		OFF		Bearing data output at low Ship's speed: True course
		#5		Ditto : Heading (Since ship's course data fluctuates by rolling and pitching when ship's speed is extremely low, heading data is output instead of course.)
			ON	
		#6	OFF	Distance signal alarm Contact: ON = No alarm
			ON	Fore-aft status Contact: ON = Aft (note 1)
		#7	OFF	CIF/NMEA 1 option data: Off
			ON	Ditto : On (Note 2.)
		#8	OFF	CIF/NMEA 2 option data: Off
			ON	Ditto : On (Note 2.)
	S5	0 to F		Engine revolution full scale setting.
	S6	0		Rate-of turn gyro data averaging time: 10 mses
		1		Ditto : 20mses
		2		Ditto : 40mses
		3		Ditto : 80mses
		4		Ditto : 160mses
		5		Ditto : 230mses
		6		Ditto : 640mses
		7 to F		Ditto : 1280mses

Note 1: Prior to setting #6 to "ON", set #3 to "ON".

Note 2: DRU (Dual Doppler Auxiliary Data) and VWT (True Wind Speed and Angle) are outputted.

3) Transceiver Unit

Board	Switch Setting		Function			Factory Setting
NCP Board	S1/S2	S1	S2	Mode selection		
		OFF	-	Normal		
	S4	ON	OFF	Stand alone TX/RX (With the switches set as shown at left, turn on the transceiver unit, and the transceiver unit operates in stand-alone mode; output power and pulse length are adjusted with S5 and S4 respectively on NCP board.)		
		OFF	ON	Stand alone test		
		0		Stand alone TX/RX mode TX range: 0 m		
		1		Ditto	:0.5 m	
		2		Ditto	:1.0 m	○
		3		Ditto	:2.0 m	
		4		Ditto	:5.0 m	
		5		Ditto	:10.0 m	
NCP Board	S5	6		Ditto	:20.0 m	
		7		Ditto	:30.0 m	
		0		Stand alone TX/RX mode power control: 0 (max)		
		1		Ditto	:1	
		2		Ditto	:2	
		3 to 7		Ditto	:3	

4) Digital Indicator

Set the DIP switch S1 on PCP baord at installalton.
