

8-port 10/100TX + 2-port Gigabit Copper/Mini GBIC SNMP Managed Industrial Switch with 8 PoE Injector Ports

User Manual

Notice FCC Warning

This Equipment has been tested and found to comply with the limits for a Class-A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy. It may cause harmful interference to radio communications if the equipment is not installed and used in accordance with the instructions. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

CE Mark Warning

This is a Class-A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

The 8 10/100TX + 2 10/100/1000T/Mini-GBIC Combo with 8 PoE Injectors Managed Industrial Switch is a cost-effective solution and meets the high reliability requirements demanded by industrial applications. Using fiber port can extend the connection distance that increases the network elasticity and performance. Besides, the industrial switch provides the PoE function for kinds of Powered Devices to receive power as well as data over the RJ-45 cable.

1.1 Hardware Features

MAC Address 8K MAC address table				
Flash ROM	4Mbytes			
DRAM	32Mbytes			
Connector	10/100TX: 8 x RJ-45 10/100/1000T/ Mini-GBIC Combo: 2 x RJ-45 + 2 x 100/1000 SFP sockets RS-232 connector: RJ-45 type			
Network Cable10Base-T: 2-pair UTP/STP Cat. 3, 4, 5/ 5E cable EIA/TIA-568 100-ohm (100m) 100Base-TX: 2-pair UTP/STP Cat. 5/ 5E cable EIA/TIA-568 100-ohm (100m) 1000Base-TX: 2-pair UTP/STP Cat. 5/ 5E cable EIA/TIA-568 100-ohm (100m)				
Optical Fiber	Distance: Multi mode: 0 to 5 km, 1300 nm (50/125 μm, 800 MHz*km) 0 to 4 km, 1300 nm (62.5/125 μm, 500 MHz*km) Single mode: 0 to 40 km, 1310 nm (9/125 μm, 3.5 PS/(nm*km)) 0 to 80 km, 1550 nm (9/125 μm, 19 PS/(nm*km)) Min. TX Output: Multi mode: -20 dBm Single mode: 0 to 40 km, -5 dBm; 0 to 80 km, -5 dBm Max. TX Output: Multi mode: -14 dBm Single mode: 0 to 40 km, 0 dBm; 0 to 80 km, 0 dBm Sensitivity: -36 to -32 dBm (Single mode); -34 to -30 dBm (Multi mode)			
PoE pin assignment	RJ-45 port # 1~# 8 support IEEE 802.3af End-point, Alternative A mode. Per port provides 15.4W ability.			

	Positive (VCC+): RJ-45 pin 1,2.		
	Negative (VCC-): RJ-45 pin 3,6.		
Protocol	CSMA/CD		
LED Per unit: Power (Green), Power 1 (Green), Power 2 (Green), Fault (Red), Master (Green), FWD (Green) 8 port 10/100: Link/Activity (Green), Full duplex/Coll (Amber) SFP port: LNK/ACT(Green), 1000T: LNK/ACT(Green) 1000M(Green)			
Power Supply	External Power Supply: DC 48V, Redundant power DC 48V and connective removable terminal block for master and slave power		
Power Consumption	116Watts (Full load)		
Operating Humidity	5% to 95% (Non-condensing)		
Operating	Standard Model: -10°C ~ 60°C		
Temperature	Wide Operating Temperature Model: -40°C ~ 75°C		
Storage Temperature	-40°C ~ 85°C		
Case Dimension	IP-30, 72mm (W) x 105mm (D) x 152mm (H)		
Installation	DIN rail and wall mount ear		
EMI	FCC Class A, CE EN61000-4-2, CE EN61000-4-3, CE EN- 61000-4-4, CE EN61000-4-5, CE EN61000-4-6, CE EN61000-4-8, CE EN61000-4-11, CE EN61000-4-12, CE EN61000-6-2, CE EN61000-6-4		
Safety	UL, cUL, CE/EN60950-1		
Stability TestingIEC60068-2-32 (Free fall), IEC60068-2-27 (Shock IEC60068-2-6 (Vibration)			

1.2 Software Features

Management	SNMP v1 v2c, v3/ Web/Telnet/CLI		
SNMP MIB	RFC 1215 Trap, RFC1213 MIBII, RFC 1157 SNMP MIB, RFC 1493 Bridge MIB, RFC 2674 VLAN MIB, RFC 1643 , RFC 1757, RSTP MIB, Private MIB, LLDP MIB		
VLAN	Port Based VLAN IEEE 802.1Q Tag VLAN (256 entries)/ VLAN ID (Up to 4K, VLAN ID can be assigned from 1 to 4094.) GVRP (256 Groups)		
Port Trunk with LACPLACP Port Trunk: 4 Trunk groups/Maximum 4 trunk members			
LLDP	Supports LLDP allowing switch to advertise its identification and capability on the LAN		
Spanning tree	IEEE802.1d spanning tree IEEE802.1w rapid spanning tree.		
Ring	Supports Ring, Dual Homing and Couple Ring Topology Provides redundant backup feature and the recovery time below 20ms		
Quality of Service	The quality of service determined by port, Tag and IPv4 Type of service, IPv4 Different Service		
Class of Service	Supports IEEE802.1p class of service, per port provides 4 priority queues		
Port Security	Supports 100 entries of MAC address for static MAC and another 100 for MAC filter		
Port Mirror	Supports 3 mirroring types: "RX, TX and Both packet".		

IGMP	Supports IGMP snooping v1,v2 256 multicast groups and IGMP query			
IP Security	Supports 10 IP addresses that have permission to access the switch management and to prevent unauthorized intruder.			
Login Security	Supports IEEE802.1X Authentication/RADIUS			
Bandwidth ControlSupport ingress packet filter and egress packet limit The egress rate control supports all of packet type and limit rates are 100K~102400Kbps(10/100), 				
Flow Control Supports Flow Control for Full-duplex and Back Pre- for Half-duplex				
System Log	Supports System log record and remote system log server			
SMTP Supports SMTP Server and 6 e-mail accounts for event alert				
Relay Alarm	Provides one relay output for port breakdown, power fail Alarm Relay current carry ability: 1A @ DC24V			
SNMP Trap	 Cold start Link up/down Ring topology changed Authorization fail PD disconnect trap-PoE port event 			

DHCP	Provides DHCP Client/ DHCP Server/ Port and IP Binding		
DNS Provides DNS client feature and supports Primary a Secondary DNS server			
SNTP	Supports SNTP to synchronize system clock in Internet		
Firmware Update	Supports TFTP firmware update, TFTP backup and restore.		
Configuration Upload/Download	Supports binary format configuration file for system quick installation		
ifAlias	Each port allows importing 128bits of alphabetic string of word on SNMP and CLI interface		

1.3 Package Contents

Please refer to the package content list below to verify them against the checklist.

- 8 10/100TX + 2 10/100/1000T/Mini-GBIC Combo with 8 PoE Injectors Managed Industrial Switch x 1
- User manual x 1
- Pluggable Terminal Block x 1
- Mounting plate x 2
- RJ-45 to DB9-Female cable x 1

Compare the contents of the industrial switch with the standard checklist above. If any item is damaged or missing, please contact the local dealer for service.

Chapter 2 Hardware Description

In this paragraph, it will describe the Industrial switch's hardware spec, port, cabling information, and wiring installation.

2.1 Physical Dimension

8 10/100TX w/ Ring Managed Industrial Switch dimension (W x D x H) is **72mm x 105mm x 152mm**

2.2 Front Panel

The Front Panel of the 8 10/100TX w/ Ring Managed Industrial Switch is shown as below:

Front Panel of the industrial switch

2.3 Bottom View

The bottom panel of the 8 10/100TX w/ Ring Managed Industrial Switch has one terminal block connector of two DC power inputs and one fault alarm.

Bottom Panel of the industrial switch

2.4 LED Indicators

The diagnostic LEDs that provide real-time information of system and optional status are located on the front panel of the industrial switch. The following table provides the description of the LED status and their meanings for the switch.

LED	Color	Status	Meaning
PWR	Green	On	The switch unit is power on
	Croon	Off	No power
R.M.	Green	On	The industrial switch is the master of Ring group
		Off	The industrial switch is not a ring master in Ring group
PWR1	Green	On	Power 1 is active
	Croon	Off	Power 1 is inactive
PWR2	Green	On	Power 2 is active
		Off	Power 2 is inactive
ΓΔΙΗ Τ	Pod	On	Power or port failure
	Rou	Off	No failure
		On	A network device is detected.
P9, P10 (RJ- 45)	Green (Upper LED)	Blinking	The port is transmitting or receiving packets from the TX device.
		Off	No device attached
	Green (Lower LED)	On	1000M
		Off	10/100M

Link/Active (P9, P10 SFP)	Green	On	The SFP port is linking	
		Blinks	The port is transmitting or receiving packets from the TX device.	
		Off	No device attached	
P1 ~ P8	Green	On	A network device is detected.	
		Blinking	The port is transmitting or receiving packets from the TX device.	
		Off	No device attached	
	Amber	On	The port is operating in full-duplex mode.	
		Blinking	Collision of Packets occurs.	
		Off	The port is in half-duplex mode or no devi is attached.	
FWD (P1 ~ P8)	Green	Green	A powered device is connected utilizing Power over Ethernet on the port	
		Off	No device is connected or power forwardin fails	

Chapter 3 Hardware Installation

In this paragraph, we will describe how to install the 8 10/100TX w/ Ring Managed Industrial Switch and the installation points attended to it.

3.1 Installation Steps

- 1. Unpack the Industrial switch
- Check if the DIN-Rail is screwed on the Industrial switch or not. If the DIN-Rail is not screwed on the Industrial switch, please refer to **DIN-Rail Mounting** section for DIN-Rail installation. If users want to wall mount the Industrial switch, please refer to **Wall Mount Plate Mounting** section for wall mount plate installation.
- 3. To hang the Industrial switch on the DIN-Rail track or wall.
- 4. Power on the Industrial switch. Please refer to the Wiring the Power Inputs section for knowing the information about how to wire the power. The power LED on the Industrial switch will light up. Please refer to the LED Indicators section for indication of LED lights.
- 5. Prepare the twisted-pair, straight through Category 5 cable for Ethernet connection.
- 6. Insert one side of RJ-45 cable (category 5) into the Industrial switch Ethernet port (RJ-45 port) and another side of RJ-45 cable (category 5) to the network device's Ethernet port (RJ-45 port), ex: Switch PC or Server. The UTP port (RJ-45) LED on the Industrial switch will light up when the cable is connected with the network device. Please refer to the LED Indicators section for LED light indication.
- **[NOTE]** Make sure that the connected network devices support MDI/MDI-X. If it does not support, use the crossover category-5 cable.
 - 7. When all connections are set and LED lights all show in normal, the installation is complete.

3.2 DIN-Rail Mounting

The DIN-Rail is screwed on the industrial switch when out of factory. If the DIN-Rail is not screwed on the industrial switch, please see the following pictures to screw the DIN-Rail on the switch. Follow the steps below to hang the industrial switch.

1. First, insert the top of DIN-Rail into the track.

2. Then, lightly push the DIN-Rail into the track.

- 3. Check if the DIN-Rail is tightened on the track or not.
- 4. To remove the industrial switch from the track, reverse above steps.

3.3 Wall Mount Plate Mounting

Follow the steps below to mount the industrial switch with wall mount plate.

- 1. Remove the DIN-Rail from the industrial switch; loose the screws to remove the DIN-Rail.
- 2. Place the wall mount plate on the rear panel of the industrial switch.
- 3. Use the screws to screw the wall mount plate on the industrial switch.
- 4. Use the hook holes at the corners of the wall mount plate to hang the industrial switch on the wall.
- 5. To remove the wall mount plate, reverse the above steps.

3.4 Wiring the Power Inputs

Please follow the steps below to insert the power wire.

1. Insert AC or DC power wires into the contacts 1 and 2 for power 1, or 5 and 6 for power.

- 2. Tighten the wire-clamp screws for preventing the wires from loosing.
- [NOTE] The wire gauge for the terminal block should be in the range between $12 \sim 24$ AWG.

3.5 Wiring the Fault Alarm Contact

The fault alarm contacts are in the middle of the terminal block connector as the picture shows below. Inserting the wires, the switch will detect the fault status of the power failure, or port link failure (available for managed model) and then forms an open circuit. The following illustration shows an application example for wiring the fault alarm contacts.

[NOTE] The wire gauge for the terminal block should be in the range between 12 ~ 24 AWG.

3.6 Cabling

- Use four twisted-pair, Category 5e or above cabling for RJ-45 port connection. The cable between the switch and the link partner (switch, hub, workstation, etc.) must be less than 100 meters (328 ft.) long.
- Fiber segment using **single-mode** connector type must use 9/125 µm single-mode fiber cable. User can connect two devices in the distance up to **30km**.
- Fiber segment using **multi-mode** connector type must use 50 or 62.5/125 µm multimode fiber cable. User can connect two devices up to **2km** distances.
- Gigabit Copper/SFP (mini-GBIC) combo port:

The Industrial switch has the auto-detected Giga port—Gigabit Copper/SFP combo ports. The Gigabit Copper (10/100/1000T) ports should use Category 5e or above UTP/STP cable for the connection up to 1000Mbps. The small form-factor pluggable (SFP) is a compact optical transceiver used in optical communications for both telecommunication and data communications. The SFP slots supporting dual mode can switch the connection speed between 100 and 1000Mbps. They are used for connecting to the network segment with single or multi-mode fiber. You can choose the appropriate SFP transceiver to plug into the slots. Then use proper multi-mode or single-mode fiber according to the transceiver. With fiber optic, it transmits at speed up to 1000 Mbps and you can prevent noise interference from the system.

Note The SFP/Copper Combo port can't both work at the same time. The SFP port has the higher priority than copper port; if you insert the 1000M SFP transceiver (which has connected to the remote device via fiber cable) into the SFP port, the connection of the accompanying copper port will link down. If you insert the 100M SFP transceiver into the SFP port even without a fiber connection to the remote, the connection of the accompanying copper port will link down immediately. To connect the transceiver and LC cable, please follow the steps shown below:

First, insert the transceiver into the SFP module. Notice that the triangle mark is the bottom of the module.

Transceiver to the SFP module

Second, insert the fiber cable of LC connector into the transceiver.

LC connector to the transceiver

To remove the LC connector from the transceiver, please follow the steps shown below:

First, press the upper side of the LC connector to release from the transceiver and pull it out.

Remove LC connector

Second, push down the metal loop and pull the transceiver out by the plastic handle.

Pull out from the transceiver

Chapter 4 Network Application

This chapter provides some sample applications to help user to have more actual idea of industrial switch function application. A sample application of the industrial switch is as below:

The illustration below shows an example of power over Ethernet application.

4.1 Ring Application

The industrial switch supports the Ring protocol that can help the network system to recovery from network connection failure within 20ms or less, and make the network system more reliable. The Ring algorithm is similar to spanning tree protocol (STP) algorithm but its recovery time is faster than STP. The following figure is a sample Ring application.

4.2 Coupling Ring Application

In the network, it may have more than one Ring group. By using the coupling ring function, it can connect each Ring for the redundant backup. It can ensure the transmissions between two ring groups not to fail. The following figure is a sample of coupling ring application.

4.3 Dual Homing Application

Dual Homing function is to prevent the connection lose from between Ring group and upper level/core switch. Assign two ports to be the Dual Homing port that is backup port in the Ring group. The Dual Homing function only works when the Ring function is active. Each Ring group only has one Dual Homing port.

[NOTE] In Dual Homing application architecture, the upper level switches need to enable the Rapid Spanning Tree protocol.

Chapter 5 Console Management

5.1 Connecting to the Console Port

The supplied cable which one end is RS-232 connector and the other end is RJ-45 connector. Attach the end of RS-232 connector to PC or terminal and the other end of RJ-45 connector to the console port of the switch. The connected terminal or PC must support the terminal emulation program.

DB 9-pin Female

5.2 Pin Assignment

DB9 Connector	RJ-45 Connector		
NC	1 Orange/White		
2	2 Orange		
3	3 Green/White		
NC	4 Blue		
5	5 Blue/White		
NC	6 Green		
NC	7 Brown/White		
NC	8 Brown		

5.3 Login in the Console Interface

When the connection between Switch and PC is ready, turn on the PC and run a terminal emulation program or **Hyper Terminal** and configure its **communication parameters** to match the following default characteristics of the console port:

Baud Rate: 9600 bps Data Bits: 8 Parity: none Stop Bit: 1 Flow control: None

M2 Properties				?
			1	1
<u>B</u> its per second:	9600			
<u>D</u> ata bits:	8		•	
Parity:	None		•	
<u>S</u> top bits:]1		•	
Elow control:	None		•	
Advanced]	<u>R</u> esto	ore Defaults	
01	<	Cancel	1 App	ilv

The settings of communication parameters

Having finished the parameter settings, click '**OK**'. When the blank screen shows up, press Enter key to have the login prompt appears. Key in '**root**' (default value) for both User name and Password (use **Enter** key to switch), then press Enter and the Main Menu of console management appears. Please see below figure for login screen.

Console login interface
5.4 CLI Management

The system supports the console management—CLI command. After you log in on to the system, you will see a command prompt. To enter CLI management interface, type in "enable" command.

The following table lists the CLI commands and description.

5.5 Commands Level

Modos	Access	Brompt	Exit	About This Model
MOUES	Method	Frompt	Method	About This Model
				The user commands
				available at the user
				level are a subset of
	Begin a		Enter	those available at the
User EXEC	session with	switch>	logout or	privileged level.
	your switch.		quit.	Use this mode to
				 Perform basic tests.
				 Display system
				information.
				The privileged
	Enter the			command is the
Drivilogod	enable		Enter	advanced mode.
EXEC	command	switch#	disable to	Use this mode to
	while in User		exit.	 Display advanced
	EXEC mode.			function status
				 Save configuration

Global Configuration	Enter the configure command while in privileged EXEC mode.	switch (config)#	To exit to privileged EXEC mode, enter exit or end	Use this mode to configure those parameters that are going to be applied to your switch.
VLAN database	Enter the vlan database command while in privileged EXEC mode.	switch (vlan)#	To exit to user EXEC mode, enter exit .	Use this mode to configure VLAN- specific parameters.
Interface configuration	Enter the interface of fast Ethernet command (with a specific interface) while in global configuration mode.	switch (config-if)#	To exit to global configuratio n mode, enter exit . To exit to privileged EXEC mode, enter exit or end .	Use this mode to configure parameters for the switch and Ethernet ports.

This section introduces the configuration and functions of the Web-Based management.

6.1 About Web-based Management

There is an embedded HTML web site residing in flash memory on CPU board of the switch, which offers advanced management features and allows users to manage the switch from anywhere on the network through a standard browser such as Microsoft Internet Explorer.

The Web-Based Management supports Internet Explorer 6.0 or later version. And, it is applied for Java Applets for reducing network bandwidth consumption, enhance access speed and present an easy viewing screen.

6.2 Preparing for Web Management

Before using the web management, install the industrial switch on the network and make sure that any one of the PCs on the network can connect with the industrial switch through the web browser. The industrial switch default value of IP, subnet mask, username and password are listed as below:

- IP Address: **192.168.16.1**
- Subnet Mask: 255.255.255.0
- Default Gateway: **192.168.16.254**
- User Name: root
- Password: root

6.3 System Login

- 1. Launch the Internet Explorer on the PC
- 2. Key in "http:// "+" the IP address of the switch", and then Press "Enter".

- 3. The login screen will appear right after
- 4. Key in the user name and password. The default user name and password are the same as '**root**'.
- 5. Press **Enter** or click the **OK** button, and then the home screen of the Web-based management appears.

Login screen

6.4 System Information

User can assign the system name, description, location and contact personnel to identify the switch. The version table below is a read-only field to show the basic information of the switch.

- System Name: Assign the system name of the switch (The maximum length is 64 bytes)
- System Description: Describes the switch.
- System Location: Assign the switch physical location (The maximum length is 64 bytes).
- **System Contact:** Enter the name of contact person or organization.
- **Firmware Version:** Displays the switch's firmware version
- Kernel Version: Displays the kernel software version
- MAC Address: Displays the unique hardware address assigned by manufacturer (default)

Switch settings interface

6.5 IP Configuration

The switch is a network device which needs to be assigned an IP address for being identified on the network. Users have to decide a means of assigning IP address to the switch.

- DHCP Client: Enable or disable the DHCP client function. When DHCP client function is enabled, the switch will be assigned an IP address from the network DHCP server. The default IP address will be replaced by the assigned IP address on DHCP server. After the user clicks Apply, a popup dialog shows up to inform the user that when the DHCP client is enabled, the current IP will lose and user should find the new IP on the DHCP server.
- IP Address: Assign the IP address that the network is using. If DHCP client function is enabled, this switch is configured as a DHCP client. The network DHCP server will assign the IP address to the switch and display it in this column. The default IP is 192.168.16.1 or the user has to assign an IP address manually when DHCP Client is disabled.
- Subnet Mask: Assign the subnet mask to the IP address. If DHCP client function is disabled, the user has to assign the subnet mask in this column field.
- Gateway: Assign the network gateway for the switch. If DHCP client function is disabled, the user has to assign the gateway in this column field. The default gateway is 192.168.16.254.
- **DNS1:** Assign the primary DNS IP address.
- **DNS2:** Assign the secondary DNS IP address.
- And then, click Apply

IP Configuration

IP configuration interface

6.6 DHCP Server

DHCP is the abbreviation of Dynamic Host Configuration Protocol that is a protocol for assigning dynamic IP addresses to devices on a network. With dynamic addressing, a device can have a different IP address every time it connects to the network. In some systems, the device's IP address can even change while it is still connected. DHCP also supports a mix of static and dynamic IP addresses. Dynamic addressing simplifies network administration because the software keeps track of IP addresses rather than requiring an administrator to manage the task. This means that a new computer can be added to a network without the hassle of manually assigning it a unique IP address.

The system provides the DHCP server function. Having enabled the DHCP server function, the switch system will be configured as a DHCP server.

6.6.1 System configuration

- DHCP Server: Enable or Disable the DHCP Server function. Enable—the switch will be the DHCP server on your local network.
- Low IP Address: Type in an IP address. Low IP address is the beginning of the dynamic IP range. For example, dynamic IP is in the range between 192.168.16.100 ~ 192.168.16.200. In contrast, 192.168.16.100 is the Low IP address.
- High IP Address: Type in an IP address. High IP address is the end of the dynamic IP range. For example, dynamic IP is in the range between 192.168.16.100 ~ 192.168.16.200. In contrast, 192.168.16.200 is the High IP address.
- **Subnet Mask:** Type in the subnet mask of the IP configuration.
- **Gateway:** Type in the IP address of the gateway in your network.
- **DNS:** Type in the Domain Name Server IP Address in your network.
- Lease Time (sec): It is the time period that system will reset the dynamic IP assignment to ensure the dynamic IP will not been occupied for a long time or the server doesn't know that the dynamic IP is idle.
- And then, click Apply

6.7 **TFTP**

It provides the functions allowing the user to update the switch firmware via the Trivial File Transfer Protocol (TFTP) server. Before updating, make sure the TFTP server is ready and the firmware image is located on the TFTP server.

6.7.1 Update Firmware

- **TFTP Server IP Address:** Type in your TFTP server IP.
- Firmware File Name: Type in the name of the firmware image file to be updated.
- Click Apply

TFTP - Update Firmware

Update I	Update Firmware Resto		tore Configuration		Backup Conf	iguration
	TFTP Server IP A	ddress	192.168.16.2			
	Firmware File I	Name	image.bin			
			Apply Help			
		дU	date Firmware interfa	ace		

6.7.2 Restore Configuration

You can restore a previous backup configuration from the TFTP server to recover the settings. Before doing that, you must locate the image file on the TFTP server first and the switch will download back the flash image.

- **TFTP Server IP Address:** Type in the TFTP server IP.
- **Restore File Name:** Type in the correct file name for restoring.
- Click Apply

TFTP - Restore Configuration

6.8 System Event Log

This page allows the user to decide whether to send the system event log, and select the mode which the system event log will be sent to client only, server only, or both client and server. What kind of event log will be issued to the client/server depends on the selection on the **Event Configuration** tab. There are four types of event—Device Cold Start, Authentication Failure, Ring Topology Change, and Port Event—available to be issued as the event log.

6.8.1 Syslog Configuration

- Syslog Client Mode: Select the system log mode—Client Only, Server Only, or Both. 'Client Only' means the system event log will only be sent to this interface of the switch, but on the other hand 'Server Only' means the system log will only be sent to the remote system log server with its IP assigned. If the mode is set in 'Both', the system event log will be sent to the remote server and this interface.
- System Log Server IP Address: When the 'Syslog Mode' item is set as Server Only/Both, the user has to assign the system log server IP address to which the log will be sent.
- Click Reload to refresh the event log displaying area.
- Click Clear to clear all the current event logs.
- Make sure the selected mode is correct, and click Apply to have the setting take effect.

6.8.2 System Event Log—SMTP Configuration

Simple Mail Transfer Protocol (SMTP) is the standard for email transmissions across the network. You can configure the SMTP server IP, mail subject, sender, mail account, password, and the recipient email addresses which the e-mail alert will send to. There are also five types of event—Device Cold Start, Authentication Failure, Ring Topology Change, and Port Event—available to be issued as the e-mail alert. Besides, this function provides the authentication mechanism including an authentication step through which the client effectively logs in to the SMTP server during the process of sending e-mail alert.

- Email Alert: With this function being enabled, the user is allowed to configure the detail settings for sending the e-mail alert to the SMTP server when the events occur.
- SMTP Server IP: Assign the mail server IP address (when Email Alert is enabled, this function will then be available).
- Sender: Type in an alias of the switch in complete email address format, e.g. switch101@123.com, to identify where the e-mail alert comes from.
- Authentication: Having ticked this checkbox, the mail account, password and confirm password column fields will then show up. Configure the email account and password for authentication when this switch logs in to the SMTP server.
- Mail Account: Set up the email account, e.g. johnadmin, to receive the email alert. It must be an existing email account on the mail server.
- **Password:** Type in the password for the email account.
- **Confirm Password:** Reconfirm the password.
- Rcpt e-mail Address 1 ~ 6: You can also fill each of the column fields with up to 6 e-mail accounts to receive the email alert.
- Click Apply to have the configuration take effect.

6.8.3 System Event Log—Event Configuration

Having ticked the **Syslog/SMTP** checkboxes, the event log/email alert will be sent to the system log server and the SMTP server respectively. Also, Port event log/alert (link up, link down, and both) can be sent to the system log server/SMTP server respectively by setting the trigger condition.

- System event selection: There are 3 event types—Device Cold Start, Authentication Failure, and Ring Topology Change. The checkboxes are not available for ticking unless the Syslog Client Mode on the Syslog Configuration tab and the E-mail Alert on the SMTP Configuration tab are enabled first.
 - Device cold start: When the device executes cold start action, the system will issue the event log/email alert to the system log/SMTP server respectively.
 - Authentication Failure: When the SNMP authentication fails, the system will issue the event log/email alert to the system log/SMTP server respectively.
 - Ring topology change: When the Ring topology has changed, the system will issue the event log/email alert to the system log/SMTP server respectively.
- Port event selection: Also, before the drop-down menu items are available, the Syslog Client Mode selection item on the Syslog Configuration tab and the E-mail Alert selection item on the SMTP Configuration tab must be enabled first. Those drop-down menu items have 3 selections—Link UP, Link Down, and Link UP & Link Down. Disable means no event will be sent to the system log/SMTP server.
 - Link UP: The system will only issue a log message when the link-up event of the port occurs.
 - Link Down: The system will only issue a log message when the link-down event of port occurs.
 - Link UP & Link Down: The system will issue a log message at the time when port connection is link-up and link-down.

6.9 Fault Relay Alarm

The Fault Relay Alarm function provides the Power Failure and Port Link Down/Broken detection. With both power input 1 and power input 2 installed and the check boxes of power 1/power 2 ticked, the FAULT LED indicator will then be possible to light up when any one of the power failures occurs. As for the Port Link Down/Broken detection, the FAULT LED indicator will light up when the port failure occurs; certainly the check box beside the port must be ticked first. Please refer to the segment of '**Wiring the Fault Alarm Contact**' for the failure detection.

- Power Failure: Tick the check box to enable the function of lighting up the FAULT LED on the panel when power fails.
- Port Link Down/Broken: Tick the check box to enable the function of lighting up FAULT LED on the panel when Ports' states are link down or broken.

Fault Relay Alarm

Fault Relay Alarm interface

6.10 SNTP Configuration

SNTP (Simple Network Time Protocol) is a simplified version of NTP which is an Internet protocol used to synchronize the clocks of computers to some time reference. Because time usually just advances, the time on different node stations will be different. With the communicating programs running on those devices, it would cause time to jump forward and back, a non-desirable effect. Therefore, the switch provides comprehensive mechanisms to access national time and frequency dissemination services, organize the time-synchronization subnet and the local clock in each participating subnet peer. Daylight saving time (DST) is the convention of advancing clocks so that afternoons have more daylight and mornings have less. Typically clocks are adjusted forward one hour near the start of spring and are adjusted backward in autumn.

- **SNTP Client:** Enable/disable SNTP function to get the time from the SNTP server.
- Daylight Saving Time: This is used as a control switch to enable/disable daylight saving period and daylight saving offset. Users can configure Daylight Saving Period and Daylight Saving Offset in a certain period time and offset time while there is no need to enable daylight saving function. Afterwards, users can just set this item as enable without assign Daylight Saving Period and Daylight Saving Offset again.
- UTC Timezone: Universal Time, Coordinated. Set the switch location time zone.
 The following table lists the different location time zone for your reference.

Local Time Zone	Conversion from UTC	Time at 12:00 UTC
November Time Zone	- 1 hour	11am
Oscar Time Zone	-2 hours	10 am
ADT - Atlantic Daylight	-3 hours	9 am
AST - Atlantic Standard EDT - Eastern Daylight	-4 hours	8 am

EST - Eastern Standard CDT - Central Daylight	-5 hours	7 am
CST - Central Standard MDT - Mountain Daylight	-6 hours	6 am
MST - Mountain Standard PDT - Pacific Daylight	-7 hours	5 am
PST - Pacific Standard ADT - Alaskan Daylight	-8 hours	4 am
ALA - Alaskan Standard	-9 hours	3 am
HAW - Hawaiian Standard	-10 hours	2 am
Nome, Alaska	-11 hours	1 am
CET - Central European FWT - French Winter MET - Middle European MEWT - Middle European Winter SWT - Swedish Winter	+1 hour	1 pm
EET - Eastern European, USSR Zone 1	+2 hours	2 pm
BT - Baghdad, USSR Zone 2	+3 hours	3 pm
ZP4 - USSR Zone 3	+4 hours	4 pm
ZP5 - USSR Zone 4	+5 hours	5 pm
ZP6 - USSR Zone 5	+6 hours	6 pm
WAST - West Australian Standard	+7 hours	7 pm

CCT - China Coast, USSR Zone 7	+8 hours	8 pm
JST - Japan Standard, USSR Zone 8	+9 hours	9 pm
EAST - East Australian Standard GST Guam Standard, USSR Zone 9	+10 hours	10 pm
IDLE - International Date Line NZST - New Zealand Standard NZT - New Zealand	+12 hours	Midnight

- SNTP Sever URL: Set the SNTP server IP address. You can assign a local network time server IP address or an internet time server IP address.
- Switch Timer: When the switch has successfully connected to the SNTP server whose IP address was assigned in the column field of SNTP Server URL, the current coordinated time is displayed here.
- Daylight Saving Period: Set up the Daylight Saving beginning date/time and Daylight Saving ending date/time. Please key in the value in the format of 'YYYYMMDD' and 'HH:MM' (leave a space between 'YYYYMMDD' and 'HH:MM').
 - > **YYYYMMDD:** an eight-digit year/month/day specification.
 - > **HH:MM:** a five-digit (including a colon mark) hour/minute specification.

For example, key in '20070701 02:00' and '20071104 02:04' in the two column fields respectively to represent that DST begins at 2:00 a.m. on March 11, 2007 and ends at 2:00 a.m. on November 4, 2007.

- Daylight Saving Offset (mins): For non-US and European countries, specify the amount of time for day light savings. Please key in the valid figure in the range of minute between 0 and 720, which means you can set the offset up to 12 hours.
- Synchronization Interval (secs): The Synchronization Interval is used for sending synchronizing packets periodically. User can assign range from 64s to 1024s. The default setting of values is "0" means that you disable the auto synchronizes feature

in SNTP client mode. You can enable the feature when filling the interval range from 64s~1024s.

Click Apply to have the configuration take effect.

6.11 IP Security

IP security function allows the user to assign 10 specific IP addresses that have permission to manage the switch through the http and telnet services for the securing switch management. The purpose of giving the limited IP addresses permission is to allow only the authorized personnel/device can do the management task on the switch.

- IP Security Mode: Having set this selection item in the Enable mode, the Enable HTTP Server, Enable Telnet Server checkboxes and the ten security IP column fields will then be available. If not, those items will appear in grey.
- Enable HTTP Server: Having ticked this checkbox, the devices whose IP addresses match any one of the ten IP addresses in the Security IP1 ~ IP10 table will be given the permission to access this switch via HTTP service.
- Enable Telnet Server: Having ticked this checkbox, the devices whose IP addresses match any one of the ten IP addresses in the Security IP1 ~ IP10 table will be given the permission to access this switch via telnet service.
- Security IP 1 ~ 10: The system allows the user to assign up to 10 specific IP addresses for access security. Only these 10 IP addresses can access and manage the switch through the HTTP/Telnet service once IP Security Mode is enabled.
- And then, click Apply to have the configuration take effect.

[NOTE] Remember to execute the "Save Configuration" action, otherwise the new configuration will lose when the switch powers off.

6.13 Port Statistics

The following chart provides the current statistic information which displays the real-time packet transfer status for each port. The user might use the information to plan and implement the network, or check and find the problem when the collision or heavy traffic occurs.

- **Port:** The port number.
- **Type:** Displays the current speed of connection to the port.
- Link: The status of linking—'Up' or 'Down'.
- State: It's set by Port Control. When the state is disabled, the port will not transmit or receive any packet.
- **Tx Good Packet:** The counts of transmitting good packets via this port.
- Tx Bad Packet: The counts of transmitting bad packets (including undersize [less than 64 octets], oversize, CRC Align errors, fragments and jabbers packets) via this port.
- **Rx Good Packet:** The counts of receiving good packets via this port.
- Rx Bad Packet: The counts of receiving good packets (including undersize [less than 64 octets], oversize, CRC error, fragments and jabbers) via this port.
- **Tx Abort Packet:** The aborted packet while transmitting.
- Packet Collision: The counts of collision packet.
- Packet Dropped: The counts of dropped packet.
- **Rx Bcast Packet:** The counts of broadcast packet.
- **Rx Mcast Packet:** The counts of multicast packet.
- Click Clear button to clean all counts.

Port Statistics interface

6.14 Port Control

In Port control you can configure the settings of each port to control the connection parameters, and the status of each port is listed beneath.

- Port: Use the scroll bar and click on the port number to choose the port to be configured.
- State: Current port state. The port can be set to disable or enable mode. If the port state is set as 'Disable', it will not receive or transmit any packet.
- Negotiation: Auto and Force. Being set as Auto, the speed and duplex mode are negotiated automatically. When you set it as Force, you have to set the speed and duplex mode manually.
- Speed: It is available for selecting when the Negotiation column is set as Force. When the Negotiation column is set as Auto, this column is read-only.
- Duplex: It is available for selecting when the Negotiation column is set as Force. When the Negotiation column is set as Auto, this column is read-only.
- Flow Control: Whether or not the receiving node sends feedback to the sending node is determined by this item. When enabled, once the device exceeds the input data rate of another device, the receiving device will send a PAUSE frame which halts the transmission of the sender for a specified period of time. When disabled, the receiving device will drop the packet if too much to process.
- Security: When the Security selection is set as 'On', any access from the device which connects to this port will be blocked unless the MAC address of the device is included in the static MAC address table. See the segment of MAC Address Table—Static MAC Addresses.
- Click Apply to have the configuration take effect.

Port Control interface

6.15 Port Trunk

Port trunking is the combination of several ports or network cables to expand the connection speed beyond the limits of any one single port or network cable. Link Aggregation Control Protocol (LACP), which is a protocol running on layer 2, provides a standardized means in accordance with IEEE 802.3ad to bundle several physical ports together to form a single logical channel. All the ports within the logical channel or so-called logical aggregator work at the same connection speed and LACP operation requires full-duplex mode.

6.15.1 Aggregator setting

- System Priority: A value which is used to identify the active LACP. The switch with the lowest value has the highest priority and is selected as the active LACP peer of the trunk group.
- Group ID: There are 13 trunk groups to be selected. Assign the "Group ID" to the trunk group.
- LACP: When enabled, the trunk group is using LACP. A port which joins an LACP trunk group has to make an agreement with its member ports first. Please notice that a trunk group, including member ports split between two switches, has to enable the LACP function of the two switches. When disabled, the trunk group is a static trunk group. The advantage of having the LACP disabled is that a port joins the trunk group without any handshaking with its member ports; but member ports won't know that they should be aggregated together to form a logic trunk group.
- Work ports: This column field allows the user to type in the total number of active port up to four. With LACP static trunk group, e.g. you assign four ports to be the members of a trunk group whose work ports column field is set as two; the exceed ports are standby/redundant ports and can be aggregated if working ports fail. If it is a static trunk group (non-LACP), the number of work ports must equal the total number of group member ports.
- Select the ports to join the trunk group. The system allows a maximum of four

ports to be aggregated in a trunk group. Click Add and the ports focused in the right side will be shifted to the left side. To remove unwanted ports, select the ports and click Remove.

- When LACP enabled, you can configure LACP Active/Passive status for each port on the State Activity tab.
- Click Apply
- Use Delete to delete Trunk Group. Select the Group ID and click Delete

Port Trunk - Aggregator Setting

Notice: The trunk function do not support GVRP and X-Ring.

Port Trunk—Aggregator Setting interface (four ports are added to the left field with LACP enabled)

6.15.2 Aggregator Information

• LACP disabled

Having set up the aggregator setting with LACP disabled, you will see the local static trunk group information on the tab of **Aggregator Information**.

6.15.3 State Activity

A

Having set up the LACP aggregator on the tab of Aggregator Setting, you can configure the state activity for the members of the LACP trunk group. You can tick or cancel the checkbox beside the state label. When you remove the tick mark of the port and click

Apply, the port state activity will change to **Passive**.

- Active: The port automatically sends LACP protocol packets.
- Passive: The port does not automatically send LACP protocol packets, and responds only if it receives LACP protocol packets from the opposite device.

[NOTE] A link having two passive LACP nodes will not perform dynamic LACP trunk because both ports are waiting for an LACP protocol packet from the opposite device.

6.16 Port Mirroring

The Port mirroring is a method for monitor traffic in switched networks. Traffic through ports can be monitored by one specific port, which means traffic goes in or out monitored (source) ports will be duplicated into mirror (destination) port.

- Destination Port: There is only one port can be selected to be destination (mirror) port for monitoring both RX and TX traffic which come from source port. Or, use one of two ports for monitoring RX traffic only and the other one for TX traffic only. User can connect mirror port to LAN analyzer or Netxray.
- Source Port: The ports that user wants to monitor. All monitored port traffic will be copied to mirror (destination) port. User can select multiple source ports by checking the RX or TX check boxes to be monitored.
- And then, click Apply button.

	Destination	Port	Source F	Port
	RX	ТХ	RX	ТХ
Port.01	Θ	0		
Port.02	0	\odot		
Port.03	0	0		
Port.04	0	0		
Port.05	0	0		
Port.06	0	0	V	
Port.07	0	0		
Port.08	0	0		
Port.09	0	0		
Port.10	0	0		

Port Mirroring

Apply Help

Port Trunk – Port Mirroring interface

6.17 Rate Limiting

You can set up every port's bandwidth rate and frame limitation type.

- Ingress Limit Frame type: select the frame type that wants to filter. There are four frame types for selecting:
 - > All
 - > Broadcast/Multicast/Flooded Unicast
 - Broadcast/Multicast
 - Broadcast only

Broadcast/Multicast/Flooded Unicast, Broadcast/Multicast and Bbroadcast only types are only for ingress frames. The egress rate only supports All type.

Rate Limiting

	Ingress Limit Frame Type	Ingress		Egress	
Port.01	All	0	kbps	0	kbps
Port.02	All Broadcast/Multicast/Flooded Unicast	0	kbps	0	kbps
Port.03	Broadcast/Multicast Broadcast only	0	kbps	0	kbps
Port.04	All	0	kbps	0	kbps
Port.05	All	0	kbps	0	kbps
Port.06	All	0	kbps	0	kbps
Port.07	All	0	kbps	0	kbps
Port.08	All	0	kbps	0	kbps
Port.09	All	0	kbps	0	kbps
Port.10	All	0	kbps	0	kbps

Rate Range is from 100 kbps to 102400 kbps or to 256000 kbps for giga ports, and zero means no limit.

Rate Limiting interface

All the ports support port ingress and egress rate control. For example, assume port 1 is 10Mbps, users can set it's effective egress rate is 1Mbps, ingress rate is 500Kbps. The switch performs the ingress rate by packet counter to meet the specified rate

- > Ingress: Enter the port effective ingress rate (The default value is "0").
- **Egress:** Enter the port effective egress rate (The default value is "0").
- And then, click Apply to apply the settings

6.18 VLAN configuration

A Virtual LAN (VLAN) is a logical network grouping that limits the broadcast domain, which would allow you to isolate network traffic, so only the members of the same VLAN will receive traffic from the ones of the same VLAN. Basically, creating a VLAN on a switch is logically equivalent of reconnecting a group of network devices to another Layer 2 switch. However, all the network devices are still plugged into the same switch physically.

This switch supports **Port-based** and **802.1Q** (tagged-based) VLAN. The default configuration of VLAN operation mode is "**Disable**".

VLAN Configuration

VLAN NOT ENABLE

VLAN Configuration interface

6.18.1 Port-based VLAN

A port-based VLAN basically consists of its members—ports, which means the VLAN is created by grouping the selected ports. This method provides the convenience for users to configure a simple VLAN easily without complicated steps. Packets can go among only members of the same VLAN group. Note all unselected ports are treated as belonging to another single VLAN. If the port-based VLAN enabled, the VLAN-tagging is ignored. The port-based VLAN function allows the user to create separate VLANs to limit the unnecessary packet flooding; however, for the purpose of sharing resource, a single port called a common port can belongs to different VLANs, which all the member devices (ports) in different VLANs have the permission to access the common port while they still cannot communicate with each other in different VLANs.

VLAN Configuration

VLAN – Port Based interface

- Pull down the selection item and focus on Port Based then press Apply to set the VLAN Operation Mode in Port Based mode.
- Click Add to add a new VLAN group (The maximum VLAN groups are up to 64).

VLAN Configuration

Apply

Group Name	VLAN_1

VLAN—Port Based Edit/Delete interface

- Use Delete to delete the VLAN.
- Use Edit to modify group name, VLAN ID, or add/remove the members of the existing VLAN group.

[NOTE] Remember to execute the "Save Configuration" action, otherwise the new configuration will lose when switch power off.

6.18.2 802.1Q VLAN

Virtual Local Area Network (VLAN) can be implemented on the switch to logically create different broadcast domain.

When the 802.1Q VLAN function is enabled, all ports on the switch belong to default VLAN of VID 1, which means they logically are regarded as members of the same broadcast domain. The valid VLAN ID is in the range of number between 1 and 4094. The amount of VLAN groups is up to 256 including default VLAN that cannot be deleted.

Each member port of 802.1Q is on either an Access Link (VLAN-tagged) or a Trunk Link (no VLAN-tagged). All frames on an Access Link carry no VLAN identification. Conversely, all frames on a Trunk Link are VLAN-tagged. Besides, there is the third mode—Hybrid. A Hybrid Link can carry both VLAN-tagged frames and untagged frames. A single port is supposed to belong to one VLAN group, except it is on a Trunk/Hybrid Link.

The technique of 802.1Q tagging inserts a 4-byte tag, including VLAN ID of the destination port—PVID, in the frame. With the combination of Access/Trunk/Hybrid Links, the communication across switches also can make the packet sent through tagged and untagged ports.

802.1Q Configuration

- Pull down the selection item and focus on 802.1Q then press Apply to set the VLAN Operation Mode in 802.1Q mode.
- Enable GVRP Protocol: GVRP (GARP VLAN Registration Protocol) is a protocol that facilitates control of virtual local area networks (VLANs) within a larger network. GVRP conforms to the IEEE 802.1Q specification, which defines a method of tagging frames with VLAN configuration data. This allows network devices to dynamically exchange VLAN configuration information with other devices. For example, having enabled GVRP on two switches, they are able to automatically exchange the information of their VLAN database. Therefore, the user doesn't need to manually configure whether the link is trunk or hybrid, the packets belonging to the same VLAN can communicate across switches. Tick this checkbox to enable GVRP protocol. This checkbox is available while the VLAN Operation Mode is in 802.1Q mode.
- Management VLAN ID: Only when the VLAN members, whose Untagged VID (PVID) equals to the value in this column, will have the permission to access the switch. The default value is '0' that means this limit is not enabled (all members in different VLANs can access this switch).
- Select the port you want to configure.
- Link Type: There are 3 types of link type.
 - Access Link: A segment which provides the link path for one or more stations to the VLAN-aware device. An Access Port (untagged port), connected to the access link, has an untagged VID (also called PVID). After an untagged frame gets into the access port, the switch will insert a four-byte tag in the frame. The contents of the last 12-bit of the tag is untagged VID. When this frame is sent out through any of the access port of the same PVID, the switch will remove the tag from the frame to recover it to what it was. Those ports of the same untagged VID are regarded as the same VLAN group members.

Note: Because the access port doesn't have an understanding of tagged frame, the column field of Tagged VID is not available.

> Trunk Link: A segment which provides the link path for one or more VLAN-

aware devices (switches). A Trunk Port, connected to the trunk link, has an understanding of tagged frame, which is used for the communication among VLANs across switches. Which frames of the specified VIDs will be forwarded depends on the values filled in the Tagged VID column field. Please insert a comma between two VIDs.

Note:

- 1. A trunk port doesn't insert tag into an untagged frame, and therefore the untagged VID column field is not available.
- 2. It's not necessary to type '1' in the tagged VID. The trunk port will forward the frames of VLAN 1.
- 3. The trunk port has to be connected to a trunk/hybrid port of the other switch. Both the tagged VID of the two ports have to be the same.
 - Hybrid Link: A segment which consists of Access and Trunk links. The hybrid port has both the features of access and trunk ports. A hybrid port has a PVID belonging to a particular VLAN, and it also forwards the specified taggedframes for the purpose of VLAN communication across switches.

Note:

- 1. It's not necessary to type '1' in the tagged VID. The hybrid port will forward the frames of VLAN 1.
- 2. The trunk port has to be connected to a trunk/hybrid port of the other switch. Both the tagged VID of the two ports have to be the same.
- Untagged VID: This column field is available when Link Type is set as Access Link and Hybrid Link. Assign a number in the range between 1 an 4094.
- Tagged VID: This column field is available when Link Type is set as Trunk Link and Hybrid Link. Assign a number in the range between 1 an 4094.
- Click Apply to have the configuration take effect.
- You can see the link type, untagged VID, and tagged VID information of each port in the table below on the screen.

6.19 Rapid Spanning Tree

The Rapid Spanning Tree Protocol (RSTP) is an evolution of the Spanning Tree Protocol and provides for faster spanning tree convergence after a topology change. The system also supports STP and the system will auto-detect the connected device that is running STP or RSTP protocol.

6.19.1 RSTP System Configuration

- The user can view spanning tree information of Root Bridge.
- The user can modify RSTP state. After modification, click Apply
 - RSTP mode: The user must enable the RSTP function first before configuring the related parameters.
 - Priority (0-61440): The switch with the lowest value has the highest priority and is selected as the root. If the value is changed, the user must reboot the switch. The value must be a multiple of 4096 according to the protocol standard rule.
 - Max Age (6-40): The number of seconds a switch waits without receiving Spanning-tree Protocol configuration messages before attempting a reconfiguration. Enter a value between 6 through 40.
 - Hello Time (1-10): The time that controls the switch to send out the BPDU packet to check RSTP current status. Enter a value between 1 through 10.
 - Forward Delay Time (4-30): The number of seconds a port waits before changing from its Rapid Spanning-Tree Protocol learning and listening states to the forwarding state. Enter a value between 4 through 30.
- [NOTE] Follow the rule as below to configure the MAX Age, Hello Time, and Forward Delay Time.
 2 x (Forward Delay Time value -1) > = Max Age value >= 2 x (Hello Time value +1)

RSTP - System Configuration

System Configuration

Port Configuration

RSTP Mode	Enable 💌
Priority (0-61440)	32768
Max Age (6-40)	20
Hello Time (1-10)	2
Forward Delay Time (4-30)	15

Priority must be a multiple of 4096 2*(Forward Delay Time-1) should be greater than or equal to the Max Age. The Max Age should be greater than or equal to 2*(Hello Time + 1). Apply Help

Max Age	20		
Hello Time	2		
Forward Delay	15		

RSTP System Configuration interface

6.19.2 Port Configuration

This web page provides the port configuration interface for RSTP. You can assign higher or lower priority to each port. Rapid spanning tree will have the port with the higher priority in forwarding state and block other ports to make certain that there is no loop in the LAN.

- Select the port in the port column field.
- Path Cost: The cost of the path to the other bridge from this transmitting bridge at the specified port. Enter a number 1 through 200,000,000.
- Priority: Decide which port should be blocked by setting its priority as the lowest. Enter a number between 0 and 240. The value of priority must be the multiple of 16.
- Admin P2P: The rapid state transitions possible within RSTP are dependent upon whether the port concerned can only be connected to exactly another bridge (i.e. it is served by a point-to-point LAN segment), or can be connected to two or more bridges (i.e. it is served by a shared medium LAN segment). This function allows the P2P status of the link to be manipulated administratively. True means the port is regarded as a point-to-point link. False means the port is regarded as a shared link. Auto means the link type is determined by the auto-negotiation between the two peers.
- Admin Edge: The port directly connected to end stations won't create bridging loop in the network. To configure the port as an edge port, set the port to "True" status.
- Admin Non Stp: The port includes the STP mathematic calculation. True is not including STP mathematic calculation. False is including the STP mathematic calculation.
- Click Apply

RSTP - Port Configuration

6.20 SNMP Configuration

Simple Network Management Protocol (SNMP) is the protocol developed to manage nodes (servers, workstations, routers, switches and hubs etc.) on an IP network. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth. Network management systems learn of problems by receiving traps or change notices from network devices implementing SNMP.

6.20.1 System Configuration

Community Strings

Here you can define the new community string set and remove the unwanted community string.

- String: Fill the name string.
- RO: Read only. Enables requests accompanied by this community string to display MIB-object information.
- RW: Read/write. Enables requests accompanied by this community string to display MIB-object information and to set MIB objects.
- Click Add .
- To remove the community string, select the community string that you defined before and click <u>Remove</u>. The strings of Public_RO and Private_RW are default strings. You can remove them but after resetting the switch to default, the two strings show up again.
- Agent Mode: Select the SNMP version that you want to use it. And then click Change to switch to the selected SNMP version mode.

6.21 QoS Configuration

Quality of Service (QoS) is the ability to provide different priority to different applications, users or data flows, or to guarantee a certain level of performance to a data flow. QoS guarantees are important if the network capacity is insufficient, especially for real-time streaming multimedia applications such as voice over IP or Video Teleconferencing, since these often require fixed bit rate and are delay sensitive, and in networks where the capacity is a limited resource, for example in cellular data communication. In the absence of network congestion, QoS mechanisms are not required.

6.21.1 QoS Policy and Priority Type

Here you can choose to use an 8-4-2-1 queuing scheme or a strict priority scheme, or select the priority type to configure QoS policy.

- **Qos Policy:** Select the QoS policy rule.
 - Using the 8,4,2,1 weight fair queue scheme: The switch will follow 8:4:2:1 rate to process priority queue from High to lowest queue. For example, while the system processing, 1 frame of the lowest queue, 2 frames of the low queue, 4 frames of the middle queue, and 8 frames of the high queue will be processed at the same time in accordance with the 8,4,2,1 policy rule.
 - Use a strict priority scheme: Always the higher queue will be processed first, except the higher queue is empty.
 - Priority Type: There are 5 priority type selections available—Port-based, TOS only, COS only, TOS first, and COS first. Disable means no priority type is selected.
- Click Apply to have the configuration take effect.

QoS Configuration interface

6.21.2 Port-based Priority

Configure the priority level for each port. With the drop-down selection item of **Priority Type** above being selected as Port-based, this control item will then be available to set the queuing policy for each port.

- Port x: Each port has 4 priority levels—High, Middle, Low, and Lowest—to be chosen.
- Click Apply to have the configuration take effect.

6.21.3 COS Configuration

Set up the COS priority level. With the drop-down selection item of **Priority Type** above being selected as COS only/COS first, this control item will then be available to set the queuing policy for each port.

- COS priority: Set up the COS priority level 0~7—High, Middle, Low, Lowest.
- Click Apply

6.21.4 TOS Configuration

Set up the TOS priority. With the drop-down selection item of **Priority Type** above being selected as TOS only/TOS first, this control item will then be available to set the queuing policy for each port.

■ **TOS priority:** The system provides 0~63 TOS priority level. Each level has 4 types of priority—High, Middle, Low, and Lowest. The default value is 'Lowest' priority for each level. When the IP packet is received, the system will check the TOS level value in the IP packet that has received. For example, the user sets the TOS level 25 as high, the system will check the TOS value of the received IP packet. If the TOS value of received IP packet is 25 (priority = high), and then the packet priority will have highest priority.

Click Apply to have the configuration take effect.

6.22 IGMP Configuration

The Internet Group Management Protocol (IGMP) is an internal protocol of the Internet Protocol (IP) suite. IP manages multicast traffic by using switches, routers, and hosts that support IGMP. Enabling IGMP allows the ports to detect IGMP queries, report packets, and manage IP multicast traffic through the switch. IGMP have three fundamental types of message shown as follows:

Message	Description				
Query	A message sent from the querier (IGMP router or switch) asking for a response from each host belonging to the multicast group.				
Report	A message sent by a host to the querier to indicate that the host wants to be or is a member of a given group indicated in the report message.				
Leave Group	A message sent by a host to the querier to indicate that the host has quit being a member of a specific multicast group.				

The switch support IP multicast, you can enable IGMP protocol on web management's switch setting advanced page, then the IGMP snooping information displays. IP multicast addresses range are from 224.0.0.0 through 239.255.255.255.

- **IGMP Protocol:** enable or disable the IGMP protocol.
- **IGMP Query:** enable or disable the IGMP query function. The IGMP query information will be displayed in IGMP status section.
- Click Apply

IGMP Configuration

IP Address	VLAN ID		Member Port

IGMP Configuration interface

6.23 Ring

Ring provides a faster redundant recovery than Spanning Tree topology. The action is similar to STP or RSTP, but the algorithms between them are not the same. In the Ring topology, every switch should be enabled with Ring function and two ports should be assigned as the member ports in the ring. Only one switch in the Ring group would be set as the master switch that one of its two member ports would be blocked, called backup port, and another port is called working port. Other switches in the Ring group are called working switches and their two member ports are called working ports. When the failure of network connection occurs, the backup port of the master switch (Ring Master) will automatically become a working port to recover from the failure.

The switch supports the function and interface for setting the switch as the ring master or not. The ring master can negotiate and place command to other switches in the Ring group. If there are 2 or more switches in master mode, the software will select the switch with lowest MAC address number as the ring master. The Ring master ring mode can be enabled by setting the Ring configuration interface. Also, the user can identify whether the switch is the ring master by checking the R.M. LED indicator on the panel of the switch.

The system also supports the **Couple Ring** that can connect 2 or more Ring group for the redundant backup function; **Dual Homing** function that can prevent connection lose between Ring group and upper level/core switch.

- Enable Ring: To enable the Ring function, tick the checkbox beside the Enable Ring string label. If this checkbox is not ticked, all the ring functions are unavailable.
 - Enable Ring Master: Tick the checkbox to enable this switch to be the ring master.
 - 1st & 2nd Ring Ports: Pull down the selection menu to assign the ports as the member ports. 1st Ring Port is the working port and 2nd Ring Port is the backup port. When 1st Ring Port fails, the system will automatically upgrade the 2nd Ring Port to be the working port.
- Enable Couple Ring: To enable the couple ring function, tick the checkbox beside

the Enable Couple Ring string label.

- Couple Port: Assign the member port which is connected to the other ring group.
- Control Port: When the Enable Couple Ring checkbox is ticked, you have to assign the control port to form a couple-ring group between the two Rings.
- Enable Dual Homing: Set up one of the ports on the switch to be the Dual Homing port. For a switch, there is only one Dual Homing port. Dual Homing function works only when the Ring function enabled.
- And then, click Apply to have the configuration take effect.

🗹 Enable Ring

Ring Configuration

This switch is Ring Master.

Apply Help

Ring Interface

- [NOTE] 1. When the Ring function enabled, the user must disable the RSTP. The Ring function and RSTP function cannot exist on a switch at the same time.
 - 2. Remember to execute the "Save Configuration" action, otherwise the new configuration will lose when switch powers off.

6.24 LLDP Configuration

Link Layer Discovery Protocol (LLDP) is defined in the IEEE 802.1AB, it is an emerging standard which provides a solution for the configuration issues caused by expanding LANs. LLDP specifically defines a standard method for Ethernet network devices such as switches, routers and wireless LAN access points to advertise information about themselves to other nodes on the network and store the information they discover. LLDP runs on all 802 media. The protocol runs over the data-link layer only, allowing two systems running different network layer protocols to learn about each other.

- **LLDP Protocol**: Pull down the selection menu to disable or enable LLDP function.
- **LLDP Interval**: Set the interval of advertising the switch's information to other nodes.
- Click Apply .

6.25 Security—802.1X/Radius Configuration

802.1x is an IEEE authentication specification which prevents the client from accessing a wireless access point or wired switch until it provides authority, like the user name and password that are verified by an authentication server (such as RADIUS server).

6.25.1 System Configuration

After enabling the IEEE 802.1X function, you can configure the parameters of this function.

- IEEE 802.1x Protocol: Enable or disable 802.1x protocol.
- Radius Server IP: Assign the RADIUS Server IP address.
- Server Port: Set the UDP destination port for authentication requests to the specified RADIUS Server.
- Accounting Port: Set the UDP destination port for accounting requests to the specified RADIUS Server.
- Shared Key: Set an encryption key for using during authentication sessions with the specified RADIUS server. This key must match the encryption key used on the RADIUS Server.
- NAS, Identifier: Set the identifier for the RADIUS client.
- Click Apply

802.1x/Radius - System Configuration

6.26 MAC Address Table

Use the MAC address table to ensure the port security.

6.26.1 Static MAC Address

You can add a static MAC address that remains in the switch's address table regardless of whether the device is physically connected to the switch. This saves the switch from having to re-learn a device's MAC address when the disconnected or powered-off device is active on the network again. Via this interface, you can add / modify / delete a static MAC address.

Add the Static MAC Address

You can add static MAC address in the switch MAC table here.

- MAC Address: Enter the MAC address of the port that should permanently forward traffic, regardless of the device network activity.
- **Port No.:** Pull down the selection menu to select the port number.
- Click Add
- If you want to delete the MAC address from filtering table, select the MAC address and click <u>Delete</u>.

MAC Address Table - Static MAC Addresses

6.26.4 MAC Address Table—Multicast Filtering

Multicasts are similar to broadcasts, they are sent to all end stations on a LAN or VLAN. Multicast filtering is the function, which end stations can receive the multicast traffic if the connected ports had been included in the specific multicast groups. With multicast filtering, network devices only forward multicast traffic to the ports that are connected to the registered end stations.

- IP Address: Assign a multicast group IP address in the range of 224.0.0.0 ~
 239.255.255.255.
- Member Ports: Tick the check box beside the port number to include them as the member ports in the specific multicast group IP address.
- Click Add to append a new filter of multicast to the field, or select the filter in the field and click Delete to remove it.

MAC Address Table - Multicast Filtering

Static MAC Addresses	MAC F	Filtering	All Mac Addresses	Multicast Filtering
	239. 239. 239.	.000.000.100 .000.001.100 .000.002.100	_12***** **34*** ****56**

					Apply					

- Actual Power Consumption: This column shows the real-time total power consumption.
- Main Supply Voltage: This column shows the output voltage of the system for PoE ports.
- **Firmware Version:** This column shows the PoE chip's firmware version.
- Port Knockoff Disabled: Power Management state where one or more PDs have been powered down so that a higher priority PD may be powered up and yet not exceed the maximum total power available for PDs.
- AC Disconnect: Tick this checkbox to monitor the AC impedance on the port terminals and removes power when the impedance rises above a certain value, for a certain period (for details, see the IEEE 802.3af specification).
- Capacitive Detection: If the port and capacitive detection are enabled, the capacitances state reads in the voltage result from the constant current. This is then

subtracted from the pre-capacitance voltage to get a charge rate. If this charge rate is within the window of the PD signatures, the device is considered to be discovered.

- And then, click Apply to carry into effect.
- **Port:** The index of PoE ports.
- **Enable State:** Check it to enable the PoE function to the port.
- **Power Limit From:** Check it to decide the power limit method.
 - Classification: When this check box is ticked, the system will limit the power supply to the powered device in accordance with the related class.
- Legacy: Check it to support the legacy power devices.
- Priority: Pull down the selection menu item to choose the priority of power supplying.
- Port Limit (<15400) mW: User can key in the power limit value which is under 15.4 Watts.
- **Mode:** Displays the operating mode of the port.
- **Current (mA):** Displays the operating current of the port.
- Voltage (V): Displays the operating voltage of the port.
- **Power (mW):** Displays the power consumption of the port.
- Determined Class: Displays the PD's class.
- And then, click Apply to carry into effect.

6.28 Factory Default

6.30 System Reboot

Reboot the switch in software reset. Click **Reboot** to reboot the system.

System Reboot

Please click [Reboot] button to restart switch device.

System Reboot interface

- Verify that is using the right power cord/adapter (DC 24-48V), please don't use the power adapter with DC output higher than 48V, or it may damage this device.
- Select the proper UTP/STP cable to construct the user network. Use unshielded twisted-pair (UTP) or shield twisted-pair (STP) cable for RJ-45 connections that depend on the connector type the switch equipped: 100Ω Category 3, 4 or 5 cable

for 10Mbps connections, 100Ω Category 5 cable for 100Mbps connections, or 100

 Ω Category 5e/above cable for 1000Mbps connections. Also be sure that the length of any twisted-pair connection does not exceed 100 meters (328 feet).

- Diagnosing LED Indicators: To assist in identifying problems, the switch can be easily monitored through panel indicators, which describe common problems the user may encounter and where the user can find possible solutions.
- If the power indicator does not light on when the power cord is plugged in, you may have a problem with power cord. Then check for loose power connections, power losses or surges at power outlet. If you still cannot resolve the problem, contact the local dealer for assistance.
- If the LED indicators are normal and the connected cables are correct but the packets still cannot be transmitted. Please check the user system's Ethernet devices' configuration or status.

RJ-45 Pin Assignments

The UTP/STP ports will automatically sense for Fast Ethernet (10Base-T/100Base-TX connections), or Gigabit Ethernet (10Base-T/100Base-TX/1000Base-T connections). Auto MDI/MDIX means that the switch can connect to another switch or workstation without changing straight through or crossover cabling. See the figures below for straight through and crossover cable schematic.

	function	
G	Disable IP security of	switch(config)#no security http
	HTTP server	
G	Disable IP security of	switch(config)#no security telnet
	telnet server	
	P P G G G G G G	 P Show configuration of DHCP server P Show client entries of DHCP server P Show IP-Binding information of DHCP server G Disable DHCP server function G Enable IP security function G Enable IP security of HTTP server G Enable IP security of telnet server G Set the IP security list P Show the information of IP security function G Disable IP security of telnet server G Set the IP security of telnet server G Disable IP security of telnet server

Port Commands Set

Commands	Level	Description	Example
interface fastEthernet	G	Choose the port for	switch(config)#interface
[Portid]		modification.	fastEthernet 2

duplex	I	Use the duplex	switch(config)#interface
[full half]		configuration	fastEthernet 2
		command to specify	switch(config-if)#duplex full
		the duplex mode of	
		operation for Fast	
		Ethernet.	
speed	I	Use the speed	switch(config)#interface
[10 100 1000 auto]		configuration	fastEthernet 2
		command to specify	switch(config-if)# speed 100
		the speed mode of	
		operation for Fast	
		Ethernet., the speed	
		can't be set to 1000 if	
		the port isn't a giga	
		port	
no flowcontrol	I	Disable flow control of	switch(config-if)#no flowcontrol
		interface	
security enable	I	Enable security of	switch(config)# interface
		interface	fastEthernet 2
			switch(config-if)# security enable
no security		Disable security of	switch(config)# interface
		interface	fastEthernet 2
			switch(config-if)# no security
bandwidth type all	I	Set interface ingress	switch(config)# interface
		limit frame type to	fastEthernet 2
		"accept all frame"	switch(config-if)# bandwidth type
			all
bandwidth type	Ι	Set interface ingress	switch(config)# interface
broadcast-multicast-		limit frame type to	fastEthernet 2
flooded-unicast		"accept broadcast,	switch(config-if)#bandwidth type
		multicast, and flooded	broadcast-multicast-flooded-
		unicast frame"	unicast
bandwidth type	I	Set interface ingress	switch(config)#interface

broadcast-multicast		limit frame type to	fastEthernet 2
		"accept broadcast and	switch(config-if)#bandwidth type
		multicast frame"	broadcast-multicast
bandwidth type		Set interface ingress	switch(config)#interface
broadcast-only		limit frame type to	fastEthernet 2
		"only accept broadcast	switch(config-if)#bandwidth type
		frame"	broadcast-only
bandwidth in	I	Set interface input	switch(config)#interface
[Value]		bandwidth. Rate	fastEthernet 2
		Range is from 100	switch(config-if)#bandwidth in 100
		kbps to 102400 kbps	
		or to 256000 kbps for	
		giga ports,	
		and zero means no	
		limit.	
bandwidth out		Set interface output	switch(config)#interface
[Value]		bandwidth. Rate	fastEthernet 2
		Range is from 100	switch(config-if)#bandwidth out
		kbps to 102400 kbps	100
		or to 256000 kbps for	
		giga ports,	
		and zero means no	
		limit.	
show bandwidth	I	Show interfaces	switch(config)#interface
		bandwidth control	fastEthernet 2
			switch(config-if)#show bandwidth
state	I	Use the state interface	switch(config)#interface
[Enable Disable]		configuration	fastEthernet 2
		command to specify	switch(config-if)# state Disable
		the state mode of	
		operation for Ethernet	
		ports. Use the disable	
		form of this command	

		to disable the port.	
show interface	Ι	show interface	switch(config)#interface
configuration		configuration status	fastEthernet 2
			switch(config-if)# show interface
			configuration
show interface status	Ι	show interface actual	switch(config)#interface
		status	fastEthernet 2
			switch(config-if)# show interface
			status
show interface	I	show interface statistic	switch(config)# interface
accounting		counter	fastEthernet 2
			switch(config-if)# show interface
			accounting
no accounting	I	Clear interface	switch(config)# interface
		accounting information	fastEthernet 2
			switch(config-if)# no accounting

Trunk Commands Set

Commands	Level	Description	Example
aggregator priority	G	Set port group system	switch(config)#aggregator priority
[1~65535]		priority	22
aggregator activityport	G	Set activity port	switch(config)#aggregator
[Group ID]			activityport 2
[Port Numbers]			
aggregator group	G	Assign a trunk group	switch(config)#aggregator group
[GroupID] [Port-list]		with LACP active.	1 1-4 lacp workp 2
lacp		[GroupID] :1~3	or
workp		[Port-list]:Member port	switch(config)#aggregator group
[Workport]		list, This parameter	2 1,4,3 lacp workp 3
		could be a port	
		range(ex.1-4) or a port	
		list separate by a	

		comma(ex.2, 3, 6)	
		[Workport]: The	
		amount of work ports,	
		this value could not be	
		less than zero or be	
		large than the amount	
		of member ports.	
aggregator group	G	Assign a static trunk	switch(config)#aggregator group
[GroupID] [Port-list]		group.	1 2-4 nolacp
nolacp		[GroupID] :1~3	or
		[Port-list]:Member port	switch(config)#aggregator group
		list, This parameter	1 3,1,2 nolacp
		could be a port	
		range(ex.1-4) or a port	
		list separate by a	
		comma(ex.2, 3, 6)	
show aggregator	Р	Show the information	switch# show aggregator 1
		of trunk group	or
			switch# show aggregator 2
			or
			switch# show aggregator 3
no aggregator lacp	G	Disable the LACP	switch(config)# no aggreator lacp
[GroupID]		function of trunk group	1
no aggregator group	G	Remove a trunk group	switch(config)#no aggreator
[GroupID]			group 2

VLAN Commands Set

Commands	Level	Description	Example
vlan database	Р	Enter VLAN configure	switch# vlan database
		mode	
Vlanmode	V	To set switch VLAN	switch(vlan)#vlanmode portbase
[portbase 802.1q		mode.	or

gvrp]			switch(vlan)# vlanmode 802.1q
			or
			switch(vlan)# vlanmode gvrp
no vlan	V	No VLAN	Switch(vlan)# no vlan
Ported based VLAN confi	gurati	on	
vlan port-based	V	Add new port based	switch(vlan)#vlan port-based
grpname		VALN	grpname test grpid 2 port 2-4
[Group Name]			or
grpid			switch(vlan)# vlan port-based
[GroupID]			grpname test grpid 2 port 2,3,4
port			
[PortNumbers]			
show vlan [GroupID]	V	Show VLAN	switch(vlan)# show vlan 23
or show vlan		information	
no vlan group	V	Delete port base	switch(vlan)# no vlan group 2
[GroupID]		group ID	
		IEEE 802.1Q VLAN	
vlan 8021q name	V	Change the name of	switch(vlan)# vlan 8021q name
[GroupName] vid		VLAN group, if the	test vid 22
[VID]		group didn't exist, this	
		command can't be	
		applied.	
vlan 8021q port	V	Assign a access link	switch(vlan)#vlan 8021q port 3
[PortNumber] access-link untag		for VLAN by port, if the	access-link untag 33
[UntaggedVID]		port belong to a trunk	
		group, this command	
		can't be applied.	
vlan 8021q port	V	Assign a trunk link for	switch(vlan)#vlan 8021q port 3
[PortNumber] trunk-link tag		VLAN by port, if the	trunk-link tag 2,3,6,99
[TaggedVID List]		port belong to a trunk	or
		group, this command	switch(vlan)# vlan 8021q port 3
		can't be applied.	trunk-link tag 3-20
vlan 8021q port [PortNumber]	V	Assign a hybrid link for	switch(vlan)#vlan 8021q port 3

hybrid-link untag		VLAN by port, if the	hybrid-link untag 4 tag 3,6,8
[UntaggedVID] tag		port belong to a trunk	or
[TaggedVID List]		group, this command	switch(vlan)# vlan 8021q port 3
		can't be applied.	hybrid-link untag 5 tag 6-8
vlan 8021q trunk	V	Assign a access link	switch(vlan)# vlan 8021q trunk 3
[PortNumber] access-link untag		for VLAN by trunk	access-link untag 33
[UntaggedVID]		group	
vlan 8021q trunk	V	Assign a trunk link for	switch(vlan)# vlan 8021q trunk 3
[PortNumber] trunk-link tag		VLAN by trunk group	trunk-link tag 2,3,6,99
[TaggedVID List]			or
[switch(vlan)# vlan 8021q trunk 3
			trunk-link tag 3-20
vlan 8021q trunk	V	Assign a hybrid link for	switch(vlan)#vlan 8021q trunk 3
[PortNumber] hybrid-link untag		VLAN by trunk group	hybrid-link untag 4 tag 3,6,8
[UntaggedVID]			or
tag [TaggedVID List]			switch(vlan)# vlan 8021q trunk 3
			hybrid-link untag 5 tag 6-8
show vlan [GroupID]	V	Show VLAN	switch(vlan)# show vlan 23
or show vlan		information	
no vlan group	V	Delete port base	switch(vlan)# no vlan group 2
[GroupID]		group ID	
1	1	1	

Spanning Tree Commands Set

Commands	Level	Description	Example
spanning-tree enable	G	Enable spanning tree	switch(config)# spanning-tree
			enable
spanning-tree priority	G	Configure spanning	switch(config)# spanning-tree
[0~61440]		tree priority parameter	priority 32768
spanning-tree max-age	G	Use the spanning-tree	switch(config)# spanning-tree
[seconds]		max-age global	max-age 15
		configuration	
		command to change	

			•
		the interval between	
		messages the	
		spanning tree receives	
		from the root switch. If	
		a switch does not	
		receive a bridge	
		protocol data unit	
		(BPDU) message from	
		the root switch within	
		this interval, it	
		recomputed the	
		Spanning Tree	
		Protocol (STP)	
		topology.	
spanning-tree hello-	G	Use the spanning-tree	switch(config)# spanning-tree
time [seconds]		hello-time global	hello-time 3
		configuration	
		command to specify	
		the interval between	
		hello bridge protocol	
		data units (BPDUs).	
spanning-tree forward-	G	Use the spanning-tree	switch(config)# spanning-tree
time [seconds]		forward-time global	forward-time 20
		configuration	
		command to set the	
		forwarding-time for the	
		specified spanning-	
		tree instances. The	
		forwarding time	
		determines how long	
		each of the listening	
		and	
		learning states last	
		before the port begins	

		forwarding.	
stp-path-cost	I	Use the spanning-tree	switch(config)#interface
[1~20000000]		cost interface	fastEthernet 2
		configuration	switch(config-if)#stp-path-cost 20
		command to set the	
		path cost for Spanning	
		Tree	
		Protocol (STP)	
		calculations. In the	
		event of a loop,	
		spanning tree	
		considers the path	
		cost when selecting	
		an interface to place	
		into the forwarding	
		state.	
stp-path-priority	I	Use the spanning-tree	switch(config)#interface
[Port Priority]		port-priority interface	fastEthernet 2
		configuration	switch(config-if)#stp-path-priority
		command to configure	128
		a port priority that	
		is used when two	
		switches tie for	
		position as the root	
		switch.	
stp-admin-p2p	I	Admin P2P of STP	switch(config)#interface
[Auto True False]		priority on this	fastEthernet 2
		interface.	switch(config-if)# stp-admin-p2p
			Auto
stp-admin-edge	I	Admin Edge of STP	switch(config)#interface
[True False]		priority on this	fastEthernet 2
		interface.	switch(config-if)#stp-admin-edge
			True

stp-admin-non-stp	I	Admin NonSTP of	switch(config)#interface
[True False]		STP priority on this	fastEthernet 2
		interface.	switch(config-if)# stp-admin-non-
			stp False
show spanning-tree	Е	Displays a summary of	switch>show spanning-tree
		the spanning-tree	
		states.	
no spanning-tree	G	Disable spanning-tree.	switch(config)#no spanning-tree

QOS Commands Set

Commands	Level	Description	Example
qos policy	G	Select QOS policy	switch(config)# qos policy
[weighted-fair strict]		scheduling	weighted-fair
qos prioritytype	G	Setting of QOS priority	switch(config)# qos prioritytype
[port-based cos-		type	
only tos-only cos-			
first tos-first]			
qos priority portbased	G	Configure Port-based	switch(config)#qos priority
[Port]		Priority	portbased 1 low
[lowest low middle high]			
qos priority cos	G	Configure COS	switch(config)# qos priority cos 0
[Priority][lowest low mid		Priority	middle
qos priority tos	G	Configure TOS Priority	switch(config)#qos priority tos 3
[Priority][lowest low mid			high
dle high]			
show qos	Р	Displays the	Switch# show qos
		information of QoS	
		configuration	
no qos	G	Disable QoS function	switch(config)# no qos

IGMP Commands Set

Commands	Level	Description	Example
igmp enable	G	Enable IGMP	switch(config)# igmp enable
		snooping function	
Igmp query auto	G	Set IGMP query to	switch(config)# igmp query auto
		auto mode	
Igmp query force	G	Set IGMP query to	switch(config)# igmp query force
		force mode	
igmp unregister flooding	G	Set unregister stream	switch(config)#igmp unregister
		flooding	flooding
igmp unregister	G	Set unregister stream	switch(config)#igmp unregister
blocking		blocking	flooding
show igmp	Р	Displays the details of	switch#show igmp configuration
configuration		an IGMP	
		configuration.	
no igmp	G	Disable IGMP	switch(config)# no igmp
		snooping function	
no igmp query	G	Disable IGMP query	switch# no igmp query

Multicast Filtering Commands Set

Commands	Level	Description	Example
multicast-filtering	I	Configure multicast	Switch(config)#interface
[IP-Addr]		filtering entry of	fastEthernet 2
		interface	switch(config-if)#multicast-
			filtering 228.1.1.1
no multicast-filtering	I	Remove multicast	Switch(config)#interface
[IP-Addr]		filtering entry of	fastEthernet 2
		interface	switch(config-if)#no multicast-
			filtering 228.1.1.1

LLDP Commands Set

Commands	Level	Description	Example
lldp enable	G	Enable LLDP function	switch(config)# IIdp enable
IIdp interval [Time sec]	G	Configure LLDP	switch(config)#IIdp interval 20
		interval	

Mac / Filter Table Commands Set

Commands	Level	Description	Example
mac-address-table static	Ι	Configure MAC	Switch(config)#interface
hwaddr		address table of	fastEthernet 2
[MAC]		interface (static).	switch(config-if)# mac-address-
			table static hwaddr
			000012345678
mac-address-table filter	G	Configure MAC	switch(config)#mac-address-table
hwaddr		address table(filter)	filter hwaddr 000012348678
[MAC]			
show mac-address-table	Р	Show all MAC address	switch#show mac-address-table
		table	
show mac-address-table	Р	Show static MAC	switch# show mac-address-table
static		address table	static
show mac-address-table	Р	Show filter MAC	Switch#show mac-address-table
filter		address table.	filter
no mac-address-table	Ι	Remove an entry of	switch(config)#interface
static hwaddr		MAC address table of	fastEthernet 2
[MAC]		interface (static)	switch(config-if)#no mac-address-
			table static hwaddr
			000012345678
no mac-address-table	G	Remove an entry of	switch(config)#no mac-address-
filter hwaddr		MAC address table	table filter hwaddr 000012348678
[MAC]		(filter)	
no mac-address-table	G	Remove dynamic	switch(config)#no mac-address-
		entry of MAC address	table

|--|

SNMP Commands Set

Commands	Level	Description	Example
snmp system-name	G	Set SNMP agent	switch(config)# snmp system-
[System Name]		system name	name I2switch
snmp system-location	G	Set SNMP agent	switch(config)# snmp system-
[System Location]		system location	location lab
snmp system-contact	G	Set SNMP agent	switch(config)# snmp system-
[System Contact]		system contact	contact where
snmp agent-mode	G	Select the agent mode	switch(config)# snmp agent-mode
[v1v2c v3 v1v2cv3]		of SNMP	v1v2cv3
snmp community-	G	Add SNMP community	Switch(config)#snmp community-
strings [Community]		string.	strings public right rw
right			
[RO/RW]			
snmp-server host	G	Configure SNMP	switch(config)#snmp-server host
[IP address]		server host	192.168.1.50 community public
community		information and	trap-version v1
[Community-string]		community string	(remove)
trap-version			Switch(config)#
[v1 v2c]			no snmp-server host
			192.168.1.50
snmpv3 context-name	G	Configure the context	switch(config)#snmpv3 context-
[Context Name]		name	name Test
snmpv3 user	G	Configure the	Switch(config)#snmpv3 user
[User Name]		userprofile for	test01 group G1 password
group		SNMPV3 agent.	AuthPW PrivPW
[Group Name]		Privacy password	
password		could be empty.	
[Authentication			
Password] [Privacy			

Password]			
snmpv3 access context-	G	Configure the access	switch(config)#snmpv3 access
name [Context Name]		table of SNMPV3	context-name Test group G1
group		agent	security-level AuthPriv
[Group Name]			match-rule Exact views V1 V1 V1
security-level

Port Mirroring Commands Set

Commands	Level	Description	Example
monitor	I	Configure source port	switch(config)#interface
[RX TX Both]		of monitor function	fastEthernet 2
			switch(config-if)#monitor RX
monitor rx [Port ID]	G	Set RX destination	switch(config)#monitor rx 2
		port of monitor	
		function	
monitor tx [Port ID]	G	Set TX destination	switch(config)#monitor tx 3
		port of monitor	
		function	
show monitor	Р	Show port monitor	switch# show monitor
		information	
show monitor	I	Show port monitor	switch(config)#interface

		information	fastEthernet 2
			switch(config-if)# show monitor
no monitor	I	Disable source port of	switch(config)#interface
		monitor function	fastEthernet 2
			switch(config-if)# no monitor

802.1x Commands Set

Commands	Level	Description	Example
8021x enable	G	Use the 802.1x global	Switch(config)# 8021x enable
		configuration	
		command to enable	
		802.1x protocols.	
8021x system radiusip	G	Use the 802.1x	Switch(config)# 8021x system
[IP address]		system radius IP	radiusip 192.168.1.1
		global configuration	
		command to change	
		the radius server IP.	
8021x system serverport	G	Use the 802.1x	switch(config)# 8021x system
[port ID]		system server port	serverport 1812
		global configuration	
		command to change	
		the radius server port	
8021x system	G	Use the 802.1x	switch(config)# 8021x system
accountport		system account port	accountport 1813
[port ID]		global configuration	
		command to change	
		the accounting port	
8021x system sharedkey	G	Use the 802.1x	Switch(config)# 8021x system
[ID]		system share key	sharedkey 123456
		global configuration	
		command to change	
		the shared key value.	

8021x system nasid	G	Use the 802.1x	switch(config)# 8021x system
[words]		system nasid global	nasid test1
		configuration	
		command to change	
		the NAS ID	
8021x misc quietperiod	G	Use the 802.1x misc	Switch(config)# 8021x misc
[sec.]		quiet period global	quietperiod 10
		configuration	
		command to specify	
		the quiet period value	
		of the switch.	
8021x misc txperiod	G	Use the 802.1x misc	Switch(config)# 8021x misc
[sec.]		TX period global	txperiod 5
		configuration	
		command to set the	
		TX period.	
8021x misc supptimeout	G	Use the 802.1x misc	Switch(config)# 8021x misc
[sec.]		supp timeout global	supptimeout 20
		configuration	
		command to set the	
		supplicant timeout.	
8021x misc	G	Use the 802.1x misc	Switch(config)#8021x misc
servertimeout [sec.]		server timeout global	servertimeout 20
		configuration	
		command to set the	
		server timeout.	
8021x misc maxrequest	G	Use the 802.1x misc	Switch(config)# 8021x misc
[number]		max request global	maxrequest 3
		configuration	
		command to set the	
		MAX requests.	
8021x misc	G	Use the 802.1x misc	Switch(config)# 8021x misc
reauthperiod [sec.]		reauth period global	reauthperiod 3000

		configuration	
		command to set the	
		reauth period.	
8021x portstate	I	Use the 802.1x port	Switch(config)#interface
[disable reject accept		state interface	fastethernet 3
authorize]		configuration	switch(config-if)#8021x portstate
		command to set the	accept
		state of the selected	
		port.	
show 8021x	Е	Displays a summary of	Switch> show 8021x
		the 802.1x properties	
		and also the port	
		sates.	
no 8021x	G	Disable 802.1x	switch(config)# no 8021x
		function	

TFTP Commands Set

Commands	Level	Description	Defaults Example
backup	G	Save configuration to	Switch(config)# backup
flash:backup_cfg		TFTP and need to	flash:backup_cfg
		specify the IP of TFTP	
		server and the file name	
		of image.	
restore	G	Get configuration from	Switch(config)# restore
flash:restore_cfg		TFTP server and need to	flash:restore_cfg
		specify the IP of TFTP	
		server and the file name	
		of image.	
upgrade	G	Upgrade firmware by	Switch(config)#upgrade
flash:upgrade_fw		TFTP and need to	flash:upgrade_fw
		specify the IP of TFTP	
		server and the file name	

	of image.	

SystemLog, SMTP and Event Commands Set

Commands	Level	Description	Example
systemlog ip	G	Set System log server	Switch(config)# systemlog ip
[IP address]		IP address.	192.168.1.100
systemlog mode	G	Specified the log	switch(config)# systemlog mode
[client server both]		mode	both
show systemlog	E	Displays system log.	Switch> show systemlog
show systemlog	Р	Show system log	switch# show systemlog
		client & server	
		information	
no systemlog	G	Disable systemlog	switch(config)# no systemlog
		functon	
smtp enable	G	Enable SMTP function	switch(config)# smtp enable
smtp serverip	G	Configure SMTP	switch(config)#smtp serverip
[IP address]		server IP	192.168.1.5
smtp sender	G	Configure sender of	switch(config)# smtp snder
[sendername]		mail	aaa@bbb.com
smtp authentication	G	Enable SMTP	switch(config)# smtp
		authentication	authentication
smtp account	G	Configure	switch(config)# smtp account
[account]		authentication account	John
smtp password	G	Configure	switch(config)#smtp password
[password]		authentication	1234
		password	
smtp rcptemail	G	Configure Rcpt e-mail	switch(config)#smtp rcptemail 1
[Index] [Email address]		Address	Alert@test.com
show smtp	Р	Show the information	switch# show smtp
		of SMTP	
no smtp	G	Disable SMTP	switch(config)# no smtp
		function	

event device-cold-start	G	Set cold start event	switch(config)#event device-cold-
[Systemlog SMTP Both]		type	start both
event authentication-	G	Set Authentication	switch(config)# event
failure		failure event type	authentication-failure both
[Systemlog SMTP Both]			
event ring-topology-	G	Set Ring topology	switch(config)# event ring-
change		changed event type	topology-change both
[Systemlog SMTP Both]			
event systemlog		Set port event for	switch(config)# interface
[Link-UP Link-		system log	fastethernet 3
Down Both]			switch(config-if)#event systemlog
			both
event smtp	I	Set port event for	switch(config)#interface
[Link-UP Link-		SMTP	fastethernet 3
Down Both]			switch(config-if)#event smtp both
show event	Ρ	Show event selection	switch# show event

Fault Relay Alarm Commands Set

Commands	Level	Description	Example
faultrelay power	G	Configure Relay Alarm	switch(config)#faultrelay power 1
		for Power Failure	
faultrelay	I	Configure Relay Alarm	switch(config)#interface
[enable disable]		for Port Link	fastethernet 3
		Down/Broken	switch(config-if)#faultrelay enable
no faultrelay	G	Disable Fault Relay	switch(config)# no faultrelay
		Alarm Function	

SNTP Commands Set

Commands	Level	Description	Example
sntp enable	G	Enable SNTP function	switch(config)# sntp enable
sntp daylight	G	Enable daylight saving	switch(config)#sntp daylight
		time, if SNTP function	
		is inactive, this	
		command can't be	
		applied.	
sntp daylight-period	G	Set period of daylight	switch(config)# sntp daylight-
[Start time] [End time]		saving time, if SNTP	period 20060101-01:01
		function is inactive,	20060202-01:01
		this command can't be	
		applied.	
		Parameter format:	
		[yyyymmdd-hh:mm]	
sntp daylight-offset	G	Set offset of daylight	switch(config)#sntp daylight-
[Minute]		saving time, if SNTP	offset 3
		function is inactive,	
		this command can't be	
		applied.	
sntp ip	G	Set SNTP server IP, if	switch(config)#sntp ip 192.169.1.1
[IP]		SNTP function is	

		inactive, this	
		command can't be	
		applied.	
sntp timezone	G	Set timezone index,	switch(config)#sntp timezone 22
[Timezone]		use "show sntp	
		timzezone" command	
		to get more	
		information of index	
		number	
sntp sync-interval	G	Set synchronization	switch(config)#sntp sync-interval
[Secs]		interval	64
show sntp	Р	Show SNTP	switch# show sntp
		information	
show sntp timezone	Р	Show index number of	switch# show sntp timezone
		time zone list	
no sntp	G	Disable SNTP function	switch(config)# no sntp
no sntp daylight	G	Disable daylight	switch(config)# no sntp daylight
		saving time	

Ring Commands Set

Commands	Level	Description	Example
ring enable	G	Enable Ring	switch(config)#ring enable
ring master	G	Enable ring master	switch(config)#ring master
ring couplering	G	Enable couple ring	switch(config)#ring couplering
ring dualhoming	G	Enable dual homing	switch(config)#ring dualhoming
ring ringport	G	Configure 1st/2nd	switch(config)#ring ringport 7 8
[1st Ring Port] [2nd		Ring Port	
Ring Port]			
ring couplingport	G	Configure Coupling	switch(config)#ring couplingport
[Coupling Port]		Port	1
ring controlport	G	Configure Control Port	switch(config)#ring controlport 2
[Control Port]			

ring homingport	G	Configure Dual	switch(config)#ring homingport 3
[Dual Homing Port]		Homing Port	
show ring	Р	Show the information of Ring	switch# show ring
no ring	G	Disable Ring	switch(config)#no ring
no ring master	G	Disable ring master	switch(config)# no ring master
no ring couplering	G	Disable couple ring	switch(config)# no ring
			couplering
no ring dualhoming	G	Disable dual homing	switch(config)# no ring
			dualhoming

PoE Commands Set

Commands	Level	Description	Example
рое	Р	Enter POE configure mode	switch# poe
system knockoff-	Р	Set PoE system Port	switch(poe)# system knockoff-
disabled		Knockoff Disabled	disabled disable
[Enable Disable]			
system ac-disconnect	Р	Set PoE system AC	switch(poe)# system ac-
[Enable Disable]		Disconnect	disconnect disable
system capacitive-detect	Р	Set PoE system	switch(poe)# system capacitive-
[Enable Disable]		Capacitive Detection	detect enable
port [PortNumbers] state	Р	Set PoE port State	switch(poe)# port 1 state disable
[Enable Disable]			
port [PortNumbers] plfc	Р	Set PoE port Power	switch(poe)# port 1 plfc enable
[Enable Disable]		Limit from	
5 I 4		Classification	
port [PortNumbers]	Р	Set PoE port Legacy	switch(poe)# port 1 legacy enable
legacy [Enable Disable]			
port [PortNumbers]	Р	Set PoE port Priority	switch(poe)# port 1 priority high
priority			
[Low High Critical]			

port [PortNumbers]	Р	Set PoE port Power	switch(poe)# port 1 powerlimit
powerlimit [Value]		Limit Value	15300
show poe	Р	Show setting of PoE function	switch# show poe
