Purpose of the Media Guide

The purpose of this media guide is to educate our customers on basic paper characteristics, paper handling, general precautions, and proper storage as related to our MFP and printer products. Use this media guide to help select the best media appropriate for your general office use, marketing brochure or collateral, booklet, or any other graphic art output.

We also offer recommended media by product that can be ordered directly from Konica Minolta to ensure high quality printing and desired machine performance. Not all media recommended within this guide can be ordered directly through Konica Minolta, you must contact the manufacturer to purchase the media.

Disclaimer

As an aid to end-users of Konica Minolta MFP and printer products, Konica Minolta Business Solutions U.S.A. Inc. (KMBS) has performed testing on certain media that may be printed by Konica Minolta's products. Based solely on such testing, KMBS has found that the products listed have functioned properly using the media listed during the course of testing. However, KMBS can give no assurances based upon such testing that the listed media will perform for any particular end-user's product, and KMBS disclaims any warranty, express or implied, to such effect.

KMBS recommends that each end user consult with its servicing dealer both to confirm that use of any listed media with the end user's product will not affect any servicing agreement with such dealer, and that the product is maintained in the appropriate environmental and other conditions stated in the product's operator's manual so as to optimize the possibility for replicating the results achieved in KMBS testing. This guide does not constitute an endorsement of the listed media, and there may be other media that enable the listed products to function properly.

Please note that the print media listed has been tested and approved for use in MFP and printers sold in the Americas only. Using certain media may affect fuser yield life.

For complete overview on product usage, please refer to the product's user manual.

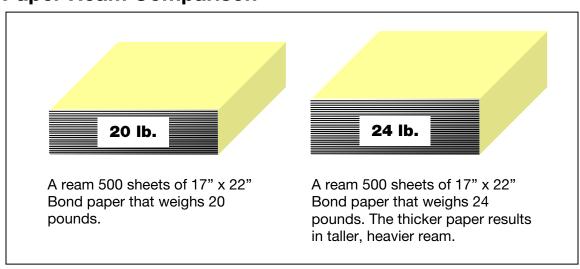

Paper Basis Weight

The basis weight refers to the weight in pounds of 500 sheets of paper when it has been cut to that paper's standard basic size. For example the basic size for Bond paper is 17 x 22 inches. If 500 sheets (a ream) of Bond is cut to its basic size of 17 x 22 inches and weighs 20 pounds, it is classified as 20 lb. bond. If a 17 x 22" ream of Bond paper weighed 24 pounds it would be called 24 lb. Bond, and so on. The chart below contains some common paper types and their basic size.

Paper Type	Basic Size
Bond	17" x 22"
Ledger	17" x 22"
Offset	25" x 38"
Book	25" x 38"
Cover	20" x 26"
Index Bristol	25-1/2" x 30-1/2"
Vellum Bristol	22-1/2" x 28-1/2"
Printing Bristol	22-1/2" x 28-1/2"
Tag / Newsprint	24" x 36"

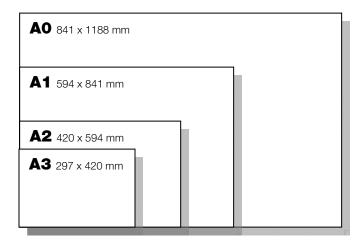

Paper Ream Comparison

ISO Size Standards

The International Organization for Standardization (ISO) has established standards for paper sizes based on the metric system (millimeters). The standards have been grouped into three different series of requirements: "A-series", for general printing, "B-series", for posters, and "C-series", for envelopes, postcards, and folders. The "A" series is the most commonly used with sizes ranging from A0, which is the largest, down to A8.

The A-series sizes are all represented as a part of the area of one square meter with a length to width ratio of 1.414. The size A0 is equivalent to the area of a square meter with each smaller size being 50% of the size of the preceding one. A1 is 50% of the area of A0, A2 is 50% of A1, and so on. Another way to look at it is that when an A0 sheet is cut in half, two A1 sheets are produced, and when an A1 sheet is cut in half, two A2 sheets are produced. Some of the sizes for the A-series are shown in the illustration below.

Sheets Sizes based on ISO Standards

In the metric system, paper is based on the weight of 500 sheets of paper that measures one square meter. This measurement is known as g/m² or grams per square meter.

North American Size Standards

Although the ISO size standards are common in many parts of the world where the metric system is the established standard for measurement, North American sheet sizes are based on inches and are shown in the illustration below.

Sheets Sizes based on North American Standards

Some paper manufacturers specify their paper on a thousand-sheet basis. The label may state something like " $25 \times 38 - 140$ M". This refers to book grade paper (based on basis size), weight of 140 pounds with the "M" standing for 1000 sheets. Since we commonly refer to paper based on basis weight of 500 sheets, this would equate to 70 lb. book stock. The 140M is 140 pounds for 1,000 sheets - divide by 2 and you have 70 lb. for 500 sheets.

Paper with specifications similar to "24/60 lb. (90 g/m²)" refers to a 24 lb. bond or 60 lb. book grade paper. Refer the paper weight conversion chart on page 10.

Common Paper Sizes in North America

Domestic		inches

Items highlighted are industry standard basis weights.

Paper Characteristics

Paper Grades

Paper grade define the use of the paper, and usually its purpose is suggested by its name. The most common grades are outlined below.

Bond

This is the most common type of paper used in a business environment. Bond papers are used for standard forms and business letters. Bond paper readily accepts ink from laser printers, inkjets, typewriters and writing pens.

Cover

As the name implies, this grade of paper is generally used for making covers for booklets. Cover stock can be purchased as coated and non-coated, textured and with finishes range from antique to smooth.

Bristol

Bristol is considered a board grade. It's very receptive to inks, has good snap and resilience - in other words - stiff.

Index

Index is commonly used as a cheap substitute to a good quality stiff paper, and is available in smooth and vellum finishes.

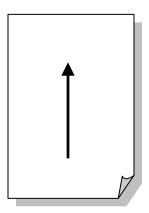

Book

As implied by its name, this grade of paper is used for textbooks as well as general printing.

Paper Grain

_ _ _ _ _ _ _ _ _ _ _ _ _ _ _

The grain of the paper refers to the direction of the fibers in a sheet of paper. Long grain paper refers to paper in which the fibers run in the same direction as the longest measurement of the paper. Short grain paper refers to paper in which the fibers run in the same direction as the shortest measurement of the paper. When paper is torn, it will tear easier and straighter when torn parallel with the grain. It will also fold easier parallel to the grain and produce a cleaner fold than if folded across the grain. Laser printers require long grain paper for the best results. Short grain paper may not feed properly into a laser printer and the heat produced by a laser printer may result in the sheets curling as they come out of the printer.

Long grain direction on an 8.5" x 11" sheet

Paper Characteristics

Paper Finish

The finish refers to the surface characteristics of the paper such as how the paper feels...is it smooth such as glossy cover or rough with an antique finish? Does the paper have a shiny appearance such as coated glossy papers or is it dull like bond paper. Does the paper enhance the look of the printed piece similar to watermarked paper or is it purely functional like newsprint?

Finishes can be applied to paper during the manufacturing process or produced offline. A finish such as Laid can be created while it is being manufactured with the use of a marking roller that forms the pattern in the paper while it is still wet. Not all of these finished types of media are commonly imaged through MFP and printers. Typically Gloss or Matte finished media are imaged on MFP and printers.

- Cockle A cockle finish simulates characteristics of hand made paper with a wavy, rippled, puckered finish. The effect is obtained by air drying the paper under minimum tension.
- **Felt** Felt is a soft texture on uncoated paper that is created during the papermaking process with a either felt covered roller or with a rubber roller with a felt pattern that creates the finish. It can also be accomplished as an offline process. The felt finish does not affect the strength of the paper.
- Gloss A gloss finish produces a shiny and reflective surface on one or both sides of certain coated papers. A higher gloss is usually seen on higher quality coated papers. The gloss finish is produced from compounds added during the paper making process.
- Laid A laid finish has the appearance of translucent lines running horizontally and vertically in the paper. It is produced during the papermaking process with a special roller that creates the pattern in the wet paper.
- **Linen** Linen finished paper resembles linen cloth and is usually produced after the papermaking process as an offline embossing process.
- **Matte** A finish on certain coated papers that is smooth but gives a dull appearance. A matte finish, as well as other types of coated paper, are good choices for print jobs in which high quality is required.
- **Parchment** A paper finish that has an old or antique appearance and is the result of washing sulfuric acid over the paper and then quickly neutralizing the acid wash. This process melts the outer paper fibers which fill the voids in the rest of the paper. Parchment is very durable and grease resistant.
- **Smooth** A smooth finish is the result of the paper passing through sets of rollers during the papermaking process. This process is known as calendering.
- **Vellum** A vellum finish has an eggshell appearance and is consistent and even but not as much as a smooth finish. Vellum is one of the most popular uncoated finishes and paper with this finish has a high ink absorbency rate.
- **Wove** An even finish in uncoated paper with a slight texture made by a felt roller covered in woven wire.

Paper Characteristics

Whiteness

The whiteness of paper is the measure or its ability to reflect the colors of light equally. The more evenly a paper reflects all colors of the spectrum, the whiter the sheet. Some papers may reflect slightly cool colors back to our eyes and give the illusion that the sheet is actually brighter than white paper. If white paper has a slight warm appearance it will not appear as bright as a sheet that reflects a cool color, however warm colors printed on a warm sheet will appear stronger than when printed on a cool sheet. Cool colors printed on a cool white sheet are also enhanced in the same way. There is no such thing as a pure white sheet of paper, since the white that we see is always influenced by the lighting of our environment and the reflections from surrounding objects.

Brightness

Brightness refers to the percent of light reflected back from a sheet of paper as measured by a light meter reading. Contrast is reduced and highlights are not as strong when paper with a lower brightness is used for a printed piece. The quality and brightness of paper is organized into six categories:

Paper Brightness						
Premium	88.0 to 95.0 Brightness					
Number 1	85.0 to 87.9 Brightness					
Number 2	83.0 to 84.9 Brightness					
Number 3	79.0 to 82.9 Brightness					
Number 4	73.0 to 78.9 Brightness					
Number 5	72.9 and below					

Acidity/Alkalinity

.

The pH (potential for Hydrogen) measurement of paper determines the degree of acidity and alkalinity in the stock. The pH scale has readings of 0 to 14 with 7 being neutral. Readings below a pH of 7.0 are acidic and above are alkaline. Each single digit actually equals a measure of 10, so a stock measuring 4.0 pH is 20 times more acidic than one measuring 6.0 pH. Paper can have an acid base, an alkaline base or it can be neutral with a pH of 7. Most paper manufactured in the 20th century was of an acid base. Acidic papers deteriorate in a relatively short period of time, and should never be used for printed items that are intended to last for many years. Since the 1970's, most of the paper used for book publishing and other printed materials where permanence is of importance, has been alkaline paper, which lasts much longer than acid based paper. Alkaline paper is manufactured with fillers such as calcium carbonate, which bring the pH above 7. An acidic paper like newsprint has a pH around 4.5 which becomes lower once it is printed. The acid level tends to break down the paper and it can deteriorate rapidly, which is why newspapers tend to yellow and fall apart in time. Alkaline paper (a pH above 7) is said to be permanent, but papers that have a neutral pH are still best for preserving items like photographic albums and as matte boards for artwork.

General Precautions for Paper Usage

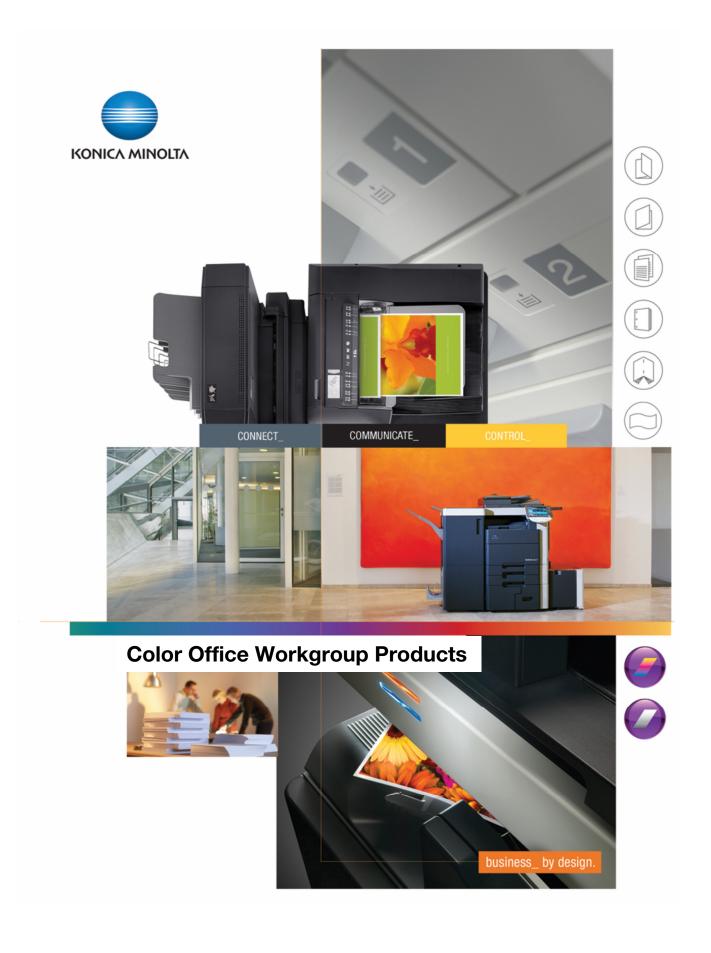

The following types of paper should not be used, otherwise decreased print quality, paper misfeeds or damage to the MFP or printer may occur:

- Overhead projector transparency that have already been fed through the machine (even if the transparency is still blank)
- Paper that has been printed on by a heat-transfer printer or an inkjet printer
- Paper that is either extremely thick or extremely thin
- Folded, curled, wrinkled, or torn paper
- Paper that has been left unwrapped for a long period of time
- Damp paper, perforated paper, or paper with punched holes
- Extremely smooth, extremely rough paper, or paper with an uneven surface
- Paper that has been treated, such as carbon-backed, heat-sensitive or pressure-sensitive paper
- Paper that has been decorated with foil or embossing
- Paper of a non-standard shape (not rectangular)
- Paper that is bound with glue, staples or paper clips
- Paper with labels attached
- · Paper with ribbons, hooks, buttons, etc. attached

Paper Storage

Observe the following precautions when storing the paper:

- Store paper in a cool, dark location with little humidity.
- If humidity is a problem, then paper should be plastic wrapped.
- Allow paper to adjust to any extreme temperature or humidity changes before using.
- If the paper becomes damp, paper misfeeds may occur. Paper that has not been loaded should be kept wrapped or placed in a plastic bag and stored in a cool, dark location with little humidity.
- Store the paper laying flat, not standing on its edge. Curled paper may cause paper misfeeds.

^{*}Note T-Shirt Transfer Paper: This paper should not be solely used in the copier and should only be used on a limited basis (250 sheets per run maximum). Also, pay particular attention if a misfeed occurs in the fuser section of the copier. It should be removed immediately (due to odor) and then 15-25 sheets of regular (20lb bond) paper should be run to clean the fusing rollers. Also cannot be used in high humidity environments.

.

^{*}Note T-Shirt Transfer Paper: This paper should not be solely used in the copier and should only be used on a limited basis (250 sheets per run maximum). Also, pay particular attention if a misfeed occurs in the fuser section of the copier. It should be removed immediately (due to odor) and then 15-25 sheets of regular (20lb bond) paper should be run to clean the fusing rollers. Also cannot be used in high humidity environments.

Media Testing and Support

Konica Minolta Business Solutions U.S.A. will conduct media testing for MFP and Printer products at a cost to the dealer, branch or VAR.

How to request media testing:

Talk to your technical support manager to place a service ticket with Technical Support/SSD to start the process.
