X-TAPI

About Phone Control

With X-TAPI you get the most popular SIP softphone in the world with an own TAPI TSP (Telephony Service Provider) and a TAPI (Telephony Advanced Programmers Interface) Client Interface solution. All applications that support TAPI, such as Sage Small Business Solutions, ACT!, CD Phonebooks, Microsoft Exchange, Microsoft Outlook and a lot of PBX and most CRM software solutions, are compatible with X-Pro TAPI.

TAPI is used by millions of corporate computer users. It is one of the most important interfaces in Microsoft Windows Communication Management. Now you are able to make calls easier as anytime before. You can make outgoing calls with a simple click on a contact in your favorite customer relationship management software. X-TAPI comes with its own tailored Telephony Service Provider. No additional third party solutions are not needed to interface with your customer relationship management software or hardware application.

Outgoing, as well as incoming calls are supported. An incoming call signals your CRM software with TAPI interface that there is a new call. Most CRM solutions display a popup window with the contact information off the callee. With X-TAPI you can now use SIP communication also with professional corporate software in the best quality.

X-Pro TAPI consists of three components:

- X-PRO (Xten's award-winning SIP softphone)
- TAPI-Driver (Telephony Service Provider)
- PhoneControl (Control software with user interface)

Please note that you can only use the TAPI features mentioned above with X-TAPI. Already installed versions of X-PRO and/or X-Lite do not provide these features. You can although use an already existing configuration of your Xten software. Please see „First Start“.

System requirements

Minimal requirements

- PC, Pentium II - CPU 266 MHz or higher
- 64 MB RAM
- 10 MB free disk space
- Windows NT/XP/2000 or Windows Me/98(Vers.2)
- Internet access (min. modem 56k or better)

Recommended configuration

- PC, Pentium III - CPU 1000 MHz or higher
- 256 MB RAM
- 10 MB free disk space
- Windows NT/XP/2000
- Internet access (flatrate, T1, xDSL)

Installation

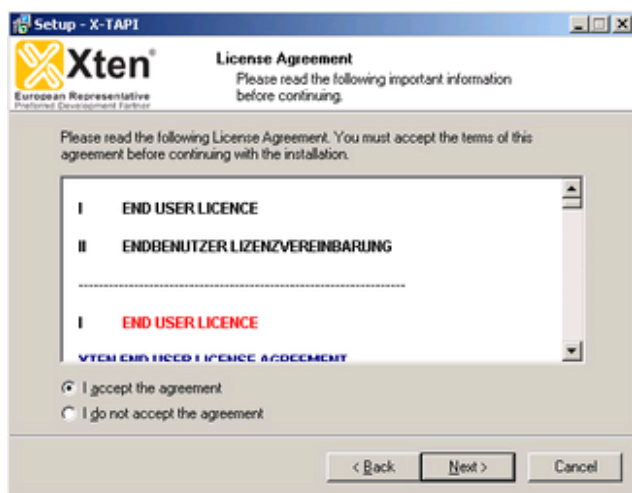

XProTAPI_ger.exe

Please execute the „X-TAPI“ Setup file. The Setup will start and the Setup assistant will help you to install X-TAPI on your computer.

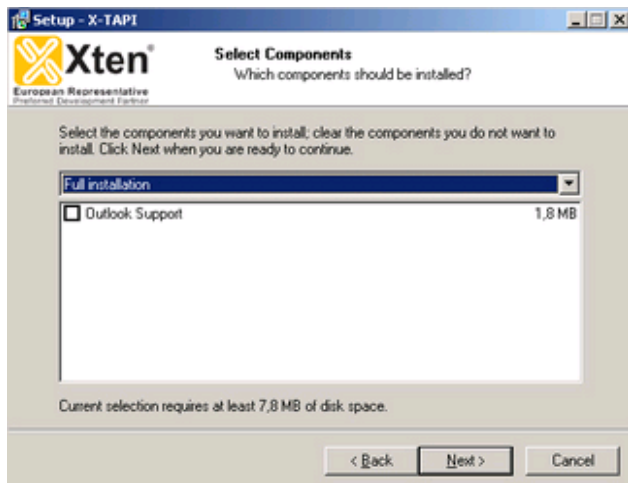

After starting setup.exe, click at "NEXT" to proceed to the license page.

Please read and accept the end user licence by marking "I accept the agreement" and press the then clicking at "Next".

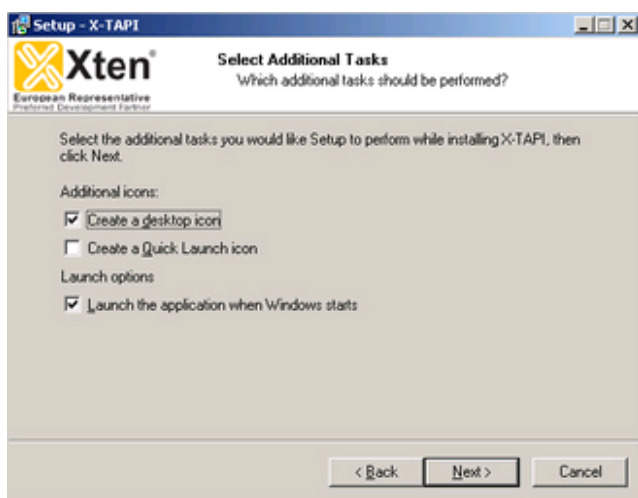

These windows display build information of the software and the default install path of X-TAPI. If you want to choose a different path, press the "BROWSE" button.

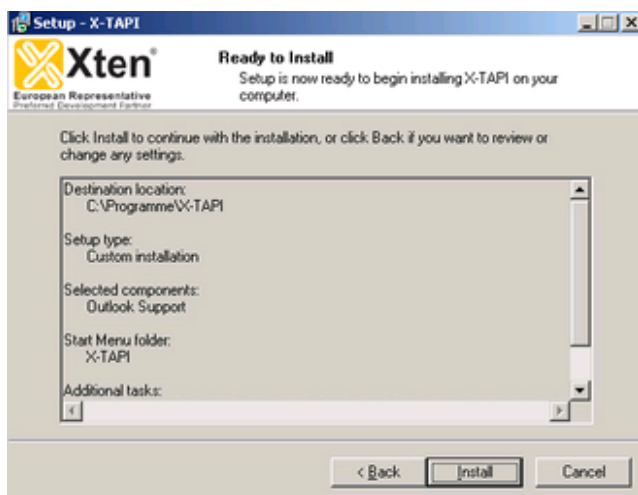

If you want to use the Outlook Add In then mark the checkbox and click "Next"

The Outlook Add-In installs automatically. You need only to restart Outlook to get the new features. All options are preconfigured and you don't need to configure it by yourselves.

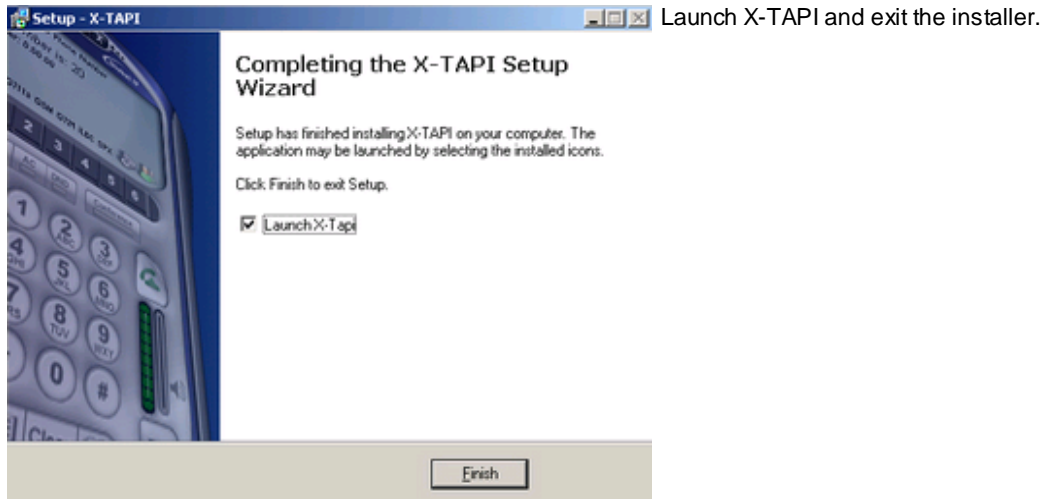

Press "NEXT" and choose now a different Folder name of X-TAPI if you want.

By clicking "NEXT" again you can set the autostart function when windows start and you set if the setup shall make desktop or quick launch icons.

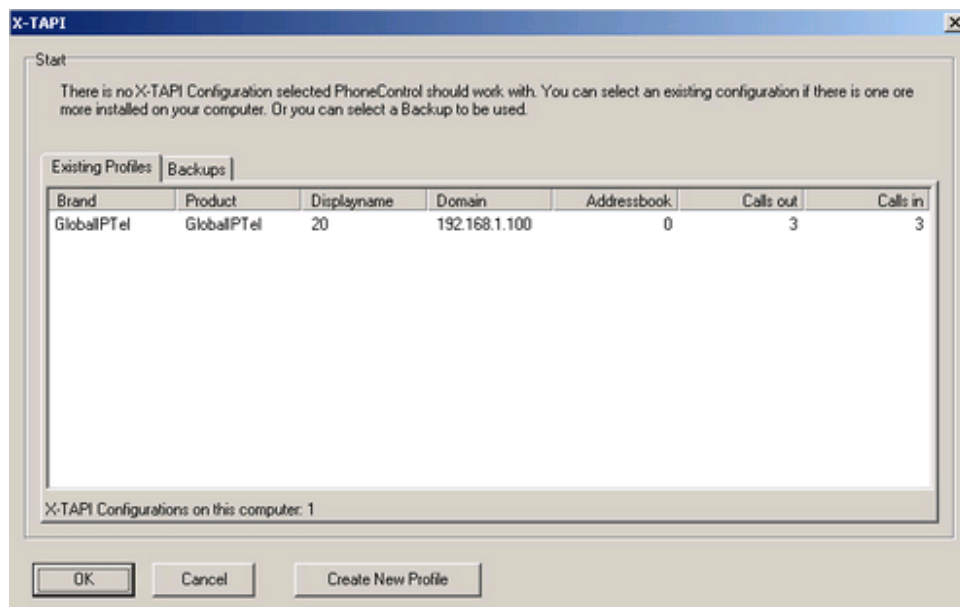

Clicking at the "NEXT" button finally installs X-TAPI.

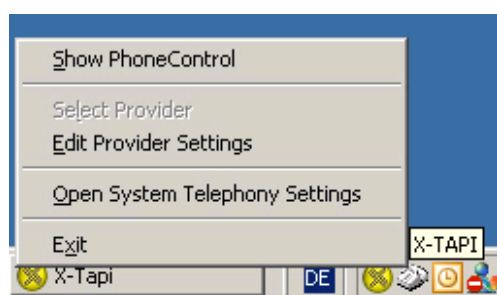

The beginning

First steps

When launching X-TAPI for the first time, you will be asked to choose a configuration for X-PRO. Already existing configurations of X-PRO will be listed at the tab „Existing Profiles“. X-PRO configuration backups can be found on the „Backups“ tab if there are any. If you do not have one of these options or if you do not want to use them, please click at the „Create New Profile“ button. A new profile will be created and X-TAPI will ask you to enter all necessary settings after the program has been started

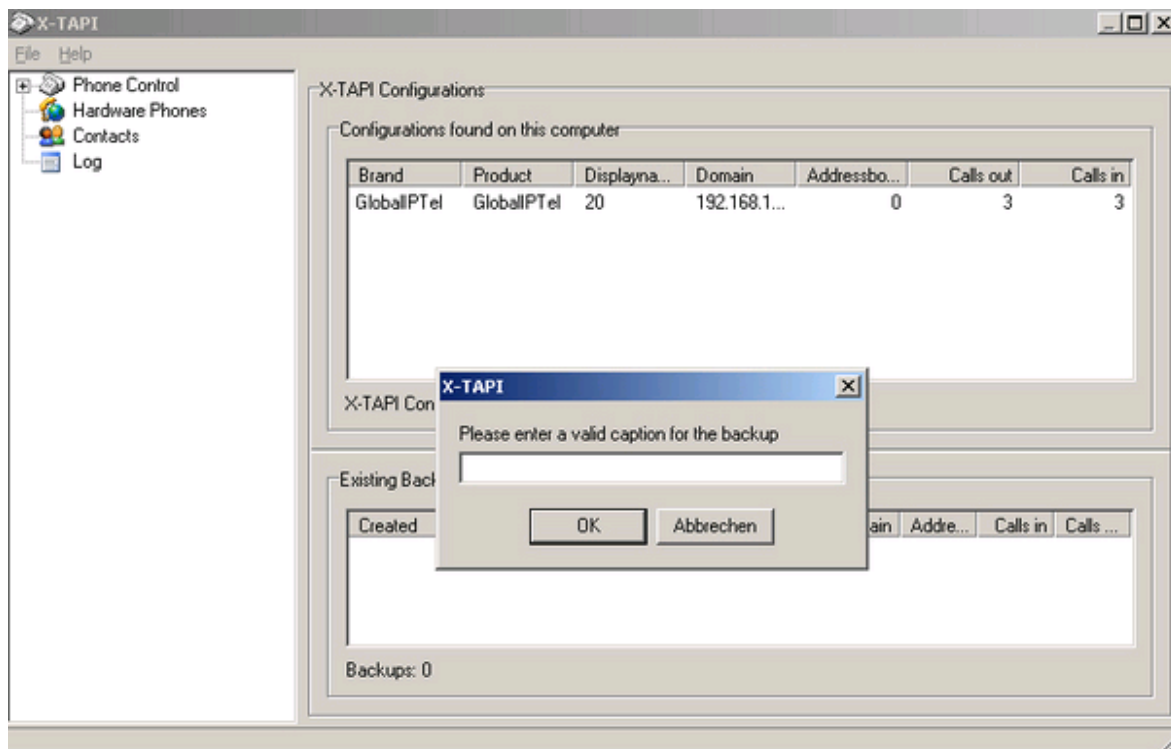

After the application has been started correctly, the X-TAPI control panel (PhoneControl) can be found in the system tray at the lower right corner of the screen. It launches a new instance of the X-PRO softphone. By clicking at the phone icon, a menu appears from which you can change or modify the provider settings. Furthermore you can open PhoneControl or the system phone settings or exit the program.

Create and restore backups

The menu item „X-PRO Configs“ provides a very convenient way to create backups of settings of the X-Pro softphone. Please note that the ini file which is located in the installation folder of X-TAPI must be saved prior to uninstalling this software in order to keep all backed up settings.

You can store a well-working configuration of the X-TAPI softphone at a click of the right mouse button. Restauration of settings is also very easy. This function is very useful when testing new SIP proxies because there is no risk to loose working settings.

Please note that all shown settings and configurations in the following description are only examples!

In order to save a existing configuration, please select "X-TAPI Configs" in the tree menu. In the window on the right side there are all existing X-Pro configurations on your computer listed. By clicking at the right mouse button, a context menu pops up. It contains the following options:

- Make backup... Creates a backup of the selectet settings.
- Set as default profile Makes the highlighted profile the default profile.
- Delete Deletes the highlighted profile.

The active standard profile appears with bold characters.

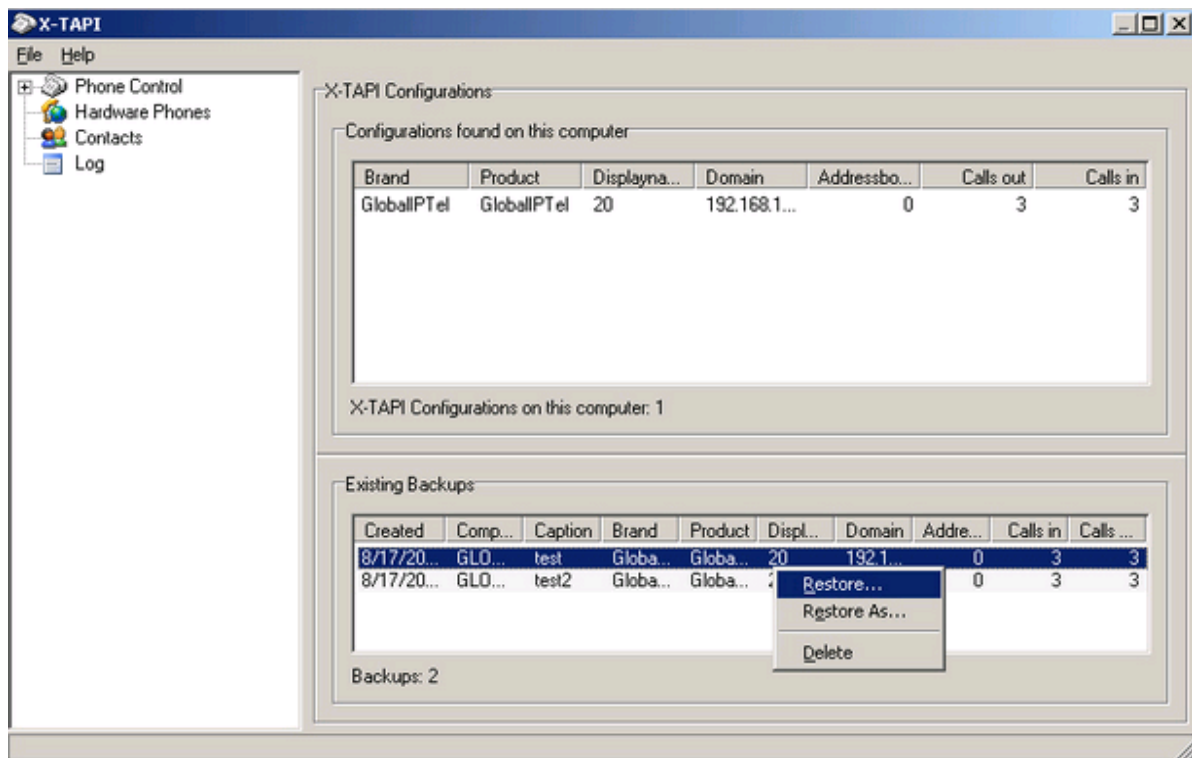

When choosing the option "Make backup...", you will be asked for the name of this profile backup.

Subsequently the backup is created. A progress bar informs about the status while the backup is created. After the backup has been created, a new entry with the previously selected name is displayed in the right window.

If you want to restore the backup, simply move the cursor to the backup that is to be restored and click the right mouse button. A context menu with the following options will pop up:

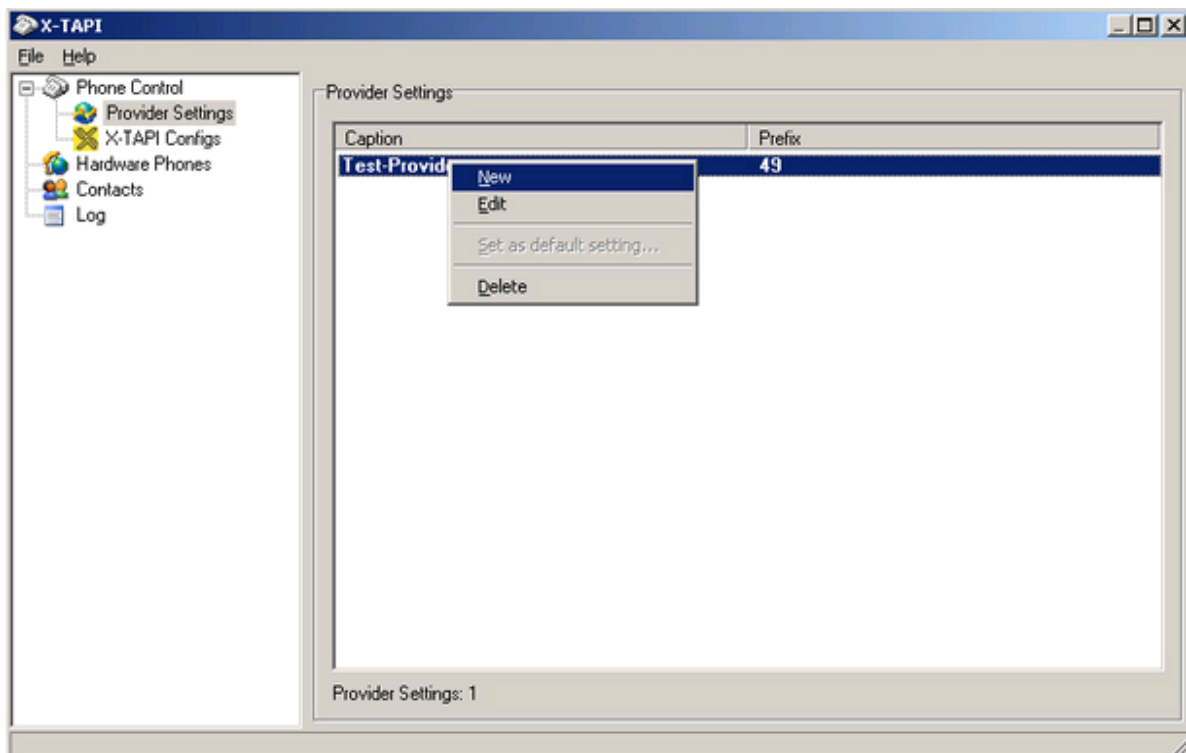

- Restore... Restores the selected backup and restarts X-TAPI
- Restore as... reserved for future extensions
- Delete Deletes the selected backup

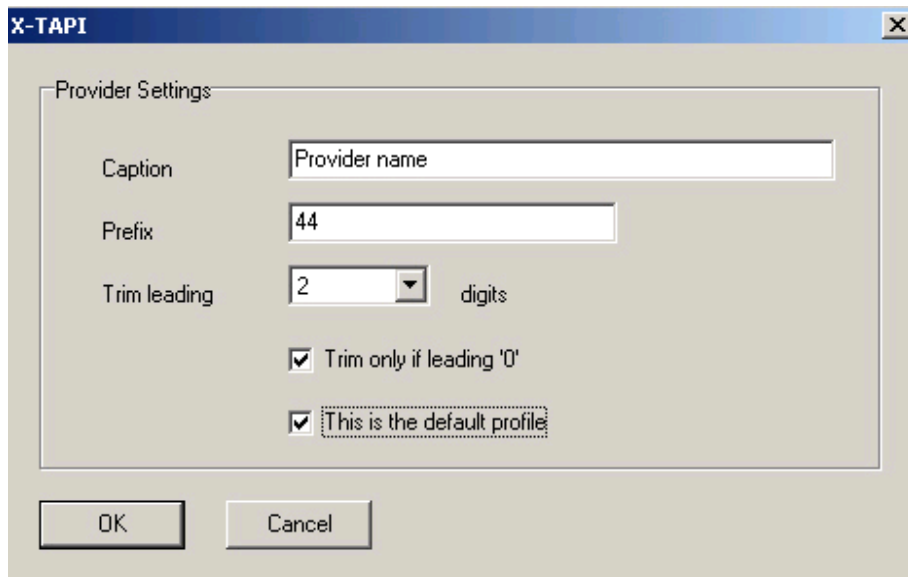

Control and exchange profiles

The X-TAPI control and dial plan profiles can be edited in the „Provider Settings” menu. You can add new settings, edit and delete settings and the active profile is defined here. In the right window you see all settings you have made in past. To change the settings please hit the right mouse button for the context menu.

- New Creates a new entry
- Edit Edit a selected entry
- Set as default setting Marked settings will be set as default setting.
- Delete Deletes a selected entry.

The "Edit" submenu instructs X-API to apply a certain dial plan. As an example, a SIP proxy might need to remove a few leading characters and add an exit code (prefix) in order to be able to translate entries in a phone book into the notation of the SIP proxy for outbound calls.

The image shows a dialog box titled "X-TAPI" with a close button in the top right corner. Inside the dialog, there is a section titled "Provider Settings" which contains the following fields and options:

- Caption:** A text input field containing the text "Provider name".
- Prefix:** A text input field containing the number "44".
- Trim leading:** A dropdown menu showing the number "2", followed by the text "digits".
- Trim only if leading '0'
- This is the default profile

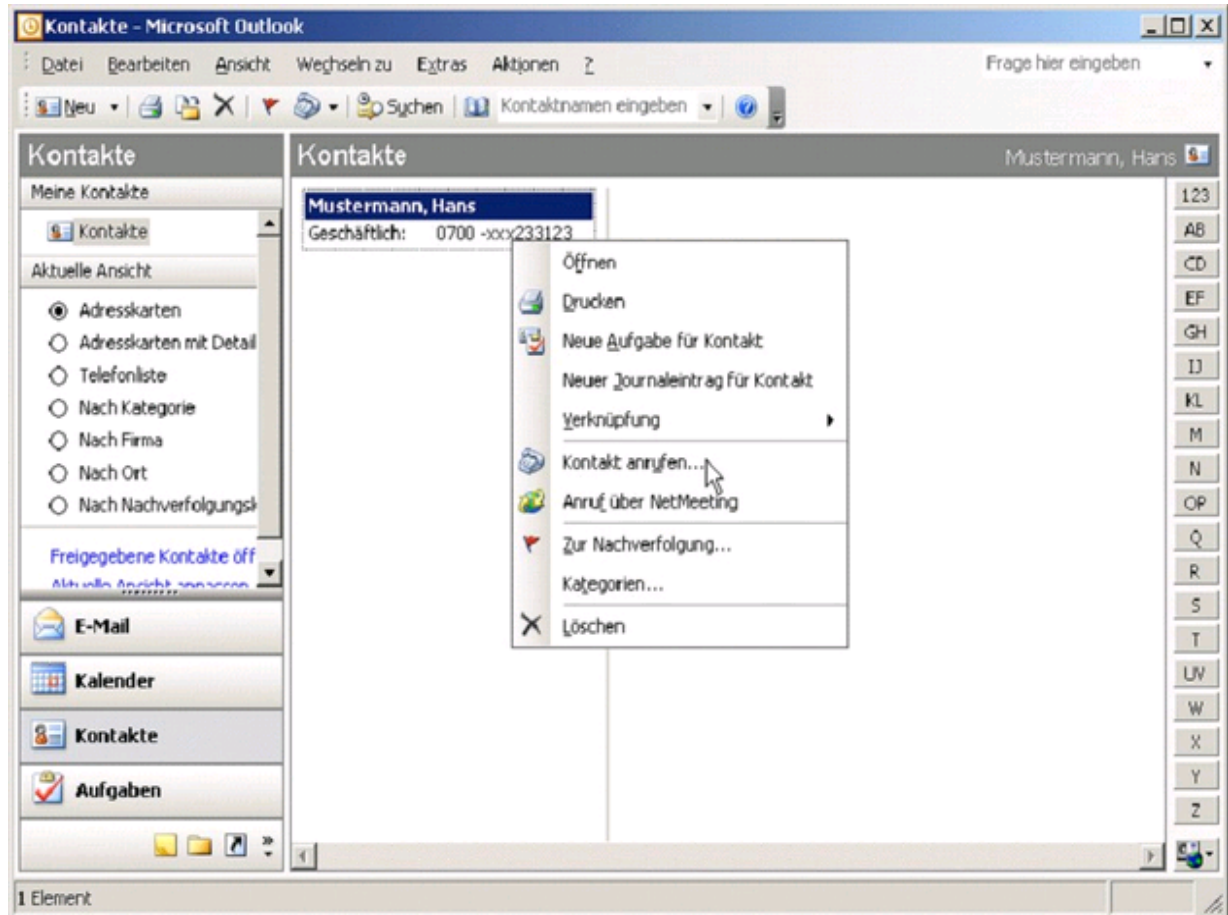

At the bottom of the dialog, there are two buttons: "OK" and "Cancel".

Outgoing calls out of TAPI supporting applications

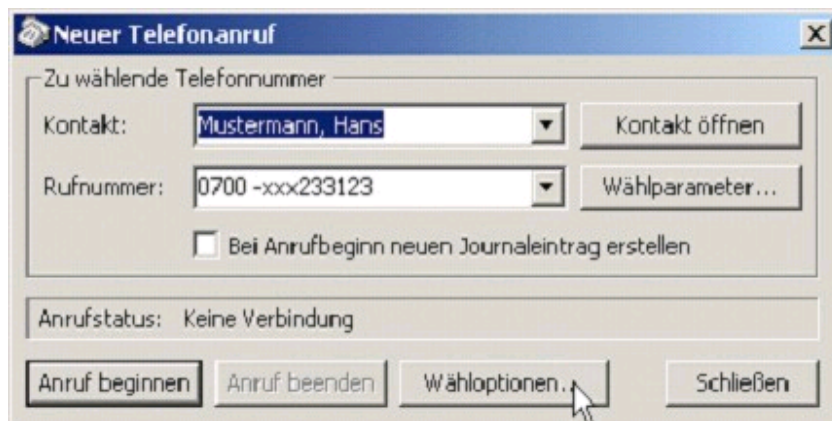

Example: Outlook 2003

Please launch Microsoft Outlook 2003 and make sure that the control panel of X-TAPI (PhoneControl) is running.

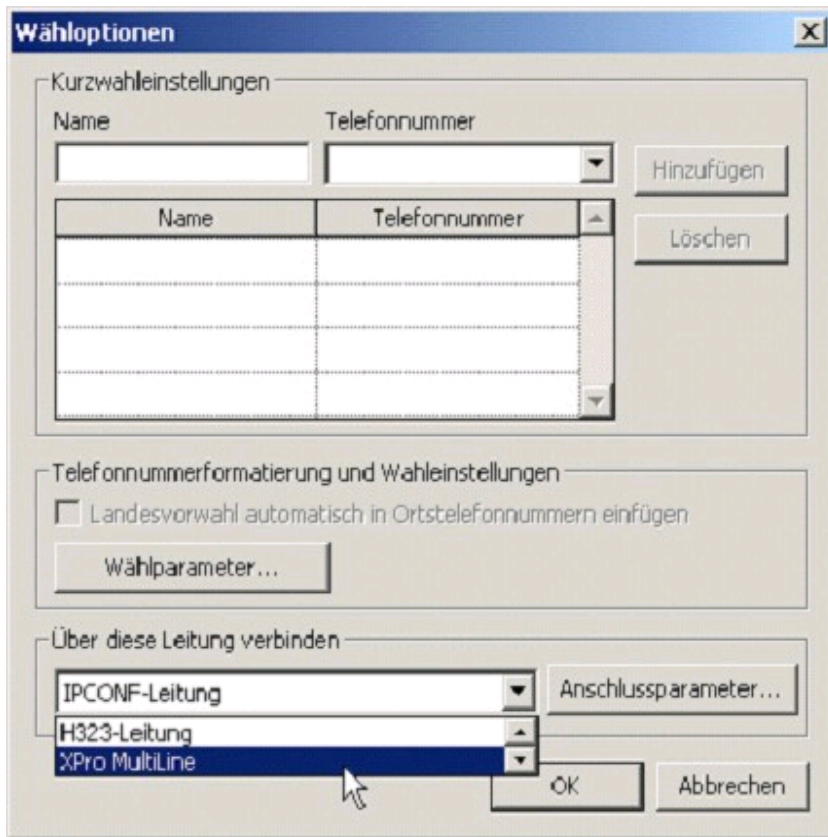

Select a contact within Outlook. Place the call by selecting „Call contact...“ from the context menu that opens when a contact is highlighted and the right mouse button is clicked at.

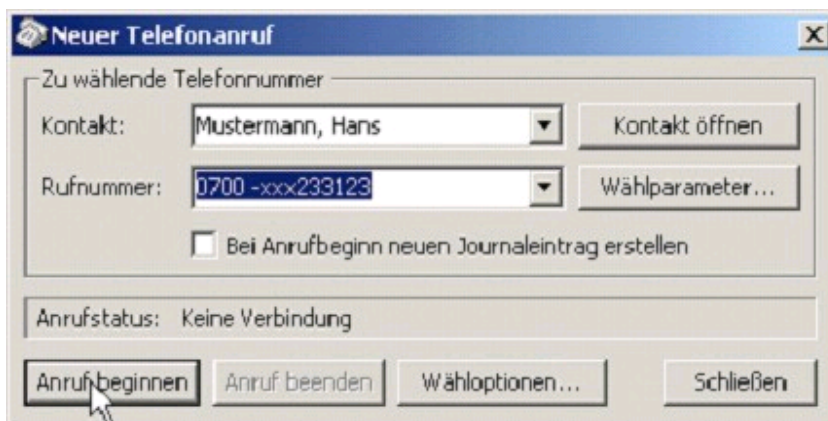

The dialog window named „New Call“ pops up. Press the “Dial options” button.

Another new dialog appears. Please select „X-PRO MultiLine“ from „Connect by this line“ and close the window by clicking „OK“.

You can then initiate the call by clicking at „Make call“. You can end the call by clicking at „Terminate call“ or alternatively by clicking at the red hang-up button in the X-TAPI user interface.

2nd example: Windows Dialer

Start Windows Dialer (dialer.exe). Select „X-PRO MultiLine“ from the options menu. Now you can start and terminate calls with the dialer.

The Windows Dialer (dialer.exe) is a standard application, which is installed with every Windows operating system. In case that you cannot find or start the dialer from the Programs menu, please refer to the following steps:

1. Click „Start“ at the task bar.
2. Choose „Execute...“
3. Enter dialer.exe and click „OK“

Many applications use Windows Dialer for making calls.

We have not included screenshots of Windows Dialer as the software may appear differently with your version of the operating system.

Incoming calls from TAPI supporting applications

From X-TAPI recognized calls are signaled by our TSP (Telephony Service Provider) automatically to all other TAPI supporting applications (Outlook Plugin, CRM Software).

Third party applications are using our information to open contact windows or notice forms. Please take a look into the user manual of your third party application if it supports TAPI and how you can configure it.

Start PhoneControl with Windows

If you want to run PhoneControl with Windows startup you can check „Start with Windows“. Please use this way and do not create a link within AutoStart.

Language support with PhoneControl

If you want to run the X-TAPI control panel when the operating system boots, please check „Start with Windows“.

The current version of X-TAPI only supports the English language.

Register X-TAPI

When purchasing the software from the online shop at www.globaliptel.com or at www.xten.de, you get an eMail with the registration key that is required for calls that are longer than 40 seconds.

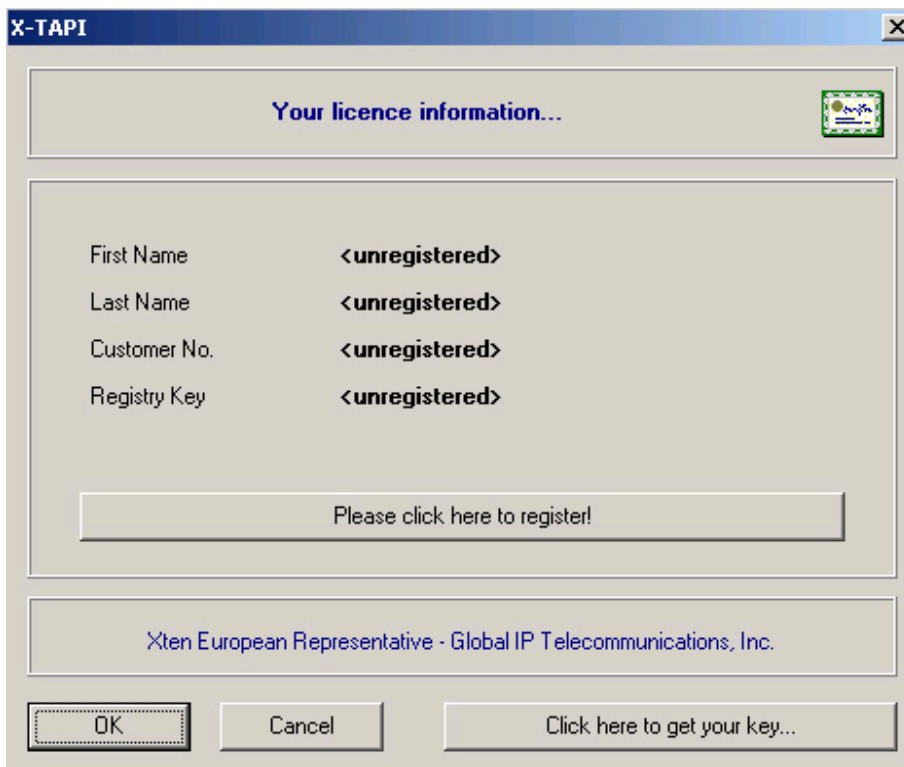

You can also find this key in your personal online account.

Please copy the key string completely by using copy / paste (STRG+C = copy, STRG+V = paste) into the registration dialog and press the "OK" button.

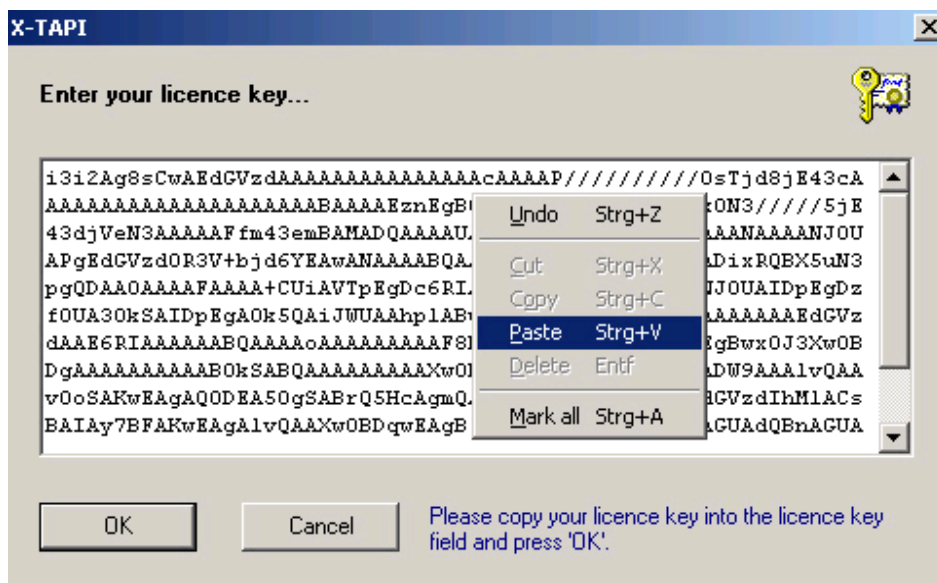

After a successful registration, your name and customer number as well as your registration key are displayed in the Registration form. The product is now fully functional.

How to register the software?

1. Choose "Show PhoneControl" in the system tray
2. Click at "File" in the top menu bar and choose the menu item "Software Registration".
The following dialog appears:

3. Click at the button "Please click here to register!". You will see following dialog:

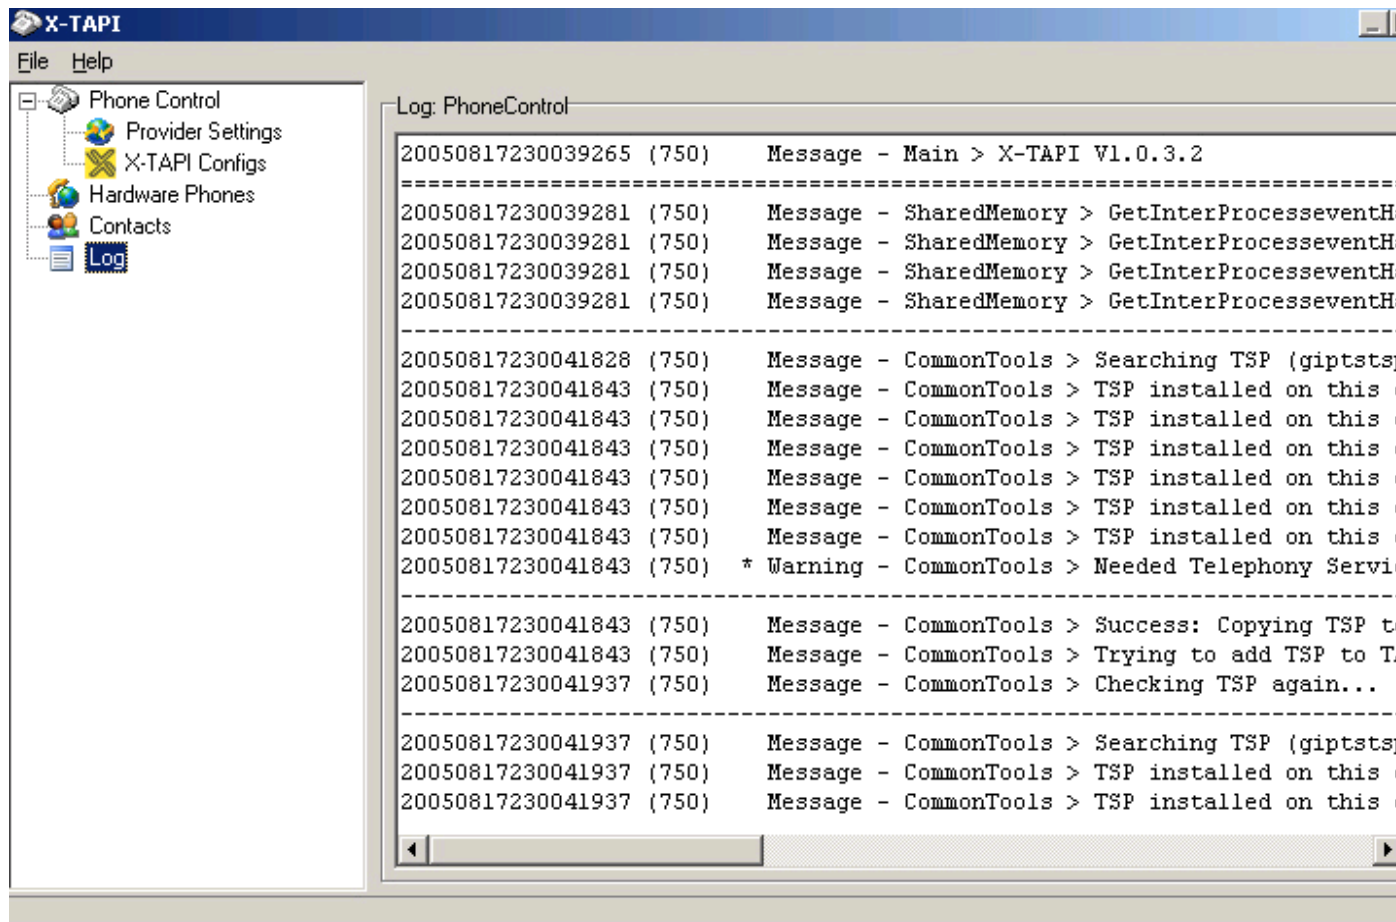

4.

5. Please copy the key that you have received from us in the Textbox by pressing "Ctrl + C" (copy) and "Ctrl + V" (paste).
6. Click at "OK" and you will see your registration information in the registration form.

Now your version of X-TAPI is a full version and you are able to make calls without any limitation.

Diagnostic and error handling

If unexpected errors occur or if features of PhoneControl are missing, the „Log“ window provides hints to our support team.

You can save the LOG file by clicking at „File“ and then *“Save LOG-File“*.

Why you need an Outlook PLUGIN

Microsoft uses different dialers in all their Windows Operating Systems. All these dialers have a commend ground, but they don't support incoming calls.

This was the main reason for Global IP Telecommunications to develop an Add-in that supports in- and outbound telephony traffic for the most widely used e-mail client in the world .

The following versions of MS Outlook are supported:

Outlook 2000
Outlook 2002 (XP)
Outlook 2003

Exchange Server (Outlook connected Folders)

The X-Outlook Add-In shows all in- and outbound calls in an own window.

IMPORTANT: Please note that the X-Outlook Add-In gets more additional functions in future. Please check our webpage time to time at www.globaliptel.com or at www.xten.de for newer versions.

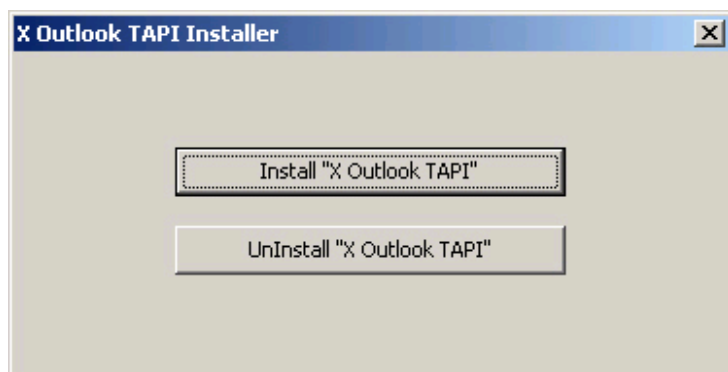

Installation

X Outlook TAPI installation is very easy. Please go to the standard application path `c:\programm\X-TAPI` and start `xoti.exe`. The installer can install and deinstall the product. Please choose "Install X Outlook TAPI"

The X Outlook Plugin is now installed. On the next start of Microsoft Outlook you will find a new tab sheet in the Options menu that pops up when clicking at "EXTRAS" in the top menu bar.

To uninstall the Outlook Add-In please start "`xoti.exe`" and press "Uninstall X Outlook TAPI"

Install and Uninstall take effect with the next start of Microsoft Outlook.

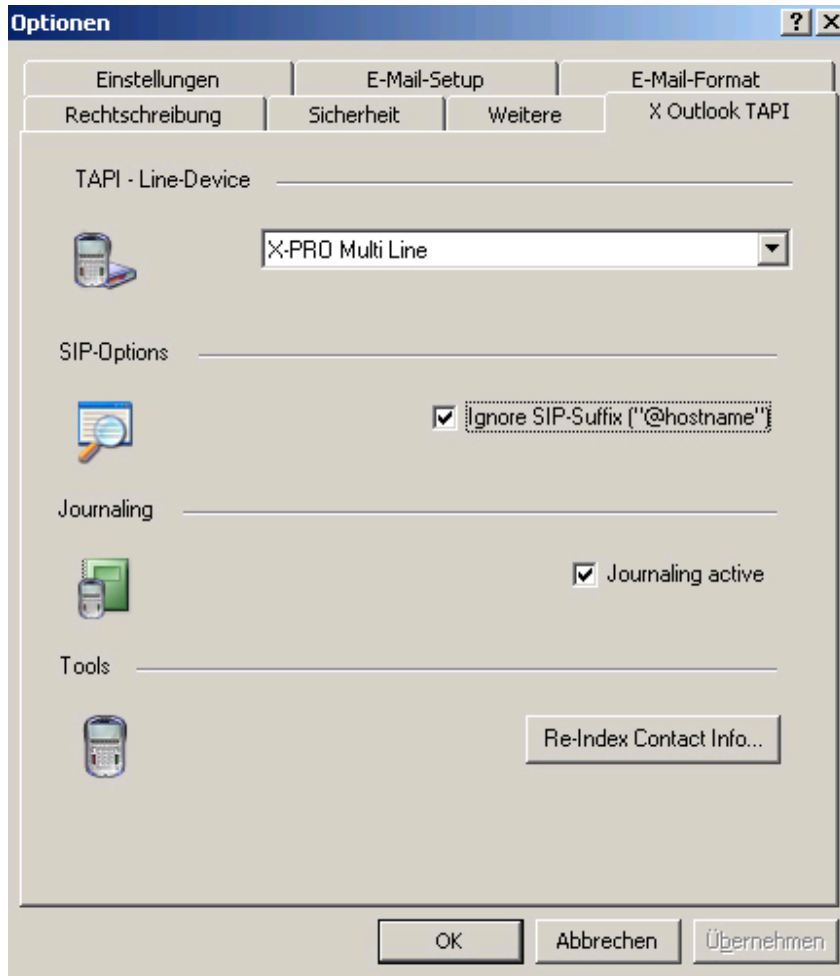

Configuration

The Outlook Add In configuration will be done automatically with the X-TAPI installation or by Hand operated installation.

You will find a new tab sheet named "X Outlook".

You can start X-TAPI and make calls. directly after the installation Outlook will open a window for incoming calls.

Functioning of the Outlook PLUGIN

With this version of X-Pro TAPI, MS Outlook integration has been optimized so that users do not need to get used to many new windows. Phone features have been integrated in the familiar Outlook environment.

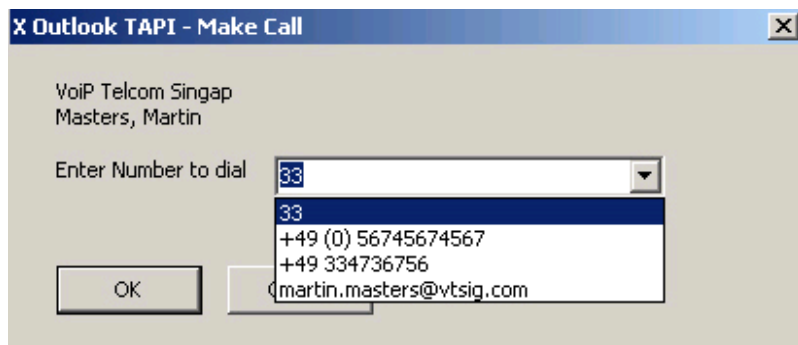

The Outlook plugin adds a new buttons with the Xten logo to the "contact" form. The button is needed to initiate outgoing calls.

If you want to make an outgoing call, please choose a contact and press the Xten button. If a contact card is already open, just press the Xten button. You will get a popup window where you can choose the phone number which is then dialled by the softphone.

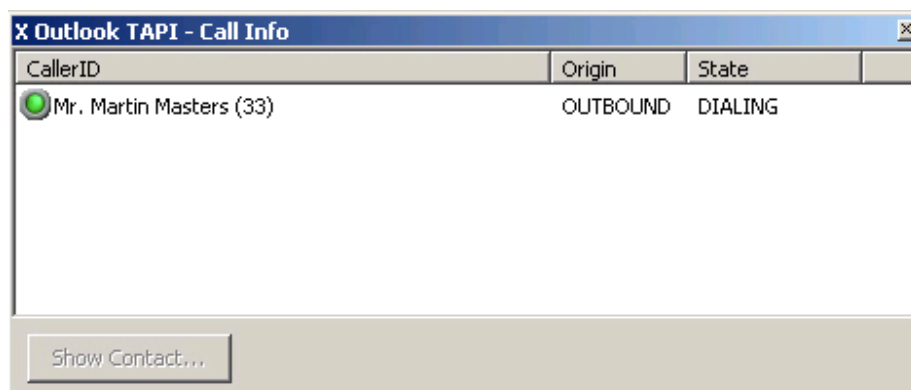

Outgoing Calls

After choosing a contact and after hitting the Xten button in order to make a call, the following window pops up:

With the pulldown menu you can choose from the available phone numbers. Please confirm your selection with "OK"

A new window that displays caller ID and the call status pops up.

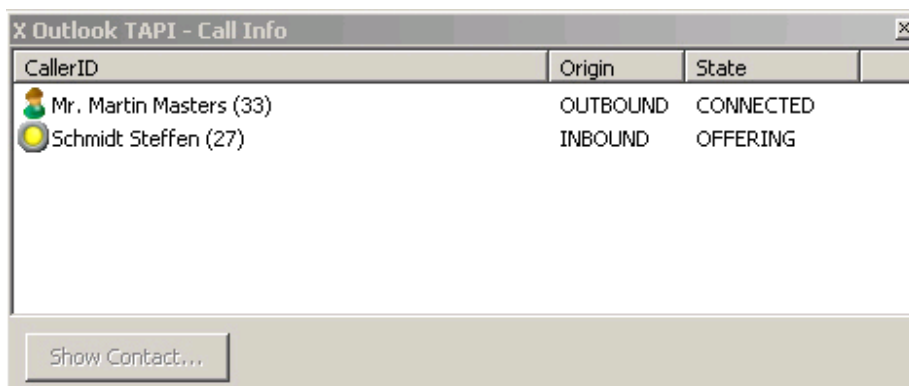

If the call has been established, "CONNECTED" is displayed as status.

The status window opens and closes automatically. It is closed as long as there are no calls.

As soon as status information is available, you can open the contact card that is associated with the callee by marking the callee and then clicking at "Show contact".

Incoming calls

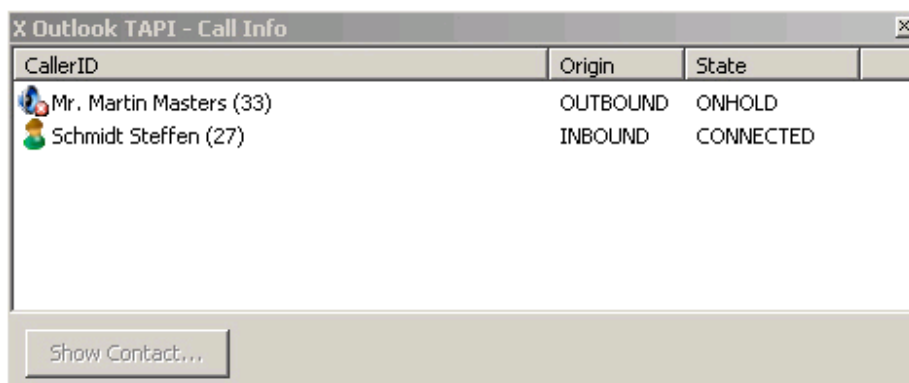

Similar to outgoing calls, a status window is opened for incoming calls. You will get the status "OFFERING" including the phone number of the callee.

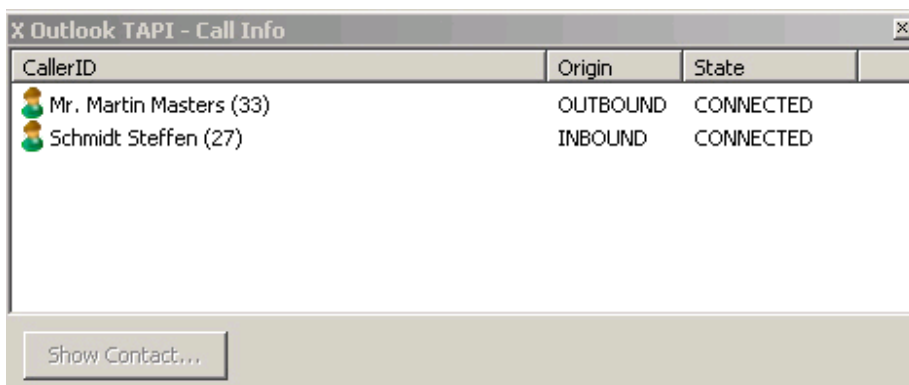

As soon as status information is available, you can open the contact card that is associated with the callee by marking the callee and then clicking at "Show contact".

You are also able to add new contacts for unknown or new callees. Mark the incoming callee and click "Show Contact..."

In following example we have changed to the callee line. The person of the first call gets ON HOLD.

Now we make a conference call with all parties and get the status Connected for all Caller and Calles.

Anrufjournal

All incoming and outgoing calls are at the standard Outlook Journal. You get all important Call data which can be sorted or categorized! Please use the familiar Outlook options to change and modify the Journal.
