

The Evolution of Laptop computers

Thinner and lighter than conventional Laptops, yet still preserving a comfortable screen size and friendly high resolution.

The idea of shrinking a whole computer system into a LCD tablet was visualized on several science-fiction movies decades ago, but it wasn't until Comdex 2000 that Microsoft announced the possibilities of its creation.

Ultra portability, unlimited possibilities

How portable is your Laptop when there's always a need for a flat horizontal space to work with it?

With a Tablet PC you can work while standing, walking, or doing any other activity, you just need a hand to hold it. And in those cases where you really need fast typing, just find a flat horizontal space like everyone else, plug our included mini portable keyboard and use it as an ordinary computer.

Portable but not isolated InnoLabs is not just a pioneer manufacturing Tablet PCs, but the first one to ever launch a full working Tablet PC a whole year before most of rest at Comdex 2001. InnoLabs has foreseen the necessity of incorporating wireless solutions into portable devices. Therefore our newest EVITA 2000 Tablet PC was designed with all modern wireless connectivity standards in mind including 802.11b, Bluetooth GPRS, GPS etc.

Don't miss the chance according to expert analysts Tablet PCs will mean 25~30% of 2003 overall portable computer market meaning 1.5~2.3 million units. But while Microsoft will officially announce the product on November 7 2002, analysts expect very few manufacturers to deliver full product after the announcement.

But why wait, InnoLabs has delivered its first Tablet PC model a year ago, and it's delivering a complete new model now, with features that even most of the other Tablet PCs won't have, making it not only the first ultra portable Tablet PC today, but one of the best there will be.

Don't wait, it's available NOW!!!
