

# DP 120F

## Instruction manual

Dear Reader.

**Thank you for your interest in a Toshiba Fax machine!**

To allow you to get your fax machine up and running as soon as possible, this manual only covers the most important criteria. Complete operating instructions can be found on the CD-ROM included with the accessories.

All items documented on the CD are highlighted in grey both in the table of contents.

Please refer to the corresponding references on the CD for further information (IBM<sup>®</sup>-compatible format).

**PREPARATION**

Unpacking .....	6
Remove transport fittings: .....	7
Prepare and insert the printer unit .....	7
Change toner .....	8
Replace drum unit .....	9
Connecting your fax machine .....	9
How to insert the recording paper: .....	10
Install exit paper trays: .....	10
Insert memory card (optional) .....	11

**INSTALLATION**

The menu system .....	12
The combination keypad .....	14
Enter user name .....	15
Enter terminal ID .....	17
Connection to PABX, obtaining a public line/Digital PABXs .....	18
Set language .....	20
Set date and time .....	21

**RECEPTION OF DOCUMENTS**

Set standby mode .....	22
Reception reduction .....	23
Memory reception .....	25
Secure RX .....	26
Activate and deactivate Secure Rx .....	29
Correct sequence printout .....	31
Multiple printout .....	32
Delete reception .....	33
Reception protection .....	34
Local copy .....	35

**TRANSMIT DOCUMENTS**

Document format .....	37
Automatic fax messages .....	38
Stack mode .....	39
Useful job management .....	40
Important transmission .....	41
Direct transmission .....	42
Transmission using alpha dial .....	43
Transmission one-touch dial .....	44
Faxing with telephone directory .....	45
Single multi-address transmission .....	46
Stored broadcast .....	47
Monitoring (direkt) .....	48
Monitoring (by job) .....	49
Set resolution .....	50
Set contrast .....	51
Transmission options, ECM on/off .....	52
Transmission options, number of pages .....	53

Transmission options, protected transmission ..	54
Transmission options, reduced speed .....	55
Transmission options, send cover sheet .....	56
Transmission options, send after scan .....	57
Chain dialling .....	58
Call redial .....	59
Resend (retained job) .....	60
Cancel a retained job (with retain job) .....	61
Cancel transmission .....	62

**POLLING**

Reserve polling .....	64
Reserve polling, permanent (general infobox) ..	66
Reserve polling, append documents .....	67
Cancel polling reservation .....	68
Single polling .....	69
Multiple polling .....	70
Cancel polling .....	72
Program Continuous Polling .....	73
Reverse direction .....	75

**STORE NUMBERS**

Alphabet dial memory .....	77
Alphabet dial options .....	79
Modify ABB numbers .....	80
Delete ABB numbers .....	81
One-touch dial keys .....	82
Cancel one-touch dial keys .....	84
Define groups .....	85
Edit groups .....	87
Cancel groups .....	88

**REPORT PRINTS**

Program selection list .....	89
Transmission reports .....	89
Transmission and reception journal .....	95
The function list .....	98
Reservation list .....	98
The dial number lists .....	101
Department list .....	102
Mains failure report .....	102
Delayed fax job .....	103

## ADVANCED SETTINGS

Set transmission header position .....	104
Reception trailer (RTI) .....	105
Permanent monitoring .....	106
Call redial .....	107
Volume of acoustic signals .....	109
Power saver (stand by) .....	110
Cost centre management .....	112
Department code .....	112
Modify or delete a department .....	114
Disable department code .....	115
Divider sheets .....	116
Cover sheet .....	118
Retain jobs .....	120
Query current job status .....	121
Basic setting, document length .....	122
Basic setting, transmission memory .....	123
Basic setting, resolution and contrast .....	124
Basic setting, ECM (error correction mode) ..	125
Basic setting, protected transmission .....	126
Basic setting, reception interval .....	127
Basic setting, Print density (saving toner) ...	128
Basic setting, sort copy .....	129
Basic setting, letter head paper .....	130
Basic setting, send after scan .....	131
Additional features (SUB, SEP, PWD) .....	132
Additional paper cassettes (optional) .....	133
Line 2 Mode (optional) .....	134

## POSSIBLE PROBLEMS

Diagnostic program .....	136
Error messages in the display .....	139
Error codes in journal .....	142
Transmission problems .....	143
Receiving problems .....	145
Cleaning document scanner .....	146
Remove document jam .....	146
How to clear a recording paper jam .....	147
Cleaning the printer unit .....	148
Remote maintenance (COMLINE) .....	149
Supply order .....	150
Download .....	150
Connection to PABX .....	151

## UK CONNECTION INFORMATION

|--|---|---|

## Unpacking

When unpacking your machine, please check that all parts shown here are present and in perfect condition.

1. Fax machine

2. Phone line cord

3. Document exit tray

4. Recording paper exit tray

5. Fuser cleaner

6. Developer assembly

7. Drum unit

8. User manual

9. Overlay

10. AC Power cord

11. Charger cleaner

12. Scraper

13. Cotton swab

14. CD-ROM

The correct location for your fax machine is easily found:

near

- a 230 V AC socket\*,
- near a telephone connection, ideally with a single line reserved for your fax machine.

\* No other equipment with high power consumption (such as a photocopier) or equipment which generates electrical noise (such as a radio, computer, radio transmitting and receiving equipment) should be connected to this mains supply.

### AC power

You will find the mains connection on the back of the machine. The ON/OFF switch is situated above the mains jack. Now switch your machine on.

Please protect your machine from:

vibration

direct sunlight

dust

humidity

heat

## Remove transport fittings:

Before you start to use your fax machine, please remove all transport fittings.

## Prepare and insert the printer unit

In order to prevent any transport damage, the high-quality printer unit of your new fax machine is supplied with the additional protection of special packaging. Please also follow the enclosed instructions.

The printer unit consists of two separate components, namely the drum unit and the developer assembly. Remove these two parts from their packaging and follow the following instructions.

1. Pull the release button to open the fax machine.

2. Hold the ends of the developer assembly, and shake the assembly several times from side to side. This will loosen the toner.
- Avoid touching the metal roller.

3. Hold the developer assembly securely in one hand, and use your other hand to peel the protective film off from the toner cartridge.
- Avoid touching the protective film, as there may be toner residues on the film.

4. Take the drum unit and insert it into the developer assembly as detailed in the drawing.
- Any damage to the printer drum will impair the image quality. You must therefore never touch the green drum surface or expose the drum to direct sunlight for more than three minutes.

5. Use the green handles to hold the printer unit, and place the unit in the fax machine as detailed in the drawing.

6. Press lightly on the green rectangles on the drum unit so that the unit audibly clicks into position.

The printer unit must be removed before the machine is transported or moved.

7. Take the fixing roller cleaner out of its packaging and install it as detailed in the drawings.

8. Use the ozone filter, if necessary.

9. Close the cover of the fax machine, which must audibly click into place.

## Change toner

As soon as the "TONER OUT" warning lamp (see [page 5](#)) lights up on your fax machine, you should replace the toner cartridge. The "TONER LOW" message in the display indicates that the machine can only print out approx. 100 more documents (depending on the print density). If you fail to replenish toner during this period, the "TONER EMPTY" message will appear in the display; this message indicates that no further documents will be printed out. If toner is not replenished, incoming fax documents are saved in memory.

1. Pull the release button to open the fax machine.

2. Hold the green handles and remove the printer unit.

3. Remove the drum unit from the developer assembly.

- Do not touch the developer roller (the black roller with a toner coating).
- Any damage to the printer drum will impair the image quality. You must therefore never touch the green drum surface or expose the drum to direct sunlight for more than three minutes.

4. Press the green button on the developer assembly, and slide the toner cartridge in the direction of this button. You can then remove the unlocked toner cartridge.

5. Take the new toner cartridge and shake it as detailed in the diagram. This loosens the toner.

6. Place the toner cartridge on the developer assembly and slide it under the four guides.

7. Then proceed as detailed on [page 7](#).

### Caution:

In case you come into contact with toner:

- If any toner dust comes into contact with a textile fabric, remove only by tapping the fabric; if necessary, brush out or use a vacuum cleaner. **Never rub.**
- Wash hands in cold water and clean thoroughly with soap.
- Wash eyes with plenty of water.
- If you have inhaled toner, breathe deeply in the open air.
- If toner gets in your mouth, wash it out with plenty of water.
- In an emergency, call a doctor.

Consumables are taken back and recycled by your TOSHIBA dealer.

## Replace drum unit

As soon as the "DRUM OPERATING TIME" warning lamp (see [page 5](#)) lights up on your fax machine, you should ensure that a new drum unit is near to hand. The "DRUM LIFE WARNING" message in the display indicates that the fax machine will only print out a further approx. 300 documents (depending on the print density). If you fail to change the drum in this period, the "REPLACE DRUM" message appears in the display; this indicates that the fax machine will not print out any more documents. If the drum unit is not replaced, incoming fax documents are saved in memory.

1. Pull the release button to open the fax machine.

2. Hold the green handles and remove the printer unit.

3. Remove the drum unit from the developer assembly.
  - Do not touch the developer roller (the black roller with a toner coating).

4. Take the new drum unit and insert it into the developer assembly as detailed in the drawing.

- Any damage to the printer drum will impair the image quality. You must therefore never touch the green drum surface or expose the drum to direct sunlight for more than three minutes.

5. Now proceed as described on [page 7](#) (the fixing roller cleaner is **not** replaced).

Consumables are taken back and recycled by your TOSHIBA dealer.

## Connecting your fax machine

### Telephone connection

Connect your fax machine (LINE jack) to the telephone socket, as shown on the right.

Mains power connection

ON/OFF switch

## How to insert the recording paper:

Remove the paper cassette

Insert cassette index (A4).

Prepare the recording paper by flexing and fanning out the stack to separate the sheets.

Press down the pressure plate until you hear it lock in place.

Place the paper so that it lies straight in the cassette with the side to be printed facedown and don't forget:

The paper cassette holds a maximum 550 sheets (80 g/sm).  
The paper is never stacked above the limit mark.

Then: Slide the cassette into the slot until you hear it lock in place.

 Do not use damp, wrinkled or torn paper.

## Install exit paper trays:

Install the exit paper tray fits in the slots on the left side of the fax.

Secure the document tray. Insert the pins of the tray into the corresponding receptacles. Unfold the extension if required.

The corona wire cleaner and scraper can be stored inside the fax machine on the rear side.

- The corona wire cleaner and scraper are used to clean components of the printer unit. Please read the instructions on [page 147](#).

## **Insert memory card (optional)**

For further details on these data, please contact your dealer or contractual partner.

## The menu system

Your fax machine is equipped with a four-line display which provides you with information concerning all operating modes. This display makes it more easy for you to work with the various functions of your fax machine, and everything is set out in a clear menu. Up to four menu items are displayed on each occasion, and a number is assigned to each of these items.

A special group of keys is used for activating the menu as well as for control activities within the various menu levels.

The ▲ key activates the menu and moves the highlight bar up.

The ▼ key moves the highlight bar down.

The ► key selects the appropriate submenu level.

The ◀ key selects the superior menu level.

Once a menu item has been selected with the highlight bar via these control keys, it is activated by pressing the ↵(ENTER) key. Alternatively, you can use the START key for this purpose.

It may well happen that more than four items are displayed in one menu. In this case, press the ▲/▼ control keys several times to display these concealed menu items.

Example: Menu 3, 1 (1. Menu item highlighted)

One version of the menu selection procedure is to enter the corresponding number of the particular menu item. It is not necessary to press the INSERT button. As soon as the relevant number has been entered, the menu item is executed. This is also applicable for the concealed menu items.

If no further key is pressed during a minute, the menu is automatically exited.

Consider the following example in order to familiarise yourself with the menu system. The system prints out the program selection list, on which you receive the complete menu structure of your fax machine.

### Selecting the menu item via number:

The first 4 menu items are displayed.

### Select a menu item

To select a sub menu, there is no need to see it in the LCD. The only requirement is that this menu item has to be in the same menu level.

The report is printed.

## The combination keypad

The combination keypad of your fax machine fulfils several functions :

- **One-touch dial keys**, for quickly dialling the number of your fax partner
- **Function keys**, for direct access to the menu
- **Computer keypad**, for entering text.

1 2 3...

A B C...

This multiple key assignment is rendered possible by templates, positioned over the combination keypad in a corresponding arrangement. The keypad has a specific function depending on the position of the template.

The **function keys** allow quick access to frequently used functions of the fax machine:

Function	see page	Function	see page
CHAIN DIAL COMM	58	SUB ADDRESS COMM	132
CHARGE CODE	112	PCL PRINT	--
DELAYED COMM	103	JOURNAL	95
DIRECT TX	42	PREV TX RPT.	93
LOW SPEED TX	55	RESERVATION LIST	98
ITU MAILBOX	91	SECURE RX	26
COVER SHEET	56	CHECK E-MAIL	--
PRIORITY TX	41	TEL LINE SELECT	134
RECOVERY TX	120	TEL LIST ENTRY	77
SEND AFTER SCAN	131	TEL LIST PRINT	101
POLLING	64	CONTRAST	51

To use, position the corresponding template (function template) in such a way that the menu designations are visible. All you then need do is press the corresponding key.

## Enter user name

In order to ensure that a transmitted fax document can also be uniquely identified, a transmission header is printed on the top 5 mm of the document. This transmission header contains various items of information, including the user name and the sender ID of the fax machine which transmitted the documents.

### User name:

You can enter any 40 characters (max.) for the user name.

Using the „KEYBOARD“ function template renders a keyboard available that can, in principle, be used just like that of a PC or a typewriter. An alternative character set is made available via the ALTERNATE key, where special characters and accented letters (e.g. Umlaut) can be selected. After pressing the ALTERNATE key, the corresponding character set is displayed by pressing the corresponding letter key. The desired character is selected via the ◀ / ▶ control keys and inserted by pressing the ⏎ (ENTER) key. Pressing the ALTERNATE key again switches the special character mode off. In order to enter numbers, please use the numerical keypad. The following table lists the special characters assigned to the respective keys.

Key	[ALTERNATE] key	[SHIFT] Taste
a	à á â ã ä å æ ç ã	À Á Â Ã Ä Å Æ Ç
c	ç ÿ	Ć Ć Č
d	d'	Đ
e	è é ê ë ì í	È É Ê Ë Ì Í
g	ğ	Ĝ
i	ì í î ï ï	Ì Í Î Ï
l	ł ' í	Ł Ł Í
n	ñ ' ñ	Ñ Ñ Ñ
o	œ °	Ò Ó Ô Õ Ö Ø Õ
r	í ' ř	Ř Ř
s		Š Š Š Š
t	ť ' ť	Ť Ť
u	ù ú û ü ú ú	Ù Ú Û Ü Ú Ú
y	ý	Ý
z		Ž Ž Ž

**Place character:** The character of your choice is placed wherever the flashing cursor is located. Please use the ◀ / ▶ keys to control the highlighted input.

**Cancel characters:** Move the cursor to the corresponding position and press the CANCEL key beneath the display. The character is then deleted and the remaining characters move one place to the left.

**Replace character:** Move the highlighting to the appropriate position and proceed as detailed under the procedure for entering a new character. The character is then overwritten.

**Insert character:** Press the INSERT key beneath the display. To exit this mode, press the INSERT key again.

When the name is completed, press the **START key**.

**Example: Toshiba**

## Connection to PABX, obtaining a public line/Digital PABXs

The fax unit can be connected not only to the public switched telephone network (public line) but also to a PABX. In this case, additional parameters have to be entered.

With **PABXs**, the public line is obtained in various ways:

- Number      Dial one digit (or several digits) in order to obtain the public line
- Flash key      With this method of obtaining the public line, the connection circuit is interrupted briefly.

 When the method of obtaining a public line has been entered, you must always press the key "※" before the actual number when you dial your fax partner. This is also applicable for saving the fax numbers (see [page 77](#)).

## Set standby mode

If your fax machine is connected to the PSTN, there are two different ways of receiving documents.

### Automatic reception

If the line is reserved exclusively for fax operation.

The fax machine switches over to reception as soon as the line rings. The number of rings before the fax machine is activated can be set (see below).

The fax machine is always activated, even if the call is initiated by a voice partner.

### Manual reception

If the line is used primarily for telephone traffic.

The call must be accepted manually; the fax machine is not activated when the line rings. The call must be accepted manually; the fax machine is not activated when the line rings. The call must be accepted by an additional telephone. If you wish to transmit a document, you must press the START key of the fax machine.

Ensure that any fax calls can be accepted by means of the external telephone. Pressing the start key only has an effect if the handset is off-hook.

## Reception reduction

If a fax is received which exceeds the length of the paper for received documents (e.g. due to a transmission header – see [page 104](#)), the copy would not be able to be printed out in full. In this case, the fax machine reduces the size of the document in scale with the original (max. 73%).

In general, this effect is not problematical. However, if the sizes of the documents must be absolutely identical, it is necessary to deactivate the **reception reduction** facility. In this case, that part of the copy which no longer fits on the page is printed out on a second page.

If you are able to do without the „rest“ of the page, activate the **discard** facility to suppress printout on the second page.

## Memory reception

Under certain circumstances, the machine cannot print out any further incoming copies:

- If there is no recording paper
- If there is a paper jam

In order to prevent problems with reception, the remaining pages are buffered in the memory of your fax machine. Once the problem has been solved, the document is printed out automatically.

In the event of a power failure, the contents of memory are retained for approx. 72 hour.

If the fax machine is to receive documents (in memory) in the event of paper-out or paper jam, the memory reception facility must be activated. This ensures that the fax machine is still able to receive documents outside normal business hours (e.g. at weekend or during the night).

- When the memory capacity is full, no further calls will be accepted.
- If you find that the memory is frequently too small, ask your dealer for a memory expansion!

# Secure RX

In the **Secure RX** mode, the fax machine is ready to receive documents; however, incoming fax documents are not printed out and are retained in memory for a defined period. This for instance prevents fax documents which are received outside normal office hours from falling into the “wrong hands”. The user is able to set the period during which the **Secure RX** mode is active. The user can also expand specific days in the week. Outside this period, all stored faxes are automatically printed out and further documents are received without any restriction.

 Secure RX can only be activated if memory reception has been activated (see [page 25](#)).

 This mode can be set only if **Secure Rx** has been configured (see [page 26](#)).

## Correct sequence printout

If more than one document is transmitted, it is normal to start with the first page. As received copies are printed out face-up, this means that the received stack of documents is in reversed order. This would mean that the first page is the last page to be printed.

Please note that the entire reception procedure is first stored in memory before it is subsequently printed out. If the capacity of the memory is not sufficient, there will be a delay in printing out the documents in the correct sequence.

If you find that the memory is frequently too small, ask your dealer for a memory expansion!

## Multiple printout

As your fax machine handles all reception jobs via its memory, it is possible for several copies instead of merely one copy to be printed out (up to 99). This means that the operator does not have to go to the photocopier. Please note that great strain is placed on the memory if you increase the number of copies and if several jobs are received simultaneously.

If you find that the memory is frequently too small, ask your dealer for a memory expansion!

# Reception protection

The process of receiving documents is not subject to any restriction in principle. However, if reception protection is activated, it is only possible for the machine to receive fax documents from partners whose fax number is stored in the fax machine. The transmitted code of the transmitter is compared against the contents of your alphabet dial memory or one-touch dial keys. If the comparison is not successful, the transmission is rejected.

 Please note that fax reception is limited when the reception protection facility has been activated. **If you have not stored any fax numbers, no further fax documents can be received!**

## Local copy

You can use your fax machine to make one or more copies (up to 99).

You can select a sorter function if several copies of various documents are to be made simultaneously. The copies are sorted and reproduced in the sequence in which the original documents were inserted into the document feed.

### Sorter function ON

- Copies are sorted automatically.
- Requires adequate memory (if memory is full, the copying process is terminated. If you find that the memory is frequently too small, ask your dealer for a memory expansion!
- All documents are scanned into the machine, resulting in a longer copying procedure.

### Sorter function OFF

- Copies are sorted manually.
- Not much memory required.
- The copying procedure is shorter.

In the case of documents that are longer in size than A4, the excess parts are not copied. If, however, all parts are to be copied, the Copy reduction function must be activated.

The **Copy reduction** function can be activated when preparing the copy. It acts in both axes, thus resulting in a true-to-scale reduction. Four fixed scales are available, as well as an automatic reduction option.

If additional (optional) **paper cassettes** are available, a specific cassette can be accessed for each respective copy.

- The copy is always made with „FINE“ resolution ( see [page 50](#)). Resolution „U-FINE“ can be set if required.
- The „HALFTONE“ mode setting is always possible.
- Automatic copy reduction is not possible when the paper cassette selector has been set to AUTO.
- The „LETTER HEAD PAPER“ cassette is not accessed if the cassette selector has been set to AUTO.
- A copy cannot be made when the fax machine is receiving a document.

Continued on next page.

## TRANSMIT DOCUMENTS

### Document format

The following table gives you an idea of the documents your fax machine can handle.

	Single sheet	2 or more sheets
Document size (max)	216 mm (W) x 1000 mm (L)	
Document size (min)	148 mm (W) x 100 mm (L)	
Effective scanning width	206 mm	
How many sheets can be loaded at one time?		max. 50 sheets A4
Thickness of paper	0,05 ~ 0,15 mm	0,06 ~ 0,12 mm
Quality of paper	Uncoated on both sides	

### Please note:

- Documents longer than 420 mm can only be loaded manually.
- If you load several sheets at one time, they should all be of the same size and paper quality.

### Problem documents ...

May not feed. This applies to

- torn, wrinkled or damp pages
- folded pages or pages with holes
- transparent pages or pages with a smooth, shiny finish
- textile or metallic documents

### There are two ways of avoiding this problem:...

...by photocopying or using a carrier sheet.

Your TOSHIBA dealer can supply you with the necessary carrier sheets.

### How to use carrier sheets:

Place your document face-up on the carrier sheet under the transparent cover. Carrier sheets can be used like normal documents except for one restriction: only one carrier sheet can be fed at one time.

### How to load documents correctly

Remove any paper clips, staples and similar objects before transmitting the document. If you intend to load documents which are longer than A4 format, you should pull out the extension of the document support. Push the side paper guide up against the document(s). Now place your document(s) on the document tray - up to 50 at one time - as shown.

All documents must be inserted face down!

Adjust the document guides to the edges of the sheets.

After 2 seconds, your document will be automatically pulled in by about 2 cm.

## Automatic fax messages

To send fax messages in the traditional manner: Insert document(s), enter the fax number and the connection is automatically established. The fax machine reads the documents into memory and then transmits them. The advantage for the user: The document feed is only ever used for a brief period of time; irrespective of whether a fax is being transmitted or not. (please also refer to [page 39, Transmission from memory](#)). If you decide to use the listening-in version (see [page 48](#)), you can also acoustically monitor the call establishment process. This is useful whenever you have problems with establishing a connection. The reason is frequently a wrong number, or a fax machine which is not ready to receive.

The free memory display varies depending on the utilisation level of stack memory.

### ...confirm with START

While the document is being read into the machine:

The machine displays the job number (file number) and current memory capacity.

The corresponding line lamp blinks as soon as the fax machine goes online.

The display indicates normal transmission or reception mode during this process.

## Stack mode

A frequently encountered problem with fax machines is that the document tray is blocked while a document is being transmitted; no other documents can be transmitted while the fax machine is transmitting or receiving documents.

### This is different with your fax machine:

All documents are read into the memory and are then transmitted from this memory. Incoming documents are also read into the memory before they are printed out. The advantage of this method is that the document tray is virtually always free and that documents can be transmitted almost irrespective of the transmission or receiving status of the fax machine.

Each procedure is known as a job. A job may consist of one or more documents which you can transmit to your partners. A job can also be a multi-address transmission or a delayed transmission. Your fax machine is able to manage 100 such jobs. Each of these jobs is placed on a stack, from where they are processed in sequence. Your fax machine accepts jobs even while it is transmitting or receiving documents; this means that the document tray is always ready.

The fax machine allocates a number to each job, and this number can be viewed via the job list (XX list) (s. [page 98](#)).

The stack memory is protected via an internal battery. This means that no memory loss occurs if the machine is switched off or if there is a power failure. As soon as the fax machine is switched on again or as soon as the power supply is restored, the job is resumed at the point at which it was interrupted. The bridging period depends on the memory status, although it is at least one hour.

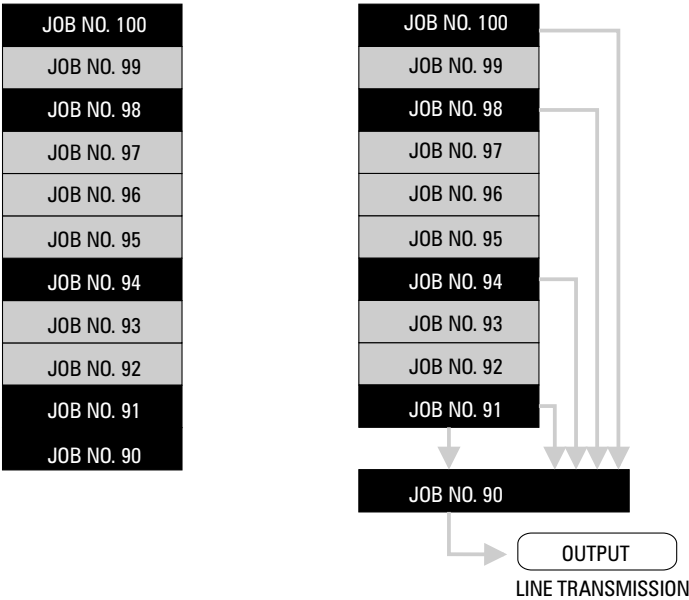

The transmission and reception memory is activated in the basic setting of the fax machine. You can change these basic settings to suit your individual requirements (see [page 25 / 123](#)).

# Useful job management

As the stack memory in your fax machine is so large, it may happen that several jobs have to be transmitted to the same fax number. As a fax connection is used more economically if more data are transmitted, it would make sense to transmit all of these jobs in a single process. Whenever it handles a new job, your fax machine therefore checks the stack to establish whether there are additional jobs with the same fax number. If this is the case, these jobs are handled together irrespective of their position in the stack. The job number of these jobs is retained until stack management encounters the first job of the same fax number. The process is recorded in the transmission journal (see [page 95](#)), with an identical sequential number.

 In case of delayed transmission the jobs are sent together if time and fax number are equal.

Some jobs of the stack have the same fax number (black).

The first job with the same fax number pulls the other jobs together.

## Important transmission

The stack of your fax works according to FIFO (first in - first out). This situation can be compared to a queue: The most recently entered job has to wait the longest. This might be problematical for transmitting a certain document, particularly if stack memory already contains several jobs. The **"important transmission"** function is available for such situations. If this function is selected, the current job is given top priority. This job is carried out immediately after the last action, irrespective of the position in stack memory.

## Transmission using alpha dial

The alphabetic dialling facility enables you to enter a brief "address" instead of the (frequently long) fax number of your partner. The real fax number is then permanently stored under this "address". The alphabetic dialling facility thus enables you to save time with frequently used fax numbers.

Please refer to **page 77** for details of how to save alphabet dialling numbers.

Please refer to **page 15** for entering letters.

### Enter the alphabet dial number

Example: "B" \*)

### ...confirm with START

The first name is displayed

**use the control keys to select the required name**

### confirm with START

The fax machine displays the selected alphabet dial memory and the fax partner allocated to this memory position.

The document is read into memory (see **page 38**)

This display appears if no name is stored under the selected letter.

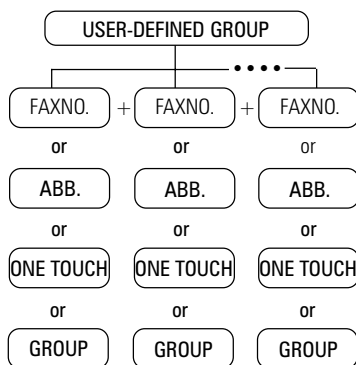

The search function is case-sensitive!

## Single multi-address transmission

If you intend to send a document to several fax partners as quickly as possible, this function can be used for defining a **single free group**. The group is cancelled after the procedure is completed. Direct-dialling numbers, one-touch dial numbers and freely assignable numbers (max. 100) can be grouped in any desired combination.

Permanently stored groups (see [page 85](#)), can also be integrated into the group in this way.

[page 38](#))

## Stored broadcast

If you have a fixed group of fax partners to whom you frequently have to send broadcast fax messages, the stored broadcast facility is just what you need. You can store 50 different group of your choice. Additional you can assign each group to a one-touch dial key. Multi-address transmission is then carried out by pressing the appropriate one-touch dial key.

Please refer to **page 85** for details of how to program permanent groups.

## Monitoring (direkt)

When a fax transmission is monitored, the call establishment attempt is played back via the built-in speaker. This means that you have an additional acoustic check for monitoring the call establishment procedure. This facility is useful whenever a connection is not established. This is frequently due to a wrong number or a fax machine that is not ready to receive.

With the listening-in alternative, the document is not read into the memory; it is retained on the tray until the receiving fax machine has been contacted.

## Set resolution

In its basic setting, your fax machine uses high resolution for transmitting or copying your documents. You can also adjust the resolution to suit the particular documents. Use the following as a rough guide:

Use the following as a rough guide:

STD	For hand-written or typewritten documents (basic setting)
FINE	For documents with small type such as newspapers and diagrams
U-FINE	For documents with very small and detailed diagrams
HALFTONE	256 grey stages for photographs or colour documents

- For the grey stages, you can choose between fine and superfine (U-FINE)
- If the resolution is increased or if the grey stage mode is selected, the transmission time is lengthened (this involves additional costs!), as more lines or more information are transmitted.

\*) Please refer to **page 124** if you wish to change the BASIC SETTING for resolution.

The setting selected in this way is only applicable for the current job. When the document has been read in, the resolution is reset to the default value.\*

**Dialling the fax partners**

## Set contrast

Where the print on documents is weak or where colour character sets are used, it is possible that some characters might not be transmitted. In such cases, you should set the contrast to darker.

On the other hand, some documents contain characters in coloured fields. In such cases, you should set the contrast to lighter.

You can judge the effect of this setting - and thus also the quality of your fax transmission - by using the self-copy facility (see [page 35](#)).

\*) Please refer to [page 124](#) if you wish to change the basic setting of the contrast.

## Transmission options, ECM on/off

Your fax machine is equipped with an error correction facility (ECM). If your fax partner also has an error correction facility, this permits error-free fax transmission. One effect linked with ECM is that the transmission time increases if there are any problems on the line. This may involve very high costs with overseas calls. For this reason, the error correction facility can be temporarily disabled.

If the error correction mode is disabled in the basic setting (see [page 125](#)), ECM is temporarily enabled using the adjacent method.

\*) Please refer to [page 125](#) if you wish to change the basic setting of the error correction mode.

## Transmission options, number of pages

Enter the number of pages to be transmitted before the transmission procedure commences (in the mode: Direct transmission, see [page 42](#)).

Before sending a document, you can use this option to enter the number of pages being sent. The until will compare the number of pages actually sent with the number you entered.

- Because the ratio of transmitted pages is automatically displayed when a document is transmitted from stack memory, the function represents a **feed check** in this mode. If the specified number of pages is not identical with the actual situation, the following message is displayed "PAGE # MISMATCH".

## Transmission options, send after scan

The default setting for the fax machine causes the fax machine to commence dialling immediately after pressing the START button for a scan job. In the case of extensive fax jobs, this can result in the page number descriptor in the TX header on the first few pages being incomplete. This in turn results in a memory overflow, the transmission is interrupted and the document part waiting in memory is deleted. This prevents the document feed becoming jammed.

If an extensive document is to be faxed, the basic settings should be adjusted temporarily. In this context, transmission is only commenced after the entire document has been scanned. Furthermore, the way in which the fax machine is to handle a memory overflow can also be set.

The basic setting for this function can be found on [page 131](#).

## Call redial

### Auto call redial:

If it was not possible for your fax message to be sent, this may be due to various reasons (please read [page 143](#)). One reason may be that the other fax machine is busy. In this case, it would make sense to call your partner again at a later time. This is done automatically by your fax; it attempts to send the fax message again approx. every 3 minutes.

You are able to individually set the period between the call redial attempts and also the number of redial attempts (see [page 107](#)).

### Manual call redial:

If the memory contains a job which you wish to redial immediately, you can select this job and manually select the redial procedure (see diagram).

- Manual call redial does not have any influence on the preset number of call redial attempts (see [page 107](#)).

**...confirm with START**

Selected job is cancelled

## Cancel transmission

If you enter the wrong fax number or if you have dialled the wrong fax partner, the relevant job has to be cancelled. It is important to distinguish between a job which is read into memory (stack mode, [page 39](#)) or transmitted directly (direct transmission, [page 42](#)).

If the job is read into memory, the current action of the fax machine is not related to the momentary operation of the machine. In order to cancel a specific job, it is necessary to select it specifically from other jobs which are waiting to be handled. This is achieved by "paging" through the job stack.

The job is displayed as follows:

SINGLE TRANSMIT

DUKE NUKEM

15-MAR-00 19:45

FILE NBR = 007

- Type of job
- Name of the fax partner  
(if the number is dialled via the numeric keypad or if no name has been entered, the machine displays the fax number).
- Date and time  
when the job was entered
- Job number (1 - 999)

JOB DELETE

In addition to cancelling a specific job from the stack, you can also cancel the current transmission. For this purpose, please refer to [page 121](#) "query job status".

## Reserve polling

### General:

The polling procedure is used for receiving a document. The difference between polling and "normal" reception is that the call is established by the person wishing to receive the document, and that the call charges are incurred by the person receiving the document.

More and more companies are using the polling facility as "FAX on DEMAND", for instance for providing information such as weather reports, current price lists, stock exchange news, traffic jam predictions, etc.

For the polling facility to be used, it must be reserved beforehand.

### Reserve polling

Other fax partners can poll information from your fax machine if you set up this facility with this function. Your document which you reserve for polling is read that into the memory of the machine so that the document tray is not blocked.

There are two types of reservation available:

- **single reservation:**

Your stored document is deleted as soon as the document has been polled.

- **permanent reservation:**

Your stored document is permanently available for polling.

Only one document can be reserved for polling.

### Polling protection

Polling reserved in this manner is not protected. I.e. every fax machine which has a polling facility is able to poll documents from your machine. The polling protection facility is activated in order to prevent unauthorised polling (only possible with single reservation).

Two options are available for polling protection:

**1. NUMBER:** With this option, you specify the number of the fax machine which is permitted to poll documents from your machine. However, it is essential that the code of the polling fax machine is identical to the number which you enter as polling protection.

Please enter the **complete** number of the polling fax machine.

Example:

Number of the polling fax machine: +44-2131-1234567890

Entry for polling protection: 4421311234567890

**2. CODE:** If you wish to reserve the polling facility exclusively for TOSHIBA fax machines, you can use the four-digit TOSHIBA code as polling protection. Documents can then only be polled if this code is identical in both fax machines.

- Only one form of polling reservation is possible at any one time.
- Please refer to [page 68](#) for details of how to cancel polling reservation.
- The choice of resolution (see [page 50](#)) also has an effect on memory behaviour. The higher the resolution, the higher is the strain placed on memory volume.

\*) In case of memory overflow, your dealer is able to offer a memory upgrade.

For the number (code) of the polling fax machine

### Enter the number

### ...confirm with START

The document will be stored in memory and is ready for polling.

## Reserve polling, permanent (general infobox)

With permanent polling, the document is retained in the memory of the fax machine so that it can be constantly polled. "FAX on DEMAND" can be configured in this way. Items of information such as weather report, current price lists, stock market news, traffic jam forecasts, etc. can thus be constantly maintained for polling.

- Only one form of polling reservation is possible at any one time.
- Please refer to **page 68** for details of how to cancel polling reservation.
- The choice of resolution (see **page 50**) also has an effect on memory behaviour. The higher the resolution, the higher is the strain placed on memory volume.

\*) In case of memory overflow, your dealer is able to offer a memory upgrade.

## Multiple polling

It is not only possible to poll documents from a *single* fax machine; you are also able to use your fax machine to poll documents from *several* fax machines. Direct-dialling numbers, one-touch dial numbers and freely assignable numbers (max. 100) can be grouped in any combination to form a **polling group**.

If you wish to use the delayed multiple polling facility you must first carry out the steps described on **page 103** before proceeding as described in the following.

## STORE NUMBERS

### Alphabet dial memory

The alphabet dial facility enables you to enter a single "address" instead of the fax number of your partner (which is frequently a long number). This "address" can be any number between 1 and 999. The real fax number is stored under this "address". With frequently used fax numbers, the alphabet dial facility enables you to save time.

A further component of the alphabet dial memory is the alternative fax number (second number). It is dialled if no fax connection is established under the normal fax number. Entry of the 2<sup>nd</sup> fax number is not absolutely necessary, but it must differ from the 1<sup>st</sup> fax number.

300 alphabet dial memories are available and the name as well as the number of your partner can be stored in this memory. You can use up to 20 characters of your choice in this memory (see [page 15](#) enter the user name).

In addition to numbers and names, it is also possible for additional options to be assigned to an alphabet dial memory position (see [page 79](#), Alphabet dial options).

Example: Alphabet dial 421:

999	Fax number (128)
998	1234567890
...	
422	2. Fax number (128)
421	0987654321
420	
...	
5	Name (20)
4	BBROWN
3	
2	Options
1	2. DELAYED COMM 3. TX REPORT 4. LINE MONITOR 5. TX ADDRESS
	Alphabet dial memory

- Please note that, in order to obtain an outside line (when equipment is connected to a PABX), the "\*" must be saved before the actual fax number.
- An error message is displayed if the user attempts to store an identical fax number in the alphabetic dialling memory. This facility prevents identical fax numbers from being stored (not applicable for alternative numbers).

## Alphabet dial options

Apart from numbers and names, it is also possible for additional options to be assigned to an alphabet dial memory position:

### Delayed Comm (2)

The fax partner is linked to a specific transmission time with this option, e.g. for fax partners in other time zones; this ensures that the documents always arrive during business hours.

### TX report (3)

Irrespective of the basic setting for printing out the transmission report (see [page 89](#)), the facility for printing out the transmission report can be activated or deactivated in relation to a specific fax partner.

### Line Monitor (4)

If the listening-in option is activated for a fax transmission, the call establishment attempt is played back via the built-in speaker. This provides the operator with an additional acoustic check of the call establishment procedure. This is useful whenever a connection is not established. The cause is frequently an incorrect number or a fax machine which is not ready to receive.

### Quality TX (5)

When sending documents overseas or if an increased error ratio is encountered, you should lower the transmission speed in order to reduce the number of errors. Similar to a situation in traffic where speed is adjusted to the given conditions!

Please note that, when lower transmission speeds are used, the actual transmission time is longer.

### Sub addressing (6)

This operating mode is used for sending fax documents in PC networks. The fax number (the number of the fax server in the network) and also the subaddress of the workstation in the network must be entered to enable the fax document to be forwarded in the network (for further information, see [page 132](#)).

### Line Select (when a 2<sup>nd</sup> line is installed) (7)

Here, the public line (Line 1, Line 2) via which the document is to be transmitted to the assigned fax partner can be preselected.

# One-touch dial keys

One-touch dialling provides you with a very easy method of dialling the number of your partner. You can assign any fax numbers to 73 keys \*. Simply press a single button to start the dialling procedure.

\*) The one-touch dial keys of your fax machine have double assignments. As soon as you operate the corresponding one-touch dial function template, additional number memory spaces are available.

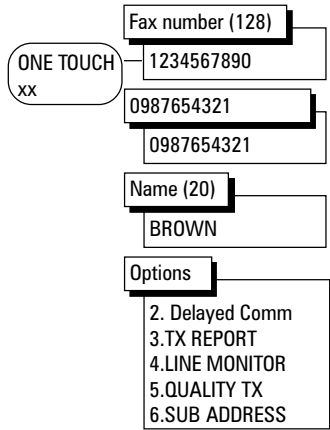

Two options are available.

## 1. Direct configuration of one-touch dial keys

- Apart from numbers and names, it is also possible for additional options to be assigned to a one-touch dial key (see [page 79](#), Alphabet dial options).
- If the operator attempts to save an identical fax number under a one-touch dial key, the system displays an error message. This prevents identical fax numbers from being saved.

Criteria which can be assigned to a one-touch dial key:

## 2. Assign alphabet dial number to a one-touch dial key

When the fax number has been stored in an alphabet dial memory, it can be additionally assigned to a one-touch dial key. This assignment is not subject to any restrictions, i.e. any one-touch dial key can be used (see [page 82](#)).

User-defined assignment of alphabet dial memories to one-touch dial keys:

Transmission reports

The transmission reports provide you with extensive and individual information concerning the various transmission jobs of your fax machine. You can use a special menu to adjust the appearance of these reports to meet your specific requirements.

ALWAYS	The transmission report is always printed after every transmission.
ON ERROR	The transmission report is printed out only if a transmission error occurs.
OFF	The transmission report is never printed out.
PRINT 1ST PG IMAGE?	The first page of the document can be printed in reduced form on the transmission report. This means that the transmission report can easily be allocated to the document.

 SENT PAGES : 001  
 STATUS : OK  
 FILE NUMBER : 084 \*\*\* SUCCESSFUL TX NOTICE \*\*\*

The entries and their meanings:

FILE NUMBER:	Corresponds to the job number. This job number is displayed in the transmission journal (q.v.) and also under the entry "F-xxx" in the transmission header on the inbound copy.
DATE	The date (and the time) when the job was placed in the fax machine.
TO / FROM	Fax number entered on the transmitted fax.
DOCUMENT PAGES	Number of document pages scanned into the machine.
START TIME	Start of connection time.
END TIME	End of connection time.
SEND PAGES	Number of pages actually transmitted.
STATUS	see: error codes <b>page 142</b> .

You can also subsequently request the transmission report for the previous 40 transmissions (first document not illustrated):

## Transmission and reception journal

Your fax machine will record messages which you transmit or receive in the form of transmission and reception journals. These lists are printed out automatically after every 150 transmissions. You can also manually request the journal at any time.

You should file this list as a record of the document jobs; if your fax machine has to be serviced, this list can provide valuable assistance for to cure the problem.

The journal output can be modified to your specifications with the following steps:

15-MAR-00 WED 19:56

001	006		02-FEB	10:28	00/14	001	+4421135				EC 603	NG B0

Meaning of the items in the journal:

NBR.	Every job in the transmission and reception journal is given a sequential number (001-999). The number in the transmission journal is displayed under the entry: "T- xxx" in the transmission header on the inbound copy. Where transmission jobs are grouped together (see <a href="#">page 40</a> ), these positions are displayed under an identical number.
FILE NBR	Corresponds to the job number. This job number is displayed under the entry: "F- xxx" in the transmission header of the inbound copy.
DATE	Date of the job
TIME	Time of the job
DURATION	Active duration of the job (minutes/seconds)
PGS	Number of transmitted or received pages
TO/FROM	Fax number of the fax partner. A diamond (◆) is displayed in front of the number if an alternative number (see <a href="#">page 77</a> ) has been selected
DEPT. NBR	Department code (see <a href="#">page 112</a> ), only displayed if journal is printed out under the master code.
ACCOUNT	Cost centre code (see <a href="#">page 112</a> )
MODUS	Transmission mode (see <a href="#">page 97</a> )
STATUS	see: error codes <a href="#">page 142</a>

### Additional details relating to the operating data of the fax machine:

Scan count: Number of scanned documents  
 Print count: Total number of printed pages  
 Drum count: Number of printed pages (x10), in relation to the current drum unit

### Codes used for transmission modes:

HS TOSHIBA High Speed mode  
 G3 Group-3 transmission  
 EC ECM error correction  
 EX ECM with abbreviated protocol  
 P Polling  
 | Transmission from PC  
 ◆ Transmission via 2<sup>nd</sup> line (optional)

	1. Digit (Bit/Sec = BPS)	2 <sup>nd</sup> digit (resolution)	3 <sup>rd</sup> digit (Mode)
0	2400	Standard 8 x 3,85	Modified Huffman (MH)
1	4800	Fine 8 x 7.7	Modified READ (MR)
2	7200	Superfine 8 x 15.4	Modified READ (MMR)
3	9600	-	JBIG coding
4	12000	Ultrafine 16 x 15.4	
5	14400		
6	V.34 (Super G3)		

### Example:

Code 522: Transmission with 14400 BPS / U-FINE/ MMR-coding

## Mains failure report

This list is printed out in the event of a memory loss (image memory / buffer memory) resulting from an enduring power failure. Depending on the charge status of the internal back-up battery, as well as the size of the image memory, the memory loss can occur within approx. one hour of a power failure.

POWER FAILURE LIST				
PAGE	:	001

RECOVERY TX	FILE NBR	FUNCTION		

## ADVANCED SETTINGS

### Delayed fax job

You can define a specific start time for your fax jobs in order to compensate for any differences in time zones or in order to take advantage of low-rate charges. Again, it is particularly advantageous that your document or documents are not read into memory, as the document feed is not blocked.

The delay applicable for sending the fax job is not only limited to 24 hours: You can program the fax job up to 30 days in advance.

The setting of the start time relates to the following fax jobs:

- Single transmission
- Broadcast transmission
- Single polling
- Multiple polling

15-MAR-00 WED 19:56

Document ready

**Operate the Menu function template**

**Press the corresponding function key**

Make your selection  
for start time (HH:MM) and day (DD)

**Enter the start time**

Example: 22:33 hours on the 18th

If the delayed fax job (within the next minute!) is to be performed on the same day, please leave "DD" blank

The following fax job is linked to the start time which has just been set.

Any fax job...

- Single transmission
- Broadcast transmission
- Single polling
- Multiple polling

## Set transmission header position

The transmission header contains the code, the name, time of transmission and the current page number. Normally it appears in the top 5 mm of the incoming copy. If this area contains important information this information is overwritten by the transmission header. In order to prevent this from happening, you are able to displace the transmission header. Accordingly, the transmission header is first printed before the copy is printed. The effect is that the length of the incoming copy is extended by approx. 5 mm.

## Reception trailer (RTI)

You can activate the reception trailer facility to ensure that reception of a document is precisely documented. The RTI is printed at the bottom of the incoming copy, and contains the current reception data such as time and date of reception as well as the IDs of the transmitter and receiver.

Please note that, when the reception trailer is activated, the inbound fax is always reduced before being printed out.

## Permanent monitoring

When a fax transmission is monitored, the call establishment attempt is played back via the built-in speaker. This means that you have an additional acoustic check for monitoring the call establishment procedure. This facility is useful whenever a connection is not established. This is frequently due to a wrong number or a fax machine that is not ready to receive.

 In this setting, **all** transmission procedures are played back via the speaker.

# Power saver (stand by)

The printer unit of your fax machine requires a heat source of approx. 170° C in order to be able to print out documents immediately. This heat source is heated at specific intervals in order to maintain the temperature at the required level. This consumes electricity, and the fan also has to run constantly. If you wish to save electric current or prevent the fan noise, you are able to deactivate the permanent heating facility. The heater in such cases would only be activated if a fax document is received or printed out. There is a delay of around 20 sec. before documents can be printed out.

Two alternatives are available:

## Super Power Saver:

In this alternative, all components which are not required are switched off (almost the entire electronics) and the display is therefore also switched off. These measures reduce the entire power consumption of the fax machine to below 2 VA (Watt). As soon as a copy is inserted, a call is received or a PC print-out performed, the fax machine resumes its functions.

The Super Power Saver mode is set either with a delay (which can be adjusted between 1 and 60 minutes) after the last action, or it can be activated by the SUPER POWER SAVER key.

- The Super Power Saver mode cannot be activated when the memory is full (memory display < 100%) and when a fault lamp is lit.

## Printer Power Saver:

The printer Power Save mode only switches off the heating facility for the fixing roller and the fan. All other functions are retained. The power consumption in this mode is approx. 15 VA (Watt).

You can use a menu for specifying the period during which the printer Power Saver mode is activated.

## Cost centre management

Transmission jobs can be assigned to any 4-digit number. The number can be used to find the specified job within the transmission report (see [page 95](#)). In this way, special transmission jobs can be linked to specific cost centres.

If this function has been activated, your are able to enter the cost centre number before every transmission. Press the **START** key to skip entry of the cost centre number.

## Department code

In order to prevent your fax machine from being used by unauthorised persons, you can lock it using a 5-digit code. 99 such codes are possible, and a separate journal is assigned to each of these codes. It is conceivable that this code can be used for setting up a cost centre management system. The fax machine can now only be enabled by entering the relevant department code. The five-digit code is entered and confirmed with the **START** key.

- If a fax is transmitted after being released by the department code, the name of the corresponding department is displayed in the transmission header of the fax partner.
- The code for department number 01 is the master code. This code must be entered for creating further department codes or cancelling existing department codes.
- If the fax machine has been enabled by a department code and if no further action takes place, the code must be entered again after a further approx. 1 minutes.

## Cover sheet

The cover sheet is a form which is placed at the head of your fax transmission. It is a tool to enable the operator to classify an incoming fax more easily. You are able to choose between a “normal” cover sheet which sets out the information in text form and a “personal” cover sheet.

With the personal cover sheet, you can add a diagram to the “normal” information. This diagram is scanned into the machine in the same way as a document and is retained in memory as the cover sheet diagram. The following diagram illustrates the relationship between document and cover sheet.

**Document:**

**Cover sheet**

Please refer to [page 56](#) for details of how to send the cover sheet.

Continued on next page.

## Retain jobs

If a job cannot be transmitted because for instance the partner fax is busy, your fax machine attempts to redial the number at regular intervals of approx. 3 minutes\*. After the XXth\* redialling, the job will be automatically deleted from the stack and a transmission report (see [page 92](#)) will be printed out. To prevent the deletion of such a job use this procedure. Each job will then be available for a certain time (1-24hours). If this job can not be successfully sent during this period it will be deleted automatically from the memory. Every time you retain a job in memory your fax prints out a transmission report (see [page 92](#)) to inform you how long this job will be retained in memory.

To send retained jobs see [page 60](#).

\*) Depending on setting (see [page 107](#))

 If too many documents are retained in memory, the fax memory will become full since every retained job requires memory.

 If you find that the memory is frequently too small, ask your dealer for a memory expansion!

## Basic setting, ECM (error correction mode)

Your fax machine is equipped with an error correction facility (ECM). If your fax partner also has an error correction facility, this permits error-free fax transmission. One effect linked with ECM is that the transmission time increases if there are any problems on the line. This may involve very high costs with overseas calls. For this reason, you can completely deactivate the ECM facility.

## Basic setting, reception interval

Fax reception may not be possible for an extended period under the following circumstances, as the fax machine is occupied solely with the transmission of documents:

- Extensive group dialling ( see [page 46 et seq.](#))
- Extensive group polling ( see [page 70](#))
- Numerous send jobs in the buffer memory

In order to ensure the possibility of receiving incoming faxes in such situations, a variable interval can be configured for in between the respective transmission and/or polling jobs.

## Basic setting, letter head paper

If the fax machine is used as a PC printer, it is possible to select other paper trays (when installed). In this context, it is customary to deposit pre-printed (letter head) paper in a specific tray. To ensure that the fax machine does not access this tray under any circumstances (e.g. no paper in the other tray), it can be excluded for the receipt of faxes.

- Function only available when optional paper tray installed.
- If a cassette has already been specified under „Separator page“ (see [page 116](#)), this function is no longer available.

## Basic setting, send after scan

The default setting for the fax machine causes the fax machine to commence dialling immediately after pressing the START button for a scan job. In the case of extensive fax jobs, this can result in the page number descriptor in the TX header on the first few pages being incomplete. This in turn results in a memory overflow, the transmission is interrupted and the document part waiting in memory is deleted. This prevents the document feed becoming jammed.

If extensive fax jobs are sent on a frequent basis, the basic setting should be changed accordingly so that the transmission does not commence until the document has been scanned completely. Furthermore, the way in which the fax machine is to handle a memory overflow can also be set.

# Additional features (SUB, SEP, PWD)

Because of the high level of innovation pressure in the telecommunications industry, fax technology is also being continuously improved. The ITU-T (formerly CCITT) operates as an international body and is responsible for ensuring standardisation of new telecommunication options. This ensures that non-proprietary compatibility is guaranteed.

All additional features described at this point are related to **fax networks**, and are added as additional information (digits) to the telefax numbers.

**Please note that the partner fax machine must also support these features. These functions would otherwise not be carried out.**

## SUB:

(Sub-Addressing) This mode is used for faxing documents in PC networks. The fax number (the number of the fax server in the network) and also the sub-address of the workstation in the network must be entered to enable the fax to be forwarded in the network.

The sub-address is entered in the form of a number with max. 20 digits.

## SEP:

(Separation Polling) This mode is used for polling from a PC network. The fax number (the number of the fax server in the network) as well as the polling address of the workstation in the network from which a fax document is to be polled must be entered.

The polling address is entered in the form of a number with max. 20 digits.

## PWD:

(Password) The password is used as additional security for actions in the PC network. This enables transmission and polling procedures in PC networks to be protected. Facilities such as "electronic signature" as well as PIN number mode are also possible.

The password is entered in the form of a number with max. 20 digits.

## Additional paper cassettes (optional)

If the capacity of the paper tray (550 sheets) is inadequate, you have the option of mounting an additional paper tray (with a capacity of 550 sheets).

Furthermore, a single-sheet feed can be used, which offers both a greater store of paper and the additional possibility of printing out **TX reports on A5** paper.

If you use your fax machine as a printer, the functionality can be expanded, accordingly.

Please contact your TOSHIBA dealer for ordering a new printer unit.

## Line 2 Mode (optional)

If the second line (optional) is installed in your fax machine, you can configure this 2<sup>nd</sup> line in numerous ways:

Setting:	Effect:	Practical note:
TX/RX	The second line has the same priority as Line 1.	The second line is also used by the fax machine as a transmission line. If you have a lot of faxes to transmit (e.g. in the case of extensive multiple-address transmissions) and value the fastest possible fax transmission, you should choose this setting.
RX ONLY (24HR)	The second line is used exclusively as a receiving line.	If you wish your fax machine to always be available, you can reserve the second line exclusively for receiving faxes. In this case, transmissions are handled via Line 1 only.
RX ONLY (TIMER)	The second line can be limited to serve solely as a receiving line within a configurable time period.	This setting represents a combination mode for the second line. Outside the specified time period, the second line has the same priority as Line 1 (see first setting). Within the specified time period, Line 2 is used exclusively for receiving faxes (see second setting).

 These settings can be temporarily circumvented via the fax function “TEL LINE SELECT” (see [page 14](#)).

Diagnostic program

Your fax machine has an automatic test routine which checks the correct functioning of the most important internal components. The results of such a test are documented in a test report, which can be printed out at any time.

You can also choose to test individual components as you see fit:

01. ADF TEST	Function of the document feed (ADF)
02. KEY TEST	Function of the individual keys on the control panel
03. LED TEST	Function of all LEDs
04. LCD TEST	Function of the LCD display
05. SPEAKER TEST	Function of the speaker
06. SWITCH TEST	Function of the sensor switch
07. TEST PRINT	Function of the printer components in the form of a print test

## Error messages in the display

Your fax machine indicates operating errors or does not carry out a function in accordance with your requirements. Before you contact customer service, consider a moment and identify the error message in the following list. You will probably then be able to remedy the fault yourself.

### General procedure to be followed for error messages in the display

1. Analyse error message.
2. Rectify cause of error.
3. Press STOP key to cancel error message in display.
4. If necessary, switch off fax machine for 10 seconds and press STOP key again.

**All error messages are retained in the display until they are acknowledged with the STOP key. If this error message does not disappear, the cause of the error has still not been rectified.**

Display	Cause	How to correct
BROKEN REGISTRATION	Alphabet memory and internal settings have been lost due to a lengthy power failure	Press the STOP key. If the error message does not disappear, activate the installation procedure (see <a href="#">page 12</a> ) and confirm all settings. The internal lithium battery is possibly depleted.
POWER FAILURE	Contents of the image memory have been lost following a power failure.	The mains error report (see <a href="#">page 102</a> ) is printed out in order to provide you with a list of lost criteria.
SCANNER COVER OPEN	The copy flap is not locked in place.	Allow this cover to snap carefully into position.
TOP COVER OPEN	The upper part of your fax machine housing has not snapped into position.	Close the housing cover carefully.
ENTRY MEMORY FULL	The fax number entry memory (one-touch/direct dial number memory) is full.	Delete fax numbers you no longer need, in order to free up memory.
MEMORY OVERFLOW	The transmission / reception memory is full.	Send your document(s) with a lower resolution, or send them using the direct mode (see <a href="#">page 42</a> ). If this error persists, please contact your dealer for a memory expansion.
DOKUMENT JAM	Documents have jammed in the document feeder.	Follow the instructions on <a href="#">page 146</a> to rectify the document jam.
UPPER PAPER EMPTY	(Only in conjunction with additional paper cassettes) No more paper in the upper cassette.	Load new recording paper (see <a href="#">page 10</a> ).

Display	Cause	How to correct
MIDDLE PAPER EMPTY	(Only in conjunction with additional paper cassettes) No more paper in the middle cassette.	Load new recording paper (see <a href="#">page 10</a> ).
LOWER PAPER EMPTY	(Only in conjunction with additional paper cassettes) No more paper in the bottom cassette.	Load new recording paper (see <a href="#">page 10</a> ).
PAPER EMPTY	The recording paper is empty	Load new recording paper (see <a href="#">page 10</a> ).
TONER LOW	The toner is almost out. Only enough toner for approx. 100 more copies.	Install a new cartridge (see <a href="#">page 8</a> ).
TONER EMPTY	There is not enough toner for printing.	Install a new cartridge (see <a href="#">page 8</a> ).
DRUM UNIT WARNING	The printer unit is almost spent. About 100 sheets can be printed after this is displayed.	Please contact your TOSHIBA dealer to order a new drum unit.
REPLACE DRUM UNIT	The drum unit is expended.	Replace the drum unit (see <a href="#">page 8</a> ).
CONFIRM DEV. UNIT	The printer unit is missing or has not been installed correctly.	Install the process unit correctly. Activate the lock facility.
DEVICE ERROR XX	Indicates a fault in the printer unit.	Contact your TOSHIBA dealer and notify him of the code in the display message.
NETWORK DISABLED	The optional network interface card (NIC) is faulty; network-specific components are not working correctly.	Check that the network interface card is installed correctly.
NETWORK ERROR	The network cable is not connected correctly (only in the case of an optional network interface card)	Check the network connection and re-establish the connection correctly.
PCL DISABLED	The optional PCL card is faulty; PCL printer components are not working correctly.	Check that the printer card is installed correctly.

Display	Cause	How to correct
CHECK LINE-1	Line 1 has no connection to the telephone network / PBX	Check the line connection at the telephone socket. If the line is connected correctly, report the fault.
CHECK LINE-2 (Only if optional second line is installed)	see "Check Line-1"	see "Check Line-1"
SORRY NOT POSSIBLE	Selected function not possible at present.	Read the operating instructions for any restrictions concerning your selected action.

## Error codes in journal

If "TRANSMISSION ERROR" appears in the display of your fax machine, the error code describes the specific error. The same code is shown also in the journal and transmission report.

Code	Cause	How to correct
10	No recording paper	Put more paper in the paper cassette.
11	Paper jam	Remove the jammed paper (see <a href="#">page 147</a> ).
12	Documents have jammed in the document feed.	Follow the instructions on <a href="#">page 146</a> to rectify the document jam.
13	Open the upper covers	Allow these covers to snap carefully into position.
20	Power failure	A power failure has occurred.
22	Memory error	If this error occurs frequently, please notify the customer service of your TOSHIBA dealer.
30	Transmission interrupted by the transmitter/receiver.	Start the transmission process again or request your fax partner to repeat the transmission process.
32	Page error	A specific number of pages has been set, but a different number of pages has been sent (see <a href="#">page 63</a> ).
33	Polling error	Polling was not reserved, or the password was incorrect, or polling protection did not meet the specified criteria (see <a href="#">page 69</a> ).
42	Memory overflow	Send your document(s) with a lower resolution, or send them using the direct mode (see <a href="#">page 42</a> ). If this error occurs frequently, please contact your dealer for a memory extension.
50	Line busy	Test the connection using the listening-in option (see <a href="#">page 48</a> ). Have you pressed "*" on the extension for obtaining an outside line (see <a href="#">page 18</a> )?
53	Wrong codeword	A document has been retrieved with the wrong codeword (see <a href="#">page 69</a> ).
60	Line busy	Send the document again.
B0-B5 C0-C4 D0-D2 F0, F1	Communication error	Bad line.  The document has probably not been transmitted. You should transmit your document again to be safe.
E0-E6	Printer fault	A printer error occurred during reception, causing a memory overflow.
87	Image cannot be saved	Memory overflow on the other machine. Transmit your document again later.

## Transmission problems

Your fax machine reports an operating error or fails to perform the required function. Before you make an unnecessary call on your service technician, take your time and see if you can help yourself. This checklist will help you recognise and eliminate errors.

Problem	Possible causes ...	... and solutions
Your document is not automatically pulled into the feeder.	Your machine displays an error.	If the display gives an error message, clear the fault and delete the display with STOP.
	The display is blank.	Check there is power on the machine. The machine must be switched on (see <a href="#">page 9</a> ).
	Document size or thickness of paper are not acceptable.	Use acceptable documents only (see <a href="#">page 37</a> ).
	The operator control panel is not firmly locked.	Close the cover. It should be firmly locked in place on both sides.
The text "transmission" is not displayed when you press the START key.	You replaced the receiver before pressing START.	Try again. Replace the receiver only when you have pressed START.
The document is damaged during sending or copying.	Document format or paper thickness not as specified.	Use acceptable documents only (see <a href="#">page 37</a> ).
	The document guides are not properly adjusted to the paper size.	Adjust the document guides accordingly.
Your fax machine performed transmission correctly but the message was not received by the receiver.	The other machine is out of paper.	Ask the receiver to put paper in his machine.
The receiver received a blank sheet instead of the document sent.	You loaded your document in the machine with the image face-up.	Send your document again: the image must be face-down on your document feeder.
The receiver reports: The document transmitted is difficult to read.	Your machine's document reader is dirty or damaged.	Make a copy of your document on your fax machine (see <a href="#">page 35</a> ). If your copy is also difficult to read, clean the document reader.

Problem	Possible causes ...	... and solutions
The receiver reports: The document transmitted is difficult to read.	RESOLUTION and CONTRAST are not set correctly.	Make a copy on your fax machine (see <a href="#">page 35</a> ) and adjust the settings to your document. You can also improve document quality: By making the print on the photocopy darker, enlarging or reducing. (see <a href="#">page 50 / 51</a> ). Then send again.
	The telephone connection is poor.	Redial. You may get a better connection.
Abbreviated or one-touch dialling do not work.	Abbreviated or one-touch dialling number is not correctly stored.	Check and correct stored numbers (see <a href="#">page 77 / 82</a> ).
Your call does not arrive although you have dialled the correct number.	If you are connected to a PABX: You have set the wrong line type.	Set the line types to EXTENSION (see <a href="#">page 18</a> ).
	Your fax machine is not connected to the PSTN.	Plug the connecting cable of your fax machine into the socket (see <a href="#">page 9</a> ).

## Receiving problems

Your fax machine reports an operating error or fails to perform the required function. Before you make an unnecessary call on your service technician, take your time and see if you can help yourself. This checklist will help you recognise and eliminate errors.

Problem	Possible causes ...	... and solutions
You press START to receive a document. But you receive nothing.	Your machine displays an error.	If the display gives an error message, clear the fault and delete the display with STOP.
	The fax machine is not correctly connected.	Check the wiring. See <a href="#">page 9</a> .
	The display is blank.	Check there is power on the machine. The machine must be switched on (see <a href="#">page 9</a> ).
	There is still a document in the feeder.	Press STOP and remove the document.
	Your fax machine is set in manual receiving mode and you replaced the handset before pressing START.	When receiving the next fax, be sure to replace the handset only after you have pressed START.
	The operator control panel is not closed.	Close the cover. Both sides of the cover must be firmly locked in place.
Your recording paper is not fed out.	The recording paper in your machine is jammed.	Remove the jammed paper (see <a href="#">page 147</a> ).
The document received is difficult to read.	Document quality is poor.	Ask the sender to reset the resolution and contrast or improve the quality of the document e.g. by making the print on the photocopy darker, enlarging or reducing. Then have it send again.
	The recording paper quality is poor.	Use acceptable recording paper (see <a href="#">page 10</a> ).
You receive a completely blank document.	The sender made a mistake when loading the document.	Check whether the sender loaded in the correct manner.
The document received is partially printed.	The operator control panel of your fax machine is not closed properly on both sides.	Close the cover. Both sides of the cover must be firmly locked in place.
You can send fax messages without any problem, although you cannot receive any.	Receiving protection is activated.	Switch off receiving protection (see <a href="#">page 34</a> ).

## Cleaning document scanner

Never use abrasive materials to clean your fax machine - they could cause damage. If documents transmitted are difficult to read, the document scanner must be cleaned. You can easily tell when: Make a test copy of the document on your fax machine and compare the copy with the original.

Open the document feed by pressing the corresponding release button.

Wipe the white metal strips and the opposing document window with a soft cloth.

If these parts are very dirty, you can also use a slightly moist cloth and then wipe off with a dry cloth.

Return the document feed to its original position. Ensure that the covers on both sides lock into place correctly.

## Remove document jam

Leave the fax machine switched on. Remove the remaining documents from the document feed.

Open the document feed by pressing the corresponding release button.

Remove the copy that caused the document jam. Check the document feed for residual scraps of paper.

Return the document feed to its original position. Ensure that the covers on both sides lock into place correctly.

## How to clear a recording paper jam

In the event of a paper jam in the receiving paper tray, the PAPER JAM XX" message is displayed. The two numbers indicate the location of the paper jam in the fax machine.

Code	Jam position
10	Paper cassette. In the case of additional cassettes: Top cassette
20	Optional paper cassette: Middle cassette
30	Optional paper cassette: Bottom cassette
50	Single-sheet feed
80	Area of the paper feed (directly downstream of the tray)
90	Area of the paper exit (directly upstream of the paper exit)

Leave the fax machine switched on. Open the side paper feed and, if applicable, pull the page out.

Subsequently open the machine cover by operating the release lever.

Remove the printer unit from the exposed machine.

If paper is located beneath the metal transport roller, release the paper by pressing the green lever (as illustrated in the diagram).

 Please take care not to tear the paper in this context.

If part of the paper is already located in the setting unit, it can be pulled out in the direction opposite to the print direction, as illustrated in the diagram.

- 
- Please take care not to tear the paper in this context.
  - Caution! The setting unit may be very hot.  
**DANGER OF BURNING!**
  - Please do not pull the paper towards the paper exit

Once you have ensured that both the jammed paper and any paper scraps have been removed, re-install the printer unit and close the machine and side paper feed cover.

### Note

If a paper jam occurs during fax reception, the remaining pages are stored in the memory. Once the paper jam has been eliminated, the remaining pages are printed out automatically.

## Cleaning the printer unit

If toner inadvertently ingresses into the fax machine, it may be necessary to clean the loading corona.

The loading corona comprises a very thin, taut wire stretched within a metal cage along the entire length of the image drum.

The supplied special tool enables you to clean the charge corona without any danger.

- Switch of the fax machine
- Pull the release button to open the fax machine (see [page 7](#))

- Holding the printer unit by the green handle, remove it from the fax machine.

- Remove the developer unit from the drum unit.

- Place the cleaning tool carefully on the metal cage (as illustrated in the drawing) and then slide it backwards and forwards several times along the entire length of the corona wire.

### NOTE

The other parts of the cleaning kit are reserved for a service call-out. Please store these objects in a safe place.

## Remote maintenance (COMLINE)

Your fax machine enables remote diagnosis to be carried out. This means that internal settings can be read and changed via the telephone line. In order to ensure that all requirements of data protection are observed, COMLINE is possible only if you temporarily enable your fax machine for this facility.

Remote maintenance may also be password protected.

## Download

This menu item allows additional technical settings that should only ever be performed by your dealer's qualified personnel.

## Connection to PABX

If your fax machine is connected to a PABX, additional sources of errors are possible. In the event of any problems, you should work through the following items and compare them against the current installation of your fax machine. Where necessary consult the person who installed your PABX.

- Does the PABX have public line capability?
- Does the PABX have DDI capability?
- Have you entered the „\*“ key before the actual fax number?
- How is the public line obtained (flash, number)?
- Which dialling mode will be used? \*

\*) The factory default in Germany is MFV (multiple frequency dialling). If impulse dialling (IWW) is to be used, please contact your dealer.

This TOSHIBA Facsimile Transceiver is intended for connection to public telecommunication services as follows:

By using the cable described as TEL LINE CABLE in the packaging list of the instruction manual. This cable plugs into the socket on the left hand side of the DP 120F which is marked LINE and the other end into the standard PSTN analogue socket found in the UK.

This terminal equipment complies with the following requirements:

- Group 3 fax modem
- Automatic call initiation
- Storage of telephone numbers for retrieval by a predetermined code
- Automatic dialling
- Automatic repeat attempts
- Call progress monitor
- Series connection facility
- LD or MF dialling
- Operation with or without dial tone being present.

Any other usage will invalidate the approval of the apparatus if as a result, it then ceases to conform to the standards against which approval was granted.

We declare, that TOSHIBA is using **CE** mark in compliance with EN 50 082-1, EN 55 022/B and EN 60 950

## EPA ENERGY STAR

For more information on the ENERGY STAR

Program, please contact:  
ENERGY STAR Printers/Fax Machines  
US EPA (62021)  
Washington, DC 20460

ENERGY STAR is an U.S. registered mark.

Addendum to the DP 120F Operator's Manual  
The United States Environmental Protection Agency (EPA) has introduced a voluntary program, the ENERGY STAR Program, to encourage the widespread and voluntary use of energy-efficient technologies that enhance the workplace, improve product performance, prevent pollution, and reduce your energy costs. As an ENERGY STAR Partner, to Toshiba Europa (I.G.) GmbH has determined that this facsimile model meets the ENERGY STAR guidelines for energy efficiency. ENERGY STAR guidelines require that all ENERGY STAR facsimiles maintain very low power consumption during idle state or have a „Power Saver“ feature that will automatically stand-down to an idle state after a period of inactivity.

## Declaration of conformity

We herewith declare:                      Manufacturer: Toshiba Europe GmbH  
    Address: Hammfelddamm 8  
    D-41460 Neuss,

that the product: Analog fax machine, Model: DP 80F/85F/120F,

fulfils the fundamental requirements pursuant to Article 3 of EU Directive 1999 / 5 / EC, and that the following harmonised standards apply:

EN 60950 :1992 + A1 :1993 + A2 :1993 + A3 :1995 + A4 :1997 + A11 :1997

EN 60825 - 1 :1994 + A11 :1996

EN 55024 :1998

EN 55022 :1998 Class A

EN 61000-3-2 :1995 + A1 :1998 + A2 :1998

EN 61000-3-3 :1995

Council Decision 1998 / 482 / EC of 20.07.98 (CTR 21)

The device is designed for all analog PBX interfaces in the European Union, as it has been tested pursuant to TBR 21.
