

XMC4400 Motor Control Application Kit

Part Number: KIT_XMC44_AE3_001

How long does it take to get a motor turn?

Few minutes with the XMC4400 Motor Control Application Kit. It has everything you need to make a plug&play experience for 3-Phase drives. This kit has a XMC4400 Microcontroller Board, the respective 24V power board including N-Channel Optimos™ power transistors and 3 phase gate driver EiceDRIVER™ from Infineon, completed with a brushless DC motor. It's supported by the DAVE™ Motor Control Apps library, including sinusoidal and block commutation as well as various position detection and sensing schemes with encoder, resolver, hall sensors and shunts.

Features

- XMC4400 Microcontroller Board
- Power board:
 - 24V/7.5 A
 - 3-Phase Inverter with N-Channel Optimos™ power transistors (BSC031N06NS3 G) and EiceDRIVER™ gate driver (6ED003L02-F2)
 - 3-Phase Inverter by Reverse Conduction IGBT

Introduction

This document describes the features and hardware details of the CPU Board XMC4400 General Purpose (CPU_44A-V2) designed to work with Infineon's XMC4400 Microcontroller. This board is part of Infineon's Hexagon Application Kits.

1 Overview

The CPU board CPU_44A-V2 houses the XMC4400 Microcontroller and three satellite connectors (HMI, COM, ACT) for application expansion. The board along with satellite cards (e.g. HMI_OLED-V1, COM_ETH-V1, AUT_ISO-V1 boards) demonstrates the capabilities of the XMC4400. The main use case for this board is to demonstrate the generic features of the XMC4400 device including tool chain. The focus is safe operation under evaluation conditions. The board is neither cost nor size optimized and does not serve as a reference design.

1.1 Key Features

The CPU_44A-V2 board is equipped with the following features

- XMC4400 (ARM[®] Cortex™-M4-based) Microcontroller, 512 kByte on-chip Flash, LQFP-100
- Connection to satellite cards via the satellite connectors COM, HMI and ACT
- USB OTG Host/Device support via micro USB connector
- Debug options
 - On-board Debugger via the Debug USB connector
 - Cortex Debug connector 10-pin (0.05")
 - Cortex Debug+ETM connector 20-pin (0.05")
- Reset push button
- RGB LED connected to GPIOs P1.10, P1.11 and P5.7
- Boot option switch
- PowerScale Connector: Ready for power consumption analysis
- 7 LED's
 - 3 Power indicating LEDs
 - 2 User LEDs (P5.2 and P1.8)
 - 1 RESET LED
 - 1 Debug LED
- Two User Buttons connected to HIB_IO_0 and P0.10
- Potentiometer, connected to analog input P14.1
- Power supply
 - Via Micro-USB connector in USB device mode
 - Via satellite connector pins (COM/ACT satellites cards can supply power to CPU board)
 - Via Debug USB connector
 - RTC backup battery

1.2 Block Diagram

Figure 1 shows the functional block diagram of the CPU_44A-V2 board. For more information about the power supply please refer to chapter 2.1.

The CPU board has got the following building blocks:

- 3 Satellite Connectors (COM, HMI ACT)
- 2 User LEDs connected to GPIOs P5.2 and P1.8
- 2 User Buttons connected to HIB_IO_0 and P0.10
- RGB LED connected to GPIOs P1.10, P1.11 and P5.7
- 2 Cortex Debug Connectors
- Variable resistor (POTI) connected to GPIO P14.1
- USB On-The-Go Connector (Micro-USB)
- On-board Debugger via Debug USB connector (Micro-USB)

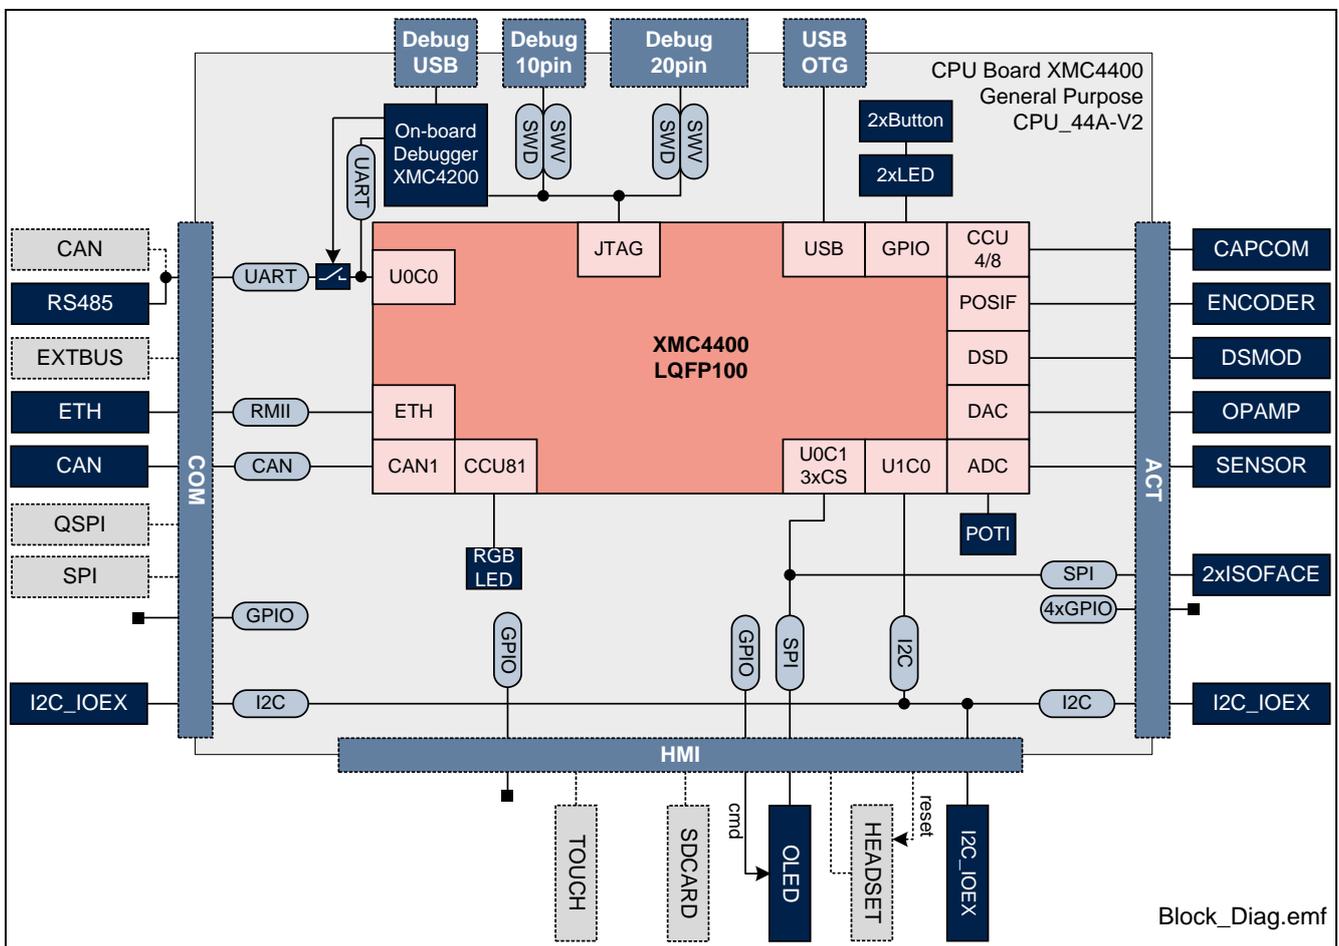

Figure 1 CPU_44A-V2 Board Block Diagram

2 Hardware Description

The following sections give a detailed description of the hardware and how it can be used.

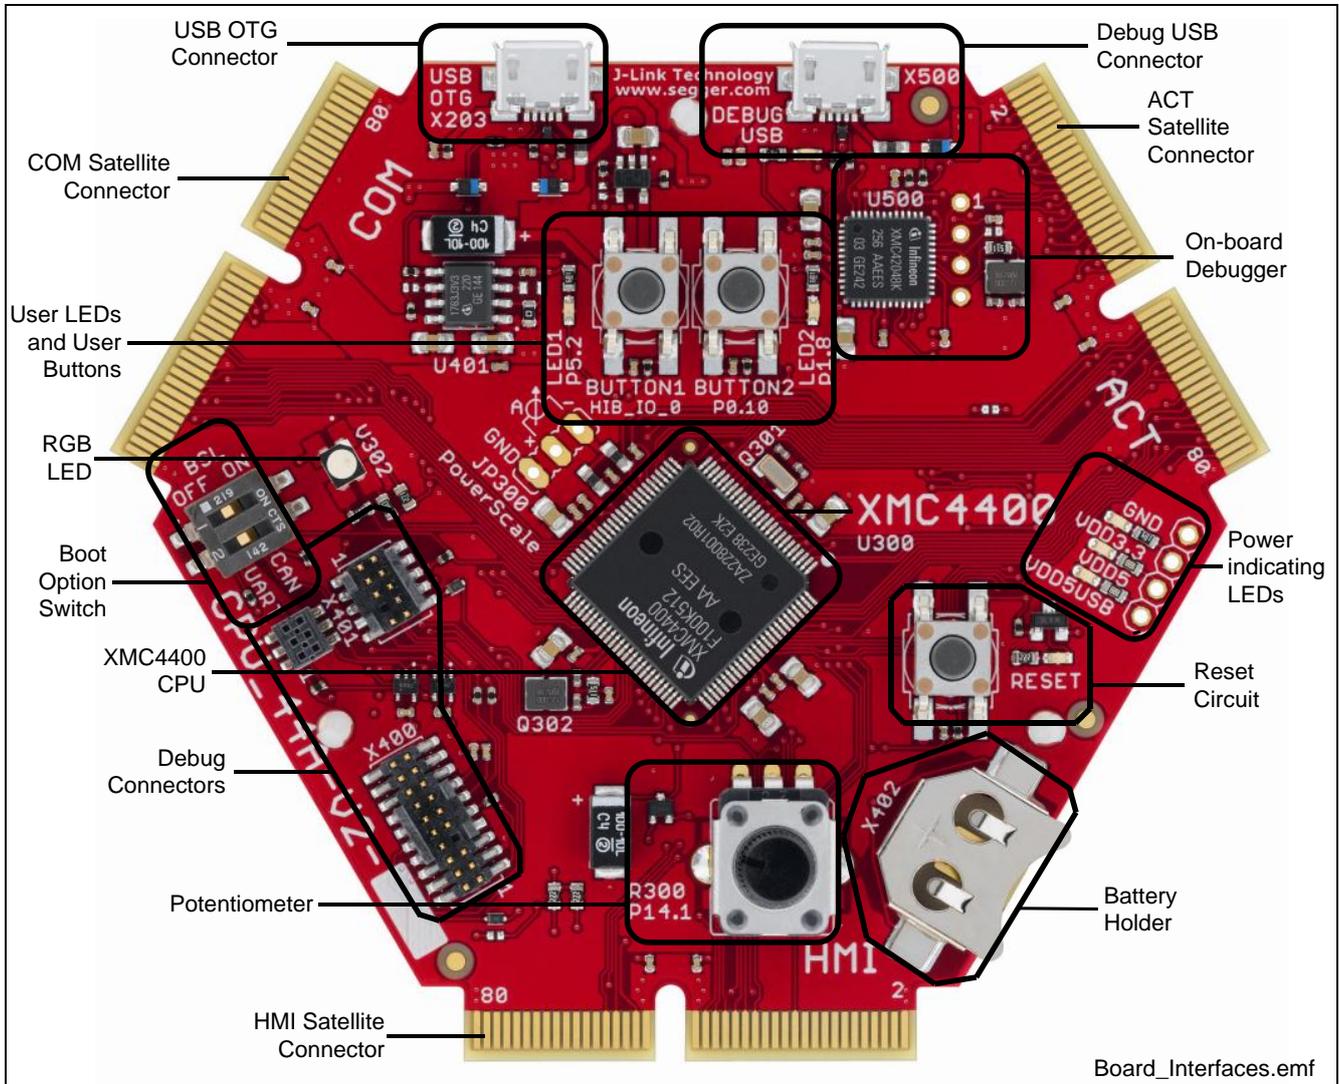

Figure 2 CPU Board XMC4400 General Purpose (CPU_44A-V2)

2.1 Power Supply

The CPU_44A-V2 board can be powered via either of the USB plugs (5 V); however, there is a current limit that can be drawn from the host PC through USB. If the CPU_44A-V2 board is used to drive other satellite cards e.g. MOT_GPDLV-V2 and the total system current required exceeds 500 mA, then the CPU_44A-V2 board needs to be powered by a satellite cards. These satellite cards support external power supply.

The typical current drawn by the CPU board without any satellite cards connected is about 190 mA (@5 V).

For powering the board through an USB interface, connect the USB cable provided with the kit to either of the Micro-USB connector on board as shown in Figure 3.

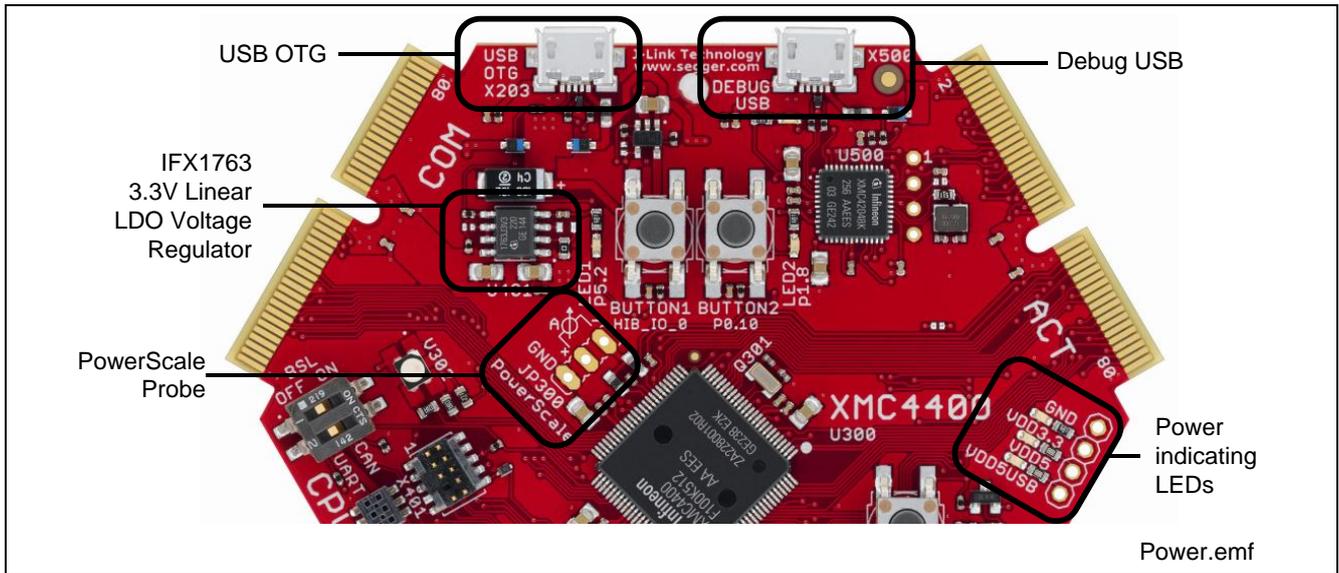

Figure 3 Powering Option

To indicate the power status of the CPU_44A-V2 board three power indicating LED's are provided on board (see Figure 3). The LED will be "ON" when the corresponding power rail is powered.

Table 1 Power status LED's

LED Reference	Power Rail	Voltage	Note
V401	VDD5	5 V	Must always be "ON"
V402	VDD5USB	5 V	"ON" if powered by USB OTG connector X203 "OFF" in all other supply cases
V403	VDD3.3	3.3 V	Must always be "ON"

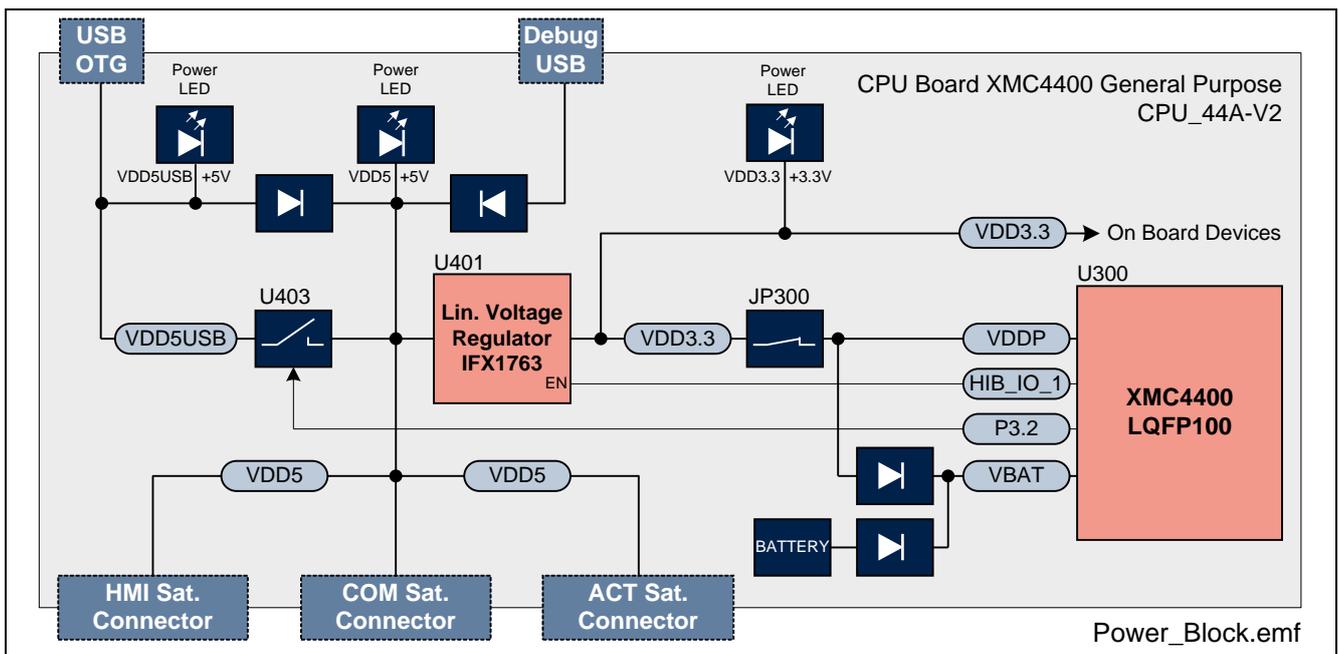

Figure 4 Block Diagram Of Power Supply

Hitex PowerScale probe is provided on the CPU_44A-V2 board to measure the power consumption of the XMC4400 device.

Table 2 Power Measurement

Jumper	Function	Description
JP300	PowerScale	A Hitex PowerScale probe can be connected for current sensing the VDD3.3 (CPU power source). Default: pos. 1-2 (closed) <i>Note: On the PCB there is a shorting trace between pin 1-2. This trace has to be cut first, before using PowerScale. Pin 3 is GND.</i>

2.2 Reset

A reset signal connected to the low-active PORST# pin of the target CPU (U300) can be issued by

- an on-board Reset Button (SW400, RESET)
- an on-board debug device (U500)
- an external debugger connected to either Cortex Debug connector X400 or X401

The RESET signal is routed to all satellite connectors. The reset circuit includes a red LED (V407) to indicate the reset status: The Reset LED (V407) will be "ON" during active reset state and will be "OFF" if reset is not active.

Be aware that PORST# is a bidirectional reset pin of the XMC4000 family which can also be pulled low by the XMC4000 device itself.

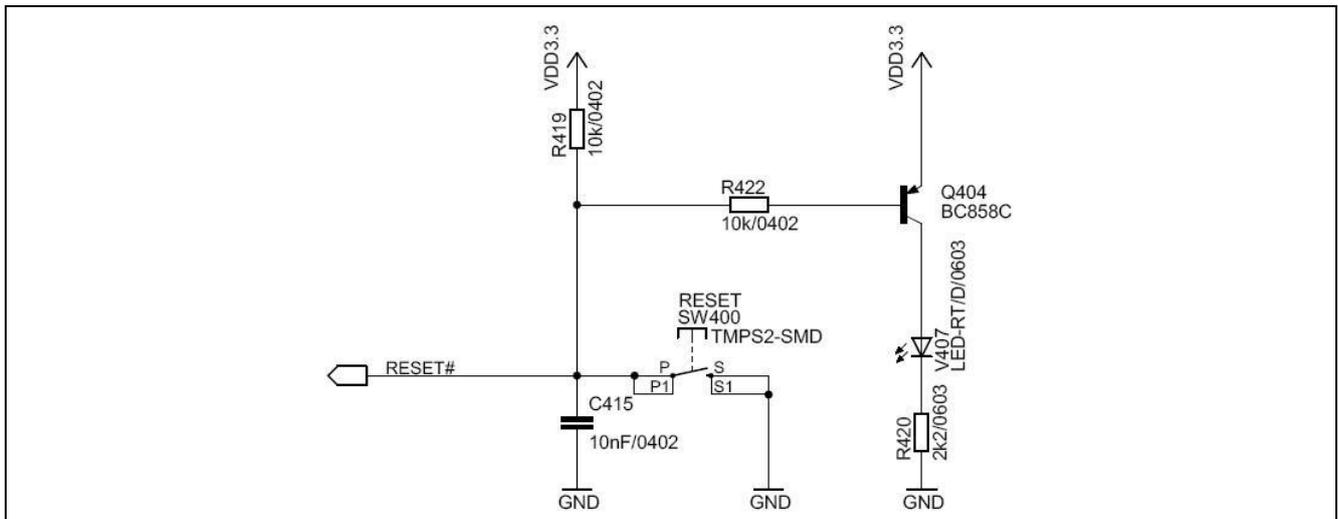

Figure 5 Reset Circuit

Figure 6 Reset LED and Reset Button

2.3 Clock Generation

An external 12 MHz crystal provides the clock signal to the XMC4400 microcontroller. The drive strength of the oscillator is set to maximum by software, in order to ensure a safe start-up of the oscillator even under worst case conditions. Therefore a serial 510 Ohm resistor will attenuate the oscillations during operations.

For the RTC clock a separate external 32.768 kHz crystal is used on board.

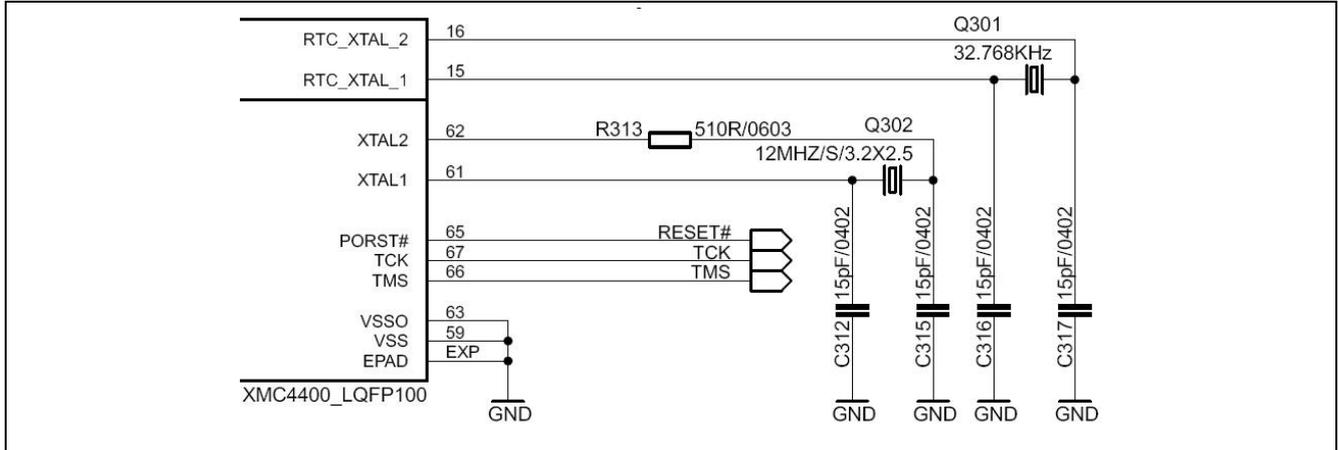

Figure 7 Clock Generation

2.4 Boot Option

During power-on-reset the XMC4400 latches the dip switch SW300 settings via the TCK and the TMS pin. Based on the values latched different boot options are possible.

Table 3 Boot Options Settings

BSL (TMS)	CAN/UART (TCK)	Boot Option
OFF (1)	UART (0)	Normal Mode (Boot from flash)
ON (0)	UART (0)	ASC BSL Enabled (Boot from UART)
OFF (1)	CAN (1)	BMI Customized Boot Enabled
ON (0)	CAN (1)	CAN BSL Enabled (Boot from CAN)

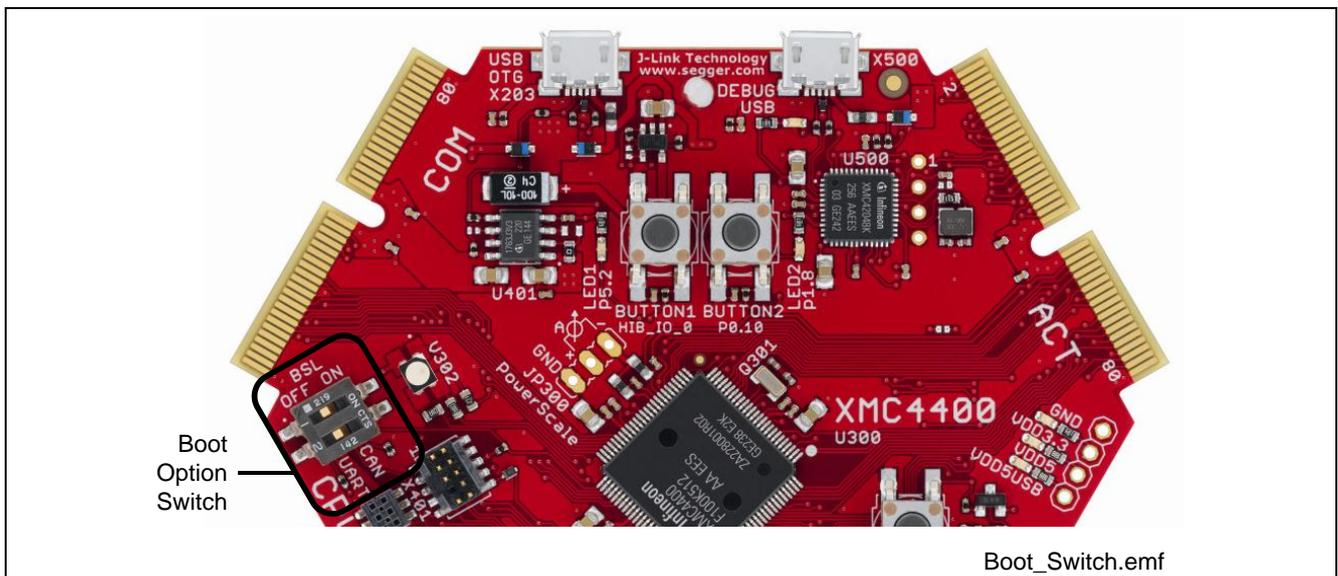

Figure 8 Boot Options Switch

2.5 Debug Interface

The CPU_44A-V2 board supports debugging via 3 different channels:

- On-board Debugger
- Cortex Debug Connector (10-pin)
- Cortex Debug+ETM Connector (20-pin)

The Hexagon Application Boards are designed to use “Serial Wire Debug” as debug interface. JTAG debug is not supported by default because the GPIO P0.7, where the required TDI function is mapped to also, is used by various Actuator boards connected to the ACT satellite connector.

Note: It is strongly recommended not to use JTAG debug mode, especially if satellites boards are connected, which uses the GPIO 0.7. For the same reason also do not use the on-board debugger in JTAG mode.

If you want to use the JTAG debug mode through the cortex debug connectors (X400, X401) anyway, enable the JTAG interface of the XMC device by assembling the pull-up resistor R427 (4k7 Ohm) and the resistor R410 (0 - 33 Ohm).

2.5.1 On-board USB Debugger

The on-board debugger [1] supports

- Serial Wire Debug
- Serial Wire Viewer
- Full Duplex UART communication via a USB Virtual COM

[1] Attention: Newer firmware versions of the on-board debugger require the latest J-Link driver (V4.62 or higher) and a Serial Port Driver (CDC driver) installed on your computer. Please check “Install J-Link Serial Port Driver” when installing the latest J-Link driver (see Figure 9)

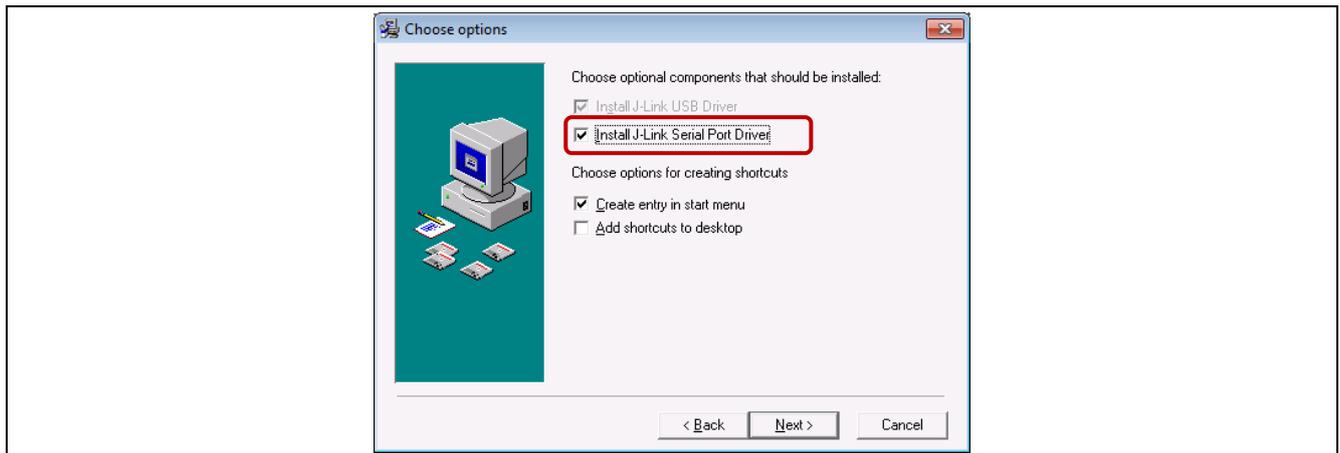

Figure 9 Installation of Serial Port Driver

The on-board debugger can be accessed through the Debug USB connector shown in Figure 10. The Debug LED V502 shows the status during debugging.

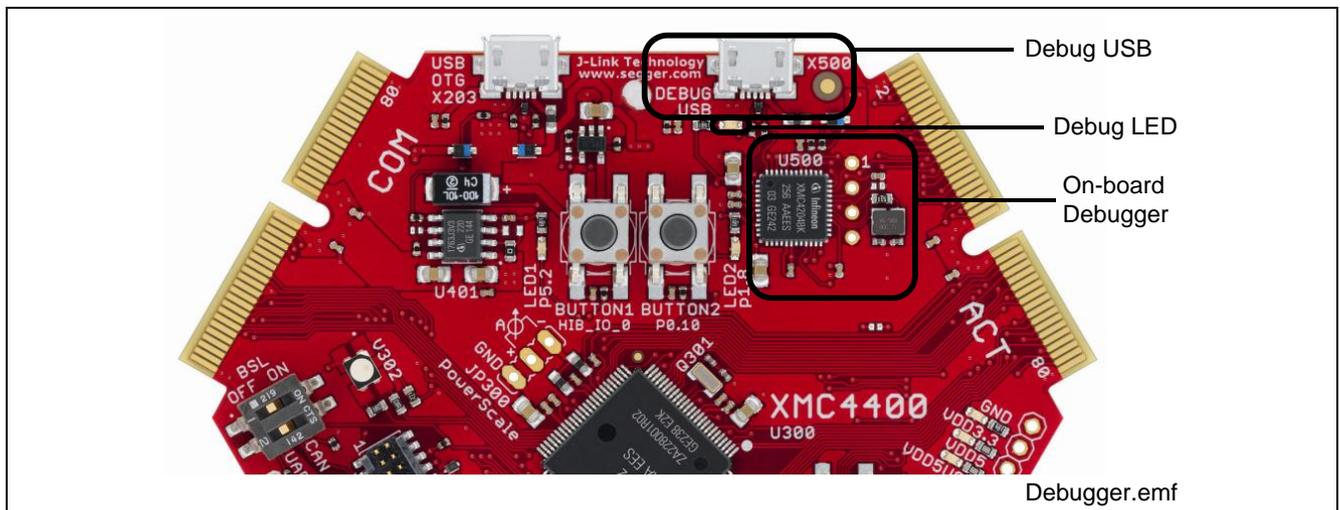

Figure 10 On-Board USB Debugger

When using an external debugger connected to the 10pin/20pin Cortex Debug Connector, the on-board debugger is switched off.

When using the USB virtual COM port function of the on-board debugger the UART interface to the COM satellite is disabled through the switches U301 and U303.

2.5.2 Cortex Debug Connector (10-pin)

The CPU_44A-V2 board supports Serial Wire Debug operation and Serial Wire Viewer operation (via the SWO signal when Serial Wire Debug mode is used) through the 10-pin Cortex Debug Connector.

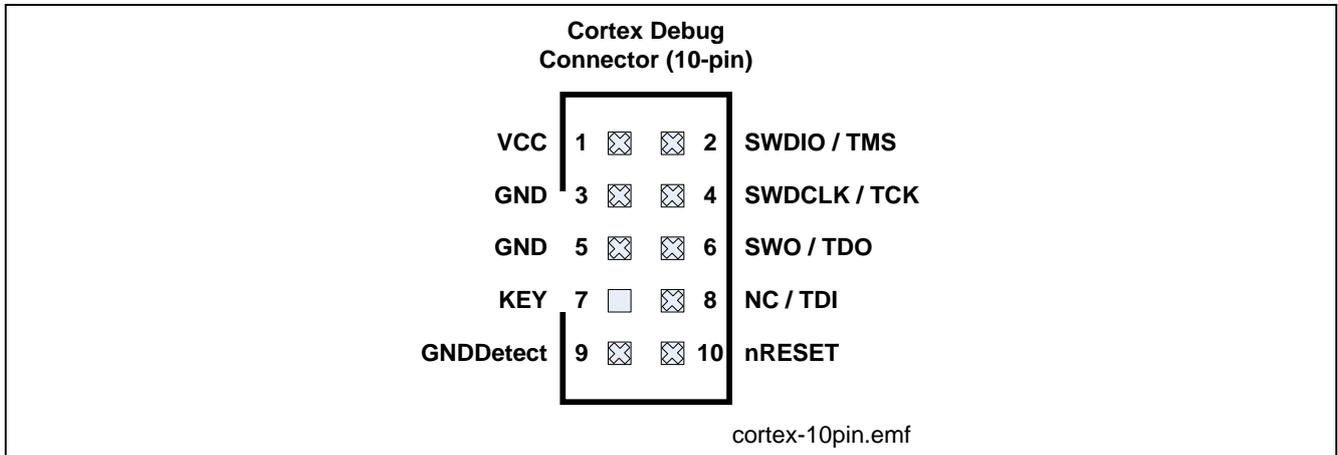

Figure 11 Cortex Debug Connector (10-pin)

Table 4 Cortex Debug Connector (10 Pin)

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
1	VCC	+3.3 V	+3.3 V
2	SWDIO / TMS	Serial Wire Data I/O	Test Mode Select
3	GND	Ground	Ground
4	SWDCLK / TCK	Serial Wire Clock	Test Clock
5	GND	Ground	Ground
6	SWO / TDO	Trace Data OUT	Test Data OUT
7	KEY	KEY	KEY
8	NC / TDI	Not connected	Test Data IN
9	GNDDetect	Ground Detect	Ground Detect
10	nRESET	Reset (Active Low)	Reset (Active Low)

Figure 12 Cortex Debug Connector (10-pin) Layout

2.5.3 Cortex Debug+ETM Connector (20-pin)

The CPU_44A-V2 board supports Serial Wire Debug operation, Serial Wire Viewer operation (via SWO connection when Serial Wire Debug mode is used) through the 20-pin Cortex Debug+ETM Connector. The board does not support the Instruction Trace operation.

JTAG Debug operation additionally would require the TDI (P0.7) signal. By default the TDI signal is disconnected from the Cortex Debug Connectors by a not assembled resistor R410, because the pin P0.7 is used by some Actuator boards connected to the ACT satellite connector.

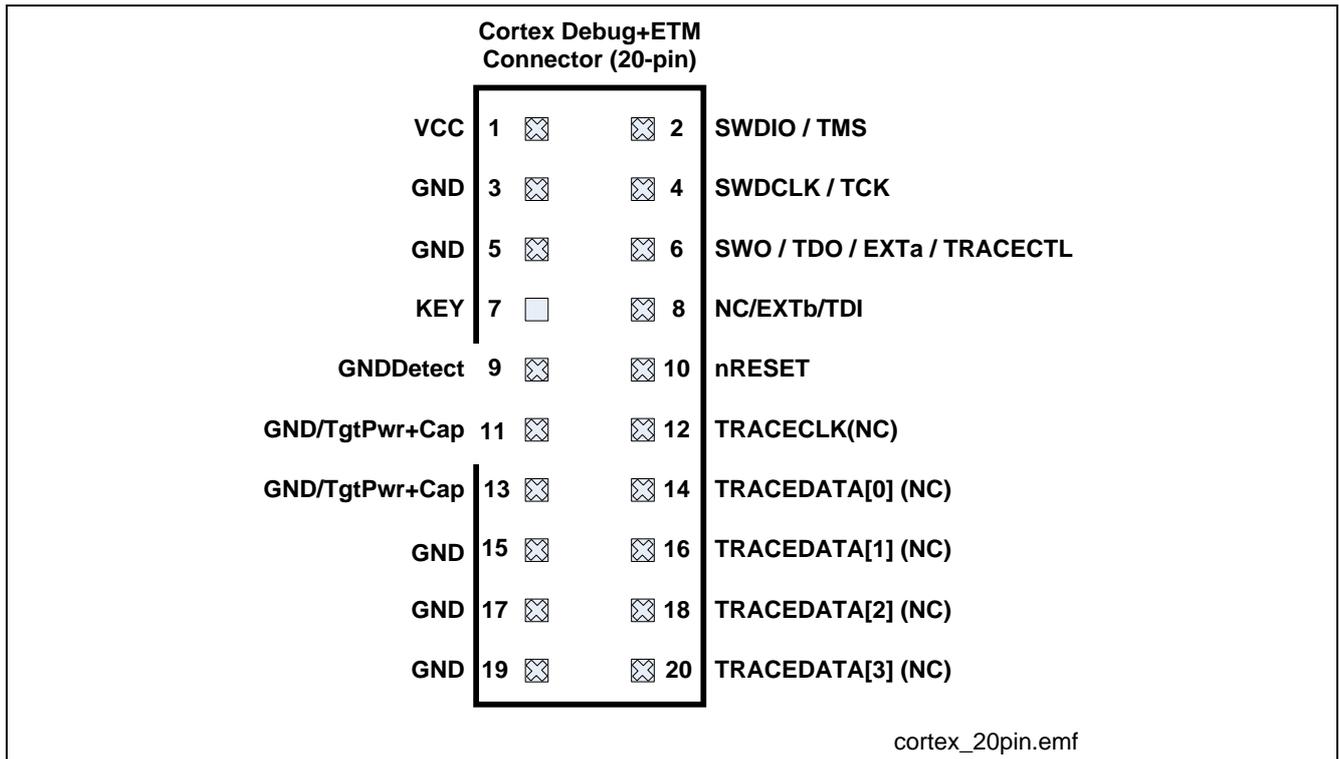

Figure 13 Cortex Debug+ETM Connector (20-pin)

Table 5 Cortex Debug+ETM Connector (20 Pin)

Pin No.	Signal Name	Serial Wire Debug	JTAG Debug
1	VCC	+3.3 V	+3.3 V
2	SWDIO / TMS	Serial Wire Data I/O	Test Mode Select
3	GND	Ground	Ground
4	SWDCLK / TCK	Serial Wire Clock	Test Clock

20	TRACEDATA[3]*	TRACEDATA[3]*	TRACEDATA[3]*

Note: * Not connected on the CPU_44A-V2 board.

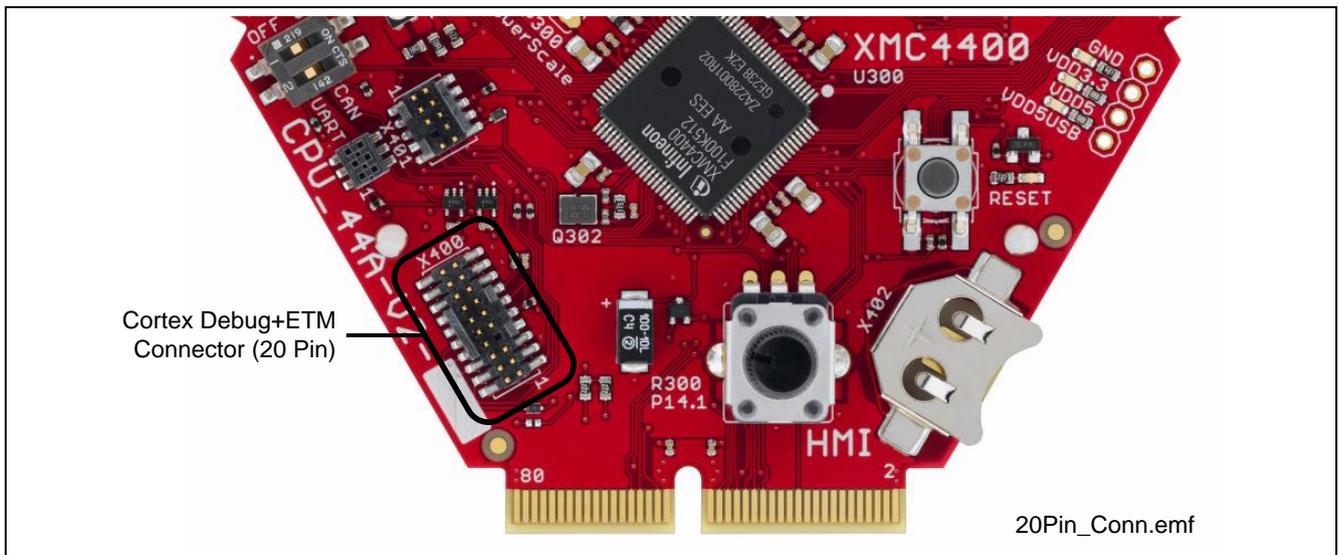

Figure 14 Cortex Debug+ETM Connector (20-pin) Layout

2.6 RGB LED

The CPU_44A-V2 board has a tricolored LED. The LED glows with either Red/Blue/Green colors as controlled by the GPIO pins given below.

Table 6 RGB LED Connections

Pin No. / Function	LED Color
P5.7 / CCU81.OUT02	RED
P1.11 / CCU81.OUT11	GREEN
P1.10 / CCU81.OUT21	BLUE

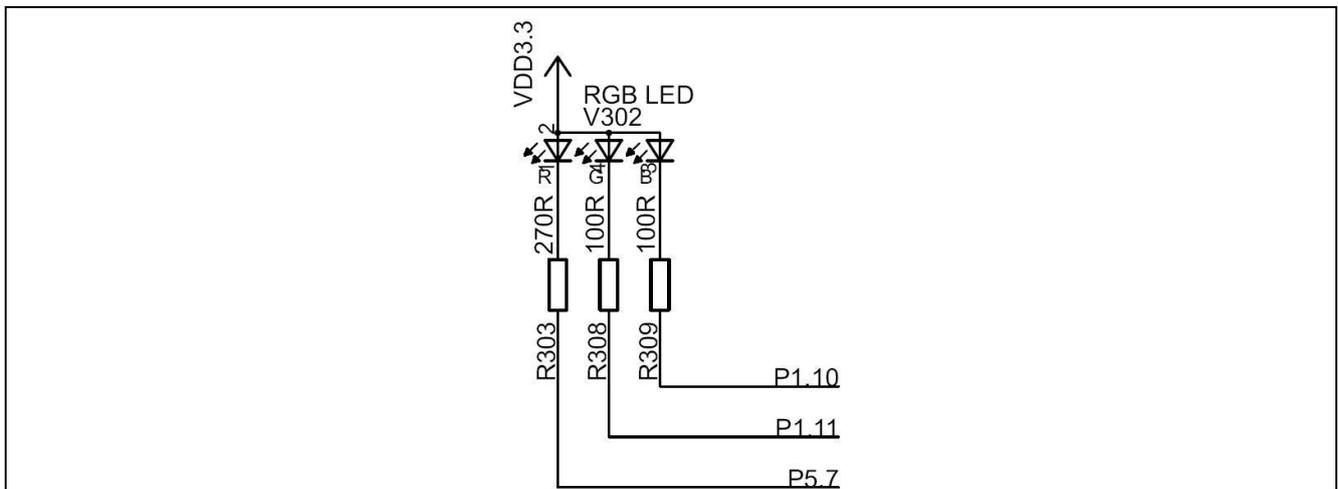

Figure 15 RGB LED

2.7 USB

The XMC4400 supports USB interface in host only mode, device only mode or as an OTG Dual Role Device (DRD). In USB device mode, power is expected through VBUS (pin 1 of X203C) from an external host (e.g. PC). When the current consumption of the application running on the Hexagon Application system is higher than 500 mA, power from an external source through satellite cards shall be used.

Note: Some PCs, notebooks or hubs have a weak USB supply which is not sufficient for proper supply. In this case use an external 5 Volt power supply or a powered USB hub.

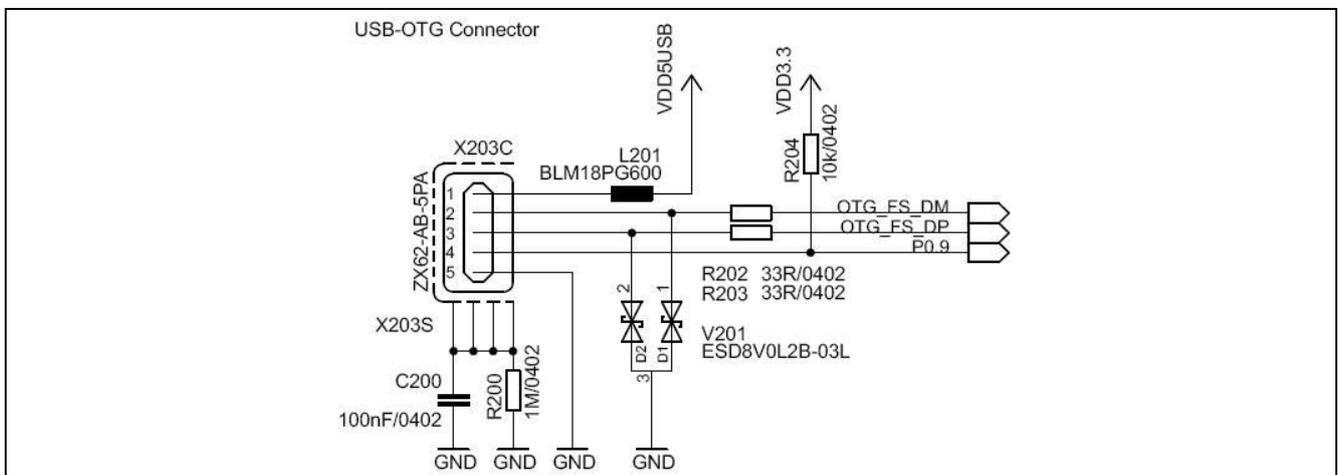

Figure 16 USB Connector

USB ID pin of the USB connector (pin 4 of X203C) is connected to the port pin P0.9 of the XMC4400. On this port pin the USD identification signal (USB.ID) of XMC4000 USB module is mapped to. An OTG device will detect whether a USB Micro-A or Micro-B plug is inserted by checking the ID pin. When the ID = FALSE a Micro-A connector is plugged in and when ID = TRUE a Micro-B connector is plugged in. When the ID is true the XMC4400 acts as a USB host else as a USB device.

Table 7 USB micro AB connector Pinot

Pin No.	Pin Name	Pin Description
1	VBUS	5 V
2	D-	Data Minus
3	D+	Data Plus
4	ID	Identification
5	GND	Ground

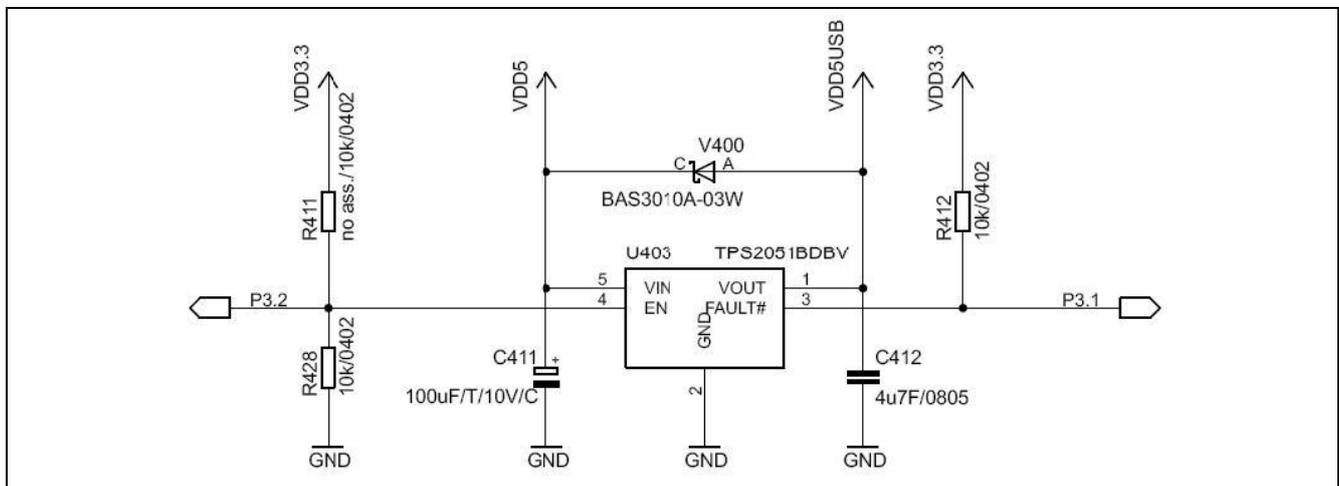

Figure 17 USB power generation - Host/OTG mode

In the host only mode and OTG mode the CPU_44A-V2 board is capable of supplying power to the connected device (e.g. USB mouse). The board has a power-switch which is controlled by the USB.BUSDRIVE signal of the XMC4400. The USB.BUSDRIVE signal is mapped to port pin P3.2 (active high).

In the Host/OTG mode a low active FAULT signal indicates to the port pin P3.1 of the XMC4400, if more than 500 mA current is drawn by the external device.

Diode V400 will allow powering the board through USB in all USB modes via e.g. a PC.

2.8 RTC

The XMC4400 CPU has two power domains, the Core Domain and Hibernate Domain.

The Core Domain (VDDP pins) is connected to the VDD3.3 rail. An on-board LDO voltage regulator generates VDD3.3 (3.3 V) from VDD5 (5 V).

The Hibernate Domain is powered via the auxiliary supply pin VBAT, which is supplied by either a 3 V coin cell (size 1216, 1220, 1225) plugged into the battery holder or 3.3 V (VDD3.3) generated by the on-board voltage regulator.

Figure 18 Battery Holder for Coin Cells

The Real Time Clock (RTC) is located in the hibernate domain. The XMC4400 uses the HIB_IO_1 signal (active low) to shut down the external LDO voltage regulator which generates the VDD3.3 (Core Domain). Even if the Core Domain is not powered the Hibernate Domain will operate if VBAT is available. The RTC keeps running as long as the Hibernate Domain is powered via the auxiliary supply VBAT. The RTC is capable to wake-up the whole system from Hibernate mode by setting HIB_IO_1 to high.

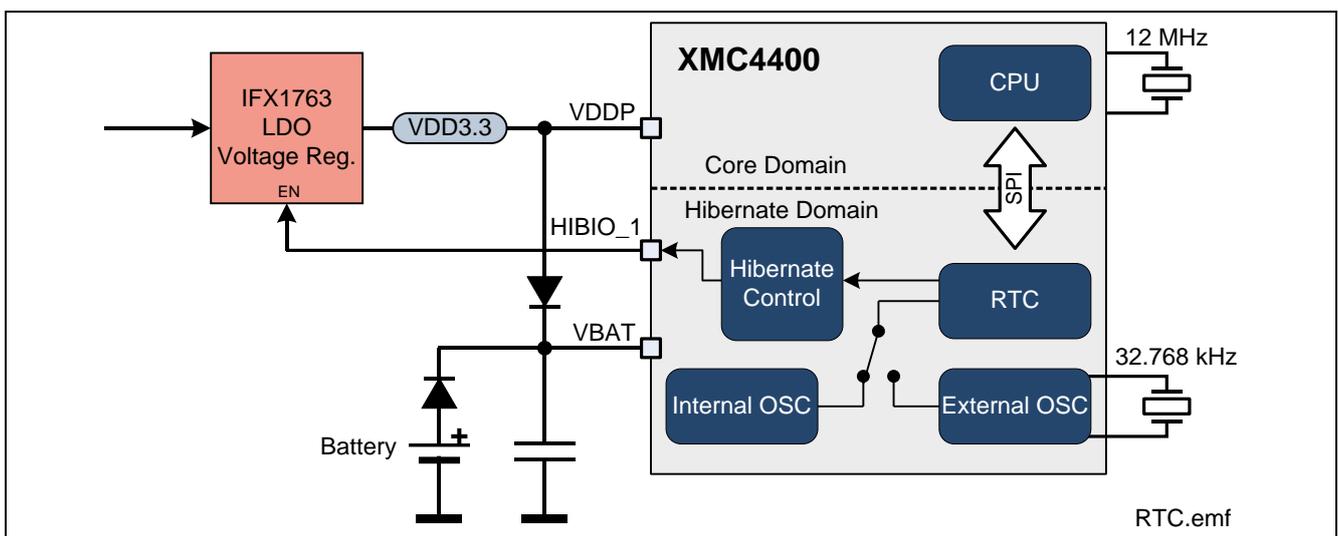

Figure 19 XMC4400 Power Domains and Real Time Clock

2.9 User LEDs and User Buttons

The port pins P5.2 and P1.8 of the XMC4400 are connected to the LEDs V300 and V301 respectively. More User LED's are available through the I2C GPIO expander on most of the satellite cards.

Table 8 User LEDs

LED	Connected to Port Pin
V300	GPIO P5.2
V301	GPIO P1.8

Two User Buttons, SW301 and SW302 are connected to P0.10 and HIB_IO_0 of XMC4400.

Table 9 User Buttons

Button	Connected to Port Pin
BUTTON1 / SW301	HIB_IO_0
BUTTON2 / SW302	P0.10

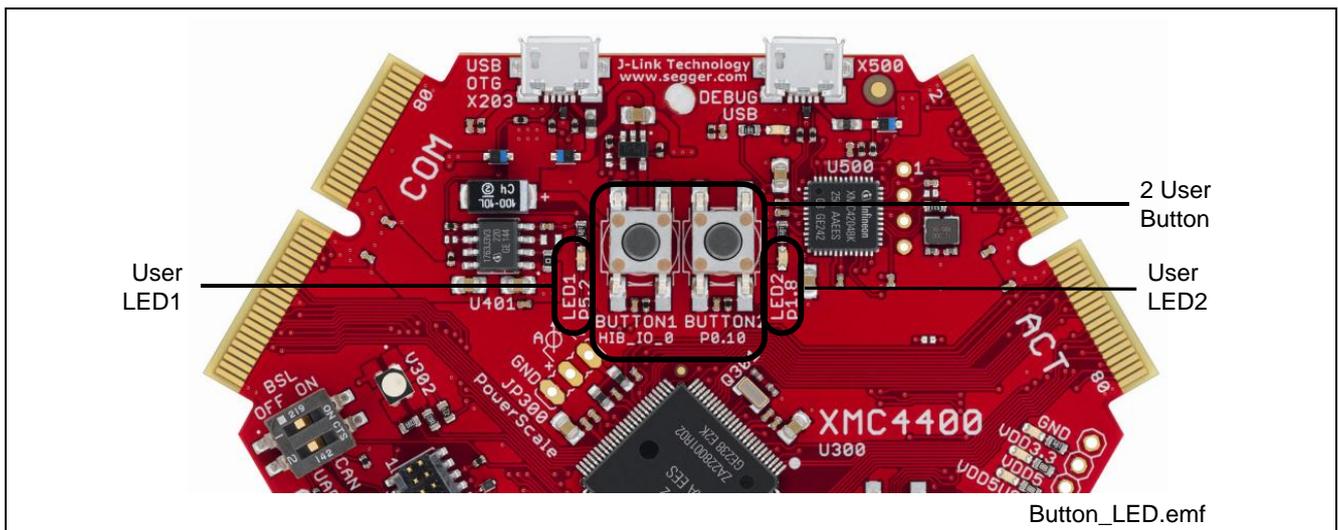

Figure 20 User LEDs and User Buttons

2.10 Potentiometer

The CPU_44A-V2 board provides a potentiometer POT1 for ease of use and testing of the on-chip analog to digital converter. The potentiometer is connected to the analog input G0_CH1 (P14.1). The analog output of the potentiometer ranges from 0 V to 3.3 V.

Table 10 Potentiometer

Potentiometer	Connected to Port Pin
R300	P14.1 / G0_CH1 (Group 0, channel 1)

2.11 Satellite Connectors

The CPU_44A-V2 board provides three satellite connectors for application extension by satellite cards:

- COM satellite connector (Communication)
- HMI satellite connector (Human Machine Interface)
- ACT satellite connector (Actuator)

Note: Satellite cards shall be connected to their matching satellite connectors only. (For e.g. COM satellite cards shall be connected to COM satellite connector only)

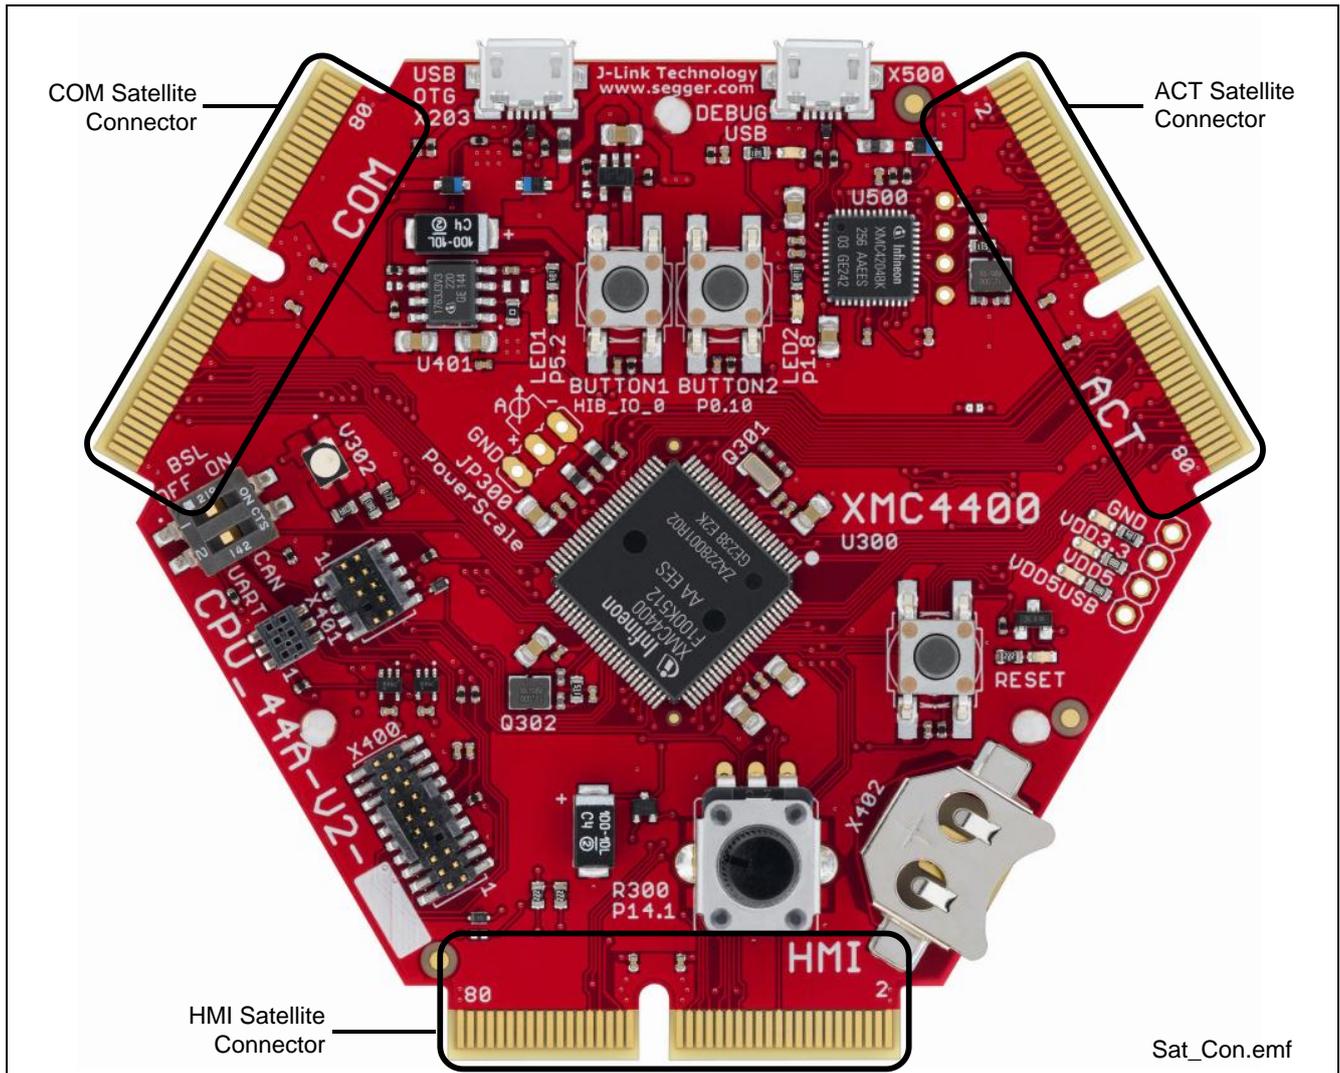

Figure 21 Satellite Connectors

Figure 24 Satellite Connector Type ACT

- (1) P0.7 can also be used for JTAG Debugging (TDI)
- (2) P0.8 is used as TRST in order to enable JTAG Debug
- (3) This pin is connected with the satellite connector via an analog switch
- (4) This ADC input does not support "Out of Range Detection"
- (5) This pin must be "enabled" by a solder jump.
- (6) Support High Resolution PWM

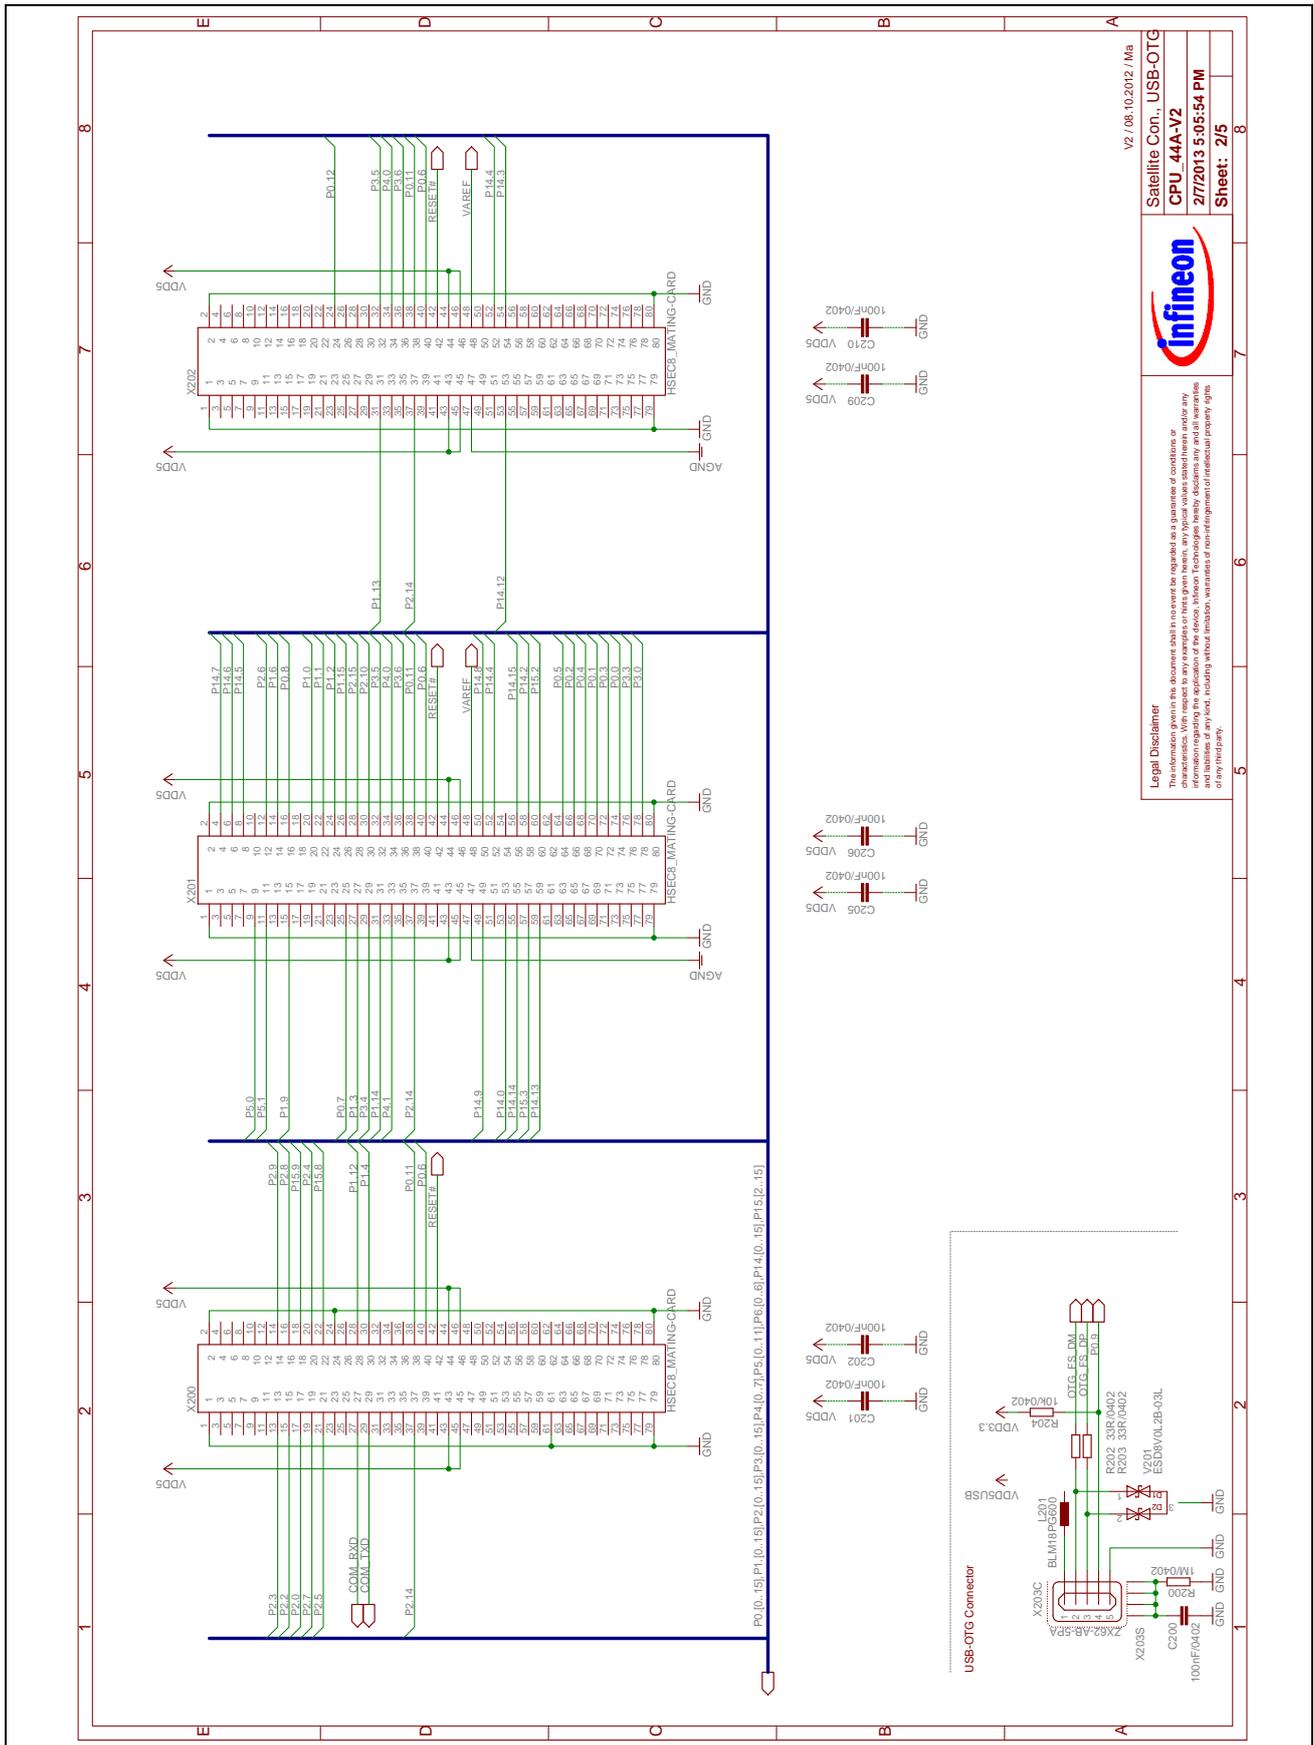

3 Production Data

3.1 Schematics

This chapter contains the schematics for the CPU board:

- Satellite Connectors, USB-OTG
- XMC4400
- Power, Debug Connectors, Reset
- On-board Debugger

The board has been designed with Eagle. The full PCB design data of this board can also be downloaded from www.infineon.com/xmc-dev.

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

Information

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

Introduction

This document describes the features and hardware details of the General Purpose Motor Drive Card (MOT_GPDLV-V2) designed to work with Infineon's CPU boards of the XMC4000 family. This board is a member of Infineon's Hexagon Application Kits.

1 Overview

The MOT_GPDLV-V2 board is an application expansion satellite card of the Hexagon Application Kits. The satellite card along with a CPU board (e.g. CPU_45A-V2 board) demonstrates the motor control capabilities of XMC4000 family. The main use case for this satellite card is proofing software algorithms and methods for motor control. The focus is safe operation under evaluation conditions. The board is neither cost nor size optimized and does not serve as a reference design.

1.1 Key Features

The MOT_GPDLV-V2 satellite card is equipped with following features

- Seamless connection to the CPU board (e.g. CPU_45A-V2) via the ACT satellite connector
- 3 phase low voltage half-bridge inverter using Infineon's N-channel OptiMOS™3 power transistors
- Gate Driver IC (6ED003L02-F2) with over-current detection circuit (ITRIP)
- Current measurement by using single or triple shunts (amplified)
- Position sensing via
 - Inductive resolver interface using delta-sigma modulator and pattern generator for resolver excitation
 - Quadrature encoder interface for both single ended and differential signals
 - Hall sensor interface
- Input voltage range: 24 V +/-20%
- Power supply
 - Switch mode power supply for 5V power generation
 - Low drop voltage regulators (15 V) for MOSFET gate driver and resolver excitation
 - Low drop voltage regulators (3.3V) for logic
- Maximum DC-link current: 7.5 A, nominal DC-link current 5 A

1.2 Block Diagram

Figure 1 shows the block diagram of the MOT_GPDLV-V2 satellite card. There are following building blocks:

- Connectors to CPU Board, power supply, motor and position interfaces
- Analog signal measurement
- Position sensing

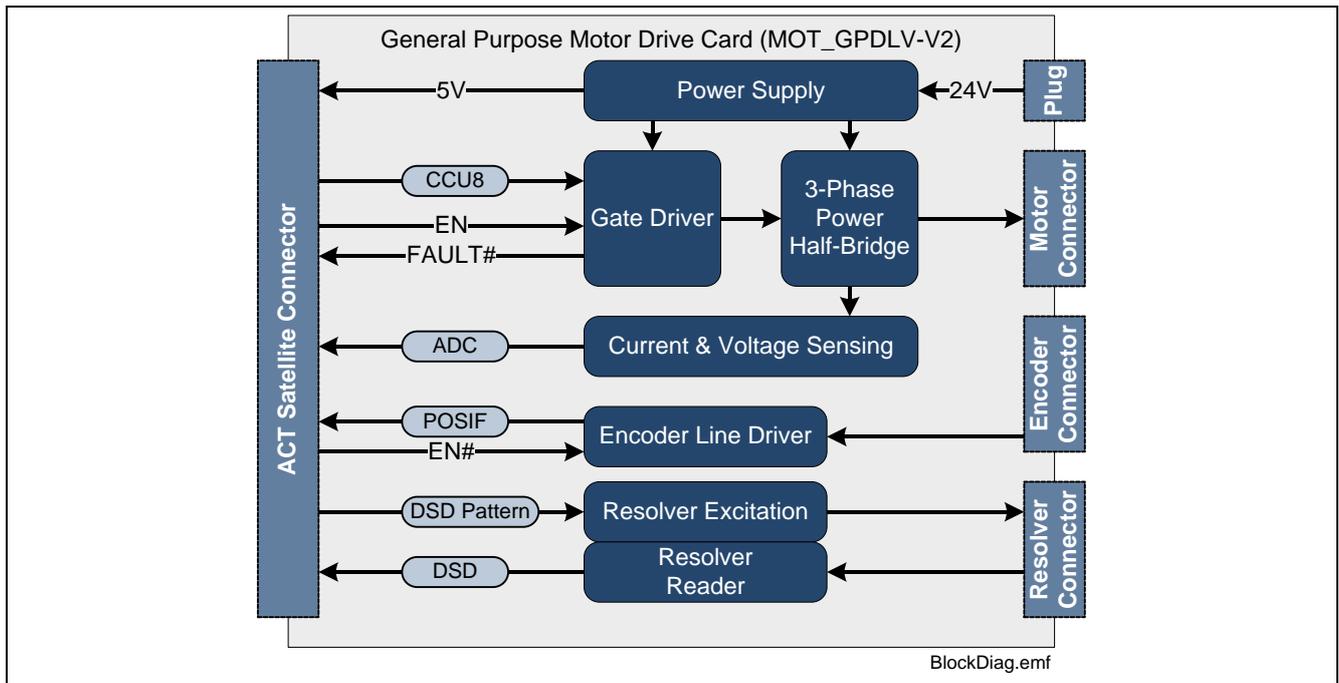

Figure 1 Block Diagram of the General Purpose Motor Drive Card

2 Hardware Description

The following sections give a detailed description of the hardware and how it can be used.

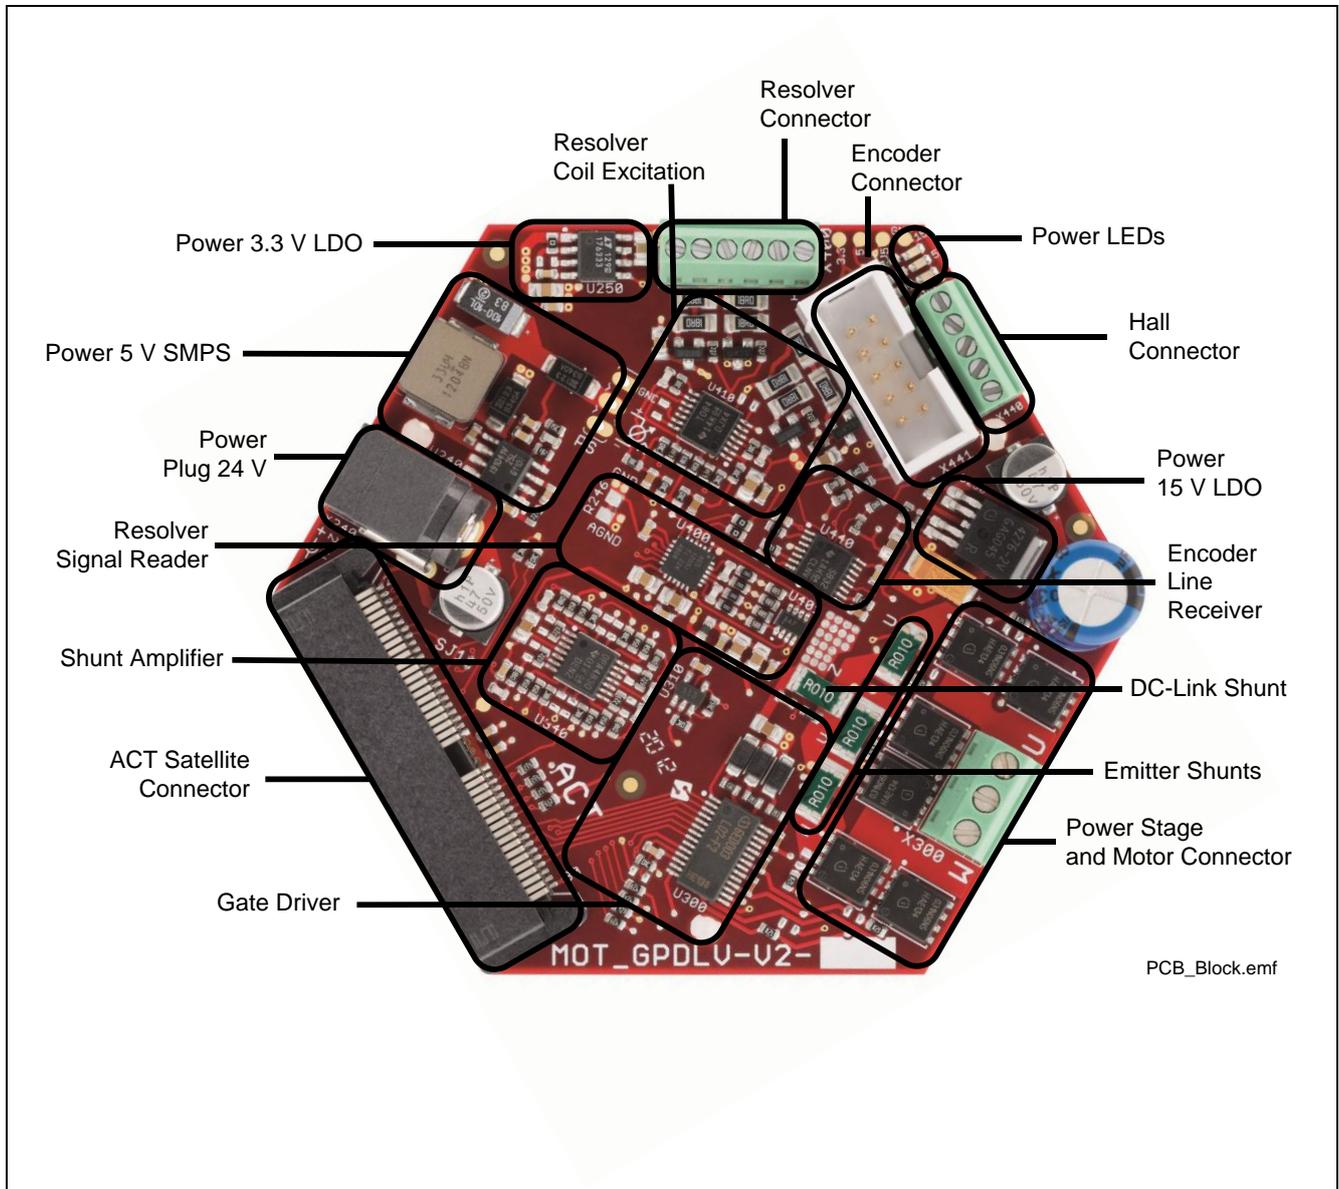

Figure 2 General Purpose Motor Drive Card

2.1 Power Supply

The General Purpose Motor Drive Card must be supplied by an external 24 Volt DC power supply connected to its power jack X240. The power to be delivered by the external power supply depends on the overall load mainly defined by the power consumption of the motor. The power supply unit (24V / 2A) delivered with the motor control kit is sufficient to drive the enclosed motor as well as other satellite cards connected to the CPU board. The power supply concept is shown in Figure 3.

A diode protects the power supply units and the circuit if more than one power supply is connected to the system via other satellite cards or via the CPU board (USB). The General Purpose Motor Drive Card is able to supply all other boards with 5V (VDD5) via the ACT satellite connector.

An on-board DC-DC converter (U240) steps down the 24 V input voltage from the power jack to 5 V (VDD5). The input voltage VDD24 must be 24 V +/-20%. The 5 Volt supply for analog circuits VDDA5 is derived from VDD5 filtered by a low pass. A LDO voltage regulator generates 3.3 V (VDD3.3) out of VDD5 and another voltage regulator generates 15 V (VDD15) power supply out of the 24 V input voltage.

Three power LEDs indicate the presence of the generated supply voltages.

Table 1 Power LED

LED	Power Rail	Voltage	Note
V210	VDD5	5.0 V	Must always be "ON"
V211	VDD3.3	3.3 V	Must always be "ON"
V212	VDD15	15.0V	Must always be "ON"

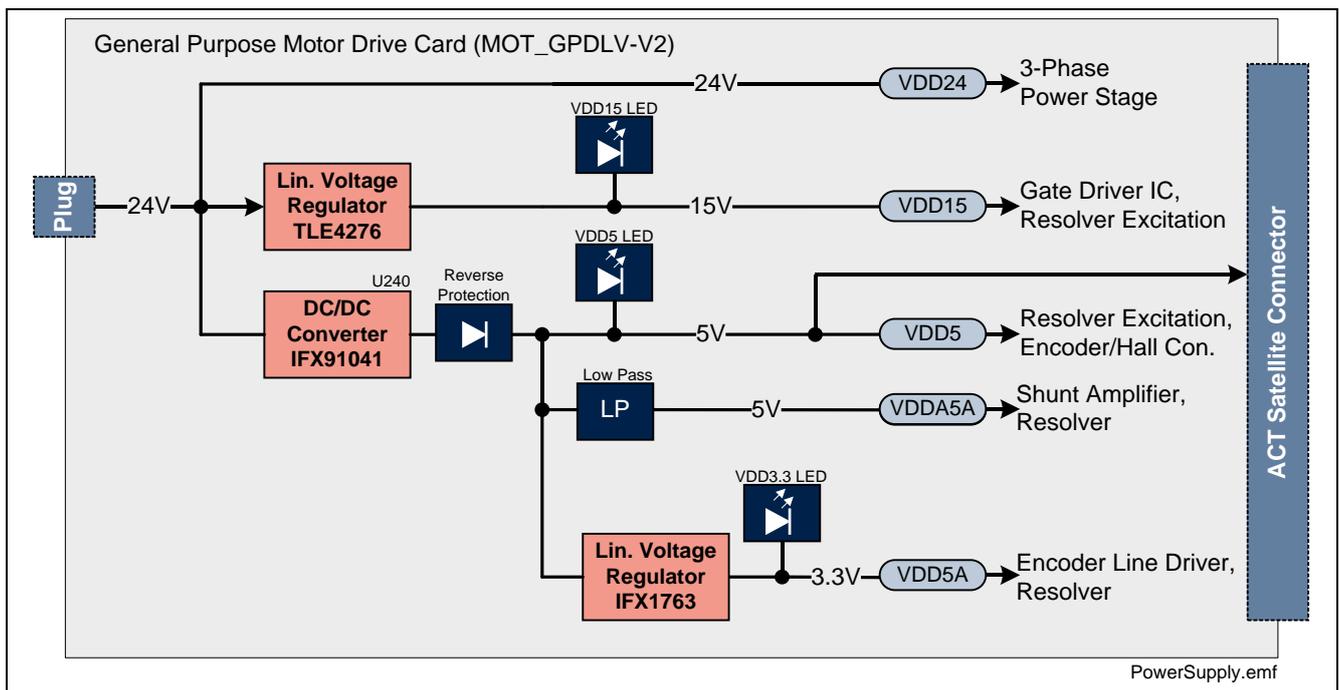

Figure 3 Block Diagram of the Power Circuit

Table 2 shows the connection of the power rails to the ACT satellite connector.

Table 2 Power rail connection to the ACT Satellite Connector

Pin No.	Power rail	Description
43,44,45,46	VDD5	5 V
1,2,79,80	GND	Ground

2.2 Satellite Connector

The satellite connector of the General Purpose Motor Drive Card is the interface to the CPU board e.g. CPU_45A-V2. Take care to connect the General Purpose Motor Drive Card always to the corresponding ACT satellite connector of the CPU board only as shown in Figure 4.

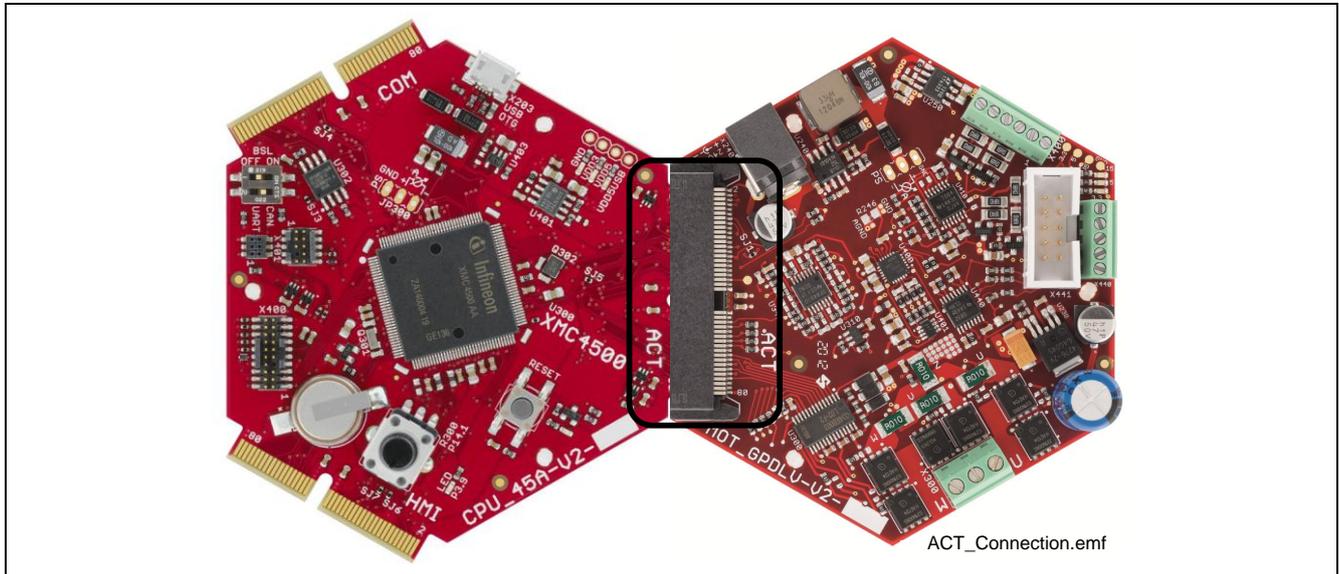

Figure 4 Connection to the CPU Board

The signal mapping details of the ACT satellite connector and the General Purpose Motor Drive Card are provided in Figure 5. The inner rows show the general function of the 80 pins of the ACT connector, which is common for all ACT satellites cards. The outer rows show the signals of the General Purpose Motor Drive Card.

The General Purpose Motor Drive Card provides 5 functional groups of signals (marked by color code) at its pins of the satellite connector:

- The encoder signals (ENCA, ENCB, ENCI): pin 4, 6 and 8
- Resolver signals (PWMN/P, MCLK, MCOS, MSIN): pin 9, 11, 13, 14, 15, 16
- Control and TRAP signals (FAULT#, ENPOW, ENENC#): pin 25, 26, 30
- Voltage and current measurement signals: (UU, UV, UW, UZ, AMP_IW...) located from pin 49 to 60
- PWM signals for the 3-Phase power stage (HIN1#, LIN1#, HIN2 ...): pin 64, 66, 68,70, 72, 74

Figure 6 Pin Mapping to XMC4500 on CPU Board CPU_45A-V2

2.3 Gate Driver and Power Stage

The power stage consists of three half-bridges using Infineon's N-channel OptiMOS™ power transistors. They are selected for a safe operation area with huge headroom, hence no cooling is needed when using at nominal current of 5 Ampere.

The gate driver (6ED003L02-F2) is Infineon's full bridge driver in SOI-technology offering an excellent ruggedness on transient voltages. The external bootstrap circuitry has been dimensioned according to the formula (see Infineon application note AN-EICEDRIVER-6EDL04-1):

$$C_{BS} = \frac{i_{QBS} \cdot t_P + Q_G}{\Delta V_{BS}} \cdot 1.2$$

$$\frac{C_{BS} \cdot \Delta V_{BS}}{1.2} = i_{QBS} \cdot t_P + Q_G$$

$$(0.833 \cdot C_{BS} \cdot \Delta V_{BS}) - Q_G = i_{QBS} \cdot t_P$$

$$t_P = \frac{(0.833 \cdot C_{BS} \cdot \Delta V_{BS}) - Q_G}{i_{QBS}}$$

With

C_{BS} : Bootstrap Capacity (1 uF)

i_{QBS} : highside driver quiescent current (max. 100 uA)

Q_G : Gate charge (max. 130 nC)

ΔV_{BS} : max. allowed voltage drop at the bootstrap capacitor (5 V)

Factor 1.2: 20% margin for capacitor

the minimum switching period t_p is 40 ms:

$$t_p = \frac{(0.833 \cdot 1 \mu F \cdot 5 V) - 130 \text{ nC}}{100 \mu A}$$

$$t_p = 40 \text{ ms}$$

The gate driver offers several protection features like under-voltage lockout, signal interlocking of every phase to prevent cross-conduction and overcurrent detection.

In an error situation a FAULT# signal is generated and must be handled by the microcontroller. The FAULT# signal changes to low state if an over-current condition has been detected by the ITRIP circuit. The ITRIP current level is measured as the amplified voltage drop over the DC-link shunt (see Figure 7). The minimum input voltage level to trigger an over-current event is specified at 380 mV. With an amplifier gain of $1 + (40.2/10) = 5.02$ and a DC-Link shunt with 10 mΩ the ITRIP will be triggered at a DC-Link current higher than 7.57 A:

$$I = U / R,$$

$$I = (0.38 \text{ V} / 5.02) / 10 \text{ m}\Omega,$$

$$I = 7.57 \text{ A}.$$

The overcurrent condition must be present for longer than about 100 us ($3 \cdot RC$ time constant of the RC filter R322, C310) in order to trigger the ITRIP. This shall protect the PCB traces and the components in the high current path.

The microcontroller must provide the PWM signals (LIN1/2/3#, HIN1/2/3#) for the high-side and low-side switches. The PWM signals must be generated low-active.

The gate driver must be enabled via signal ENPOW.

A phase current measurement is provided via shunt resistors

- a) single shunt (10 mΩ) in the DC-link path and/or
- b) triple shunt (10 mΩ) in the low-side path

The resistance of the shunts limits the system behavior and may not fit to the low-ohmic power transistors. This is intended as the main purpose of this board is to proof SW algorithms and methods over a wide range.

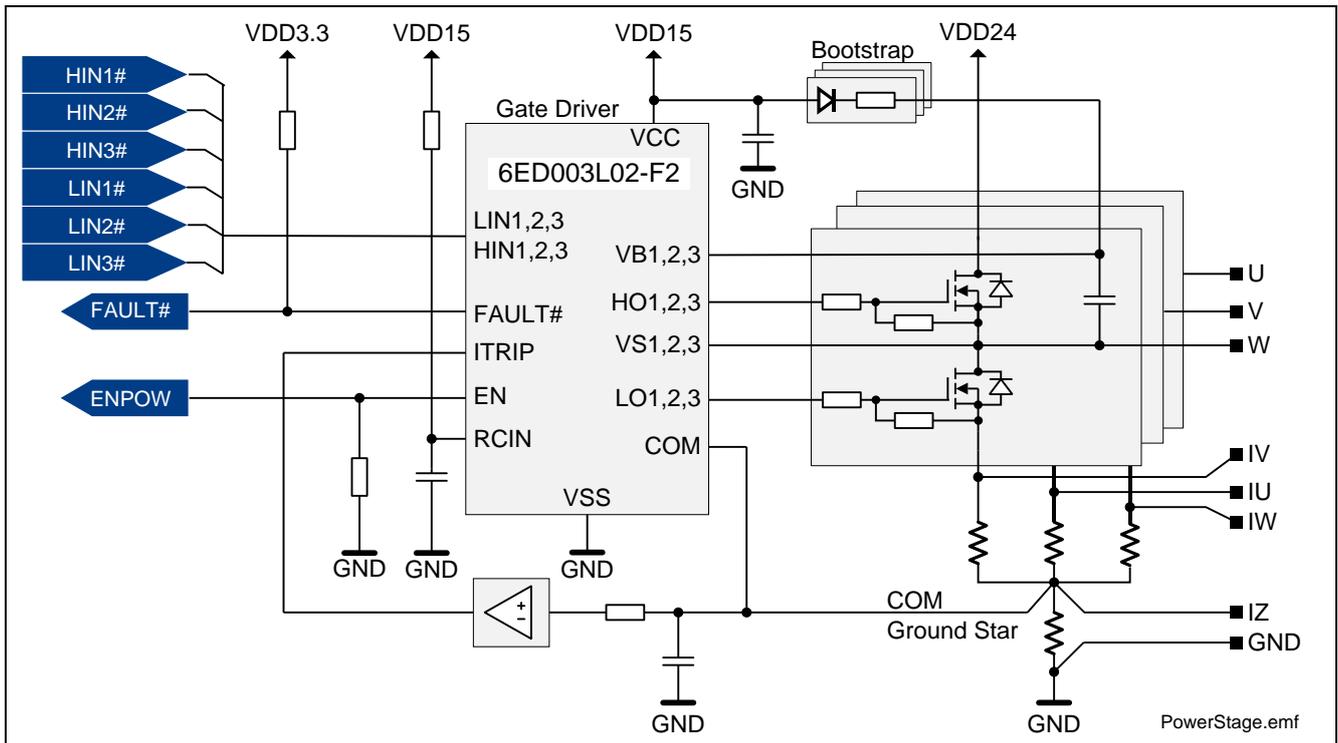

Figure 7 Block Diagram of the Gate Driver and the Power Stage

Table 3 shows the connection of the Gate Driver signals to the ACT satellite connector.

Table 3 Gate Driver signals connection to the ACT Satellite Connector

Pin No.	Signal Name	Description
25	FAULT#	this signal indicates over-current and under-voltage (low-active)
26	ENPOW	High level enables the power stage (high-active)
64	HIN1#	High-side logic input 1 (low-active)
66	LIN1#	Low-side logic input 1 (low-active)
68	HIN2#	High-side logic input 2 (low-active)
70	LIN2#	Low-side logic input 2 (low-active)
72	HIN3#	High-side logic input 3 (low-active)
74	LIN3#	Low-side logic input 3 (low-active)

2.4 Voltage and Current Measurements

The phase current measurement is illustrated on the left side of Figure 8; the right side shows the voltage divider for the voltage measurement.

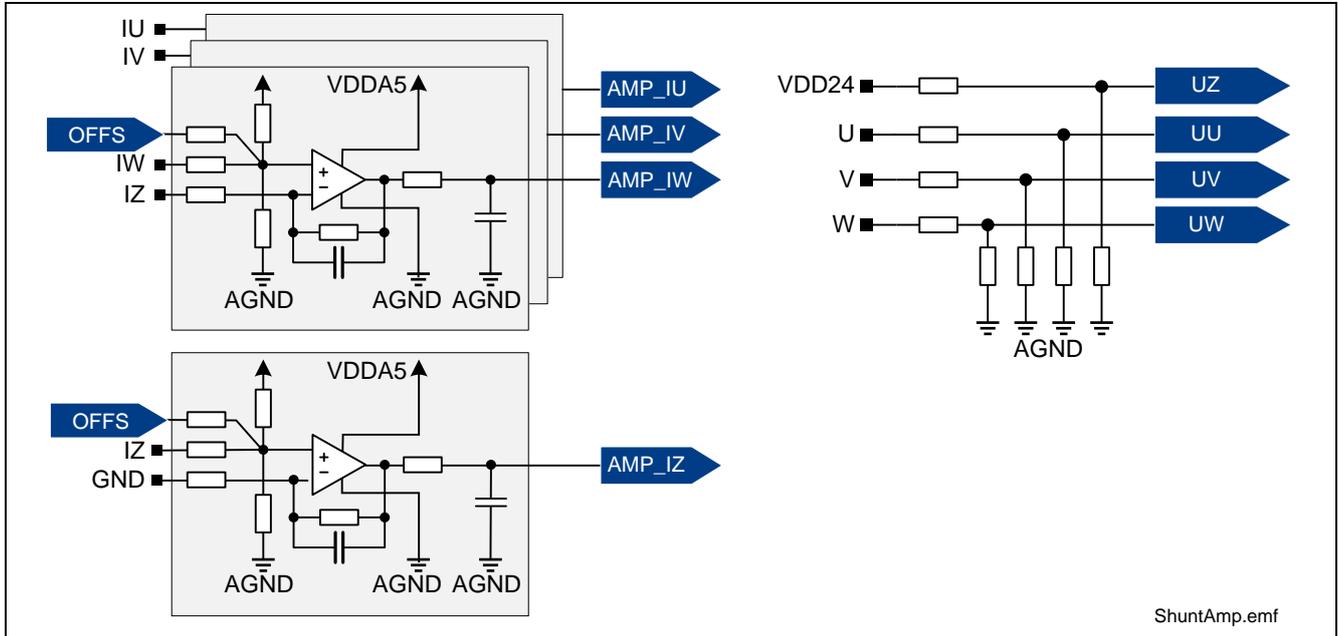

Figure 8 Measurement of Voltages and Currents

2.4.1 Phase Current Measurement

The current measurement can be done via a single shunt (signal IZ) in the DC-link path or via triple shunts (IU, IV, IW) in the emitter path. In both cases the measurement is dimensioned for the following requirements:

Motor power range up to 120W which leads to a nominal DC-link current of about 5 Ampere and a maximum phase peak current of about 20 Ampere. The phase current range is 75 mA to 20 A.

A shunt resistance of 10 mΩ leads to 0.75 mV voltage drop @ 75 mA and 200 mV voltage drop @ 20 A. This voltage is amplified by a non-inverting amplifier. The output of the operational amplifier (AMP_IU, AMP_IV, AMP_IW, AMP_IZ) is available at the ACT Satellite Connector and connected to ADC input channels of the XMC4000 microcontroller.

The gain of the operational amplifier is set to 21 ($G = 1 + (R1 / R2)$), which leads to an output voltage of 15.75 mV @ 75 mA and 4.20 V @ 20A.

The XMC4000 offers a DAC output which is used as DC offset generator for the OpAmps (signal OFFS). The DAC voltage must be adjusted to a voltage level of about 1.2 V in order to get 0 V at the output of the OpAmps when there is no current flow through the shunts. Alternatively the offset can be generated by a resistive voltage divider.

2.4.2 Phase Voltage Measurement

The phase voltage is directly measured using resistive dividers at the phases (signals UZ, UU, UV, and UW). The divider is dimensioned to divide the measured voltage UZ, UU, UV, UW by factor 10.21. The formula to calculate the phase voltage U_{PHx} from the measured voltage U_x is:

$$U_{PHx} = 10.21 * U_x$$

Table 4 summarizes all voltage signals and current signals available at the ACT satellite connector.

Table 4 Voltage and Current signals at the ACT Satellite Connector

Pin No.	Signal Name	Description
50	OFFS	Offset voltage input required for the shunt amplifier

Table 4 Voltage and Current signals at the ACT Satellite Connector

Pin No.	Signal Name	Description
53	AMP_IU	Amplified shunt voltage output representing the current of phase U
57	AMP_IV	Amplified shunt voltage output representing the current of phase V
49	AMP_IW	Amplified shunt voltage output representing the current of phase W
59	AMP_IZ	Amplified shunt voltage output representing the DC-link current
56	UU	Divided voltage output of phase U (divided by 10.21)
52	UV	Divided voltage output of phase V (divided by 10.21)
60	UW	Divided voltage output of phase W (divided by 10.21)
55, 58, 61	UZ	Divided DC-link output voltage (divided by 10.21)

2.5 Resolver Interface

For rotor position detection a resolver can be used. The three coils of the resolver must be connected to the connector X400 as shown in Figure 9.

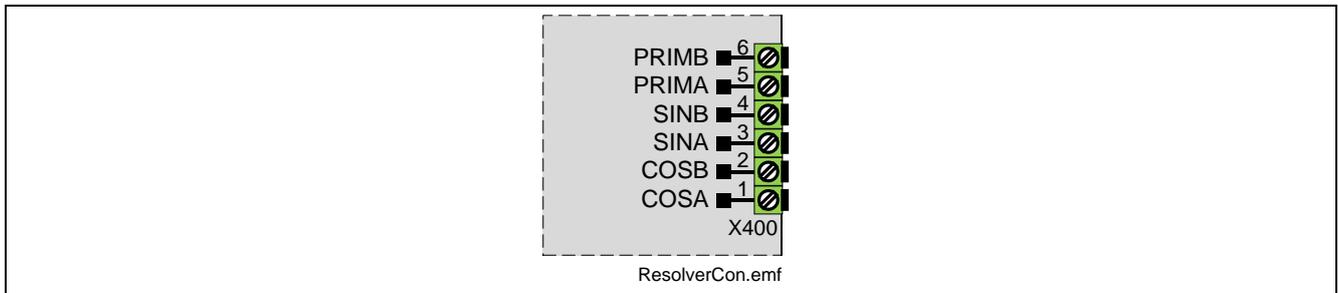

Figure 9 Connection Scheme of the Resolver Connector

The XMC4000 devices use an on-chip pattern generator for the excitation of the primary coil and a decimation filter to read the SIN/COS feedback measured by a delta-sigma modulator.

The primary coil excitation is done via the microcontroller signals PWMP/PWMN which is a digital data stream with a selectable clock rate in the MHz range. These signals are integrated, amplified and fed to the primary coil of the resolver as shown in Figure 10.

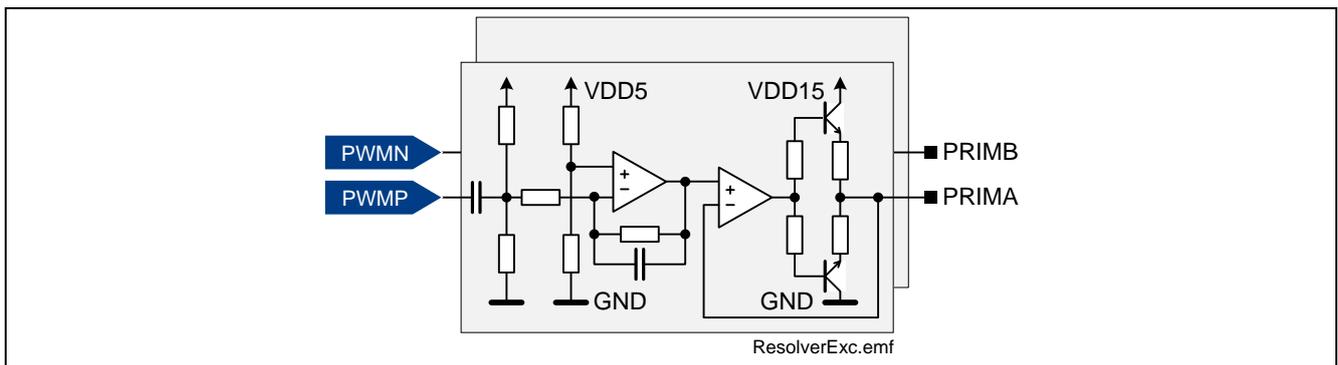

Figure 10 Resolver Excitation Circuit

The feedback signals (SINA/B and COSA/B) of the secondary coils are fed to a delta-sigma modulator ADS1205 which has an internal clock and generates the SIN/COS serial data stream on the signals MSIN/MCOS. It also provides the modulator clock MCLK. The circuit is shown in Figure 11.

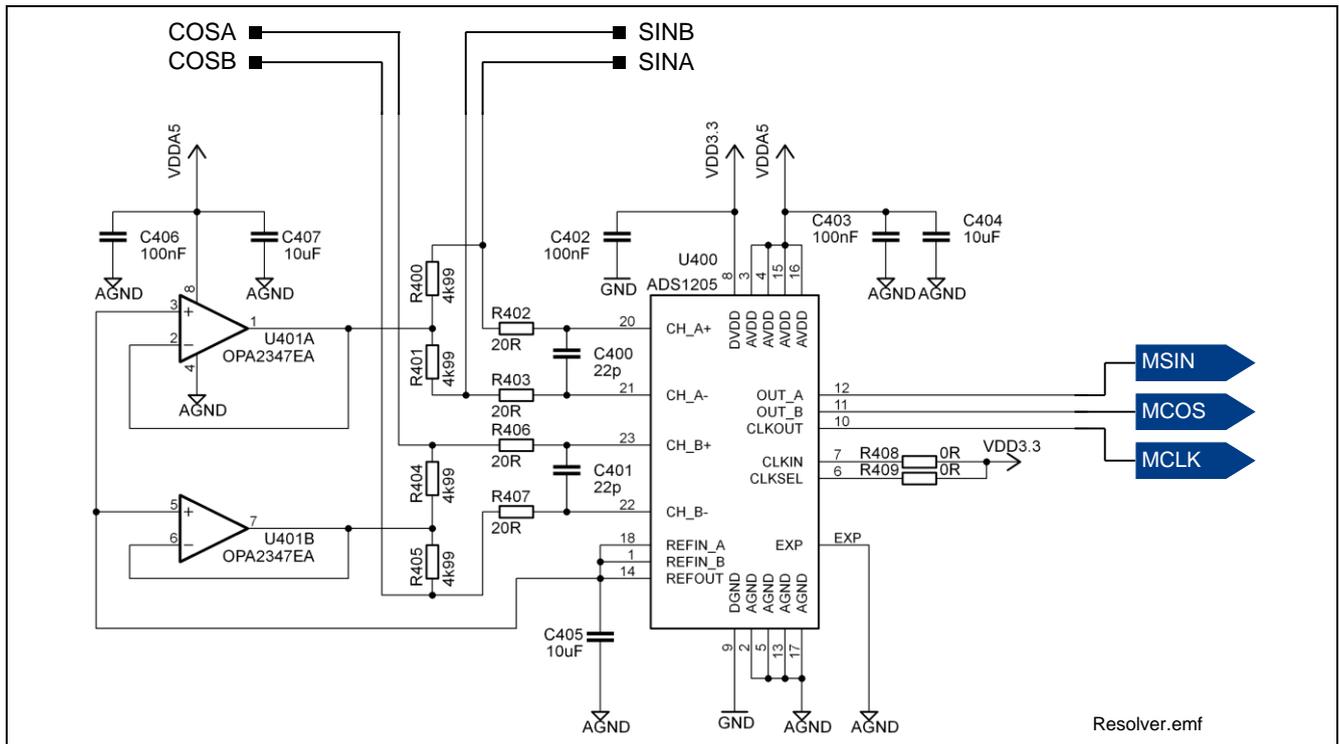

Figure 11 Resolver Modulator Circuit

Table 5 summarizes all signals of the resolver which are connected to the ACT satellite connector.

Table 5 Resolver signals at the ACT Satellite Connector

Pin No.	Signal Name	Description
9	PWMN	Excitation input signal (inverted)
11	PWMP	Excitation input signal
14	MCOS	COS signal output of the delta sigma modulator
16	MSIN	SIN signal output of the delta sigma modulator
15, 13	MCLK	Clock output of the delta sigma modulator

2.6 Encoder and Hall Interface

A quadrature encoder can be used for detecting the actual rotor position. There are single-ended and differential encoders, the board supports both types. For the differential types an encoder line receiver is required as the microcontroller needs single ended signals.

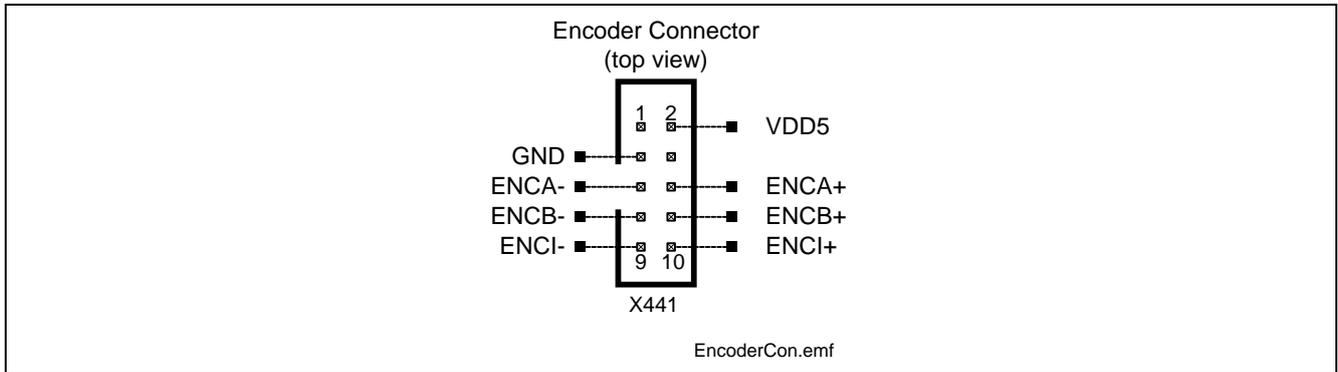

Figure 12 Encoder Connector for differential encoder signals

The differential signals from the encoder (ENCA+/-, ENCB+/-, ENCI+/-) must be connected to the 10-pin encoder connector X441 (Figure 13). The receiver must be enabled by the signal ENENC# (set to "0").

In case of using a single ended encoder or a hall sensor the signals must be applied to the connector X440 and the encoder line receiver must be disabled by setting the signal ENENC# to high level (default).

The parallel operation of both a differential encoder and a hall sensor is possible by adapting the resistor values shown in Figure 13. The pull-up resistors value must be changed to 4.7 k Ω , the serial resistors must be set to 680 Ω . This will ensure appropriate signal levels for the encoder signals ENCx in all use cases and limits the current to about 5 mA.

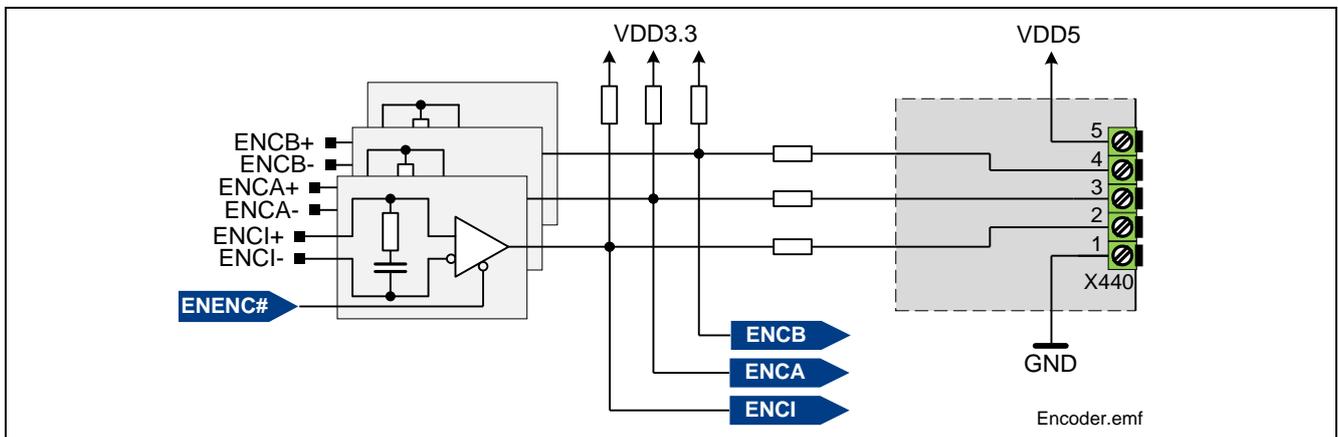

Figure 13 Encoder Line Receiver (differential signals) and hall interface

Figure 6 shows the connection of the encoder/hall signals available at the ACT satellite connector.

Table 6 Encoder / hall signals at the ACT Satellite Connector

Pin No.	Signal Name	Description
30	ENCEN#	enable signal for the encoder line receiver (active low)
4	ENCA	Encoder channel A
6	ENCB	Encoder channel B
8	ENCI	Encoder channel I

3 Production Data

3.1 Schematics

This chapter contains the schematics for the General Purpose Motor Drive Card (MOT_GPDLV-V2):

- Figure 14: Satellite Connector, Power Supply
- Figure 15: Gate Driver, Power Stage, Shunt Amplifier, Motor Connector
- Figure 16: Resolver, Encoder, Hall Connector

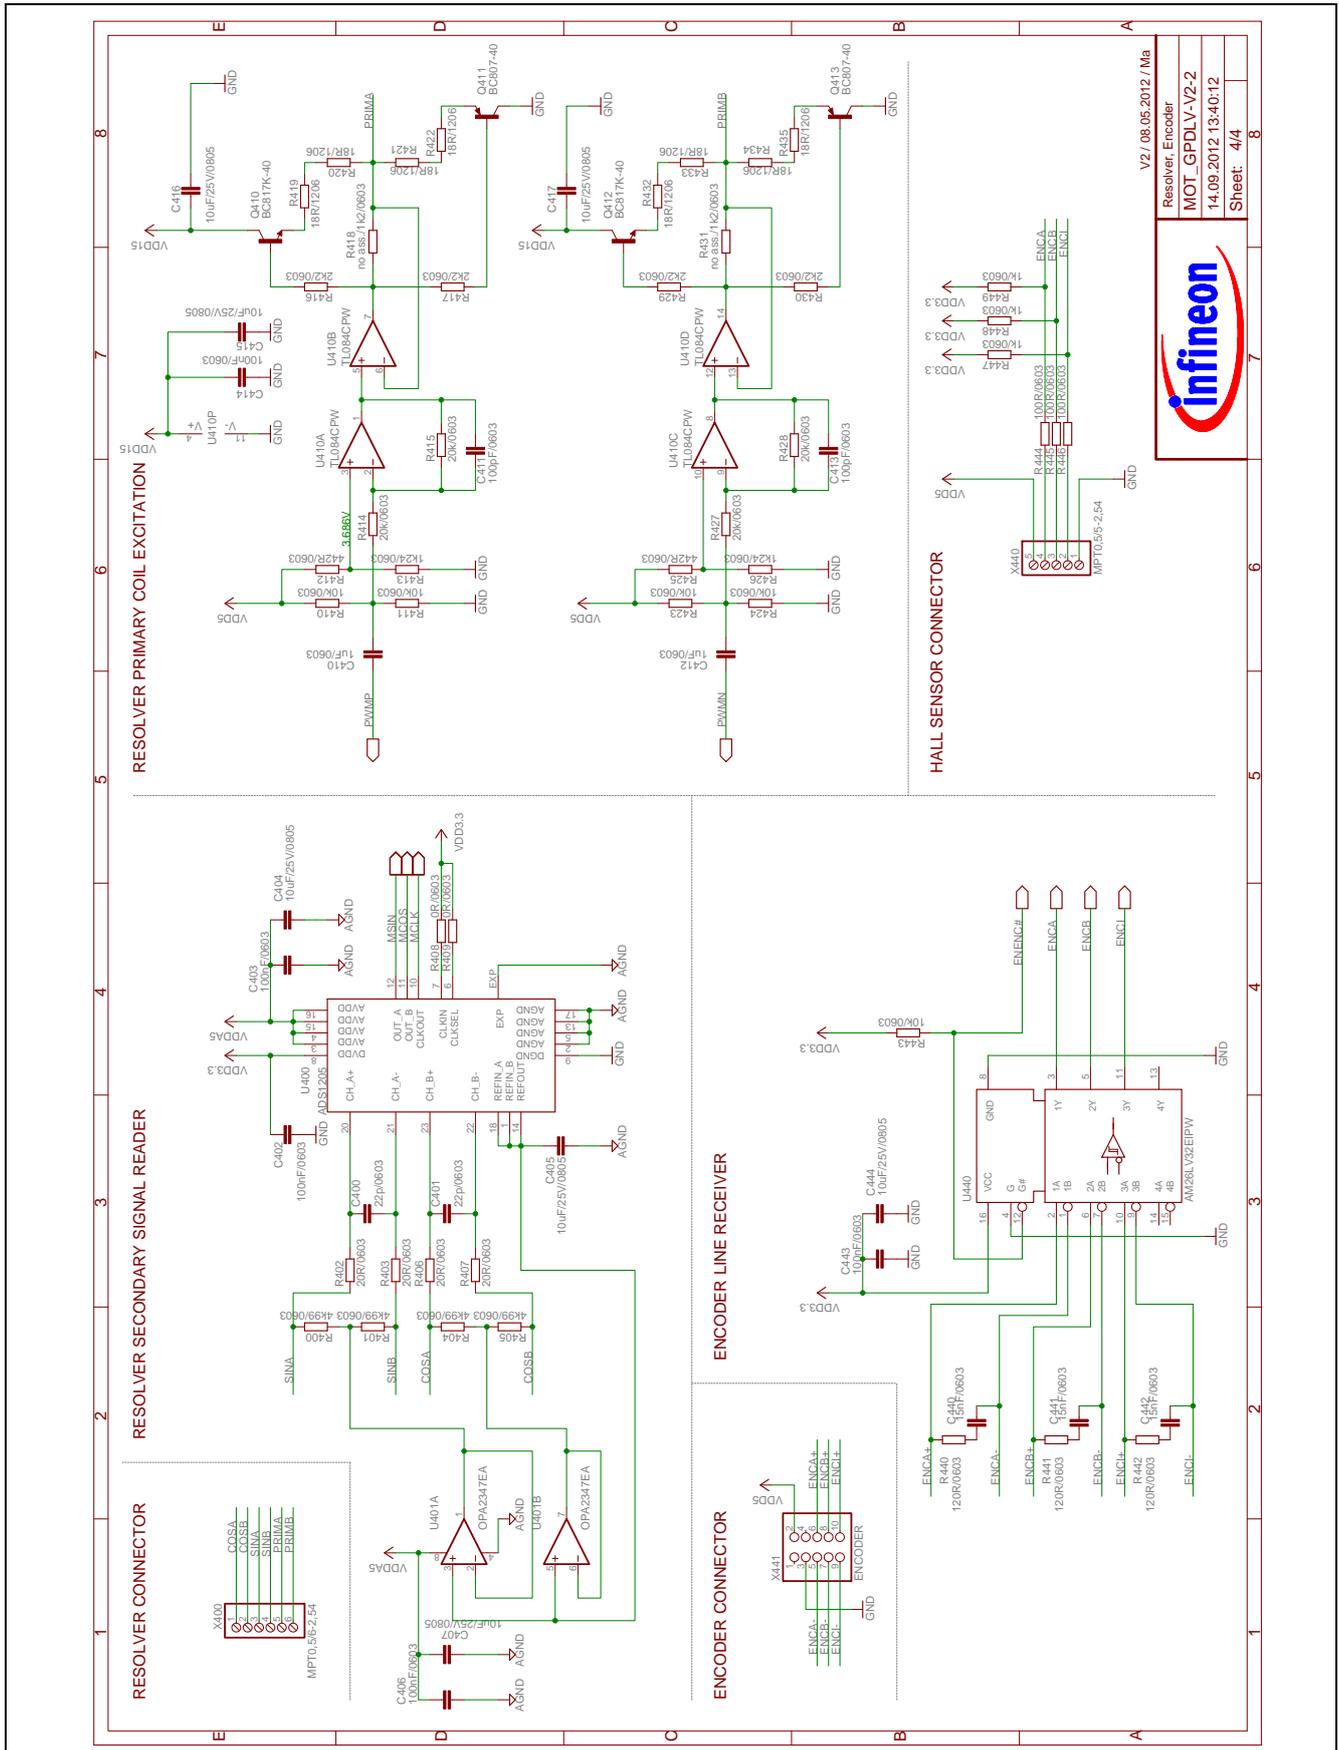

Figure 16 Resolver, Encoder, Hall Connector

3.2 Components Placement and Geometry

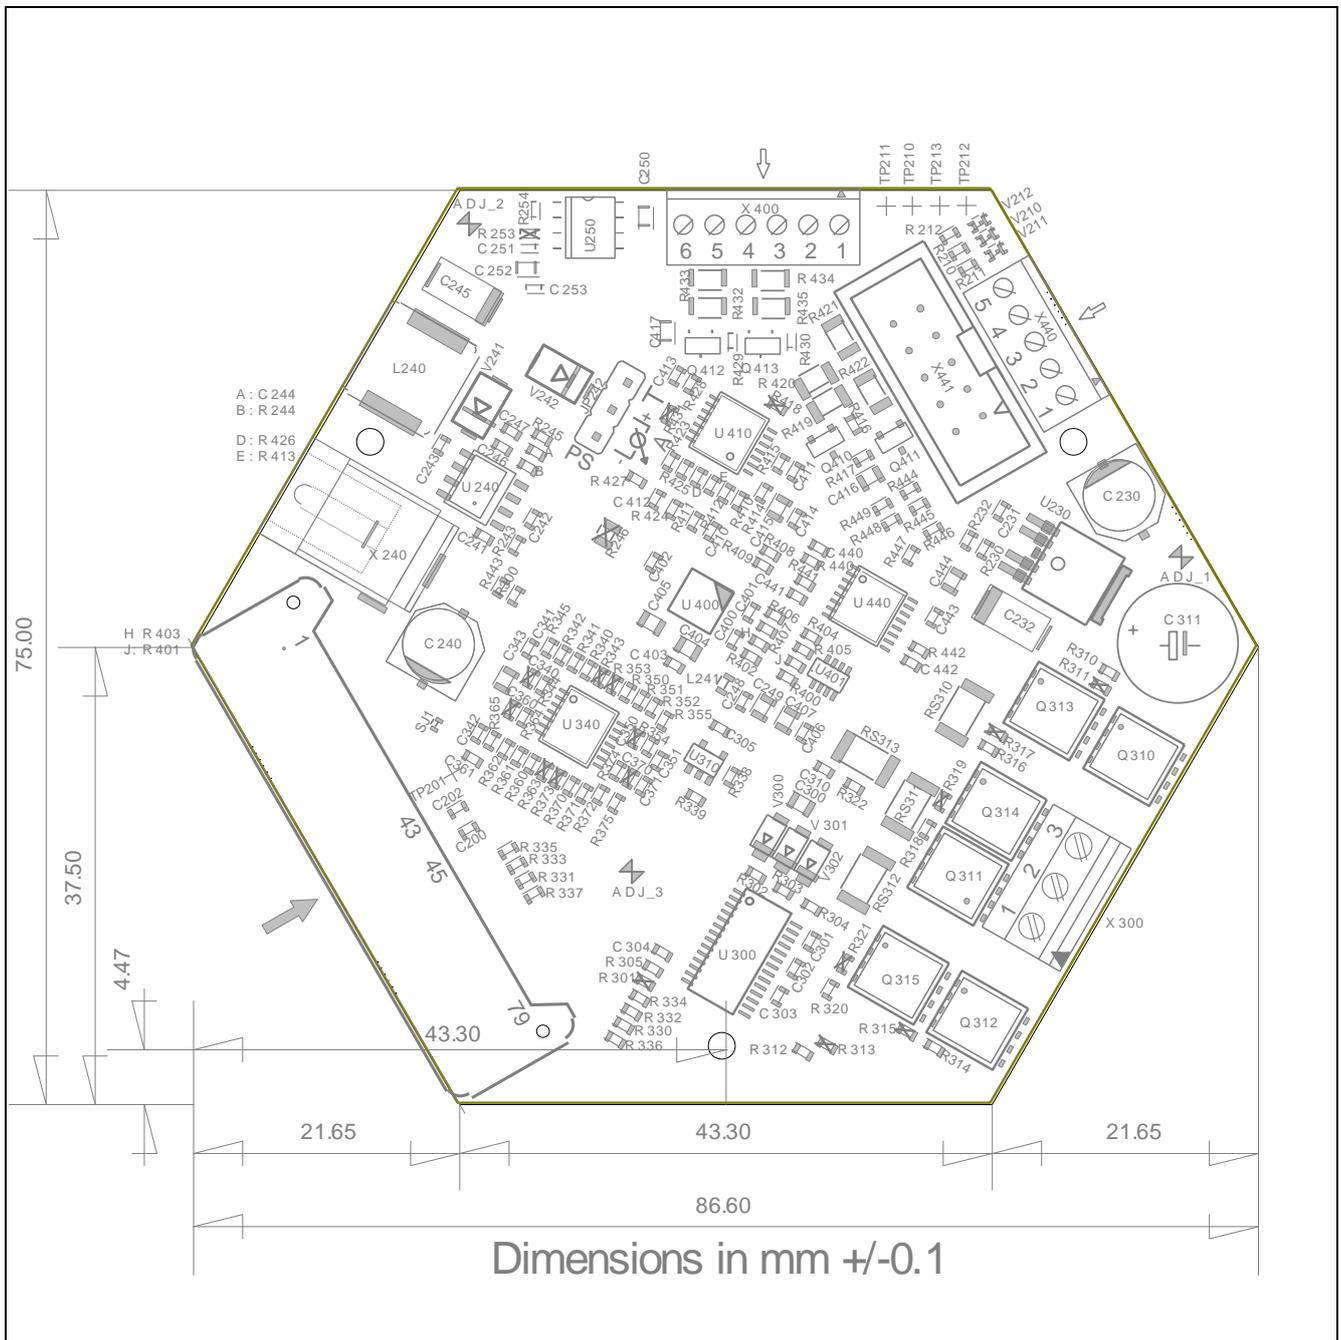

Figure 17 Components Placement and Geometry

3.3 List of Material

The list of material is valid for a certain assembly version for the General Purpose Motor Drive Card. This version is stated in the header of the Table 7. The assembly version number can be identified by the board identification code printed on the PCB. The last digit field "002" of the board identification codes "MOT_GPDLV-V2-002" is representing the assembly version. If there is no assembly version number printed on the PCB (white empty field) than the PCB has the assembly version number 1.

The only difference between both assembly version 1 and 2 is the value of the resistor R322. In version 1 it is 100 kΩ, whereas in assembly version 2 R322 is 3.3 kΩ.

43	2	442R/0603	Resistor	R412, R425
44	1	470pF/0603	Capacitor	C244
45	1	680R/0603	Resistor	R211
46	1	ADS1205	Delta-Sigma Modulator	U400
47	1	AM26LV32EIPW	Differential Line Receiver	U440
48	2	B340A-13-F	Schottky Diode	V241, V242
49	2	BC807-40	Transistor	Q411, Q413
50	2	BC817K-40	Transistor	Q410, Q412
51	1	BLM18PG600	Inductor	L241
52	6	BSC031N06NS3G	Infineon OptiMOS3 Power-Transistor	Q310, Q311, Q312, Q313, Q314, Q315
53	1	BUCHSE-LP-5A	Power Plug	X240
54	3	DFLU1400	Diode	V300, V301, V302
55	1	ENCODER	Connector	X441
56	3	FIDUCIAL	FIDUCIAL	ADJ_1, ADJ_2, ADJ_3
57	1	HSEC8-140-01-S-RA	SAMTEC 80-pin connetor	X200
58	1	IFX1763SJV33	Voltage Regulator	U250
59	1	IFX91041EJV	Voltage Regulator	U240
60	3	LED-GN/D/0603	LED green	V210, V211, V212
61	1	LMV321DBV	OpAmp	U310
62	1	MKDS1/3-3,81	PHOENIX Connector	X300
63	1	MPT0,5/5-2,54	PHOENIX Connector	X440
64	1	MPT0,5/6-2,54	PHOENIX Connector	X400
65	1	OPA2347EA	OpAmp	U401
66	1	OPA4830IPW	OpAmp	U340
67	1	TL084CPW	OpAmp	U410
68	1	TLE4276-2DV	Voltage Regulator	U230
69	1	no ass./0R/0603	Resistor	R253
70	2	no ass./1k2/0603	Resistor	R418, R431

Table 7 List of Material for General Purpose Motor Drive Card (MOT_GPDLV-V2-002)

Sl. No.	Qty	Value	Device	Reference Designator
71	1	no ass./10nF/0603	Capacitor	C251
72	4	no ass./22k/0603	Resistor	R343, R353, R363, R373
73	4	no ass./0603	Capacitor	C340, C350, C360, C370
74	7	no ass./0603	Resistor	R301, R311, R313, R315, R317, R319, R321
75	1	no ass./0805	Resistor	R246
76	1	3-pin header	PowerScale Connector	JP242
77	1	0402	Solder Jumper	SJ1
78	5	no assembly	SMD Pads	TP201, TP210, TP211, TP212, TP213
