| 6. Photocell | 13. Access menu button / Return function |
| 7. Micro USB socket / Firmware Update | |

DISPLAY PANEL - DASHBOARD

- 1 EL-Skyport synchronisation speed
- 2 EL-Skyport frequency channel
- 3 EL-Skyport group number
- 4 Photocell status
- 5 Ready beep
- 6 Recycling time
- 7 Battery level
- 8 Power in J
- 9 Pilot lamp timer
- 10 Flash function
- 11 Flash function value
- 12 Increase selected f-stop
- 13 Flash test
- 14 Decrease selected f-stop
- 15 Power of outlet A in f-stop
- 16 Total power in f-stop
- 17 Power of outlet B in f-stop

DEDICATED BUTTON

PILOT LAMP

A short press on the pilot lamp button turns on the pilotlight of the Quadra Head for 15 seconds. Values can be changed from 1 – 60 seconds. A long press keeps the LED pilotlight on for as long as there is battery power.

MENU FEATURES

DISPLAY PANEL - MAIN MENU

PHOTOCELL

The photocell options allow you to switch the photocell on and off and to set up pre-flash for perfect synchronization with speedlites.

DISPLAY	OPTIONS	SUB-OPTIONS
PHOTOCELL	off	
	on	
	Pre-flash	From 1 to 10 pre-flashes
	set up pre-flash	auto / manual / block time / timeframe

When the photocell is on, the flash unit will trigger at any recognised flash impulse.

The pre-flash option can be adjusted manually if the number of pre-flashes of the speedlite is known. Otherwise, simply choose “set up pre-flash” and release a speedlite exposure. The number of pre-flashes will be automatically detected and stored. You are now ready to work with your speedlites.

MANUAL PRE-FLASH SETUP (FOR ADVANCED USERS)

In some cases depending on the technology of the speedlite unit, the automatic pre-flash detection may not work. In this case you can try a manual setup.

- manual: enter the number of pre-flashes from 1 to 20.
- block time: set the delay between each pre-flash from 0.5 to 5 ms.
- Timeframe: set the time window in which all pre-flashes, including the main flash, are released.

Note: We cannot suggest any values or settings here; this depends on the speedlite unit and must be tested until the correct synchronisation between the flash unit and the speedlite is achieved.

EL-SKYPORT TRANSCEIVER FEATURES & SETUP

The EL-Skyport options allow you to select the synchronisation speed and to define group and channel settings.

DISPLAY	OPTIONS	SUB-OPTIONS
SKYPORT	off r.0	
	normal r.1	
	speed r.2	
	group	From “group 1” to “group 4”
	channel	From “channel 1” to channel 20”

If you work with the EL-Skyport system you can easily choose the synchronization speed. The “normal” synchronization mode is good when long distances are needed whereas the “speed” synchronization should be used when higher shutter speeds are needed with enabled digital cameras.

Finally you can choose in which group and frequency you would like to work. Change group settings to have a better control between main light and second lights. Change frequency channel to avoid interference.

AUDIO

The audio options give you the choice of different settings for when the capacitors are 100% charged and the unit is ready to flash.

DISPLAY	OPTIONS	SUB-OPTIONS
AUDIO	ready volume	From "off" to "max"
	error volume	From "off" to "max"
	key volume	From "off" to "max"
	ready tone	From "tone 1" to "tone 2"

The volume of the ready, error and key tones can be adjusted, enabling you to work silently if necessary. The ready tone can be chosen to improve acoustical recognition for when all flashes have fired and have recycled.

FLASH MODE

The flash mode menu enables you to configure your ELB unit to suit your style of shooting.

DISPLAY	OPTIONS	SUB-OPTIONS
FLASH MODE	flash before ready	disabled / enabled
	default sequence	unit address / total units/ seq. timeout
	delayed	set delay (in ms)
	strobo	frequency / duration
	Setup the activated mode	

The flash before ready feature gives you the choice between flashing the unit before full recycle or to be able to flash only when the unit has fully recycled.

Stay on default if you wish to do everyday flash photography.

SEQUENCE SETUP

Use sequence mode to catch a moving sequence with a number of indexed units, for example, of a jumping person in up to 20 different images. The following setup must be programmed in order to use the features.

- unit address: Every unit requires its own address; every time a trigger is released the corresponding flash unit will respond. Up to 20 units can be addressed.
- total units: Indicates the total number of addressed flash units.
- sequence timeout: Time after which the sequence restarts back to first addressed unit. The timeout can be programmed from 0.1s to 5s. This setting is necessary to flash the addressed units in the right order.

DELAY SETUP

Set a delay to your ELB unit to flash with a specific delay after triggering (e.g. second curtain).

- Set delay (in ms): Time in which the unit should fire a flash after the camera shutter has been opened. The delay time can be programmed from 1ms (0.001 s.) to 10000ms (10 s.). Please see the suggested values in the table page 10 if you want to have second curtain sync via skyport.

Note: to fine-tune the milliseconds, the scale can be modified in 1, 10, 100 and 1000 steps. Press the User preset modelling lamp button to choose your step. This option is only active in the flash delay setup menu.

STROBO SETUP

Take an image with stroboscopic effects and open camera shutter. The overlapping moving sequence is visible in one image.

- Frequency: Number of flashes per second. Programmable from 1 to 10Hz.
- Duration window: Time during of the moving sequence you wish to capture. Programmable from 0.5 s. to 5 s.

Note: The unit must be set in fast recycling time in the “power settings” menu. If the error sound is heard, this means the recycling time cannot follow the settings. Please reduce the Hz setting or the flash power to a lower value.

POWER SETTINGS

Power settings help you define standby and when to auto-off to save energy. You can also define recycling time depending on the battery level left.

DISPLAY	OPTIONS	SUB-OPTIONS
POWER SETTINGS	auto standby	From disabled to [60min] in steps of 1 min - default 10 minutes
	auto-off	From disabled to [60min] in steps of 1 min - default 15 minutes
	pilot lamp timer	From [1 sec] to [60 sec] in steps of 1 sec - default 15 sec.
	recycling time	eco / fast
	step per push	From [0.1 f-stop] to [1.0 f-stop] - default 0.1 f-stop

The standby option lets you decide after how long the unit goes into standby mode, enabling you to quickly turn the unit back on when needed.

The auto-off option does just what its name suggests. When left unattended the unit will switch off automatically after the indicated time.

The pilot lamp timer is dedicated to the LED Pilot lamp of the Quadra heads.

Finally the step per push options enables you to modify in which steps you change the power on the dashboard.

STATISTICS

Check lifetime of the unit and the flashtube.

DISPLAY	OPTIONS
STATISTICS	unit life
	flash count
	power-on cnt

You can easily check the current usage of the unit and the flashtube. Very useful for servicing or second-hand retail.

TROUBLESHOOTING

SOFT RESET

To reset all settings to default values, push the left and right buttons at the same time and hold for at least 1 second. The unit will reboot and will clear all working parameters.

This will not reset the counter in the “Statistics” menu.

FLASHTUBE REPLACEMENT

Flashtubes have a long life with general use however multi-flashing in long sequences can cause overheating of the electrodes leading to premature ageing. If the flashtube is broken or cracked, triggers only sporadically, or you notice an important colour temperature shift, it could be that the flashtube of the Quadra head needs replacing.

PREVIOUS GENERATION BATTERIES

The ELB 400 can also work in conjunction with the older generations of batteries of the Ranger Quadra whether they are Lead-Gel or Lithium-Ion.

ERROR MANAGEMENT

EN

ERROR NUMBER	DESCRIPTION	SOLUTION
1	Capacitor over voltage	Switch the unit off, wait 2 minutes and switch the unit on again. If the error shows up again the unit requires a check up at an authorized Elinchrom service centre.
3	Discharge timeout error	
4	Charge timeout error	
15	Temperature sensor error	
60	Communication bus error	
90	Safety stop system (generic error)	
2	System over heat	Wait until the unit has cooled down. The unit will switch back to the normal operation as soon as the temperature decreases to a normal working level.
11	Battery low	The unit has detected a mains supply fault. Please check the mains/battery supply. It could be not working correctly.
61	Battery unseal error	Switch the unit off, wait 2 minutes and switch the unit on again. If the error shows up again the battery requires a check up at an authorized Elinchrom service centre.

QUADRA HEAD INFORMATION

FITTING REFLECTORS

1. Always switch off the unit before connecting accessories and reflectors.
2. Disconnect the flash cable from the ELB 400 pack.
3. Mount the Quadra head to a tripod and lock the security screw.
4. Place the reflector over the Quadra head, with the umbrella hole showing down.
5. Press the Quadra head locking knob firmly down and turn the reflector to the right until you hear the snap-in noise.
6. Check if the reflector is well fitted.
7. Reconnect the flash cable to the pack and switch the unit on.
8. Proceed in the same manner when exchanging reflectors.

EN

FLASHTUBE REPLACEMENT

To exchange a user replaceable plug-in flashtube, please follow the instructions below:
Switch the ELB 400 pack OFF.

1. Disconnect the cable first from the pack and secondly from the Quadra head.
2. Once the Quadra head has cooled down, place the head on a dry and clean surface.
3. Attention: Use protective gloves to remove the flashtube:
 - Pull the flashtube firmly out of the terminals.
 - If the tube is broken, use security gloves. Avoid cutting yourself!
 - Never touch the metal electrodes and ensure that the unit is discharged and disconnected from the pack! Use an insulated tool to pull out the electrodes.
4. Take the new flashtube. A protective gloves and/or insulated tissue **MUST BE USED** as any contact with your fingers on the glass may result in dark markings once the flashtube is in use.
 - For the Pro head use the horseshoe type flashtube / N° 24087
 - For the Action head use the omega flashtube / N° 24086
5. Check that the tube is correctly aligned centrally and that the trigger contact is gripping the tube.
6. Re-connect and test the unit as usual.

Quadra Pro head - N° 20121

Quadra Action head - N° 20151

BATTERY INFORMATION

- The battery can be charged at an ambient temperature from 0°C to +45°C, if the temperature is exceeded, the safety circuitry of the battery will shut down to avoid damage to the Li-Ion cells.
- There is no memory-effect; our Lithium-Ion battery can be recharged from any charge level.
- A completely charged battery will need to be recharged latest every 3 months.
- Please refer to the battery guide to know how to take care of your battery in the best possible way.

BATTERY FUSE

The battery is secured with an ATO 20 A fuse. The topside of the battery includes transport pockets for two spare ATO 20 A fuses. When travelling by air and in general, remove the fuse to deactivate the battery and place the fuse into the free transport pocket!

1. Insert the 20 A fuse into the battery.
2. First connect the Elinchrom Li-Ion charger with the battery, and then connect the charger to the mains.
3. Charge the battery until the Elinchrom Li-Ion charger status light turns to green.
4. Press the battery button to check if the battery capacity is at 100% (4 green LEDs).
5. Remove first the mains connection, and then remove the charger from the battery.

BATTERY STATUS

The Li-Ion battery implements a full-integrated monitoring circuitry, which allows the user to know exactly the available capacity of the battery when pressing the push button, located on the front of the battery LED's.
