GETTING STARTED

SURVEYXACT QUICKQUEST

Welcome to SurveyXact QuickQuest

TOPICS IN THIS GUIDE

- 2 Introduction
- 3 Starting QuickQuest
- 8 Working on questions
- 20 Working on validations
- 23 Working on activations
- 26 Customizing variables
- 27 Other functions

INTRODUCTION

This quick guide is a brief introduction to QuickQuest – the new tool for creating questions in SurveyXact. The guide introduces the QuickQuest interface and helps you to create questions safely and securely.

QUICKQUEST – THE EASY WAY

At a glance:

- Focus on ease-of-use and overview. QuickQuest is aimed at beginners, intermediate and advanced users alike to enable them to quickly create questions appropriate to their needs.
- Easy access to the functions you want, where you want them. QuickQuest offers faster navigation so it only takes a few clicks to achieve the desired results.
- In QuickQuest, we have automated and pre-defined a number of important procedures, such as the selection of question types and the use of validations and activations. You will therefore find that it is faster and easier to create and customize questions.
- With QuickQuest, your questions can be prepared and edited from various platforms; PCs, tablets and smart phones. For example, you can easily correct even complicated questions from your mobile device.
- QuickQuest contains a number of new functions; an Undo function if you want to undo a change or you make an error, an option for retrieving previously saved versions of your questions, as well as immediate access to the preview sample, so you can see how the questions are displayed to the respondents.

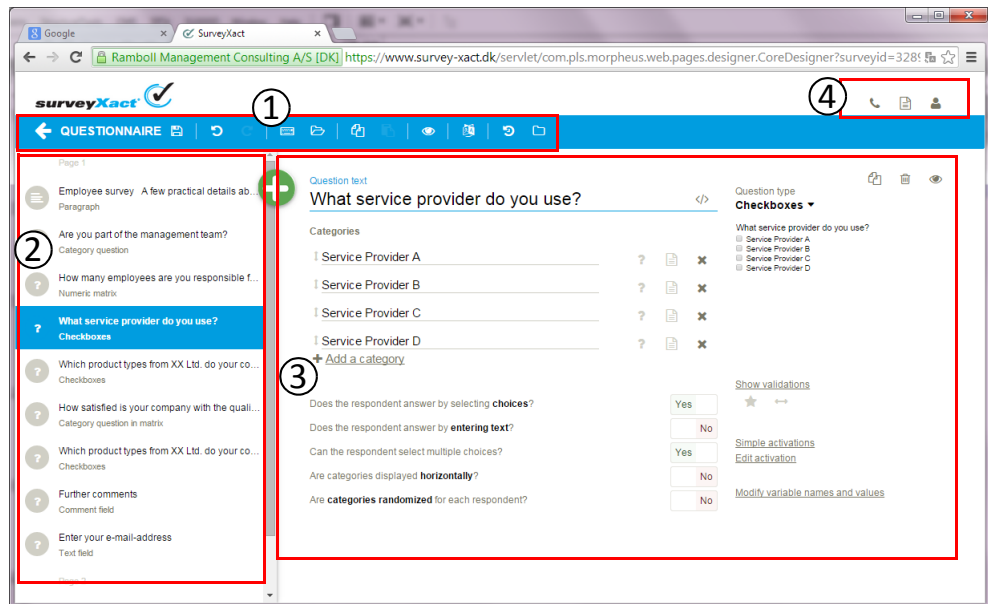

The former Advanced Designer is now called QuickQuestplus.

STARTING QUICKQUEST

QuickQuest is launched from the **QUESTIONNAIRE** tab in the **Questionnaires** menu from the **Edit questions with QuickQuest** menu item.

STRUCTURE OF THE BROWSER WINDOW

① **Toolbar:** Provides access to a number of useful editing functions and tools.

② **Overview:** Shows the questionnaire's hierarchical structure. You can easily change the order of question elements from the overview.

③ **Workspace:** The space where you work on the questionnaire's questions, validations and activations.

④ **Help and support:** Provides access to the user manual and telephone support.

TOOLBAR

The toolbar in QuickQuest is displayed at the top of the browser window.

From the toolbar you can:

- Return to the **QUESTIONNAIRE** tab in SurveyXact
- Save the questions
- Undo and redo actions - multiple times
- Retrieve saved questions from the library
- Copy and paste questionnaire elements
- Access the *Insert from text* toolbar
- Work on questions in different language versions
- Access the background questionnaire
- Access previously saved versions of the questions.

Read more here:

- 'Insert question from text' on page 19
- 'Retrieving previous versions of questions' on page 27

OVERVIEW

The overview displays the questionnaire's hierarchical structure – from top to bottom. It reveals the individual questionnaire elements, i.e. the front page, questions, pagebreaks, and back page if there is one.

When you click on an element in the overview, you instantly access this element in the workspace.

Each element is represented by a symbol and/or a specific color. Activations and validations are represented by colored lines in the overview.

In addition to the overview serving as a visual representation of the questionnaire structure, you can use it to customize the structure; move elements around using drag and drop. A highlighted element can easily be copied using the **Copy** and **Paste** buttons on the toolbar.

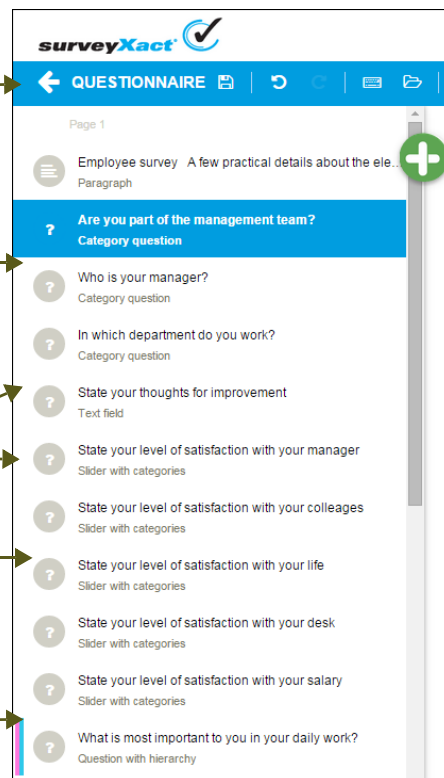

You can copy an element using the **Copy** and **Paste** buttons on the toolbar.

When you highlight an element, it is displayed in the workspace.

You can easily rearrange the order of elements by dragging and dropping with the mouse.

Each questionnaire element is represented by a unique icon.

A question linked to an activation is indicated by a colored line.

WORKSPACE

The workspace is the focal point of your work on the individual questions. This is where questions are created and customized, e.g. with validations and activations.

The workspace offers easy access to the functions required for each question and its design, whether you are a new, intermediate or advanced user.

The screenshot shows the SurveyXact QuickQuest workspace interface. It is divided into several sections:

- 1** (Top left): The main question text area, labeled "Question text", containing the question "What service provider do you use?". Below the question is a list of categories: "Service Provider A", "Service Provider B", "Service Provider C", and "Service Provider D". Each category has a question mark icon, a document icon, and a delete icon. There is a link to "Add a category".
- 2** (Bottom left): A section for customizing the question, containing five yes/no questions:
 - Does the respondent answer by selecting **choices**? (Yes)
 - Does the respondent answer by **entering text**? (No)
 - Can the respondent select multiple choices? (Yes)
 - Are categories displayed **horizontally**? (No)
 - Are **categories randomized** for each respondent? (No)
- 3** (Top right): The "Question type" dropdown menu, currently set to "Checkboxes".
- 4** (Bottom right): A section for "Show validations", "Simple activations", "Edit activation", and "Modify variable names and values".
- 5** (Top right): A small box containing icons for copying, deleting, and previewing the question.

① The relevant question is displayed here.

② Area where users can easily customize the question or change its type, so it is appropriate for its purpose. This area is ideal for new users who are unfamiliar with question terminology.

③ Shows the question type. This enables you to easily switch to a new question type.

④ Access to validations, activations and modification of variable names and values.

⑤ Buttons for copying, deleting, and previewing questions.

A FEW TIPS FOR NAVIGATION IN QUICKQUEST

It is recommended that you don't use the shortcut menu in the browser window, i.e., the menu which appears when you right-click the mouse. None of the displayed commands are linked to the use of QuickQuest.

In the same way, it is recommended that you do not use the browser's **Forward** and **Back** buttons to navigate in QuickQuest. Clicking the **Back** button will just send you back to the **QUESTIONNAIRE** tab.

You are advised not to use the browser window's **Forward** and **Back** keys to navigate in QuickQuest.

To close a window, click on the small cross in the window's top right-hand corner or click **Cancel** or **Save**.

To exit QuickQuest, click on the **QUESTIONNAIRE** button. This returns you to the **QUESTIONNAIRE** tab where you can test and distribute your questionnaire.

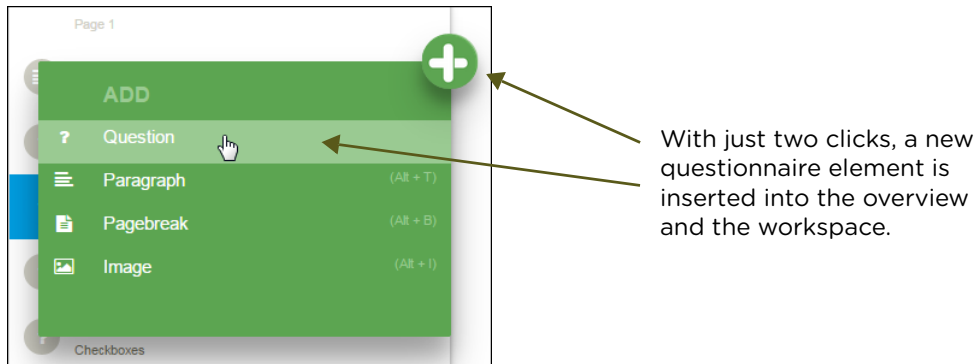

WORKING ON QUESTIONS

This section describes how you can easily create questions in QuickQuest with the desired questionnaire elements:

- questions
- body text (for example, for use on front pages, back pages and instructions)
- pagebreaks
- images

ADDING QUESTIONNAIRE ELEMENTS

The starting point for creating new questionnaire elements is the **PLUS** button located at the center of QuickQuest's workspace window.

QUESTION TYPES

Questions are generally divided into:

- Text questions,
- Questions with choices
- Number questions.

Within each of these categories there are a number of sub-types:

Text field	With the <i>Text field</i> question type, respondents can enter their response on a single line.
Comment field	With the <i>Comment field</i> question type, respondents can enter their response on several lines.
Rich text field	With the <i>Rich text field</i> question type, respondents can enter their response on a line which can be linked to formatting, for example, bold, italic, or a specific font size. Respondents can also choose to answer the question with several responses in a bulleted list.
Text field in matrix	With the <i>Text field in matrix</i> question type, respondents can enter their response to multiple sub-questions on individual lines.
Comment field in matrix	With the <i>Comment field in matrix</i> question type, respondents can enter their response to multiple sub-questions on individual lines.

Category question

With the *Category question* question type, respondents can indicate their response by selecting between different choices.

Note that category questions are divided into two sub-types; *single-choice questions* and *multiple-choice questions*. With single-choice questions, respondents have to indicate just one choice among several. With multiple-choice questions, several choices can be specified for the same question.

Horizontal radio buttons

With the *Horizontal radio buttons* question type, respondents can indicate their response by selecting between different choices which are displayed as radio buttons.

Dropdown menu

With the *Dropdown menu* question type, respondents can indicate their response by selecting between different choices which are displayed as a dropdown menu.

Slider with categories

With the *Slider with categories* question type, respondents can indicate their response by selecting between different choices by moving a slider.

Category question in matrix

With the *Category question in matrix* question type, respondents can indicate their response to a question with multiple sub-questions by means of a single choice for each sub-question.

Multiple-choice matrix questions

With the *Multiple-choice matrix question* question type, respondents can indicate their response to a question with multiple sub-questions by means of multiple choices for each sub-question.

Questions with hierarchy

With the *Hierarchy* question type, respondents can indicate their response by specifying a priority for multiple choices.

Matrix in multiple dimensions

With the *Matrix questions in multiple dimensions* question type, respondents can indicate their response to a question with multiple sub-questions by means of multiple choices for each sub-question.

Numeric field

With the *Numeric field* question type, respondents can indicate their response by a number.

Numeric question with slider

With the *Numeric question with slider* question type, respondents can indicate their response by selecting a number by moving a slider.

Numeric matrix

With the *Numeric matrix* question type, respondents can respond to the matrix's sub-questions using numeric fields.

Creating a category question

For a category question, respondents select between choices.

Procedure:

1. Click on **PLUS** and select **Question**. By default, new questions are created as Category questions.
2. Enter the question's title under *Question text*.
3. Enter the first choice under *Choices*. Note that the question is saved as you go along.

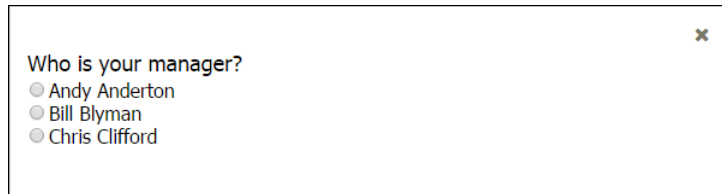

The screenshot shows the 'Question text' field with the text 'Who is your manager?'. Below it, the 'Categories' section lists 'Andy Anderton' and 'Bill Blyman', with a green '+ Add a category' link at the bottom. To the right, the 'Question type' is set to 'Category question'. Below this, a preview shows the question text and the two categories with radio button icons. To the right of the categories list, there are three icons: a question mark, a document, and an 'X'.

Click on the **Omit in calculations** icon if the question should be omitted from calculations when this question is subsequently analyzed.

Click on the **Add textbox** icon if the question requires an extra field where respondents can enter their response.

4. Click **Add a category** and enter the other choices.
5. Where necessary, click on the **Add textbox** icon if the question requires an extra field where respondents can enter their response. This gives respondents the option of providing a response which is not shown among the choices.
6. Click on the **Omit in calculations** icon if the question should be omitted from calculations when this question is subsequently analyzed.

7. Where necessary, click on the **Preview sample** button to see how the finished question will appear to the respondents.

Who is your manager?

- ☐ Andy Anderton
- ☐ Bill Blyman
- ☐ Chris Clifford

More information on which validations can be linked to this type of question can be found in the section 'Working on validations' on page 20.

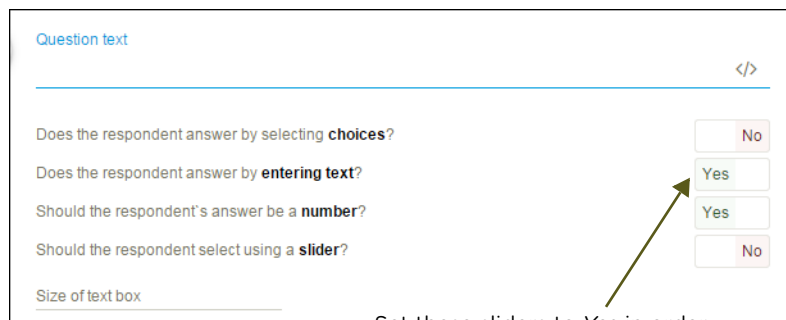

Creating a number question

In this procedure, we will demonstrate how easy it is to create and customize questions using the customize area just below the question. The following describes the creation of a number question.

More information on this type of customization can be found under 'Customizing questions' on page 18

Procedure:

1. Click on **PLUS** and select **Question**.
2. By default, the question is created as a category question, but you can easily change this to a number question in the area under the question text by clicking **Yes** in the fields *Does the respondent answer by **entering text**?* and *Should the respondent's answer be a **number**?*

Question text

Does the respondent answer by selecting **choices**? No

Does the respondent answer by **entering text**? Yes

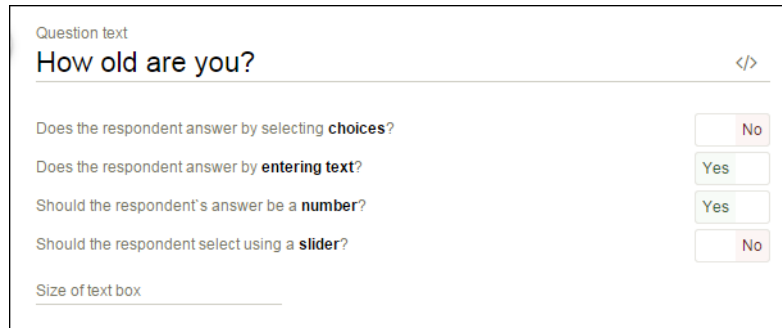

Should the respondent's answer be a **number**? Yes

Should the respondent select using a **slider**? No

Size of text box

Set these sliders to Yes in order to create a number question.

3. Enter the question text under *Question text*.

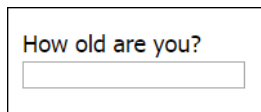

The screenshot shows the configuration interface for a question. At the top, there is a label 'Question text' and a text input field containing 'How old are you?'. To the right of the text field is a code icon (</>). Below the text field, there are four validation options, each with a corresponding 'Yes' or 'No' button:

- Does the respondent answer by selecting **choices**? (No button is selected)
- Does the respondent answer by **entering text**? (Yes button is selected)
- Should the respondent's answer be a **number**? (Yes button is selected)
- Should the respondent select using a **slider**? (No button is selected)

At the bottom, there is a label 'Size of text box' followed by a horizontal line for input.

4. Where necessary, click on the **Preview sample** button to see how the finished question will appear to the respondents.

The screenshot shows the finished question as it appears to respondents. It consists of the text 'How old are you?' followed by a text input field.

More information on which validations can be linked to this type of question can be found in the section 'Working on validations' on page 20.

Creating a category question in matrix

With a matrix question, the respondent is asked to consider multiple sub-questions relating to the parent question.

Procedure:

1. Click on **PLUS** and select **Question**.
2. Under **Question type** change the question's type from *Category question* to *Category question in matrix*.
3. Enter the question's title under *Question text*, and indicate the choices available.

6. More information on which validations can be linked to this type of question can be found in the section 'Working on validations' on page 20.

Creating a question with hierarchy

For a question with hierarchy, respondents answer by prioritizing the various choices in relation to each other.

Procedure:

1. Click on **PLUS** and select **Question**.
2. Under **Question type**, change the question's type from *Category question* to *Question with hierarchy*.
3. Enter the question's title under *Question text*, and then specify the desired sub-questions.

Question text	
What is most important to you in your daily work?	</>
Sub-question	
Relationship with my colleagues	✕
Relationship with my manager	✕
Salary	✕
Frequent work satisfaction analyses	✕
Variety of food selection during lunch	✕
+ Add a sub-question	✕

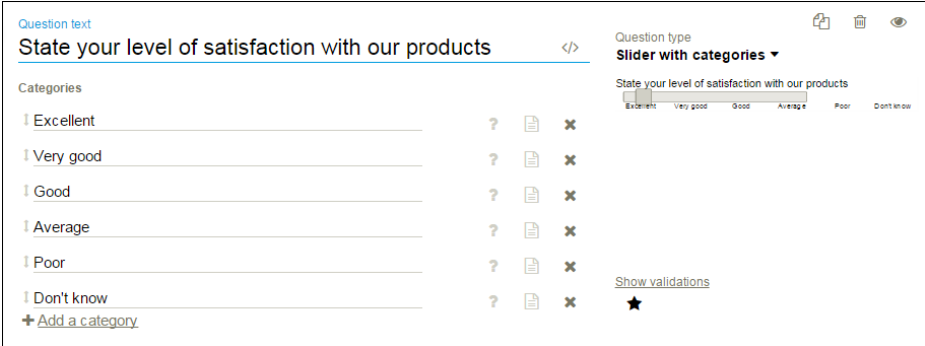

More information on which validations can be linked to this type of question can be found in the section 'Working on validations' on page 20.

Creating a category question with slider

When a question is displayed with a slider, respondents can answer the question by moving the slider toward the desired choice.

Procedure:

1. Click on **PLUS** and select **Question**.
2. Under **Question type**, change the question's type from *Category question* to *Slider with categories*.
3. Enter the question's title under *Question text*, and then specify the desired choices; *Yes*, *No*, and *Don't know*.

4. 

5. Click the **Preview sample** button to see how the finished question will appear to the respondents.

CUSTOMIZING QUESTIONS

In the area just below the question in QuickQuest, there is a range of options for quickly customizing each question. This area is aimed at less advanced users who may not be so familiar with question terminology or who need to work on advanced question types.

However, even advanced users may benefit from the rapid navigation which this area provides.

The displayed customization options reflect the question type you are currently working on. If you change a setting, the displayed options will also be changed.

The user performs the customization by moving the slider from, for example, Yes to No and thereby changing a specific function. Some examples are given below:

- Should the respondent enter text or number?
- Should choice sets be used?
- How should choices be displayed? Horizontally? In a dropdown menu?
- Should randomization be used? If so, to what extent?
- Should rich text be entered?

User-friendly customization of your question. Answer Yes or No to a simple question to customize the questionnaire's questions. →

The screenshot shows the customization options for a 'Category question' titled 'Who is your manager?'. The interface includes a list of categories (Andy Anderton, Bill Blyman, Chris Clifford) and a set of customization questions with Yes/No sliders. A red box highlights the customization questions. To the right of the sliders are links for 'Show validations', 'Simple activations', 'Edit activation', and 'Modify variable names and values'.

Customization Question	Yes	No
Does the respondent answer by selecting choices ?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Does the respondent answer by entering text ?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Can the respondent select multiple choices?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Should the respondent select using a slider ?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Should the respondent select choices from a dropdown menu ?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Are categories displayed horizontally ?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Are categories randomized for each respondent?	<input type="checkbox"/>	<input checked="" type="checkbox"/>

INSERT QUESTION FROM TEXT

With the **Insert from text** function, you can create your question quickly and easily. **Insert from text** is an effective tool, regardless of whether questions are simple or complicated. The questions are entered using a special notation directly into an editor and the result is instantly displayed in a preview sample. It is also possible to cut and paste pre-prepared questions into the editor.

Click **Show help** for a guide to the complete notation which enables you to create most question types, pagebreaks and body text. Questions created using **Insert from text** can be further processed in QuickQuest and QuickQuestplus.

Procedure:

1. Click on the little keyboard icon in the toolbar.
2. Enter your questions in the **Input** box and note how they are created in the **Result** area as you type.

When you insert a line break, a text question is automatically created where respondents can enter their responses.

If you add choices on the following lines – followed by a line break – the choices are automatically formatted as radio buttons.

The screenshot shows a dialog box titled "Insert from text" with a close button (X) in the top right corner. Inside the dialog, there is a message: "This dialog box lets you insert question from text. Start to enter a text on the left so you can see your question on the right." Below this message is a link labeled "Show help". The dialog is divided into two main sections: "Input" on the left and "Result" on the right. In the "Input" section, the following text is entered:
Who is your manager?
Andy
Bill
Chris

In which department do you work?
East
West

State your thoughts for improvement

In the "Result" section, the text is automatically formatted into a survey structure:
Who is your manager?
☐ Andy
☐ Bill
☐ Chris

In which department do you work?
☐ East
☐ West

State your thoughts for improvement

At the bottom right of the dialog, there are two buttons: "Paste" and "Cancel".

3. Click **Paste** to create the questions in QuickQuest.

WORKING ON VALIDATIONS

A *validation* is a check to ensure that the respondent has answered a question properly. If the validation condition has not been satisfied, the respondent cannot continue to the next page of the questionnaire.

In QuickQuest, the possible validations are made available as you create a question and you can easily indicate whether or not they should be included. There are various customization options.

The screenshot shows the 'How old are you?' question editor. On the left, there are four toggle switches for question settings: 'Does the respondent answer by selecting choices?' (No), 'Does the respondent answer by entering text?' (Yes), 'Can the respondent enter text over multiple lines?' (No), and 'Should the respondent's answer be a number?' (No). Below these is a 'Size of text box' input field. On the right, the 'Question type' is set to 'Text field'. Below this is a preview of the question: 'How old are you?' with a text input field. At the bottom right, there is a 'Show validations' section with four icons: a star (Must be supplied), an '@' symbol (Email), a calendar (Date), and a document with a checkmark (Required). Below the icons are links for 'Simple activations', 'Edit activation', and 'Modify variable names and values'.

Validations available for each question type are displayed here. Click on an icon to activate and deactivate a validation.

The following validations are available.

Must be supplied. Checks whether the question has been answered. If it has not been answered, the respondent cannot continue to the next page of the questionnaire and a message is displayed. This validation is available for all question types.

Use min./max. This is used for category questions which are *multiple-choice questions*. Checks whether the number of the respondent's answers conforms to the limits (minimum/maximum) on the number of possible answers that you have assigned to this question.

As part of this validation, it is also possible to specify whether certain choices should be mutually exclusive. For more information, see 'Customizing validations' on page 22.

Valid e-mail address. Checks whether the e-mail address the respondent has entered is in the correct format. This validation is available for text questions.

Valid date format. Checks whether the date format the respondent has specified is correct. This validation is available for text questions.

Valid date range. Checks whether the date range the respondent has specified is correct. This validation is available for text questions.

CUSTOMIZING VALIDATIONS

With the **Show validations** command, you have the option of customizing the validations in different ways. Amongst other things, you can edit the text to be shown to the respondents if they do not answer a question or use an incorrect format.

The customization is carried out in the **Validations** window. Which settings can be changed depends on the type of validation.

Validations

Select the validations you want for this questionnaire

Should the categories be mutually exclusive?

No

WORKING ON ACTIVATIONS

An activation is used to control whether or not an element is displayed. An element is a page, question, row, column, text element, or answer choice.

In QuickQuest, you can access activations under the menu items **Simple activations** and **Edit activation**.

Question text

Should the respondent select choices from a **dropdown menu**? ☐ No

Are categories displayed **horizontally**? ☐ No

Are **categories randomized** for each respondent? ☐ No

[Show validations](#)

[Simple activations](#)

[Edit activation](#)

[Modify variable names and values](#)

Click on **Simple activations** to quickly link an activation.

Click on **Edit activation** to create broader activation rules.

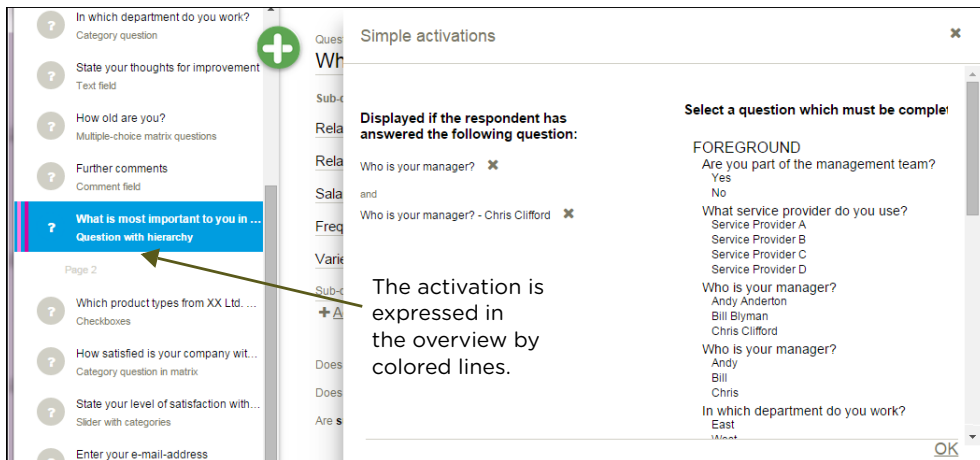

SIMPLE ACTIVATIONS

With the **Simple activations** function, you can quickly create something similar to a jump in the old Smart Designer, i.e. specify that a question should only be displayed if a previous question has been answered and/or a specific response has been given.

In the example on the next page, a specific question about satisfaction with a product range is only displayed if the response Yes indicates that the company exports.

Note that the activation is expressed by color codes in the overview.

In the overview, you can use the mouse to drag the activation so it also covers other questions.

EDIT ACTIVATIONS

When you click **Edit activation**, you have the option of creating more advanced activation expressions. The dialog box you are working in here is similar in structure to the **Enter expression** dialog box which you will be familiar with from the previous Advanced Designer (now QuickQuestplus).

CUSTOMIZING VARIABLES

If you wish to modify variable names and values for individual questions, this can be done using the **Modify variable names and values** function in the workspace. This opens a dialog box where you can modify these names and values for the relevant question.

It may, for example, be relevant to modify variable values for closed-choice questions.
Modify the required values and click **OK**.

The dialog box titled "Modify variable names and values" contains the following information:

Variable Name	Categories

OTHER FUNCTIONS

RETRIEVING PREVIOUS VERSIONS OF QUESTIONS

When you save your questions in QuickQuest, they are saved as a new version. This means that you will not be overwriting the same version from one session to the next.

You can retrieve a previous version of your question at any time by clicking **Show history** on the toolbar.
