# Installation Technical Documentation for the WRIA-1 DSS

*created by Christopher Michaelis on October 19, 2004*

## Installation Technology Overview

Software these days cannot simply be copied to a destination computer and run. Modern software components are complex and intricate, often having a long list of dependencies which must be properly installed and registered with windows. In an effort to keep track of software and dependencies, we have organized the components of the WRIA-1 DSS using pre-built installation modules (merge modules) and InstallShield installations. There are many software packages available to help in organizing software to be installed; we have settled on InstallShield Express 5.1 as an excellent balance of cost and features. We utilize Microsoft Visual Studio to build merge modules, which is the only significant lack of functionality in InstallShield Express.

The software we use for installations is explained briefly below.

### InstallShield Express 5.1

InstallShield Express is a product intended specifically for developing installations. These installations can run on any version of Windows (InstallShield Express 5.1 does not support Linux or PalmOS or Windows CE).

The installations produced by InstallShield express are capable of installing files to a system, installing merge modules (see below for a definition of merge modules), creating shortcuts to files, adding windows registry entries, and performing custom actions (DLL calls or executable files). InstallShield Express provides some flexibility in configuring the user interface which will be presented during an installation. The “Express” edition of InstallShield is a bit limited, but the price tag difference between this and the “Full” edition makes using it very worthwhile. The features that we’re missing by not using the “Full” edition are basically not having complete and utter control over the installation process (i.e., changing the order in which dialogs appear, creating completely new dialogs, or performing special functions during the middle of the installation). InstallShield Express is also not capable of producing merge modules; we use Microsoft’s Visual Studio to accomplish this.

InstallShield Express does still allow “Custom Actions” at the end of the installation; a custom action is a call to an external executable file or DLL. This file can be on the installation media or installed with the product.

Using InstallShield Express is a fairly straightforward process. On opening the project (the .ise file), you’ll see a panel on the left-hand side with options such as “Redistributables”, “Files”,

“Custom Actions”, etc. Clicking on each of these in turn will display that option in the main window. They are each fairly self-explanatory, with the following cautions:

First, “redistributables” refers to merge modules. This is important to point out so that you realize that this is where the merge modules are selected. The merge modules that appear here are the modules which are present in the directory C:\Program Files\InstallShield\Express\Objects. Therefore, after putting together a merge module, in order for InstallShield to see and use it, you must place the file (\*.msm) in that directory.

Secondly, when you build the installation (using the menu option or the toolbar icon), the installation will build only the last media type which you had selected. If you have configured more than one media type, they will NOT all be built – you must click on each one in turn, then click the build icon.

Thirdly, when you’re trying to locate your built installation, it will usually be buried under many levels of subdirectories. Suppose you’re working with installation X.isx; there will be a subdirectory entitled X next to X.isx. Under this directory, there will be an Express subdirectory. Under this directory, there will be a subdirectory for each of the media types that you have built. Suppose you built a “CDROM” installation; there will be a subdirectory entitled CDROM. In this subdirectory, there will be about three directories; the one you care about is entitled “Disk Images”. In this directory, there will be a DISK1, DISK2, and so forth.

Fourthly, if you build an installation which spans multiple disks or CDs, you must label those CDs to match the subdirectory that the files were in. For example, when burning the files from DISK1 onto a CD, you must set that CD’s volume label to DISK1. This applies to DISK2, DISK3, and so forth. If you do not set the volume label of the CD properly, then the installation will not recognize the CD as being the proper disk. The installation will ask for disk “2”. Even if the CD you insert has the proper files on it, if the label is not DISK2 the installation will not accept the CD.

Fifthly, there are a few file restrictions that you need to be aware of. You should never place the following files in the C:\Program Files\MapWindow\Plugins subdirectory (or any subdirectory underneath Plugins) :

- a. stdole.dll
- b. MapWinInterfaces.dll
- c. Microsoft.VisualBasic.Compatibility.dll
- d. MapWinGIS.ocx

These items may appear in the same directory as MapWindow.exe. Files such as AxInterop.MapWinGIS.dll and Interop.MapWinGIS.dll can be in the plugins subdirectory, but not MapWinGIS.ocx itself.

With these tips, you should be able to use InstallShield express fairly easily. If you have questions on using InstallShield, the software comes with a ‘Quick Start’ guide which can be quite useful. There is also in-depth documentation available in the help menu.

## Merge Modules

Often, it is desirable to build a reusable installation package for a given component. Take, for instance, MapWindow 3.1. This software package is used as the basis for a wide variety of applications and purposes. It doesn't make sense to put together a MapWindow installation every time it is needed. To solve this problem, we use Merge Modules.

A merge module is an installation module which is usually self-contained and doesn't need anything else to have the complete piece. For instance, the MapWindow merge module contains the MapWindow software and all of the dependencies that MapWindow needs.

Merge modules are also often used to group together a component and all of that component's dependencies. An example of this is the AddFlow flowcharting component. This component is a single file, but it has a few dependencies. So, this single file and all of its dependencies are packaged together into AddFlow.msm, which is a self-contained package providing the AddFlow charting component and everything it needs. Any application which needs this component, then, can include the merge module in its installation, without needing to worry if all of the dependencies and such have also been included. This is a great way to modularize components and simplify a large installation.

One more example of merge modules is the Time Series Analyst merge module. This software requires MapWindow, since it's a MapWindow plugin. However, the merge module does NOT include MapWindow. It does, however, include all of the other dependencies – Gigasoft Proessentials, Windows components, et cetera. This provides a bit more flexibility – if you want to put together an installation to give the Time Series Analyst to somebody who you already know has MapWindow, you could put together an InstallShield installation containing the Time Series merge module and a database with a few shapefiles, excluding MapWindow on purpose. If you wanted to give the installation to users without MapWindow, you could simply include the MapWindow merge module as well.

Using merge modules slows down development slightly in the beginning, as you must decide what needs to be put into separate merge modules and you must create “wrapper” installations to hold these merge modules. However, this small time investment in the beginning speeds up future installations considerably and pays for itself several times over.

Often, you may build a merge module for inclusion in large installations, but you also wish to be able to install only the component in the merge module without installing other things as well. The Time Series Analyst is another ideal example of this – sometimes, you may want to install only the Time Series Analyst. Since a merge module cannot be installed directly, you must create an InstallShield installation which installs nothing but this merge module. This is referred to as a “Wrapper” installation for that merge module, since its sole purpose is to wrap that merge module, making it installable.

Occasionally in this document when describing merge modules, you'll see a reference to a “wrapper” installation location. This is showing where a wrapper installation for merge module has already been created.

201  
202 Additionally, a merge module may contain other merge modules. A good example of this is the  
203 Model Manager merge module, which also contains the AddFlow merge module. Suppose that  
204 you had another merge module, X.msm, which also contained the AddFlow merge module; if  
205 you build an InstallShield installation that includes both X.msm and the Model Manager merge  
206 module, InstallShield will automatically detect that AddFlow is included twice and will only use  
207 the files once. This is particularly important with very common components that are duplicated  
208 many times in an installation. This phase of building the installation is called “merging”, hence  
209 the term “merge module”.

## 210 **Visual Studio 2002 (or 2003)**

211 The majority of the software for the WRIA-1 DSS has been created using various versions of  
212 Microsoft’s Visual Studio; the scope of this section is not focused on software, but rather using  
213 Visual Studio for the purpose of building Merge Modules.

214  
215 Visual Studio can be used to build complete application packages, but I find Visual Studio  
216 severely limited in terms of customizing the installation and making it professional looking. I use  
217 Visual Studio only for merge modules, and this is because InstallShield Express will not build  
218 merge modules. (InstallShield Developer edition will allow you to build merge modules;  
219 however, it is considerably more expensive than InstallShield Express, and Visual Studio, a tool  
220 we already have, can do Merge Modules perfectly well.)

221  
222 All of the merge modules have been created with Visual Studio 2002, and can therefore be  
223 opened with Visual Studio 2002 or 2003. To create a new merge module from scratch, choose  
224 New Project from the File menu. Select “Setup or Deployment” project, then choose Merge  
225 Module. You’ll get an empty list; from here, you may add an executable (dependencies will  
226 automatically be determined and added). You may also add any other file type. Do this by either  
227 dragging a file in, or right-clicking and choosing Add File.

228  
229 The path which files are configured to install to in the merge module will carry over to the  
230 installation that uses the merge module; the installer using the merge module cannot specify a  
231 different path to install the files, unless you place files in the “retargetable” folder. Therefore,  
232 place the files carefully, paying attention to directory structure.

233  
234 You may change where the merge module output goes by right-clicking on the project in the  
235 right-hand pane. Choose Properties, and you’ll see a window with a text box labeled “Project  
236 output”. Change this to the place you’d like the merge module to go.

237  
238 Build the merge module by choosing Build from the menu. When the file has been built,  
239 remember to place the resulting .msm in the proper location. For InstallShield Express, this is  
240 “c:\Program Files\InstallShield\Express\Objects”. If you’re using Visual Studio or any other  
241 installation utility, you’ll likely need to place the merge module in “c:\Program Files\Common  
242 Files\Merge Modules”. After rebuilding an existing merge module, simply overwrite the old one.

## Detailed Explanation of Installations and Merge Modules

Here, all of the installations and merge modules that are used within the WRIA-1 DSS installation package will be listed and explained. For those components which were built at USU, the contents of the merge module and the purpose of each file will be listed. Components which were not built at USU (i.e., Microsoft component merge modules) will list only what that component is. Be aware that some of the files in these merge modules may change slightly over time, but the overall contents and purpose will remain the same.

### WRIA-1 Final Deliverable Standard Edition Installshield Installation

*(installation\WRIA-1 Final Deliverable Standard\WRIA-1 Final Deliverable.ise)*

This is the main “container” for all components, data, and merge modules which need to be installed with the Nooksack DSS. This InstallShield installation packages everything together and generates the set of install CDs to be distributed to end users.

This is the Standard edition of the installation, which means that it includes the following components and objects:

Merge Modules *(explanation of these component will follow in this document)*

AddFlow Flowchart Components (AddFlow.msm)

DBMS Standard Edition (DBMSStandard.msm)

Gigasoft Proessentials Charting Components (Gigasoft.msm)

MapWindow 3.1 (MapWindow3.1.msm)

Model Manager (Model Manager.msm)

Model Manager Elements (ModelManagerElements.msm)

Macroinvertebrate Data Viewer (MIVViewer.msm)

Physical Habitat Simulation 1D Viewer (PHabSim1DViewer.msm)

Physical Habitat Simulation 2D Viewer (PS2DViewer.msm)

Photo Viewer (mwPhotoViewer.msm)

Time Series Data Analyst (mwTimeSeries.msm)

Watershed Characterization Report (mwWatershedChar.msm)

Well Log Data Viewer (mwWellviewer.msm)

Crystal Reports 8.5 Runtime Components (CrystalReports85.msm)

Crystal Reports .NET Data Access (Crystal\_Database\_Access2003.msm)

Crystal Reports .NET English (Crystal\_Database\_Access2003\_enu.msm)

Crystal Reports .NET Managed Code (Crystal\_Managed2003.msm)

Seagate Crystal Reports Keycode Manager (Crystal\_regwiz2003.msm)

Data Access Objects 3.60 (DAO360.msm)

Distributed Component Object Model 95 (DCOM95.msm)

Microsoft Foundations Classes 6.0 Libraries (MFC42.msm)

Microsoft C Runtime Library 6.0 (MSVCRT.msm)

Microsoft C++ Runtime Library 6.0 (MSVCP60.msm)

Microsoft Chart Control 6.0 (MSCHRT20.MSM)

288 Microsoft Chart VB Control (VB\_Control\_mschart\_RTL\_X86\_---.msm)  
 289 Microsoft Common Dialog Control 6.0 (COMDLG32.msm)

*These are the databases and the database attachers.*

\Microsoft SQL Server\MSSQL\Data\Resources\1033\SQLDMO.rll

*This is the English language resource file for SQL Server.*

\WRIA-1\_DSS\\*.\*

*This is the DSS Data and User Documentation.*

[TempFolder]

\MSDE\\*. \* *This is the MSDE installation program*

Special Actions

If this installation is going to be used on a computer with multiple users, you'll need to perform the following steps:

1. Build the installation normally.
2. Download and install ORCA, a tool for editing installation databases.  
[http://msdn.microsoft.com/library/default.asp?url=/library/en-us/msi/setup/orca\\_exe.asp](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/msi/setup/orca_exe.asp)
3. Open ORCA. Open the .msi file associated with the installation that you just built. This will be on the first disk of your installation. This will probably be called "WRIA-1 Final Deliverable Standard Edition.msi".
4. Click on the Components table; you'll see a long list of data.
5. Find the component called "Global\_Controls\_MSCOMCT2OCX...". This component is associated with GUID "3207D1B8-80E5-11D2-B95D-006097C4DE24".
6. Find the "keypath" field for this component. Click into that field, and clear out its contents. (Clear out only the KEYPATH portion; don't delete the entire row!)
7. Close and save the .msi file.
8. The installation package may now be safely distributed to end users.

## 376 **WRIA-1 Final Deliverable Administrative Edition Installshield Installation**

377 *(installation\WRIA-1 Final Deliverable Administrative\WRIA-1 Final Deliverable.ise)*

378

379 This is the main “container” for all components, data, and merge modules which need to be  
380 installed with the Nooksack DSS. This InstallShield installation packages everything together  
381 and generates the set of install CDs to be distributed to end users.

382

383 This is the Administrative edition of the installation, which means that it includes the following  
384 components and objects:

385

386 *Merge Modules* *(explanation of these component will follow in this document)*

387 AddFlow Flowchart Components (AddFlow.msm)

388 DBMS Administrative Edition (DBMSAdmin.msm)

389 Gigasoft Proessentials Charting Components (Gigasoft.msm)

390 MapWindow 3.1 (MapWindow3.1.msm)

391 Model Manager (Model Manager.msm)

392 Model Manager Elements (ModelManagerElements.msm)

393 Macroinvertebrate Data Viewer (MIVViewer.msm)

394 Physical Habitat Simulation 1D Viewer (PHabSim1DViewer.msm)

395 Physical Habitat Simulation 2D Viewer (PS2DViewer.msm)

396 Photo Viewer (mwPhotoViewer.msm)

397 Time Series Data Analyst (mwTimeSeries.msm)

398 Watershed Characterization Report (mwWatershedChar.msm)

399 Well Log Data Viewer (mwWellviewer.msm)

400 Crystal Reports 8.5 Runtime Components (CrystalReports85.msm)

401 Crystal Reports .NET Data Access (Crystal\_Database\_Access2003.msm)

402 Crystal Reports .NET English (Crystal\_Database\_Access2003\_enu.msm)

403 Crystal Reports .NET Managed Code (Crystal\_Managed2003.msm)

404 Seagate Crystal Reports Keycode Manager (Crystal\_regwiz2003.msm)

405 Data Access Objects 3.60 (DAO360.msm)

406 Distributed Component Object Model 95 (DCOM95.msm)

407 Microsoft Foundations Classes 6.0 Libraries (MFC42.msm)

408 Microsoft C Runtime Library 6.0 (MSVCRT.msm)

409 Microsoft C++ Runtime Library 6.0 (MSVCP60.msm)

410 Microsoft Chart Control 6.0 (MSCHRT20.MSM)

411 Microsoft Chart VB Control (VB\_Control\_mschart\_RTL\_X86\_---.msm)

412 Microsoft Common Dialog Control 6.0 (COMDLG32.msm)

413 Microsoft Component Category Manager Library (COMCAT.msm)

414 Microsoft Data Access Components (MDAC) 2.5 (MDAC25.msm)

415 MDAC 2.6 (MDAC26.msm)

416 MDAC 2.7 (MDAC27enu.msm)

417 Microsoft FlexGrid Control 6.0 (MSFLXGRD.msm)

418 Microsoft OLE 2.40 for 95/NT4.0 (OLEAUT32.msm)

419 Microsoft Typelib Information Library (tlbinf32.msm)

 490

#### 491 *Special Actions*

492 If this installation is going to be used on a computer with multiple users, you'll need to  
 493 perform the following steps:

- 494 1. Build the installation normally.
- 495 2. Download and install ORCA, a tool for editing installation databases.
- 496 3. Open ORCA. Open the .msi file associated with the installation that you just built.  
 497 This will be on the first disk of your installation. This will probably be called  
 498 "WRIA-1 Final Deliverable Administrative Edition.msi".
- 499 4. Click on the Components table; you'll see a long list of data.
- 500 5. Find the component called "Global\_Controls\_MSCOMCT2OCX...". This  
 501 component is associated with GUID "3207D1B8-80E5-11D2-B95D-  
 502 006097C4DE24".
- 503 6. Find the "keypath" field for this component. Click into that field, and clear out its  
 504 contents. (Clear out only the KEYPATH portion; don't delete the entire row!)
- 505 7. Close and save the .msi file.
- 506 8. The installation package may now be safely distributed to end users.

507

508

509

## 510 **AddFlow Flowchart Components (AddFlow.msm)**

511 (installation\AddFlow\Merge Module\AddFlow\AddFlow.sln)

512 This is a merge module built with Visual Studio to provide the AddFlow™ components which  
513 are used by the Model Manager. All of the files in this merge module are installed to the  
514 Windows System directory (usually c:\windows\system32).

515

### 516 Files Included

517 ADDFLOW3.LIC *The file storing the USU AddFlow component license.*

518 AddFlow3.ocx *The actual ActiveX AddFlow component.*

519 Mfc42.msm *Microsoft Foundations Classes 4.2, an AddFlow dependency.*

520 Msvcr71.msm *Microsoft Visual C Runtime Library, an AddFlow dependency.*

521 Oleaut32.msm *OLE Automation libraries, an AddFlow dependency.*

522

## 523 **DBMS Standard Edition (DBMSStandard.msm)**

524 (installation\DBMS\Merge Module\DBMSStandard\DBMSStandard.sln)

525 (InstallShield Wrapper at installation\DBMS\DBMSStandard.ise)

526

527 This is a merge module built with Visual Studio to provide the standard edition of the  
528 DBMS/LaunchPad. This is the Standard edition, meaning it does not allow remote data editing or  
529 LaunchPad reconfiguration. All of the files in this merge module are installed to C:\Program  
530 Files\LaunchPad.

531

### 532 Files Included

533 Adodb.dll *Used for database access (Active Data Object)*

534 axinterop.mscomctl2.dll *.NET wrapper for ActiveX component mscomctl2*

535 axinterop.msflexgridlib.dll *.NET wrapper for ActiveX component MSFlexGrid*

536 crystal\_database\_Access\_2003.msm *Crystal Reports Database Libraries*

537 CrystalDecisions.CrystalReports.Engine.dll *Crystal Reports Core Engine*

538 CrystalDecisions.ReportSource.dll *Crystal Reports Data Source Locator*

539 CrystalDecisions.Shared.dll *Shared Libraries for Crystal Reports*

540 CrystalDecisions.Windows.Forms.dll *Form designer for Crystal Reports*

541 CrystalKeyCodeLib.dll *Registration Library for Crystal Reports*

542 Dotnetfxredist\_x86\_enu.msm *Suppressed (not installed - .NET Framework)*

543 Dtspkg.dll *Used for database management (DTS = Distributed Transactions)*

544 Interop.DTS.dll *.NET wrapper for Dtspkg.dll*

545 Interop.MSComCtl2.dll *.NET Wrapper for MSComCtl2.dll*

546 Interop.MSFlexGridLib.dll *.NET Wrapper for MSFlexGrid*

547 Interop.SQLOLE2.dll *.NET Wrapper for SQLOLE2 component*

548 LifestagePlotter.dll *.NET Component for editing Fish Lifestage data*

549 Mscomctl2.msm *Microsoft Common Controls library; used for animation controls*

550 Msflxgrd.msm *Microsoft FlexGrid control; used for data editing interface*

551 SQLOLE2.dll *SQL Distributed Management Object – used to manage SQL Server*

552 Stdole.dll *Standard OLE interface library*  
 553 DBMS.conf *DBMS Configuration File (prebuilt for Nooksack)*  
 554 DBMS.exe *DBMS Executable itself – Standard Edition*  
 555 DBMS.pdb *DBMS Program Debug Library – helpful for debugging purposes*  
 556 ICSharpCode.SharpZipLib.dll *Compression library – used to speed up network*  
 557 MDAC27ENU.msm *Data Access components for ODBC data access*

## 558 **DBMS Administrative Edition (DBMSAdmin.msm)**

559 (installation\DBMS\Merge Module\DBMSAdmin\DBMSAdmin.sln)  
 560 (InstallShield Wrapper at installation\DBMS\DBMSAdmin.ise)

561  
 562 This is a merge module built with Visual Studio to provide the administrative edition of the  
 563 DBMS/LaunchPad. This is the Administrative edition, meaning it allows remote data editing and  
 564 LaunchPad reconfiguration. All of the files in this merge module are installed to C:\Program  
 565 Files\LaunchPad.

566  
 567 *Files Included*  
 568 Adodb.dll *Used for database access (Active Data Object)*  
 569 axinterop.mscomctl2.dll *.NET wrapper for ActiveX component mscomctl2*  
 570 axinterop.msflexgridlib.dll *.NET wrapper for ActiveX component MSFlexGrid*  
 571 crystal\_database\_Access\_2003.msm *Crystal Reports Database Libraries*  
 572 CrystalDecisions.CrystalReports.Engine.dll *Crystal Reports Core Engine*  
 573 CrystalDecisions.ReportSource.dll *Crystal Reports Data Source Locator*  
 574 CrystalDecisions.Shared.dll *Shared Libraries for Crystal Reports*  
 575 CrystalDecisions.Windows.Forms.dll *Form designer for Crystal Reports*  
 576 CrystalKeyCodeLib.dll *Registration Library for Crystal Reports*  
 577 Dotnetfxredist\_x86\_enu.msm *Suppressed (not installed - .NET Framework)*  
 578 Dtspkg.dll *Used for database management (DTS = Distributed Transactions)*  
 579 Interop.DTS.dll *.NET wrapper for Dtspkg.dll*  
 580 Interop.MSComCtl2.dll *.NET Wrapper for MSComCtl2.dll*  
 581 Interop.MSFlexGridLib.dll *.NET Wrapper for MSFlexGrid*  
 582 Interop.SQLDMO.dll *.NET Wrapper for SQLDMO component*  
 583 LifestagePlotter.dll *.NET Component for editing Fish Lifestage data*  
 584 Mscomctl2.msm *Microsoft Common Controls library; used for animation controls*  
 585 Msflxgrd.msm *Microsoft FlexGrid control; used for data editing interface*  
 586 SQLDMO.dll *SQL Distributed Management Object – used to manage SQL Server*  
 587 Stdole.dll *Standard OLE interface library*  
 588 DBMS.conf *DBMS Configuration File (prebuilt for Nooksack)*  
 589 DBMS.exe *DBMS Executable itself – Administrative Edition*  
 590 DBMS.pdb *DBMS Program Debug Library – helpful for debugging purposes*  
 591 ICSharpCode.SharpZipLib.dll *Compression library – used to speed up network*  
 592 MDAC27ENU.msm *Data Access components for ODBC data access*

593

## 594 **Gigasoft Proessentials Charting Components (Gigasoft.msm)**

595 (Installation\GigaSoft\Merge Module\Gigasoft\Gigasoft.sln)

596

597 This is a merge module used to provide all of the Gigasoft ProEssentials graphing components,  
598 both versions 3 and 4, and all of their dependencies. This was built in response to consistently  
599 missing dependencies for these controls. All of these files are placed in the Windows System32  
600 directory; some are registered, some are not.

601

### 602 Files Included

603 Pe3do16a.ocx *Contains a ProEssentials ActiveX control.*

604 Pe3do32a.ocx *Contains a ProEssentials ActiveX control.*

605 Pego16a.ocx *Contains a ProEssentials ActiveX control.*

606 Pego32a.ocx *Contains a ProEssentials ActiveX control.*

607 Pego32b.ocx *Contains a ProEssentials ActiveX control.*

608 Pegrp16a.dll *Contains requisite libraries used by the ActiveX controls.*

609 Pegrp32a.dll *Contains requisite libraries used by the ActiveX controls.*

610 Pegrp32b.dll *Contains requisite libraries used by the ActiveX controls.*

611 Pepco16a.ocx *Contains a ProEssentials ActiveX control.*

612 Pepco32a.ocx *Contains a ProEssentials ActiveX control.*

613 Pepso16a.ocx *Contains a ProEssentials ActiveX control.*

614 Pepso32a.ocx *Contains a ProEssentials ActiveX control.*

615 Pesgo16a.ocx *Contains a ProEssentials ActiveX control.*

616 Pesgo32a.ocx *Contains a ProEssentials ActiveX control.*

617 Pesgo32b.ocx *Contains a ProEssentials ActiveX control.*

618

## 619 **MapWindow 3.1 (MapWindow3.1.msm)**

620 (Installation\MapWindow31\Merge

621 Module\MapWindow3.1\MapWindow3.1\MapWindow3.1.sln)

622

623 This is a merge module intended to wrap MapWindow 3.1 and all of its immediate dependencies  
624 together. All of the files are placed in C:\Program Files\MapWindow.

625

626 There are a bunch of files ending in .bgd, .shp, .shx, and .dbf that are not listed here. These are  
627 data items used by the sample project (USA).

628

### 629 Files Included

630 Interop.MapWinGIS.dll *.NET wrapper for MapWinGIS ActiveX control.*

631 AxInterop.MapWinGIS.dll *.NET wrapper for MapWinGIS ActiveX control.*

632 Comdlg32.msm *Common Dialog controls (Save As, Open...)*

633 Default.mwcfg *The default MapWindow configuration file.*

634 DevComponents.DotNetBar.dll *Component used for MapWindow menus.*

635 GridWizard.dll *MapWindow Grid Wizard plugin for processing grids.*

636 MapWindow.exe *MapWindow main executable program.*

637 MapWindow31.chm *Help file for MapWindow.*  
 638 MapWinGIS.ocx *MapWindow core mapping ActiveX component.*  
 639 MapWinInterfaces.dll *MapWindow plugin interface definitions.*  
 640 Microsoft.VisualBasic.Compatibility.dll *.NET library for handling VB6 plugins*  
 641 Mscomctl.msm *Microsoft Common Controls library*  
 642 MSIMG32.dll *Microsoft Image library*  
 643 mwIdentifier.dll *MapWindow Feature Identifier plugin for examining maps*  
 644 ShapefileEditor.dll *MapWindow Shapefile Editor plugin*  
 645 TableEditor.mw.dll *MapWindow Shapefile Table Editor plugin.*  
 646 Tlbinf32.msm *Microsoft Type Library Information object*  
 647 UnitedStates.mwprj *Example Project for USA (Also includes many data items)*  
 648

## 649 **Model Manager (Model Manager.msm)**

650 (Installation\Model Manager\Merge Module\Model Manager\Model Manager.sln)  
 651  
 652 This merge module includes the Model Manager MapWindow plugin, and it also includes the  
 653 AddFlow components, which it uses. The files are placed in C:\Program  
 654 Files\MapWindow\Plugins\ModelManager.  
 655

656 *Files Included*  
 657 AxInterop.Addflow3Lib.dll *.NET wrapper for Addflow ActiveX control.*  
 658 DevComponents.DotNetBar.dll *Used for the dockable menu bars and model list*  
 659 Dotnetfxredist\_x86\_enu.msm *Suppressed (not installed)*  
 660 Interop.AddFlow3Lib.DLL *.NET library wrapper for AddFlow*  
 661 Interop.DSSIntfcLib.dll *.Net Library wrapper for the DSS Model Interface*  
 662 Stdole.dll *Suppressed (not installed)*  
 663 System.dll *Suppressed (not installed)*  
 664 System.drawing.dll *Suppressed (not installed)*  
 665 System.xml.dll *Suppressed (not installed)*  
 666 AddFlow.msm *The AddFlow component used to create the scenario layout*  
 667 ModelManager.dll *The Model Manager MapWindow plugin*  
 668 ModelManager.pdb *Program Debug Database for the Model Manager*  
 669 mwDSS.xmlcf *Configuration file for the Nooksack DSS*  
 670 ScenarioBuilder.xml *Configuration file for the Scenario Builder layout*  
 671

## 672 **Model Manager Elements (ModelManagerElements.msm)**

673 (Installation\Model Manager Elements\Merge  
 674 Module\ModelManagerElements\ModelManagerElements.sln)  
 675  
 676 This merge module contains all of the model elements (filters, data editors, and models) that the  
 677 Model Manager can use. They're all lumped together in this merge module because it doesn't

make sense to separate them all into separate installations. The files are placed in C:\Program Files\MapWindow\Plugins\ModelManager\Elements.

Files Included

Interop.DSSIntfcLib.dll .NET wrapper for the DSS Model Interface library.  
Interop.MapWinGIS.dll .NET wrapper for the MapWindow Mapping component.  
DiversionChanger.dll The diversion changer model element  
DiversionChanger.pdb Program debug database for the above  
Interop.MapWinGIS.dll .NET wrapper for the MapWindow Mapping component.  
LandCoverSummary.dll The Land Cover summarizer model element  
LandCoverTypes.xml Land Cover type definitions for the Land Cover Summary  
mwBestManagementPractice.dll Best Management Practices model element  
mwChangeLandCover.dll Land Cover Changer model element  
mwClimateChanger.dll Climate Changer model element  
mwPopulationChanger.dll Population Changer model element  
mwRainDataFilter.dll Rain Data Filter data element  
ReservoirStorage.dll Reservoir Storage editor model element  
ReservoirStorage.pdb Program debug database for the above

**Macroinvertibrate Data Viewer (MIVViewer.msm)**

(Installation\MacroInvert\Merge Module\mwMIVViewer\mwMIVViewer.sln)

This is the merge module for the Macroinvertibrate Data Viewer MapWindow plugin. This consists primarily of the DLL for this plugin and a few dependencies. The files are placed in C:\Program Files\MapWindow\Plugins\mwMIVViewer.

Files Included

AxInterop.MSChart20Lib.dll .NET wrapper for Microsoft Chart ActiveX control  
Interop.MSChart20Lib.dll .NET wrapper for Microsoft Chart ActiveX control  
Mschart20.msm Merge module containing MS Chart control and dependencies  
mwMacroInvertDataViewer.dll MacroInvertibrate Data Viewer plugin

**Predicted Habitat Simulation 1D Viewer (PHabSim1DViewer.msm)**

(Installation\mwPhabSim1DViewer\MergeModule\mwPhabSim1DViewer\mwPhabSim1DViewer.sln)

This merge module contains the PHabSim 1D data viewer, as well as its help file and a few dependencies of this component. Files are installed to C:\Program Files\MapWindow\Plugins\mwPhabSim1DViewer.

Files Included

AxInterop.PE3DO32BLib.dll .NET wrapper for ProEssentials controls  
Interop.PE3DO32BLib.dll .NET wrapper for ProEssentials controls  
BLOBManage.dll Custom DLL used to manage the data for this plugin

720 Interop.BLOBMANAGELib.dll *.NET wrapper for custom BLOB dll*  
 721 Interop.PE3DO32BLib.dll *.NET wrapper for ProEssentials controls*  
 722 Interop.PESGO32BLib.dll *.NET wrapper for ProEssentials controls*  
 723 mwPhabSim1DViewer.dll *The PHabSim 1D MapWindow Plugin DLL*  
 724 Pe3do32b.ocx *Gigasoft ProEssentials control*  
 725 Pego32b.ocx *Gigasoft ProEssentials control*  
 726 Pegrp32b.dll *Gigasoft ProEssentials control*  
 727 Pepco32b.ocx *Gigasoft ProEssentials control*  
 728 Pepso32b.ocx *Gigasoft ProEssentials control*  
 729 Pesgo32b.ocx *Gigasoft ProEssentials control*  
 730 PHab1DUserManual.doc *User's Documentation for the PHabSim 1D Viewer*

### 731 **Predicted Habitat Simulation 2D Viewer (PS2DViewer.msm)**

732 (Installation\mwPS2DViewer\Merge Module\mwPS2DViewer\mwPS2DViewer.sln)  
 733  
 734 This merge module contains the PHabSim 2D viewer plugin as well as mapping components, a  
 735 media player, and graphing components. Files are installed to C:\Program  
 736 Files\MapWindow\Plugins\mwPS2DViewer.

737  
 738 *Files Included*  
 739 AxInterop.MapWinGIS.dll *.NET Wrapper for MapWindow Map component*  
 740 AxInterop.MediaPlayer.dll *.NET Wrapper for Windows Media Player component*  
 741 AxInterop.PESGO32BLib.dll *.NET wrapper for Proessentials graph control*  
 742 Interop.MediaPlayer.dll *.NET wrapper for Windows Media Player component*  
 743 Interop.PESGO32BLib.dll *.NET wrapper for Proessentials Graph Control*  
 744 mwPhabSim2DViewer.dll *PHabSim 2D Viewer MapWindow plugin component*  
 745 Pe3do32b.ocx *Gigasoft ProEssentials graphing component*  
 746 Pego32b.ocx *Gigasoft ProEssentials graphing component*  
 747 Pegrp32b.dll *Gigasoft ProEssentials graphing component*  
 748 Pepco32b.ocx *Gigasoft ProEssentials graphing component*  
 749 Pepso32b.ocx *Gigasoft ProEssentials graphing component*  
 750 Pesgo32b.ocx *Gigasoft ProEssentials graphing component*

### 751 **Photo Viewer (mwPhotoViewer.msm)**

752 (Installation\Photo Viewer\Merge Module\mwPhotoViewer\mwPhotoViewer.sln)  
 753 (InstallShield Wrapper at Installation\Photo Viewer\Standalone Plugin and Data  
 754 Install\NooksackPhotoViewer.ise)  
 755  
 756 This merge module contains the Photo Viewer two DLL files; a very simple merge module. The  
 757 files are installed to C:\Program Files\MapWindow\Plugins\mwPhotoViewer.

758  
 759 *Files Included*  
 760 AxInterop.MapWinGIS.dll *.NET wrapper for MapWindow map component*  
 761 Interop.MapWinGIS.dll *.NET wrapper for MapWindow map component*  
 762 mwPhotoViewer.dll *PhotoViewer MapWindow Plugin DLL*

## 763 **Time Series Data Analyst (mwTimeSeries.msm)**

764 (Installation\TimeSeries\MergeModule\mwTimeSeries\mwTimeSeries.sln)  
765 (InstallShield Wrapper with Sample Data at Installation\TimeSeries\TimeSeriesDataAnalyst.ise)

766  
767 This merge module contains the Time Series Analyst tool, formerly the Water Quality Analyst  
768 and Streamflow Analyst. The merge module contains the MapWindow plugin and a bunch of  
769 graphing components. The files are installed in C:\Program  
770 Files\MapWindow\Plugins\mwTimeSeries.

771

### 772 Files Included

773 AxInterop.MSFlexGridLib.dll .NET wrapper for MS FlexGrid control  
774 AxInterop.PEGOALib.dll .NET wrapper for Proessentials Controls  
775 AxInterop.PESGOALib.dll .NET wrapper for Proessentials Controls  
776 Interop.MSFlexGridLib.DLL .NET wrapper for MS FlexGrid control  
777 Interop.PEGOALib.dll .NET wrapper for Proessentials controls  
778 Interop.PESGOALib.dll .NET wrapper for Proessentials controls  
779 Msflxgrd.msm Merge module containing Microsoft FlexGrid control.  
780 MDAC26.msm Microsoft Data Access Components – for database access.  
781 mwTimeSeries.dll The Time Series Analyst MapWindow plugin.  
782 Pe3do32a.ocx Gigasoft ProEssentials graphing component.  
783 Pego32a.ocx Gigasoft ProEssentials graphing component.  
784 Pegrp32a.dll Gigasoft ProEssentials graphing component.  
785 Pepco32a.ocx Gigasoft ProEssentials graphing component.  
786 Pepso32a.ocx Gigasoft ProEssentials graphing component.  
787 Pesgo32a.ocx Gigasoft ProEssentials graphing component.

## 788 **Watershed Characterization Report (mwWatershedChar.msm)**

789 (Installation\Watershed Characterization\Merge  
790 Module\mwWatershedChar\mwWatershedChar.ise)  
791 (InstallShield Wrapper at Installation\Watershed Characterization\Merge  
792 Module\WatershedChar.ise)

793  
794 This merge module contains the Watershed Characterization MapWindow plugin as well as a  
795 large number of prerequisites. Most of the prerequisites are installed either to the windows  
796 system directory, or to the .NET assembly location (usually C:\Windows\Microsoft.NET\...). The  
797 plugin itself is installed to C:\Program Files\MapWindow\Plugins\mwWatershedChar.

798

### 799 Files Included

800 ADODB.dll Active Data Objects database driver DLL  
801 AxInterop.MapWinGIS.dll .NET Wrapper for MapWinGIS component  
802 AxInterop.MSChart20Lib.dll .NET wrapper for Chart Control  
803 AxInterop.MSComCtl2.dll .NET wrapper for Common Controls  
804 AxInterop.MSFlexGridLib.dll .NET wrapper for MS Flexgrid Control  
805 AxInterop.PE3DOALib.dll .NET wrapper for Gigasoft Proessentials

806 AxInterop.PEGOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 807 AxInterop.PEPCOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 808 AxInterop.PESGOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 809 Interop.MapWinGIS.dll *.NET wrapper for MapWinGIS component*  
 810 Interop.MSChart20Lib.dll *.NET wrapper for Chart Control*  
 811 Interop.MSComCtl2.dll *.NET wrapper for Common Controls*  
 812 Interop.MSFlexGridLib.dll *.NET wrapper for MS Flexgrid Control*  
 813 Interop.PE3DOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 814 Interop.PEGOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 815 Interop.PEPCOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 816 Interop.PESGOALib.dll *.NET wrapper for Gigasoft Proessentials*  
 817 LifestagePlotter.dll *Fish Periodicity Lifestage plot control*  
 818 LifestagePlotter.pdb *Debug database for above control*  
 819 mwWatershedChar.chm *Help document for Watershed Characterization*  
 820 mwWatershedChar.dll *Watershed CharacterizationReport Generator Plugin*  
 821 mwWatershedChar.pdb *Debug database for above DLL*  
 822 ReportViewer.exe *Watershed Characterization Report Viewer stub*  
 823 ReportViewer.pdb *Debug database for above EXE*  
 824 rptViewerPass.dat *Data file for communication between report plugin and EXE*  
 825 Mschrt20.msm *Microsoft Chart component merge module*  
 826 Mscomctl2.msm *Microsoft Common Controls 2 merge module*  
 827 Msdatasrc.dll *Microsoft DataSource control*  
 828 Msflxgrd.msm *Microsoft Flexgrid Control merge module*  
 829 Sqldmo.dll *Microsoft SQL Server Distributed Management Object*

### 830 **Well Log Data Viewer (mwWellviewer.msm)**

831 (Installation\Well Viewer\Merge Module\mwWellviewer\mwWellViewer.sln)  
 832 (InstallShield Wrapper at Installation\Well Viewer\Merge Module\WellViewer.ise)  
 833  
 834 This is a merge module to install the Well Log Data Viewer and dependencies other than  
 835 MapWindow. Files are installed to C:\Program Files\MapWindow\Plugins\mwWellViewer.  
 836

#### 837 Files Included

838 AxInterop.PESGOALib.dll *.NET Wrapper for Gigasoft ProEssentials control*  
 839 AxInterop.PESGOALib.dll *.NET Wrapper for Gigasoft ProEssentials control*  
 840 Interop.PEGOALib.dll *.NET Wrapper for Gigasoft ProEssentials control*  
 841 Interop.PESGOALib.dll *.NET Wrapper for Gigasoft ProEssentials control*  
 842 mwWellViewer.dll *Well Log Viewer Plugin for MapWindow*

### 843 **Crystal Reports 8.5 Runtime Components (CrystalReports85.msm)**

844 This merge module is produced and distributed by Business Objects, Inc. This provides the core  
 845 redistributable components needed by software using Crystal Reports.  
 846

847     **Crystal Reports .NET Data Access (Crystal\_Database\_Access2003.msm)**

848     This merge module is produced and distributed by Business Objects, Inc. This provides the  
849     redistributables to allow Crystal Reports to connect to and use a Microsoft Access database.

850     **Crystal Reports .NET English (Crystal\_Database\_Access2003\_enu.msm)**

851     This merge module is produced and distributed by Business Objects, Inc. This provides the core  
852     redistributable components which are specific to the US English language.

853     **Crystal Reports .NET Managed Code (Crystal\_Managed2003.msm)**

854     This merge module is produced and distributed by Business Objects, Inc. This provides the core  
855     redistributable components needed by software using the Crystal extensions to Microsoft's .NET  
856     languages.

857     **Seagate Crystal Reports Keycode Manager (Crystal\_regwiz2003.msm)**

858     This merge module is produced and distributed by Business Objects, Inc. This provides the  
859     registration key indicating which developer produced the software, and authorizing the client  
860     computer to use the Crystal Reports components.

861     **Data Access Objects 3.60 (DAO360.msm)**

862     This merge module is produced by Microsoft Corp. It provides the Data Access Objects SDK  
863     (Software Development Kit) used to access databases from code.

864     **Distributed Component Object Model 95 (DCOM95.msm)**

865     This merge module is produced by Microsoft Corp. This is a core requirement for most Windows  
866     applications.

867     **Microsoft Foundations Classes 6.0 Libraries (MFC42.msm)**

868     This merge module is produced by Microsoft Corp. This provides libraries and dependencies  
869     needed by software developed with Microsoft Visual C++.

870     **Microsoft C Runtime Library 6.0 (MSVCRT.msm)**

871     This merge module is produced by Microsoft Corp. This provides libraries and dependencies  
872     needed by software developed with Microsoft Visual C.

873     **Microsoft C++ Runtime Library 6.0 (MSVCP60.msm)**

874     This merge module is produced by Microsoft Corp. This provides libraries and dependencies  
875     needed by software developed with Microsoft Visual C++ 6.0.

876 **Microsoft Chart Control 6.0 (MSCHRT20.MSM)**

877 This merge module is produced by Microsoft Corp. This provides the Microsoft Chart control, a  
878 simple bar-chart style control.  
879

880 **Microsoft Chart VB Control (VB\_Control\_mschart\_RTL\_X86\_---.msm)**

881 This merge module is produced by Microsoft Corp. This provides the Microsoft Chart control, a  
882 simple bar-chart style control, packaged specifically for use with Visual Basic.

883 **Microsoft Common Dialog Control 6.0 (COMDLG32.msm)**

884 This merge module is produced by Microsoft Corp. This provides the DLL used to create  
885 “common dialogs” such as Print, Save As, Open and such.

886

887 **Microsoft Component Category Manager Library (COMCAT.msm)**

888 This merge module is produced by Microsoft Corp. This is a core requirement for most Windows  
889 applications that use ActiveX.

890 **Microsoft Data Access Components (MDAC) 2.5 (MDAC25.msm)**

891 This merge module is produced by Microsoft Corp. It provides the Data Access components,  
892 specifically the ODBC (Open Database Compatibility) interface and a bunch of drivers for  
893 interacting with various database formats. This is version 2.5 of the components.

894 **MDAC 2.6 (MDAC26.msm)**

895 This merge module is produced by Microsoft Corp. It provides the Data Access components,  
896 specifically the ODBC (Open Database Compatibility) interface and a bunch of drivers for  
897 interacting with various database formats. This is version 2.6 of the components.

898 **MDAC 2.7 (MDAC27enu.msm)**

899 This merge module is produced by Microsoft Corp. It provides the Data Access components,  
900 specifically the ODBC (Open Database Compatibility) interface and a bunch of drivers for  
901 interacting with various database formats. This is version 2.7 (US English) of the components.

902 **Microsoft FlexGrid Control 6.0 (MSFLXGRD.msm)**

903 This merge module is produced by Microsoft Corp. It provides the FlexGrid control, a grid  
904 control used to create a spreadsheet-style grid layout.

905    **Microsoft OLE 2.40 for 95/NT4.0 (OLEAUT32.msm)**

906    This merge module is produced by Microsoft Corp. This is a core requirement for most Windows  
907    applications that use ActiveX.

908    **Microsoft Typelib Information Library (tlbinf32.msm)**

909    This merge module is produced by Microsoft Corp. This is a core requirement for most Windows  
910    applications that use ActiveX.  
911

912    **Microsoft Windows Common Controls 6.0 (MSCOMCTL.msm)**

913    This merge module is produced by Microsoft Corp. It provides the FlexGrid control, a grid  
914    control used to create a spreadsheet-style grid layout.

915

916    **Microsoft Windows Common Controls-2 6.0 (MSCOMCT2.msm)**

917    This merge module is produced by Microsoft Corp. It provides a large collection of controls  
918    which are commonly used, including animation controls and picture-related controls.

919    **OLE Database Access 2.1 (OLEDB21.msm)**

920    This merge module is produced by Microsoft Corp. It provides the OLE database access SDK for  
921    accessing and communicating with databases.

922    **SQL Distributed Management Object (SQL-DMO.msm)**

923    This merge module is produced by Microsoft Corp. It provides a convenient library to interact  
924    with Microsoft SQL Servers, performing common administration, backup, and query tasks.

## 1. Table Design

Following is a list of tables that must be included with the 1D Habitat Viewer Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters.  
*NOTE: This database is created (except for the `tblPDFs` and `tblPhotographs` tables) by exporting the data from the PHABWin-2002 program. Most of this data is in a specialized format that can only be written using this program.*

### **Table:** `tblCalibrationSetPoints`

**Description:** Contains the Velocity and Manning's N values for each point in the given Calibration Set.

*NOTE: This table is created by PHABWin-2002 program.*

| Field    | Type       | Size         | Key Field           | Primary Key | Comments  |
|----------|------------|--------------|---------------------|-------------|---|
| DBCCode  | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | Unique ID for each Calibration Set point.   |
| CalSetID | Number     | Long Integer | Yes (Duplicates OK) | No          | The ID for the Calibration Set that this point belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblCalibrationSets</i> table. |
| Point 2  | Number     | Single       | No                  | No          | Velocity at .2 depth for this calibration set point.  |
| Point 8  | Number     | Single       | No                  | No          | Velocity at .8 depth for this calibration set point.  |
| ManN     | Number     | Single       | No                  | No          | Manning's N value for this calibration set point.   |

### **Table:** `tblCalibrationSets`

**Description:** Contains the Water Surface Level (WSL) and StageQ values for each Calibration Set at a given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field   | Type       | Size         | Key Field           | Primary Key | Comments   |
|---------|------------|--------------|---------------------|-------------|--|
| DBCCode | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Calibration Set. It corresponds with the <i>CalSetID</i> Field in the <i>tblCalibrationSetPoints</i> table. |

|        |        |              |                           |    |   |
|--------|--------|--------------|---------------------------|----|---|
| XSecID | Number | Long Integer | Yes<br>(Duplicates<br>OK) | No | This is the ID for the Cross Section that this Calibration Set belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblCrossSections</i> table.   |
| ID     | Number | Long Integer | Yes<br>(Duplicates<br>OK) | No | This is an ID for this Calibration Set that is unique for the given Cross Section.<br><i>NOTE: This value can be duplicated for each unique Cross Section, but it cannot be duplicated within the same Cross Section.</i> |
| WSL    | Number | Single       | No                        | No | This is the Water Surface Level (WSL) value for this Calibration Set.   |
| StageQ | Number | Singe        | No                        | No | This is the StageQ that the WSL value represents for this Calibration Set.  |

**Table:** tblCrossSectionPoints

**Description:** Contains the Point Location (X, Y, and Z values) and the Channel Index for each point in the given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field         | Type       | Size         | Key Field              | Primary Key | Comments  |
|---------------|------------|--------------|------------------------|-------------|---|
| DBCCode       | AutoNumber | Long Integer | Yes<br>(No Duplicates) | Yes         | This is a unique ID for each Cross Section point.   |
| XSecID        | Number     | Long Integer | Yes<br>(Duplicates OK) | No          | This is the ID for the Cross Section that this point belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblCrossSections</i> table. |
| X             | Number     | Single       | No                     | No          | This is the X-value of the location of this cross sectional point.  |
| Y             | Number     | Single       | No                     | No          | This is the Y-value of the location of this cross sectional point.  |
| Z             | Number     | Single       | No                     | No          | This is the Z-value of the location of this cross sectional point.  |
| Channel Index | Number     | Single       | No                     | No          | This is the Channel Index for this cross sectional point.   |

995 **Table:** tblCrossSections  
 996 **Description:** Contains the Cross Section ID, Thalweg, and Stage Zero Flow (SZF) values  
 997 for each Cross Section in the given Result Set.  
 998 *NOTE: This table is created by PHABWin-2002 program.*

| Field    | Type       | Size         | Key Field           | Primary Key | Comments  |
|----------|------------|--------------|---------------------|-------------|---|
| DBCCode  | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Cross Section. It corresponds with the <i>XSecID</i> Field in the <i>tblCalibrationSets</i> table, the <i>tblCrossSectionPoints</i> table, the <i>tblResultsHabefQ1Q2</i> table, the <i>tblResultsHabefSpeciesCompare</i> table, the <i>tblResultsHabtae</i> table, the <i>tblResultsVelocity</i> table, and the <i>tblResultsWSL</i> table. |
| ResultID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Result Set that this Cross Section belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblResultSets</i> table.   |
| ID       | Number     | Single       | Yes (Duplicates OK) | No          | This is an ID for this Cross Section that is unique for the given Result Set.<br><i>NOTE: This value can be duplicated for each unique Result Set, but it cannot be duplicated within the same Result Set.</i>  |
| Thalweg  | Number     | Single       | No                  | No          | This is the Thalweg value for this Cross Section.   |
| SZF      | Number     | Single       | No                  | No          | This is the Stage Zero Flow (SZF) value for this Cross Section.   |

999  
 1000  
 1001 **Table:** tblPDFs **Description:** Contains the PDF Documents that are available for the  
 1002 given Result Set (not always created).

| Field    | Type       | Size         | Key Field           | Primary Key | Comments   |
|----------|------------|--------------|---------------------|-------------|--|
| DBCCode  | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each PDF Document.   |
| ResultID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Result Set that this PDF Document belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblResultSets</i> table. |

|              |      |     |    |    |   |
|--------------|------|-----|----|----|---|
| PDF_Filename | Text | 255 | No | No | This is the File path where the PDF Document is located.<br><i>NOTE: This value is a relative path value. It is stored relative to this database.</i><br><i>For Example:</i><br>\\Site_Name\\PDFs\\Filename.PDF |
|--------------|------|-----|----|----|---|

1003  
1004  
1005  
1006  
1007

**Table:** tblPhotographs

**Description:** Contains the Photographs, and their comments, that are available for the given Result Set (not always created).

| Field          | Type       | Size         | Key Field           | Primary Key | Comments  |
|----------------|------------|--------------|---------------------|-------------|---|
| DBCode         | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Photograph.  |
| ResultID       | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Result Set that this Photograph belongs to. It corresponds with the <i>DBCode</i> Field in the <i>tblResultSets</i> table.   |
| Photo_Filename | Text       | 255          | No                  | No          | This is the File path where the Photograph is located.<br><i>NOTE: This value is a relative path value. It is stored relative to this database.</i><br><i>For Example:</i><br>\\Site_Name\\Photos\\Filename.jpg |
| Comments       | Memo       |              | No                  | No          | These are the comments about this Photograph. These are displayed in the Viewer for the user to see.  |

1008  
1009  
1010  
1011  
1012

**Table:** tblProductionFlows

**Description:** Contains the simulated Production Flows for the given Result Set.

*NOTE: This table is created by PHABWin-2002 program.*

| Field  | Type       | Size         | Key Field           | Primary Key | Comments  |
|--------|------------|--------------|---------------------|-------------|---|
| DBCode | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each simulated Production Flow. |

|          |        |              |                     |    |   |
|----------|--------|--------------|---------------------|----|---|
| ResultID | Number | Long Integer | Yes (Duplicates OK) | No | This is the ID for the Result Set that this simulated Production Flow belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblResultSets</i> table. |
| Flow     | Number | Single       | No                  | No | This is the simulated Production Flow value.  |

**Table:** tblResultSet

**Description:** Contains the available Result Sets exported for the given Station.

*NOTE: This table is created by PHABWin-2002 program.*

| Field     | Type       | Size         | Key Field           | Primary Key | Comments  |
|-----------|------------|--------------|---------------------|-------------|---|
| DBCCode   | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Result Set. It corresponds with the <i>ResultID</i> Field in the <i>tblCrossSections</i> table, the <i>tblPDFs</i> table, the <i>tblPhotographs</i> table, the <i>tblProductionFlows</i> table, and the <i>tblSpecies</i> table. |
| StationID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Station that this Result Set belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblStations</i> table.   |
| Name      | Text       | 50           | No                  | No          | This is the name given to this Result Set.  |

**Table:** tblResultsHabefQ1Q2

**Description:** Contains the simulated Effective Habitat Flow Comparison Results for the given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field   | Type       | Size         | Key Field           | Primary Key | Comments   |
|---------|------------|--------------|---------------------|-------------|--|
| DBCCode | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of simulated Effective Habitat Flow Comparison Results.   |
| XSecID  | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Cross Section that this set of simulated Effective Habitat Flow Comparison Results belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblCrossSections</i> table. |

|          |            |  |    |    |  |
|----------|------------|--|----|----|--|
| HABBlloc | OLE Object |  | No | No | This is the set of simulated Effective Habitat Flow Comparison Results.<br><i>NOTE: This value is in a Binary Large Object (BLOB) format. It is specially written by the PHABWin-2002 program.</i> |
|----------|------------|--|----|----|--|

**Table:** tblResultsHabefSpeciesCompare

**Description:** Contains the simulated Effective Habitat Species Comparison Results for the given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field    | Type       | Size         | Key Field           | Primary Key | Comments  |
|----------|------------|--------------|---------------------|-------------|---|
| DBCCode  | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of simulated Effective Habitat Species Comparison Results.   |
| XSecID   | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Cross Section that this set of simulated Effective Habitat Species Comparison Results belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblCrossSections</i> table. |
| HABBlloc | OLE Object |              | No                  | No          | This is the set of simulated Effective Habitat Species Comparison Results.<br><i>NOTE: This value is in a Binary Large Object (BLOB) format. It is specially written by the PHABWin-2002 program.</i>       |

**Table:** tblResultsHabtae

**Description:** Contains the simulated Habitat Results for the given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field   | Type       | Size         | Key Field           | Primary Key | Comments   |
|---------|------------|--------------|---------------------|-------------|--|
| DBCCode | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of simulated Habitat Results.   |
| XSecID  | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Cross Section that this set of simulated Habitat Results belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblCrossSections</i> table. |

|         |            |  |    |    |  |
|---------|------------|--|----|----|--|
| HABBloc | OLE Object |  | No | No | This is the set of simulated Habitat Results.<br><i>NOTE: This value is in a Binary Large Object (BLOB) format. It is specially written by the PHABWin-2002 program.</i> |
|---------|------------|--|----|----|--|

**Table:** tblResultsVelocity

**Description:** Contains the simulated Velocity Results for the given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field   | Type       | Size         | Key Field           | Primary Key | Comments   |
|---------|------------|--------------|---------------------|-------------|--|
| DBCode  | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of simulated Velocity Results.  |
| XSecID  | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Cross Section that this set of simulated Velocity Results belongs to. It corresponds with the <i>DBCode</i> Field in the <i>tblCrossSections</i> table. |
| VELBloc | OLE Object |              | No                  | No          | This is the set of simulated Velocity Results.<br><i>NOTE: This value is in a Binary Large Object (BLOB) format. It is specially written by the PHABWin-2002 program.</i>      |

**Table:** tblResultsWSL

**Description:** Contains the simulated Water Surface Level (WSL) Results for the given Cross Section.

*NOTE: This table is created by PHABWin-2002 program.*

| Field  | Type       | Size         | Key Field           | Primary Key | Comments  |
|--------|------------|--------------|---------------------|-------------|---|
| DBCode | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of simulated Water Surface Level (WSL) Results.  |
| XSecID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Cross Section that this set of simulated Water Surface Level (WSL) Results belongs to. It corresponds with the <i>DBCode</i> Field in the <i>tblCrossSections</i> table. |

|         |            |  |    |    |   |
|---------|------------|--|----|----|---|
| WSLBloc | OLE Object |  | No | No | This is <b>the</b> set of simulated Water Surface Level (WSL) Results.<br><i>NOTE: This value is in a Binary Large Object (BLOB) format. It is specially written by the PHABWin-2002 program.</i> |
|---------|------------|--|----|----|---|

**Table:** tblSpecies

**Description:** Contains the Information for each Species and Lifestage pair available in the given Result Set.

*NOTE: This table is created by PHABWin-2002 program.*

| Field     | Type       | Size         | Key Field           | Primary Key | Comments   |
|-----------|------------|--------------|---------------------|-------------|--|
| DBCCode   | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Species and Lifestage pair. It corresponds with the <i>SpeciesID</i> Field in the <i>tblSpeciesSI</i> table.                          |
| ResultID  | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Result Set that this Species and Lifestage pair belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblResultSets</i> table. |
| Species   | Text       | 255          | No                  | No          | This is the name of the Species.   |
| Lifestage | Text       | 255          | No                  | No          | This is the name of the Lifestage of the Species.  |

**Table:** tblSpeciesSI

**Description:** Contains the simulated Suitability Index (SI) values (Depth, Velocity, Temperature, and Channel Index) for the given Fish.

*NOTE: This table is created by PHABWin-2002 program.*

| Field     | Type       | Size         | Key Field           | Primary Key | Comments  |
|-----------|------------|--------------|---------------------|-------------|---|
| DBCCode   | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each simulated Suitability Index (SI) value.  |
| SpeciesID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Fish that this simulated Suitability Index (SI) value belongs to. It corresponds with the <i>DBCCode</i> Field in the <i>tblSpecies</i> table. |
| SI Type   | Number     | Long Integer | No                  | No          | This is the Suitability Index (SI) Type for this value. It corresponds with the <i>DBCCode</i> Field in the <i>tblSpeciesSIType</i> table.                            |

|             |        |              |    |    |   |
|-------------|--------|--------------|----|----|---|
| Point       | Number | Long Integer | No | No | This is the Cross Section Point number for this value (keeps the data ordered).   |
| Value       | Number | Single       | No | No | This is the Depth, Velocity, Temperature, or Channel Index value.   |
| SI          | Number | Single       | No | No | This is the Suitability Index (SI) value for the given value.   |
| Description | Text   | 255          | No | No | This is the Description of the Suitability Index (SI) value.<br><i>NOTE: This value is only used for the Channel Index plot type.</i> |

**Table:** tblSpeciesSIType

**Description:** Contains the available Species Suitability Index (SI) Plot Types.

*NOTE: This table is created by PHABWin-2002 program.*

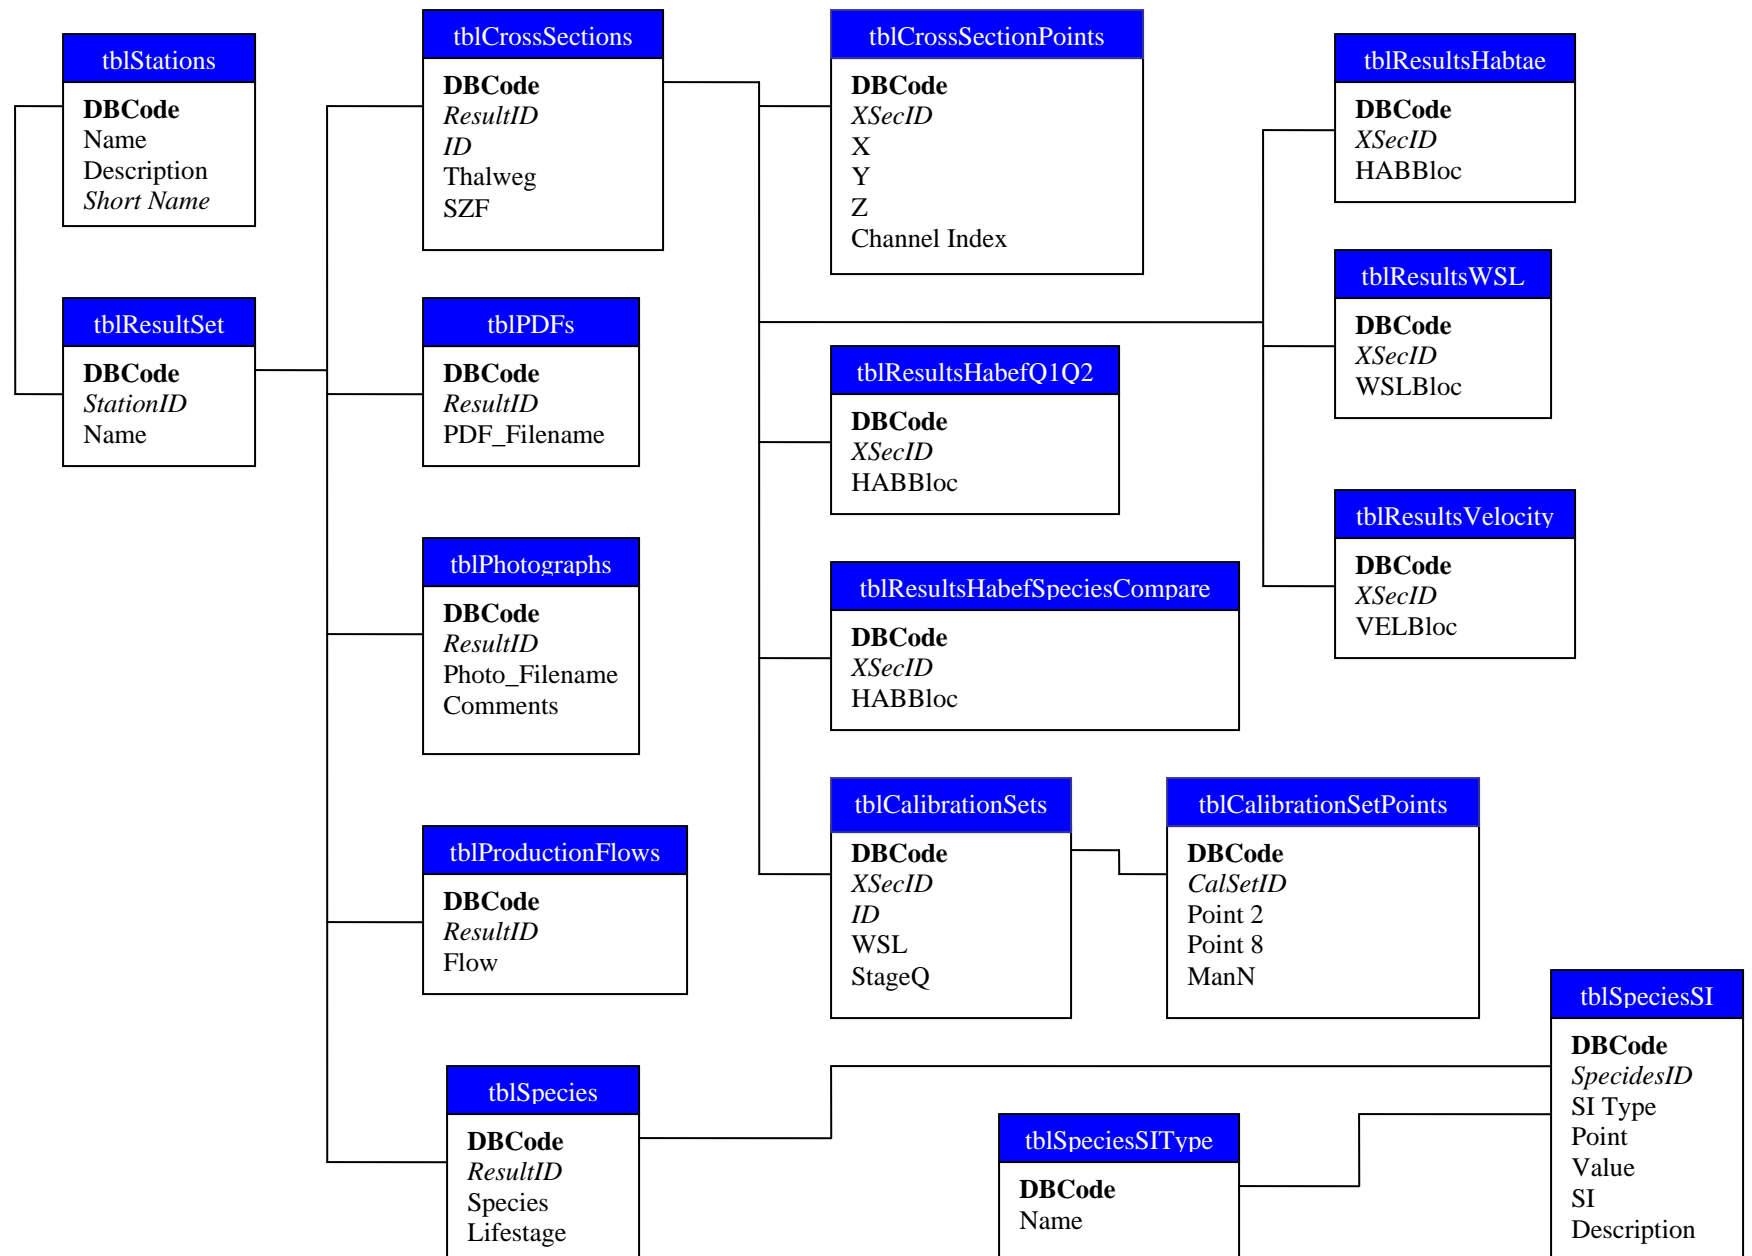

| Field  | Type       | Size         | Key Field           | Primary Key | Comments   |
|--------|------------|--------------|---------------------|-------------|--|
| DBCode | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Species Suitability Index (SI) Plot Type. It corresponds with the <i>SI Type</i> Field in the <i>tblSpeciesSI</i> table.                              |
| Name   | Text       | 50           | No                  | No          | This is the Name of the Type of the Species Suitability Index (SI) Plot Type.<br><i>NOTE: The available Plot Types should be: Depth, Velocity, Temperature, and Channel Index.</i> |

**Table:** tblStations

**Description:** Contains the information (ID, Name, and Description) for each Station.

*NOTE: This table is created by PHABWin-2002 program.*

| Field       | Type       | Size         | Key Field           | Primary Key | Comments   |
|-------------|------------|--------------|---------------------|-------------|--|
| DBCode      | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Station. It corresponds with the <i>StationID</i> Field in the <i>tblResultSet</i> table. |
| Name        | Text       | 255          | No                  | No          | This is the Name of the Station.   |
| Description | Text       | 255          | No                  | No          | This is the Description of the Station.  |
| Short Name  | Text       | 255          | Yes (Duplicates OK) | No          | This is the Short Name for the Station.  |

## 2. Data Needs

There are three types of data needed for the 1D Habitat Viewer: a point shapefile, a database type, and a database.

- Point Shapefile – this needs to be in the same projection as the other shapefiles in your project. It contains the point locations of where each of the Stations are located. This file will have a tag that will be associated with it by the plug-in: “rapidlocations”. There needs to be a field containing the *Station Name* in this shapefile.
- Database Type – this is the type of database that you are connecting to. IE: Access, SQL Server.
- Database – this is the database of 1D Habitat Data that has been exported from the PHABWin-2002 Program, and had the PDF and Photograph tables added. This database needs to be organized as described in *Section 1. Table Design*.

The layer corresponding with the point shapefile stated above is marked with the tag “rapidlocations”. If the user removes the layer associated with this tag without first closing the 1D Habitat Viewer plug-in, then the Shapefile settings will be reset, and if the Project is then saved, then the Shapefile settings in the project file will also be overwritten.

As stated above, the shapefile requires one field to be found in the data table. Following is the description of the required Field in the shapefile (an example field name, the field type, a description of the data that gets entered into this field, and how the field data is associated with the data in the database.

Required data layer field:

- a. *Station Name* – String – The Name for the Station at this location. It corresponds with the DBCode field in the tblStations table found in the database. Each value that is found in this field (in the shapefile) also needs to be found in the database.

## 3. Dependencies

The 1D Habitat Viewer plug-in requires the following software components and modules to be installed:

### Software:

Gigasoftware's ProEssentials Graphing Tools Version 4  
MapWindow 3.1  
Visual Studio .NET 2003

1113 Modules and Components:  
 1114 BLOBManage 1.0 Type Library  
 1115 Gigasoft ProEssentials 3D Sci-Graph v4  
 1116 Gigasoft ProEssentials Sci-Graph v4  
 1117 MapWindow Interfaces  
 1118 MapWinGIS Map Control  
 1119  
 1120 Integrated Development Environment (IDE)  
 1121 Visual Studio .NET 2003  
 1122

## 1123 4. Setup

1124  
 1125 To begin using the 1D Habitat Viewer, it must first be loaded into MapWindow. Once it  
 1126 is loaded, click on the 1D Habitat icon,  **1D**, located on the Map Window toolbar. If the  
 1127 shapefile (if associated) and database associations (as described in *Section 2: Data*  
 1128 *Needs*) have been configured properly and the database is accessible, then the 1D Habitat  
 1129 Viewer will appear allowing the user to select and view the 1D Habitat Simulation data  
 1130 for available stations.

1131  
 1132 If the data associations have not been properly set, then a Connection Form will appear  
 1133 allowing you to set the shapefile (if desired), the database type, and the database. Then,  
 1134 after the shapefile (if desired), the database type, and the database have been properly  
 1135 associated, select the 1D Habitat icon,  **1D**, from the Map Window toolbar and the viewer  
 1136 will appear allowing the user to view the data.

1137  
 1138 See the User's Manual for more information and details on associating the data with the  
 1139 1D Habitat Viewer.  
 1140

## 1141 5. Code Compiling

1142  
 1143 Compiling the 1D Habitat Viewer is a fairly straightforward task. After ensuring that all of the  
 1144 required components discussed in *Section 3: Dependencies* are present, load the project into  
 1145 Visual Studio .Net 2003. This Plugin was created using Visual Basic (VB).  
 1146

1147 The project needs to include the following files:

| <u>File Name</u>  | <u>Purpose</u>  |
|-------------------|---|
| AssemblyInfo.vb   | Contains information relating to the DLL assembly. Generated by VB.NET.     |
| clsDBFunctions.vb | Contains functions used for accessing and updating the associated database. |
| clsEHFlowInfo.vb  | Contains classes for accessing and storing Expected Habitat data.           |

|   |  |
|---|--|
| clsObservedInfo.vb                                    | Contains a class for accessing and storing Calibration Set (Observed) Data.  |
| clsObservedVelocities.vb                              | Contains a class for accessing and storing Observed Velocity data for the Calibration Set (Observed) Data.   |
| clsPredictedFlow.vb                                   | Contains a class for accessing and storing Flow, Water Surface Level (WSL), and Velocity data for the simulated Predicted Flow Data.   |
| clsPredictedHabitat.vb                                | Contains a class for access and storing Predicted Habitat data for the simulated Predicted Flow Data.  |
| clsPS1DMain.vb  | Contains a class that implements the MapWindow plugin interface.   |
| clsSpecies.vb   | Contains a class for accessing and storing Species and SpeciesSI data for the simulated Predicted Flow Data.   |
| clsXSecPoints.vb                                      | Contains a class for accessing and storing Cross Section Data.   |
| frmDBConnection.vb,<br>frmDBConnection.resx           | Displays the Connection form that allows the user to associate the shapefile and shapefile field (if desired), the database type, and the database with the 1D Habitat Viewer plug-in.   |
| frmHotSpot.vb,<br>frmHotSpot.resx                     | Displays the form that allows the user view the data for a specific point on any of the graphs.  |
| frmPS1DVisualization.vb,<br>frmPS1DVisualization.resx | Displays the 1D Habitat Viewer form. This form contains the many plots, photographs, and other miscellaneous viewable data for available stations. You show this form by selecting the 1D Habitat icon,  , from the Map Window toolbar or by selecting one or more points on the associated shapefile.                  |
| frmSelectLayer.vb,<br>frmSelectLayer.resx             | Displays the form to select the point shapefile associated with the 1D Habitat Viewer plug-in. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk. This form will only be shown if the user decides to associate a shapefile with this plug-in.  |
| frmSelectPDF.vb,<br>frmSelectPDF.resx                 | Displays the form to select a PDF Filename to view.  |
| ImageConverter.vb                                     | Contains a class that implements functions that allows you to convert images to and from an IPictureDisp object. This is needed so that the VBCompatibility.dll does not need to be referenced. This class allows the 1D Habitat image,  , to be associated with the points on the associated (if desired) shapefile. |
| modDSSDefinitions.vb                                  | This module contains the variables that define the table and field variable name for the 1D Habitat Viewer database. These variables are used throughout the project, so if anything should change in the database, the table or field name value only has to be changed in 1 location in the program.   |
| modFormFunctionality.vb                               | This module contains variables for copying and saving the data in the various plots in the 1D Habitat Viewer.  |

|                           |  |
|---------------------------|--|
| modGlobals.vb             | This module contains the variables used throughout the forms, such as the form declaration variables, MapWindow variables, and others.   |
| modPlotColors.vb          | This module contains the variable definitions and functions for creating and setting the various plots' colors.  |
| modPlotNameDefinitions.vb | This module contains the variable definitions for the available plot types in the 1D Habitat Viewer.   |
| modUtils.vb               | This module contains functions that are used throughout the project for reporting errors, file functionality, searching shapefiles, and other necessary functionality.   |
| PluginInfo.vb             | Contains a class that implements an interface to access (read from and write to) the Project File.   |
| trout1D.bmp               | Bitmap version of the trout1D.ico. It is used as a custom image for the point shapefile associated with the 1D Habitat Viewer plug-in.<br><i>NOTE: this file needs to be an embedded resource</i>  |
| trout1D.ico               | Icon that is used as the Map Window Legend picture when using a custom image for the point shapefile if associated with the 1D Habitat Viewer. It also is the icon on the Map Window Toolbar for the 1D Habitat Viewer plug-in.<br><i>NOTE: this file needs to be an embedded resource</i> |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| AxPE3DO32BLib        | CopyLocal = True  |
| AxPESGO32BLib        | CopyLocal = True  |
| BLOBMANAGELib        | CopyLocal = True  |
| MapWinGIS            | CopyLocal = False |
| MapWinInterfaces     | CopyLocal = False |
| PE3DO32BLib          | CopyLocal = True  |
| PESGO32BLib          | CopyLocal = True  |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |
| System.Drawing       | CopyLocal = False |
| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwPhabSim1DViewer.dll has now been created with Microsoft Visual Studio .NET 2003. It is created in the *mwPhabSim1DViewer* subdirectory in the *\Plugins* folder. Next time that MapWindow is run, if the mwPhabSim1DViewer.dll was built to the correct folder, the updated changes to the 1D Habitat Viewer will be available.

## 1. Table Design

Following is a list of tables that must be included with the 2D Habitat Viewer Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling, and cases, and types for each table and its parameters. *NOTE: Some of the data in this database, and some of the files used by the 2D Habitat Viewer plug-in were created using a specialized 2D Data Importer. The data created using this importer is in a specialized format that can only be written using this program.*

**Table:** tblBackgroundImageFiles

**Description:** Contains the available Background Image File name and location for a given station.

| Field          | Type        | Size         | Key Field           | Primary Key | Comments  |
|----------------|-------------|--------------|---------------------|-------------|---|
| Background_ID  | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | Unique ID for each Background Image.  |
| Station_ID     | Number      | Long Integer | Yes (Duplicates OK) | No          | The ID for the Station that this Background Image belongs to. It corresponds with the <i>Station_ID</i> Field in the <i>tblStations</i> table.  |
| Image_Filename | Text        | 255          | No                  | No          | This is the File path where the Background Image is located. This file must be in a BMP, PNG, or GIF format. If this Background Image has a World File associated with it, the World File needs to be located next to the Background Image File.<br><i>NOTE: This value is a relative path value. It is stored relative to this database.</i><br><i>For Example:</i><br><i>\Station\BackgroundImage\Filename.bmp.</i> |

1216 **Table:** tblFishDistribution  
 1217 **Description:** Contains the available Fish Distribution File names, types, and locations for  
 1218 each Species.  
 1219 **NOTE:** *this set of data is not based on Station, it is Area wide.*

| Field        | Type        | Size         | Key Field           | Primary Key | Comments  |
|--------------|-------------|--------------|---------------------|-------------|---|
| FD_ID        | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Fish Distribution File.  |
| Species_Name | Text        | 255          | No                  | No          | This is the Name of the Species that this Fish Distribution File belongs to.<br><i>NOTE: if this file is a background file, then the value = ALL.</i>   |
| FD_FileType  | Text        | 255          | No                  | No          | This is the Type of Shapefile or Grid that this Fish Distribution File is.<br><i>NOTE : Possible values include Fish Distribution, Hillshade, Watershed Boundary, County Boundary, or Marine Boundary.</i>  |
| FD_Filename  | Text        | 255          | No                  | No          | This is the File path where the Fish Distribution File is located. This file must be a valid Shapefile or Grid file.<br><i>NOTE: This value is a relative path value. It is stored relative to this database. For Example:<br/>\\FishDistribution\FDLayers\Filename.shp</i> |

1220  
 1221  
 1222  
 1223 **Table:** tblFishObsFiles  
 1224 **Description:** Contains the available Fish Observation shapefile overlays for the given  
 1225 Station.

| Field      | Type       | Size         | Key Field           | Primary Key | Comments   |
|------------|------------|--------------|---------------------|-------------|--|
| FishObs_ID | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Fish Observation Overlay.   |
| Station_ID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Station that this Fish Observation Overlay belongs to. It corresponds with the <i>Station_ID</i> Field in the <i>tblStations</i> table. |

|                  |      |     |    |    |   |
|------------------|------|-----|----|----|---|
| FishObs_Filename | Text | 255 | No | No | <p>This is the File path where the Fish Observation Overlay File is located. This file must be a valid Polygon Shapefile.</p> <p><i>NOTE: This value is a relative path value. It is stored relative to this database.</i></p> <p><i>For Example:</i></p> <p><i>\Station\FishObs\Filename.shp</i></p> |
|------------------|------|-----|----|----|---|

**Table:** tblFlows

**Description:** Contains the Flow values for the given Station.

**NOTE:** *This table needs to be filled in previous to running the 2D Data Importer.*

| Field      | Type       | Size                             | Key Field           | Primary Key | Comments   |
|------------|------------|----------------------------------|---------------------|-------------|--|
| Flow_ID    | AutoNumber | Long Integer                     | Yes (No Duplicates) | Yes         | This is a unique ID for each Flow. It corresponds with the <i>Flow_ID</i> Field in the <i>tblMeshFiles</i> table.                          |
| Station_ID | Number     | Long Integer                     | Yes (Duplicates OK) | No          | This is the ID for the Station that this Flow belongs to. It corresponds with the <i>Station_ID</i> Field in the <i>tblStations</i> table. |
| Flow_cms   | Number     | Double (Fixed: 2 decimal places) | No                  | No          | This is the Flow value in <i>cubic meters per second</i> (cms : m <sup>3</sup> /sec).  |
| Flow_cfs   | Number     | Double (Fixed: 2 decimal places) | No                  | No          | This is the Flow value in <i>cubic feet per second</i> (cfs : ft <sup>3</sup> /sec).   |
| AVI_Frame  | Number     | Long Integer                     | No                  | No          | This is the AVI Frame number that this Flow corresponds with.  |

1233  
1234  
1235  
1236  
1237

**Table:** tblMediaFiles

**Description:** Contains the File paths and names for the available miscellaneous Media Files for a given Station.

**NOTE:** Available miscellaneous Media File Types are AVI, Aerial View, PDF, Photograph, and Habitat Suitability Curve Definition Files.

| Field          | Type       | Size         | Key Field           | Primary Key | Comments   |
|----------------|------------|--------------|---------------------|-------------|--|
| Media_Files_ID | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Media File.   |
| Station_ID     | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Station that this Media File belongs to. It corresponds with the <i>Station_ID</i> Field in the <i>tblStations</i> table.   |
| Media_Type_ID  | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the Media Type for this Media File. It corresponds with the <i>Media_Type_ID</i> Field in the <i>tblMediaTypes</i> table.  |
| Media_Filename | Text       | 255          | No                  | No          | This is the File path where the Media File is located.<br><i>NOTE: This value is a relative path value. It is stored relative to this database.</i><br><i>For Example:</i><br><i>\Station\Miscellaneous\Filename.ext</i> |
| Comments       | Memo       |              | No                  | No          | This contains any information that is needed to be displayed or noted about this Media File.   |

1238  
1239  
1240  
1241  
1242

**Table:** tblMediaTypes

**Description:** Contains the available miscellaneous Media File Types.

**NOTE:** This table should already be completed for you. Only these types are viewable.

| Field         | Type       | Size         | Key Field           | Primary Key | Comments   |
|---------------|------------|--------------|---------------------|-------------|--|
| Media_Type_ID | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Media Type. It corresponds with the <i>Media_Type_ID</i> Field in the <i>tblMediaFiles</i> table. |
| Media_Type    | Text       | 50           | No                  | No          | This is the name of the Media Type.<br><i>NOTE: Available Types = AVI, Aerial View, PDF, Photograph,</i>                       |

|             |      |     |    |    |  |
|-------------|------|-----|----|----|--|
|             |      |     |    |    | <i>HSC</i>   |
| Description | Text | 255 | No | No | This is a description of the Media File Type.<br><i>For Example: For Media_Type = AVI, Description = AVI Files</i> |

**Table:** tblMeshFiles

**Description:** Contains the Base Meshfile, and the compressed Flow and Species Files for a given Station.

**NOTE:** *This table and the files associated with this table are populated and created by the 2D Data Importer program.*

| Field         | Type       | Size         | Key Field           | Primary Key | Comments  |
|---------------|------------|--------------|---------------------|-------------|---|
| Mesh_ID       | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Mesh File or Compressed File.  |
| Station_ID    | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Station that this Mesh File or Compressed File belongs to. It corresponds with the <i>Station_ID</i> Field in the <i>tblStations</i> table.  |
| Flow_ID       | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Flow that this Mesh File or Compressed File belongs to. It corresponds with the <i>Flow_ID</i> Field in the <i>tblFlows</i> table.<br><i>NOTE: This value is only used if this Mesh File is a Compressed Flow or Species File. Otherwise it's value = 0.</i> |
| Species_ID    | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Species that this Mesh File or Compressed File belongs to. It corresponds with the <i>Species_ID</i> Field in the <i>tblSpecies</i> table.<br><i>NOTE: This value is only used if this Mesh File is a Compressed Species File. Otherwise it's value = 0.</i> |
| Mesh_Filename | Text       | 255          | No                  | No          | This is the File path where the Mesh File or Compressed File is located.<br><i>NOTE: This value is a relative path value. It is stored relative to this database.</i>   |

|  |  |  |  |  |  |
|--|--|--|--|--|--|
|  |  |  |  |  | For Example:<br>\\Station\Mesh\FileType\Filename.ext |
|--|--|--|--|--|--|

1250  
1251  
1252  
1253  
1254  
1255  
1256

**Table:** tblSpecies

**Description:** Contains the available Species for a given Station.

**NOTE:** *This table needs to be filled in previous to running the 2D Data Importer.*

*The values in this table are only used with the tblMeshFiles table, they are not used for the tblFishDistribution table.*

| Field        | Type       | Size         | Key Field           | Primary Key | Comments  |
|--------------|------------|--------------|---------------------|-------------|---|
| Species_ID   | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Species. It corresponds with the <i>Species_ID</i> Field in the <i>tblMeshFiles</i> table.                       |
| Station_ID   | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Station that this Species belongs to. It corresponds with the <i>Station_ID</i> Field in the <i>tblStations</i> table. |
| Species_Name | Text       | 50           | No                  | No          | This is the name of the Species.<br><i>NOTE: The format for this value is: Species : Lifestage</i>  |

## 2. Data Needs

There are two types of data needed for the 2D Habitat Viewer: a point shapefile and a database.

- Point Shapefile – this needs to be in the same projection as the other shapefiles in your project. It contains the point locations of where each of the Stations are located. This file will have a tag that will be associated with it by the plug-in: “2DIntensiveSites”. There needs to be a field containing the *Station ID* in this shapefile.
- Database – this is the database of 2D Habitat Data that has been imported using the *2D Data Importer* and the rest of the tables created/entered manually. This database needs to be organized as described in *Section 1. Table Design*.

The layer corresponding with the point shapefile stated above is marked with the tag “2DIntensiveSites”. If the user removes the layer associated with this tag without first closing the 2D Habitat Viewer plug-in, then the Shapefile settings will be reset, and if the Project is then saved, then the Shapefile Connection Settings in the project file will also be over-written.

As stated above, the shapefile requires one field to be found in the data table. Following is the description of the required Field in the shapefile (an example field name, the field type, a description of the data that gets entered into this field, and how the field data is associated with the data in the database.

Required data layer field:

- a. *Station ID* – Integer – The ID for the Station at this location. It corresponds with the *Station\_ID* field in the *tblStations* table found in the database. Each value that is found in this field (in the shapefile) also needs to be found in the database.

## 3. Dependencies

The 2D Habitat Viewer plug-in requires the following software components and modules to be installed:

### Software:

Gigasoft’s ProEssentials Graphing Tools Version 4  
MapWindow 3.1  
Windows Media Player  
Visual Studio .NET 2003

### Modules and Components:

Gigasoft ProEssentials Sci-Graph v4  
ICSharpCode.SharpZipLib

1316 MapWindow Interfaces  
1317 MapWinGIS Map Control  
1318  
1319 Integrated Development Environment (IDE)  
1320 Visual Studio .NET 2003  
1321

## 1322 4. Setup

1323  
1324 To begin using the 2D Habitat Viewer, it must first be loaded into MapWindow. Once it  
1325 is loaded, click on the 2D Habitat icon, , located on the Map Window toolbar. If the  
1326 shapefile and database associations (as described in *Section 2: Data Needs*) have been  
1327 configured properly and the database is accessible, then the 2D Habitat Viewer will  
1328 appear allowing the user to select and view the 2D Habitat Data for available stations.  
1329

1330 If the data associations have not been properly set, then a Connection Form will appear  
1331 allowing you to set the shapefile and the database. Then, after the shapefile and the  
1332 database have been properly associated, select the 2D Habitat icon, , from the Map  
1333 Window toolbar and the viewer will appear allowing the user to view the data.  
1334

1335 See the User's Manual for more information and details on associating the data with the  
1336 2D Habitat Viewer.  
1337

## 1338 5. Code Compiling

1339  
1340 Compiling the 2D Habitat Viewer is a fairly straightforward task. After ensuring that all  
1341 of the required components (those discussed in *Section 3: Dependencies*) are present,  
1342 load the project into Visual Studio .Net 2003. This Plugin was created using Visual  
1343 Basic (VB).  
1344

1345 The project needs to include the following files:  
1346

| <u>File Name</u>      | <u>Purpose</u>  |
|-----------------------|---|
| AssemblyInfo.vb       | Contains information relating to the DLL assembly.<br>Generated by VB.NET.                                |
| clsDirectionPtVals.vb | Contains a class that defines variables and functions used<br>for drawing the Direction Arrow on the Map. |
| clsHSCData.vb         | Contains classes for accessing and storing Habitat<br>Suitability Curve Data.                             |
| clsMapData.vb         | Contains a class that defines variables and functions for<br>loading Shapefiles into the Map.             |
| clsPS2DMain.vb        | Contains a class that implements the MapWindow plugin<br>interface.                                       |

|   |  |
|---|--|
| clsWUADData.vb                                  | Contains classes for accessing and storing Weighted Usable Area (WUA) Data.  |
| frmDBConnection.vb,<br>frmDBConnection.resx     | Displays the Connection form that allows the user to associate the shapefile and shapefile field, and the database with the 2D Habitat Viewer plug-in.   |
| frmFlowFrameIndex.vb,<br>frmFlowFrameIndex.resx | Displays the form that allows the user view the AVI Frame vs. Flow Indexing.   |
| frmPS2DViewer.vb,<br>frmPS2DViewer.resx         | Displays the 2D Habitat Viewer form. This form contains the Physical (Map), HSC, WUA, Fish Distribution, and other Miscellaneous viewable data for available stations.<br><br>You show this form by selecting the 2D Habitat icon,  , from the Map Window toolbar or by selecting one or more points on the associated shapefile. |
| frmSelectFishObs.vb,<br>frmSelectFishObs.resx   | Displays the form to select the Fish Observation Overlay File to view with the Physical (Map) Data.  |
| frmSelectLayer.vb,<br>frmSelectLayer.resx       | Displays the form to select the point shapefile associated with the 2D Habitat Viewer plug-in. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk.   |
| ImageConverter.vb                               | Contains a class that implements functions that allows you to convert images to and from an IPictureDisp object. This is needed so that the VBCompatibility.dll does not need to be referenced. This class allows the 2D Habitat image,  , to be associated with the points on the associated shapefile.                        |
| modColorSchemes.vb                              | This module contains the variables that define the Coloring Schemes for the Physical (Map) Data Plots.   |
| modDBDefinitions.vb                             | This module contains the variables that define the table and field variable name for the 2D Habitat Viewer database. These variables are used throughout the project, so if anything should change in the database, the table or field name value only has to be changed in 1 location in the program.   |
| modFDDefinitions.vb                             | This module contains the variables that define the Coloring Schemes, Legend Colors, File Types, Fish Distribution Types, and Shapefile Info for the Fish Distribution Data.  |
| modGlobals.vb                                   | This module contains the variables used throughout the forms, such as the form declaration variables, MapWindow variables, conversion constants, resizing variables, Shapefile and Database variables, and others.   |
| modHSCDefinitions.vb                            | This module contains the variable definitions for the Habitat Suitability Curve Data.  |
| modMapDefinitions.vb                            | This module contains the variable definitions of the Plot Types, Shapefile Fieldnames, and Species SI Types for the Physical (Map) Data.   |
| modOtherDefinitions.vb                          | This module contains the enumeration and variable  |

|                  |   |
|------------------|---|
|                  | definitions for the Miscellaneous Data.   |
| modUtils.vb      | This module contains functions that are used throughout the project for reporting errors, file functionality, Drawing the North and Direction Arrows, shapefile functionality, decompressing Physical Data files, conversion functionality, and other necessary functionality.          |
| PluginInfo.vb    | Contains a class that implements an interface to access (read from and write to) the Project File.  |
| ScaleBarUtils.vb | Contains enumerations, conversion constants, and a class to draw a Scalebar in the desired units.   |
| trout2D.bmp      | Bitmap version of the trout2D.ico. It is used as a custom image for the point shapefile associated with the 2D Habitat Viewer plug-in.<br><i>NOTE: this file needs to be an embedded resource</i>   |
| trout2D.ico      | Icon that is used as the Map Window Legend picture when using a custom image for the point shapefile associated with the 2D Habitat Viewer. It also is the icon on the Map Window Toolbar for the 2D Habitat Viewer plug-in.<br><i>NOTE: this file needs to be an embedded resource</i> |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                               |                   |
|-------------------------------|-------------------|
| AxMapWinGIS                   | CopyLocal = True  |
| AxMediaPlayer                 | CopyLocal = True  |
| AxPESGO32BLib                 | CopyLocal = True  |
| ICSharpCode.SharpZipLib       | CopyLocal = True  |
| MapWinGIS (Interop.MapWinGIS) | CopyLocal = True  |
| MapWinInterfaces              | CopyLocal = False |
| MediaPlayer                   | CopyLocal = True  |
| PESGO32BLib                   | CopyLocal = True  |
| stdole                        | CopyLocal = False |
| System                        | CopyLocal = False |
| System.Data                   | CopyLocal = False |
| System.Drawing                | CopyLocal = False |
| System.Windows.Forms          | CopyLocal = False |
| System.XML                    | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwPhabsim2DViewer.dll has now been created with Microsoft Visual Studio .NET 2003. It is created in the *mwPS2DViewer* subdirectory in the *\Plugins* folder. Next time that MapWindow is run, if the mwPhabsim2DViewer.dll was built to the correct folder, the updated changes to the 2D Habitat Viewer will be available.

## 1. Table Designs

Best Management Practices Database: BestManagementPractices.bmp

Table: BMP\_DefaultValues

| Field Name            | Data Type    | Description   |
|-----------------------|--------------|---|
| BMP_Name              | Text         | The name of the best management practice  |
| PercentApplication    | Long Integer | The percentage of the land cover or watershed area the best management practice is applied to |
| N_Reduction           | Long Integer | The percentage of reduction for nitrogen  |
| NH3_NH4_N_Reduction   | Long Integer | The percentage of reduction for NH <sub>3</sub> + NH <sub>4</sub> - N                         |
| NO2_NO3_N_Reduction   | Long Integer | The percentage of reduction for NO <sub>2</sub> + NO <sub>3</sub> - N                         |
| Phos_Reduction        | Long Integer | The percentage of reduction for phosphorus  |
| BOD_Reduction         | Long Integer | The percentage of reduction for BOD   |
| FecalColBac_Reduction | Long Integer | The percentage of reduction for fecal coliform bacteria                                       |
| 11                    | Yes/No       | Does the BMP affect this land cover classification (OpenWater)                                |
| 12                    | Yes/No       | Does the BMP affect this land cover classification (Perennial Ice/Snow)                       |
| 21                    | Yes/No       | Does the BMP affect this land cover classification (Low Intensity Residential)                |
| 22                    | Yes/No       | Does the BMP affect this land cover classification (High Intensity Residential)               |
| 23                    | Yes/No       | Does the BMP affect this land cover classification (Commercial/Industrial/Transportation)     |
| 31                    | Yes/No       | Does the BMP affect this land cover classification (Bare Rock/Sand/Clay)                      |
| 32                    | Yes/No       | Does the BMP affect this land cover classification (Quarries/Strip Mines, Gravel Pits)        |
| 33                    | Yes/No       | Does the BMP affect this land cover classification (Transitional)                             |
| 41                    | Yes/No       | Does the BMP affect this land cover classification (Deciduous Forest)                         |

|    |        |   |
|----|--------|---|
| 42 | Yes/No | Does the BMP affect this land cover classification (Evergreen Forest)             |
| 43 | Yes/No | Does the BMP affect this land cover classification (Mixed Forest)                 |
| 51 | Yes/No | Does the BMP affect this land cover classification (Shrubland)                    |
| 61 | Yes/No | Does the BMP affect this land cover classification (Orchards/Vineyards)           |
| 71 | Yes/No | Does the BMP affect this land cover classification (Grasslands/Herbaceous)        |
| 81 | Yes/No | Does the BMP affect this land cover classification (Pasture/Hay)                  |
| 82 | Yes/No | Does the BMP affect this land cover classification (Row Crops)                    |
| 83 | Yes/No | Does the BMP affect this land cover classification (Small Grains)                 |
| 84 | Yes/No | Does the BMP affect this land cover classification (Fallow)                       |
| 85 | Yes/No | Does the BMP affect this land cover classification (Urban/Recreational Grasses)   |
| 89 | Yes/No | Does the BMP affect this land cover classification (Dairy)                        |
| 91 | Yes/No | Does the BMP affect this land cover classification (Woody Wetlands)               |
| 92 | Yes/No | Does the BMP affect this land cover classification (Emergent Herbaceous Wetlands) |

| 89 | Yes/No | Does the BMP affect this land cover classification (Dairy)                        |
| 91 | Yes/No | Does the BMP affect this land cover classification (Woody Wetlands)               |
| 92 | Yes/No | Does the BMP affect this land cover classification (Emergent Herbaceous Wetlands) |

1411

## 1412 2. GIS Data Needs

1413

1414 The Best Management Practices Tool requires a drainages shapefile to manage BMPs on a per  
1415 drainage basis. The default installation location for this drainage shapefile is:

1416 C:\Program Files\WRIA-1\_DSS

1417 \DSS\_Data\GIS\_Data\Shapefiles\Watershed\bsnwria1\_v7.shp

## 1418 3. Dependencies

1419

1420 The Best Management Practices plug-in requires the following software to be installed:

1421 Software:

1422 MapWindow 3.1

1423 DSS Model Manager

1424 Integrated Development Environment (IDE):

1425 Visual Studio .NET 2003 Complete Install

## 1426 4. Setup

1427

1428 The WRIA-1\_DSS Installation installs the Best Management Practices Tool in the MapWindow  
1429 Plugins folder.

1430 (This is usually located at C:\Program Files\MapWindow\Plugins\ModelManager\Elements”).

## 1431 5. Building

1432

1433 To compile the Best Management Practices Tool, add the files below to a Microsoft Visual  
1434 Studio .NET 2003 Visual Basic .NET Library Project.

1435

1436 mwBestManagementPractices project files:

1437

| <u>File Name</u>          | <u>Purpose</u>   |
|---------------------------|--|
| AssemblyInfo.vb           | Contains information relating to the DLL assembly. Generated by VB.NET.                  |
| BestManagementPractice.vb | Implements MapWindow Plugin and the DSS Interface routines, allowing the Best Management |

|                             |  |
|-----------------------------|--|
|                             | Practices Tool to act as a MapWindow Plugin and a DSS element.   |
| ChangeDatabase.ico          | An icon used for the Change Database button on the toolbar.  |
| DBClient.vb                 | Contains the routines used to connect to a database and store the best management practices created.                         |
| Delete.ico                  | An icon used for the Delete BMP button on the toolbar.   |
| Edit.ico                    | An icon used for the Edit BMP button on the toolbar.   |
| frmConfiguration.vb         | Contains the routines used to select a best management practices database.   |
| frmCreateBMP.vb             | Allows the user to create best management practices for specified drainages.   |
| frmEditDefaultParameters.vb | Allows the user to edit default bmp parameters in the database (THIS HAS BEEN DISABLED IN THE CODE TO AVOID DATA CORRUPTION) |
| frmOpenScenarioBMPs.vb      | Allows the user to select a previous set of BMPs for a specified scenario number.  |
| frmSelectLayer.vb           | Contains the routines used to select a layer from MapWindow's view.  |
| New.ico                     | An icon used for the New BMP button on the toolbar.  |
| Open.ico                    | An icon used for Open BMP button on the toolbar.   |
| Save.ico                    | An icon used for the Save BMP button on the toolbar.   |

Add the following references to the project:

- DssIntfcLib.dll
- MapWinGIS.ocx
- MapWinInterfaces.dll
- stdole.dll
- System.dll
- System.Data.dll
- System.Drawing.dll
- System.Windows.Forms.dll
- System.Xml.dll

You are now ready to compile the project by clicking the Build Solution menu option under the menu Build.

The Best Management Practices Tool is installed in all versions of the WRIA-1 DSS installation.

---

## Technical Documentation: Nooksack DBMS/LaunchPad

Last Revision: 3/22/04

### Table of Contents

## 1. Table Designs

Database: LaunchPad

**Table:** Binaries

**Description:** Contains information about the products that the DBMS supports updating. Any product in this list will be checked to see if the local computer has an up-to-date copy, as well as giving users the option to install any missing component.

| Field          | Type      | Size | Indexed | Primary Key | Comments   |
|----------------|-----------|------|---------|-------------|--|
| productName    | Text      | 50   | Yes     | No          | Name of product or component.  |
| currentVersion | Text      | 50   | No      | No          | Most recent version (version the server is distributing)   |
| updateDate     | Date/Time |      | No      | No          | Last date updated by the Update Tool   |
| allowDownload  | Boolean   |      | No      | No          | True/False – allow user to download the component? [Not Implemented]   |
| recordnumber   | Numeric   |      | Yes     | Yes         | Internal record number.  |
| lastLocalPath  | Text      | 255  | No      | No          | The last place the component was located on the local computer when being updated. Used for convenience from the Updater tool. |

**Table:** BinariesFiles

**Description:** Contains information about the files associated with each of the products in the Binaries table.

| Field                 | Type    | Size | Indexed | Primary Key | Comments   |
|-----------------------|---------|------|---------|-------------|--|
| binaryRecNumber       | Numeric |      | Yes     | No          | Recordnum from the Binaries table that this record is associated with.                               |
| fullPathOnRemote      | Text    | 400  | No      | No          | Where this file belongs on the client computers.   |
| filerecordnumber      | Numeric |      | Yes     | Yes         | Internal record number.  |
| VersionFileForProduct | Boolean |      | No      | No          | True/False – indicates that this file is the file which determines the version of the whole product. |
| downloadPath          | Text    | 400  | No      | No          | Location (URL) where the file may be downloaded from.  |
| filesize              | Numeric |      | No      | No          | Size of the file, in bytes.  |

1496 Database: ChangeLog

1497

1498 **Table:** Changes

1499 **Description:** Contains a log of who has changed data in the database. This table is filled  
1500 by triggers on every SQL server table.

| Field        | Type      | Size | Indexed | Primary Key | Comments  |
|--------------|-----------|------|---------|-------------|---|
| tablename    | Text      | 150  | No      | No          | The name of the table modified.                               |
| datemodified | Date/Time |      | No      | No          | Date the changes were made.                                   |
| hostname     | Text      | 150  | No      | No          | The hostname of the computer making the changes               |
| username     | Text      | 150  | No      | No          | The username (if retrievable) of the user making the changes. |
| appname      | Text      | 150  | No      | No          | Name of application making change                             |
| actiontaken  | Text      | 150  | No      | No          | Action taken – insert/delete/update                           |
| recordnumIFA | Numeric   |      | No      | No          | Record number altered in the table, if available.             |

1501

1502

1503 **Table:** CommonUsers

1504 **Description:** Known users who make changes to the database. Related to the table above  
1505 by username. Provides descriptive information about known users who make changes.

| Field      | Type | Size | Indexed | Primary Key | Comments  |
|------------|------|------|---------|-------------|---|
| username   | Text | 255  | No      | No          | Username corresponding to the username in Changes |
| commonname | Text | 255  | No      | No          | The full name or descriptive information.         |

1506

## 1507 2. Dependencies

1508

1509 The DBMS requires the following software components and modules to be installed:

1510 Software:

1511 Visual Studio .NET 2002

1512 Microsoft SQL Server 2000 (optional)

1513 --This will provide administration tools which make management of the  
1514 databases much easier.--

1515 InstallShield Express 3.5 with Service Pack 4 (or better)

1516

1517 Components:

1518 Microsoft Common Controls 6.0

1519 Microsoft Common Controls-2 6.0

1520 Microsoft Common Controls-3 6.0  
1521 Microsoft FlexGrid Control 6.0  
1522 Fish Periodicity Lifestage Plotter Control (USU)  
1523 Microsoft SQL-DMO Data Object  
1524  
1525 Other parts of the DBMS/LaunchPad Suite: (described in section 4)  
1526 The DBMS/LaunchPad itself  
1527 DBMS Server (*Windows Service*)  
1528 DBMS Server Configuration Editor  
1529 DBMS Update Assistant  
1530 LaunchPad Product Updater  
1531

### 1532 3. Setup

1533  
1534 **DBMS Server**  
1535 The DBMS Server is a windows service. This needs to first be configured with the  
1536 DBMS Server configuration tool. First, set the root path for GIS data; this is the directory  
1537 containing the GIS data for which updates need to be propagated. Also set the  
1538 administrator's e-mail address and a mail server which may be used to send mail, and set  
1539 the interval between data reindexes. This interval should be often enough to capture data  
1540 changes, but not more than every half hour.

1541  
1542 When complete, save this configuration file to a location you'll remember.

1543  
1544 Next, install the DBMS Server service. This may be done by copying the binary  
1545 executable to a location on the server (any location is fine; typically, this is in a  
1546 subdirectory of c:\Program Files). Once the binary has been copied, use the  
1547 InstallUtil.exe file that should be with the binary executable. Type the following  
1548 command:

1549 InstallUtil DBMSService.exe

1550 The command will provide a great deal of output, hopefully finishing with an "Install  
1551 Successful". Now, the service is listed under Services (Start-Settings-Control Panel-  
1552 Administrative Tools-Services).

1553  
1554 Move the configuration file you saved above so that it is located next to the  
1555 DBMSService.exe file. Do this before starting the service!

1556  
1557 Now, it's necessary to decide where to place binary update components and binary  
1558 installation packages. This can be anywhere you prefer. Copy these files into place, and  
1559 write down the path to each of these locations.

1560  
1561 You'll also need to create a database backup directory, where the DBMS Client will ask  
1562 the server to create a database backup to download (for updating databases). Write down  
1563 this path as well.

1564

Finally, you'll need a web server such as IIS (Internet Information Services) or Apache (a free web server) installed. Configure your web server such that the directories above are accessible.

The directories which need to be accessible through the web browser, in summary:

1. GIS Data directory. This is the same directory that you configured in the DBMS Server Configuration Tool.
2. The binary component update directory, storing the binary components which will be updated with the DBMS.
3. The binary installation directory, storing the installation programs which will be downloaded by the DBMS.
4. The database backup directory. Nothing needs to be placed in this directory immediately; backups will be generated and placed here for the database updater to download.

Items number two and three may optionally be the same directory, but number 1 should not be shared with any other data items or files. It's recommended that you use a separate directory for each of these items.

Items 1, 3, and 4 are configured in the DBMS Client's configuration file; item number 2 is configured on a per-component basis in the LaunchPad database.

Write down the URLs to get to each of these directories through the web server, as they will be needed in the DBMS Client (LaunchPad) setup instructions. Also write down the actual path to the database backup directory, relative to the server's directory structure.

Next, MS SQL Server or MSDE will need to be installed on the server. Follow the installation instructions for whichever of these two you'd like to use, then attach the LaunchPad database and any other databases that you wish to update using the DBMS. There should be five user databases total: ChangeLog, LaunchPad, WRIAReportData, FlowData, and WaterQuality.

After attaching the LaunchPad database, check the contents of the Binaries table to ensure that the products that you wish to be automatically updated are listed. You may do this with the LaunchPadProductUpdater tool, or you may use a third-party database modification tool. If you choose the latter, you'll need to know this: for each Binaries recordnumber, there are one or more BinariesFiles records that are associated with it (Binaries.recordnumber -> BinariesFiles.binaryRecNumber). Also ensure that the downloadpath and fullpathonremote fields in the BinariesFiles records are correct.

At this point, the server should be configured and ready for use.

### **DBMS Client (LaunchPad)**

The DBMS Client uses a configuration file similar to that used by the server. There is not a standalone configuration program for the DBMS Client, however. The configuration

file, DBMS.conf, may be edited by hand using Notepad or it may be written by making the appropriate changes using the Administrative Tools button in the DBMS Client itself.

Once this configuration file has been properly generated and set up, it may be distributed to all clients along with the DBMS executable. You may also include the DBMS.conf file with the binaries in an installer and distribute the installer to the clients. (A DBMS standalone installer already exists.)

The configuration file contains connection information to reach the SQL server, as well as the URLs for each of the directories listed under DBMS Server configuration. The contents of the configuration file follow in the table below. Once each of these values is configured, the DBMS Client configuration is complete.

| <u>Tag in Configuration File</u> | <u>Purpose</u>  | <u>Default Value</u>  |
|----------------------------------|---|---|
| SQLServerAddr                    | SQL Server address.   | Nooksack.uwrl.usu.edu   |
| SQLPort                          | Port number of SQL server   | 22  |
| SQLUID                           | SQL Server Username   | WRIAUser  |
| SQLPWD                           | SQL Server Password   | quebec41  |
| SQLTrusted                       | Indicates whether to use Integrated Security.   | False   |
| UpdateDLPath                     | Where to download GIS data updates.   | <a href="http://nooksack.uwrl.usu.edu/DBMSSource/">http://nooksack.uwrl.usu.edu/DBMSSource/</a> |
| BinaryDLPath                     | Where to download binary installation packages. (Individual components configured in database.) | <a href="http://nooksack.uwrl.usu.edu/download/">http://nooksack.uwrl.usu.edu/download/</a>     |
| DatabaseDLPath                   | Where to download database backups for updating databases.                                      | <a href="http://nooksack.uwrl.usu.edu/dbupdates/">http://nooksack.uwrl.usu.edu/dbupdates/</a>   |
| DatabaseBKPath                   | Path on server (relative to server) where database backups are created and stored.              | e:\nookweb\dbupdates\   |
| BinaryUpdatesPath                | Location of the binary updates (NOT the installers!) on the server. Relative to the             | e:\nookweb\DBMSSource\  |

|                 |  |                       |
|-----------------|--|-----------------------|
|                 | server.  |                       |
| DataUpdatesPath | Path to GIS data updates, relative to server.        | E:\nookweb\DBMSSource |
| ProxyUID        | Username to access the proxy server with. Encrypted. | (blank)               |
| ProxyPWD        | Password to access the proxy server with. Encrypted. | (blank)               |

The DBMS needs to know the locations relative to the server so that it may prune directories when necessary; it also needs to know the URLs to get the files in the first place.

## 4. Building

Compiling the DBMS and any of the DBMS-related tools is a straightforward task. After ensuring that all of the required components discussed in item 3 above are present, load the project into Visual Studio and click the Build icon, or select Build from the menu. These instructions hold true for any of the individual projects of the DBMS.

The individual projects, their purpose, and their contents are described below.

### **DBMS Server (Windows Service)**

This tool is used to maintain an index file of data available for the client tool (the LaunchPad) to download. It runs as a windows service and scans the target directory (and all subdirectories) to create the index file, taking the time between index scans and the location for all files from the configuration file next to the executable. The server also listens for requests to update the replication databases (the database backups that are zipped in the download directory). The client can send the request, then disconnect and let the server finish without an active connection; or, the client can send a request and wait for completion, receiving progress updates along the way.

| <u>File Name</u>    | <u>Purpose</u>   |
|---------------------|--|
| AssemblyInfo.vb     | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| DBMSService.vb      | The actual service routines. Contains an implementation of a windows service.  |
| ProjectInstaller.vb | This class causes the service to be installed as a <i>service</i> instead of just as a binary application.   |
| UserConnection.vb   | Contains a user connection class, a new instance of which is created every time a new user connects to the service. This is currently unused – see the DBMS source code. |

1646  
1647  
1648  
1649  
1650

### **DBMS Server Configuration Editor**

This tool allows the configuration file used by the DBMS Server to be edited. This provides a simple, easy-to-use interface to change values such as the time between reindexes, location of GIS data, and administrator e-mail address.

| <u>File Name</u>    | <u>Purpose</u>   |
|---------------------|--|
| AssemblyInfo.vb     | Contains information relating to the DLL assembly. Generated by VB.NET.    |
| frmConfigOptions.vb | Form containing the configuration file editor, providing a user interface. |

1651  
1652  
1653  
1654  
1655  
1656  
1657

### **DBMS Update Assistant**

This is a tool used by the DBMS/LaunchPad when it needs to download a product update for itself. When started, it ends all instances of the DBMS it finds running, then downloads the updated DBMS/LaunchPad executable from the location specified in the LaunchPad database. After finishing, it restarts the DBMS.

| <u>File Name</u> | <u>Purpose</u>  |
|------------------|---|
| AssemblyInfo.vb  | Contains information relating to the DLL assembly. Generated by VB.NET.                                       |
| DBMSAssist.vb    | The form contains a progress meter showing activity – on load, the form performs its actions described above. |

1658  
1659  
1660  
1661  
1662  
1663  
1664  
1665  
1666

### **LaunchPad Product Updater**

This is a tool to facilitate uploading new versions of components by programmers. The program lists all of the components available for updating and their associated files; a product may be updated, or a new product may be added. The tool uploads the files to the server and adds appropriate entries into the LaunchPad database.

**Note:** The “Allow User Download” feature is not implemented, i.e. all components may be downloaded by the user.

| <u>File Name</u> | <u>Purpose</u>   |
|------------------|--|
| AssemblyInfo.vb  | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| Form1.vb         | The form contains the fields to display all product information, and allows the user to change the data or upload a new project to the server. |

1667  
1668  
1669  
1670

### **DBMS/LaunchPad Main Project**

This is the main DBMS/LaunchPad. When the LaunchPad is first run, it will scan the computer for all requisite components and data items. If something is missing, it will provide the user with the opportunity to download and install it. If all necessary components are present, the DBMS will allow the user to edit data on the master server (if the Administrative Edition is in use), or the user may launch the Nooksack DSS. The user may also check for updates – this causes the DBMS to scan the local computer to see if any data items or binary components on the remote computer are newer than the local components/data items. If newer components are found, the user may download and install the updates. The LaunchPad may also be used to send a request to the server to update the databases that are available for download (“replication databases”).

| <u>File Name</u>                 | <u>Purpose</u>   |
|----------------------------------|--|
| AssemblyInfo.vb                  | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| frmChangeLogView.vb              | This form shows the log of changes made to the database.   |
| frmDIStatus.vb                   | This is a simple status indicator used to show the progress in updating the remote databases. This is used only if the user decides to wait for the server to finish, rather than disconnecting. |
| frmEditFishDist.vb               | Allows the user to change fish distribution for a drainage.  |
| frmEditFishHabitatRestoration.vb | Allows the user to change the text block representing fish habitat restoration projects.   |
| frmEditGlossary.vb               | Allows editing of the glossary terms and definitions.  |
| frmEditISF.vb                    | Allows editing of instream flow requirements.  |
| frmEditOverview.vb               | Allows editing of the report overview. The disclaimer is static and may not be edited.   |
| frmEditPeriodicity.vb            | Lets the user edit fish periodicity for a given dataset, drainage, and stream segment.   |
| frmEditRecreation.vb             | Allows editing of recreational data – location and activities – for a drainage.  |
| frmEditStreamClosures.vb         | Allows editing of stream closure data for a drainage.  |
| frmEditWashingtonCensus.vb       | Allows editing of the census data used in the report.  |
| frmEditZoningAbbrev.vb           | Lets the user edit zoning abbreviations; i.e. R-Forest = Rural Forest.   |
| frmFlowData.vb                   | Lists flow data collected for a given station. Allows user to select the station from a combo box.   |
| frmFlowDataAgenciesImport.vb     | Allows flow data agencies to be imported into the database from a delimited text file.   |

|                                 |   |
|---------------------------------|---|
| frmFlowDataCommentsImport.vb    | Allows flow data comments to be imported into the database from a delimited text file.  |
| frmFlowDataGageStationImport.vb | Allows flow data gage stations to be imported into the database from a delimited text file.   |
| frmFlowDataImport.vb            | Allows flow data to be imported into the database from a delimited text file.   |
| frmGridEditor.vb                | Provides a generic form and datagrid to edit large tables. The specific database and table are set at runtime, as are the window caption, window labels, and other details. The table can then be edited through the bound datagrid. These settings are accomplished through public data members (.settings_*)                        |
| frmImportPreview.vb             | Shows a preview of what the data will look like once imported from the text file, to ensure it's as desired before performing an actual import. This is a generic screen used from all of the import screens.   |
| frmProxyConfiguration.vb        | Web proxy configuration screen; appears whenever a proxy server that requires authentication is detected.   |
| frmREditAddAggrDrainage.vb      | Inserts a drainage into a predefined aggregation.   |
| frmREditAggregations.vb         | Allows the user to add and remove drainages from predefined aggregations, or add and remove predefined aggregations.  |
| frmREditDrainages.vb            | Allows editing of the drainage information, e.g. name, description, area.   |
| frmRemoteEdit.vb                | This is the “launcher screen” for remote data editors; after a user has selected which database to edit, gives the user a list of tables they may edit. Clicking a table name launches the appropriate data editor form. Also allows the user to alter database connection information and alter installation and data download URLs. |
| frmSectionEdit.vb               | Allows the user to edit data sources, headings, commentary, and visibility for all of the sections within the report. These changes are made on the master server, as with everything in DBMS, for propagation to clients.  |
| frmShellfishByDrainage.vb       | Allows editing of the text block representing shellfish comments for each drainage.   |
| ReportMain.vb                   | This contains all of the preparation the reports themselves. Maps are generated in this module as well.   |
| frmSplash.vb                    | This is the main screen – This does the component checking to ensure requisite components are present. This form is also responsible for the data update scanning.  |

|                              |   |
|------------------------------|---|
| frmWaterQuality.vb           | Allows the user to edit Water Quality data, including import water quality data (Calls importer screens below).             |
| frmWellsByDrainage.vb        | Allows altering the number of wells per drainage as well as changing the well-related comments for the drainage.            |
| frmWQAgencyCodeImport.vb     | Allows the user to import water quality agency code data from a delimited text file.  |
| frmWQCommentCodeImport.vb    | Allows the user to import water quality comment code data from a delimited text file.                                       |
| frmWQDataCodeImport.vb       | Allows the user to import water quality data from a delimited text file.  |
| frmWQDataImport.vb           | Allows the user to import water quality data from a delimited text file. All code descriptions must be imported separately. |
| frmWQParameterCodeImport.vb  | Allows the user to import water quality parameter code data from a delimited text file.                                     |
| frmWQQAQCCodeImport.vb       | Allows the user to import water quality QAQC (quality assurance/quality check) codes from a delimited text file.            |
| frmWQSourceDatabaseImport.vb | Allows the user to import water quality source database codes from a delimited text file.                                   |
| frmWQStationImport.vb        | Allows the user to import water quality stations from a delimited text file.  |
| web.avi                      | This is the file transfer animation shown during a file download or data update.  |

### Installers

An installer exists for only the DBMS/LaunchPad, as it is the only project intended to be widely distributed. The Update Assistant is automatically downloaded when needed by the DBMS, so no installer is necessary for it.

The DBMS/LaunchPad tool will download other components or installers as necessary, so no other installations need to be built and shipped with this one.

## 1. Input Habitat Database Table Design

Following is a list of tables that must be included with the Input Habitat Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters.

**Table:** tblLifestages

**Description:** Contains the Lifestage Information for each of the Species that are available.

| Field          | Type        | Size         | Key Field           | Primary Key | Comments  |
|----------------|-------------|--------------|---------------------|-------------|---|
| Lifestage_ID   | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | Unique ID for each Lifestage available. It corresponds with the <i>Lifestage_ID</i> Field in the <i>tblPeriodicity</i> table, the <i>tblWUA_MethodB</i> table, and the <i>tblWUA_MethodC</i> table. |
| Species_ID     | Number      | Long Integer | Yes (Duplicates OK) | No          | The ID for the Species that this Lifestage belongs to. It corresponds with the <i>Species_ID</i> Field in the <i>tblSpecies</i> table.  |
| Lifestage_Name | Text        | 255          | No                  | No          | Name of the Lifestage.  |

**Table:** tblNodes

**Description:** Contains the Node Info (ID, Drainage Info, Reach Info) for all available nodes.

| Field     | Type        | Size         | Key Field           | Primary Key | Comments   |
|-----------|-------------|--------------|---------------------|-------------|--|
| Pk_NodeID | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Node.   |
| Node_ID   | Number      | Long Integer | Yes (No Duplicates) | No          | This is the ID for this Node. It is the value that corresponds with NodeID that is stored in the Input Model Nodes Point Shapefile. It also corresponds with the <i>Node_ID</i> Field in the <i>tblPeriodicity</i> table, the <i>tblWUA_MethodB</i> table, and the <i>tblWUA_MethodC</i> . |

|               |        |              |                     |    |   |
|---------------|--------|--------------|---------------------|----|---|
| Drainage_ID   | Number | Long Integer | Yes (Duplicates OK) | No | This is the ID for the Drainage that this node belongs to.  |
| Drainage_Name | Text   | 255          | No                  | No | This is the Name of the Drainage that this node belongs to. |
| Reach_ID      | Number | Long Integer | Yes (Duplicates OK) | No | This is the ID for the Reach that this node belongs to.     |
| Reach_Name    | Text   | 255          | No                  | No | This is the Name of the Reach that this node belongs to.    |

1759  
1760  
1761  
1762

**Table:** tblPeriodicity

**Description:** Contains the Bi-Monthly Periodicity values.

| Field          | Type        | Size         | Key Field           | Primary Key | Comments  |
|----------------|-------------|--------------|---------------------|-------------|---|
| Periodicity_ID | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of Periodicity values in the table.  |
| Node_ID        | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Node that this set of Periodicity values belong to. It corresponds with the <i>Node_ID</i> Field in the <i>tblNodes</i> table.           |
| Lifestage_ID   | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Fish that this set of Periodicity values belong to. It corresponds with the <i>Lifestage_ID</i> Field in the <i>tblLifestages</i> table. |
| Jan_1          | Number      | Integer      | No                  | No          | Periodicity Value for the 1 <sup>st</sup> half of January for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>                       |
| Jan_2          | Number      | Integer      | No                  | No          | Periodicity Value for the 2 <sup>nd</sup> half of January for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>                       |
| Feb_1          | Number      | Integer      | No                  | No          | Periodicity Value for the 1 <sup>st</sup> half of February for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>                      |
| Feb_2          | Number      | Integer      | No                  | No          | Periodicity Value for the 2 <sup>nd</sup> half of February for the given fish, node   |

|       |        |         |    |    |   |
|-------|--------|---------|----|----|---|
|       |        |         |    |    | pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Mar_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of March for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Mar_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of March for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Apr_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of April for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Apr_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of April for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| May_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of May for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| May_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of May for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Jun_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of June for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Jun_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of June for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Jul_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of July for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Jul_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of July for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |

|       |        |         |    |    |   |
|-------|--------|---------|----|----|---|
| Aug_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of August for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Aug_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of August for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Sep_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of September for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Sep_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of September for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Oct_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of October for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Oct_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of October for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Nov_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of November for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Nov_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of November for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Dec_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of December for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Dec_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of December for the given fish, node   |

|  |  |  |  |  |  |

**Table:** tblSpecies

**Description:** Contains the Species Information (ID, Name) for each one available.

| Field        | Type        | Size         | Key Field           | Primary Key | Comments   |
|--------------|-------------|--------------|---------------------|-------------|--|
| Species_ID   | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Species. It corresponds with the Species_ID Field in the tblLifestages table. |
| Species_Name | Text        | 255          | No                  | No          | This is the Name of the Species.   |

1768  
1769  
1770  
1771  
1772  
1773

**Table:** tblWUA\_MethodB

**Description:** Contains the Weighted Usable Area (WUA) data for the Method B Data Extrapolation Method.

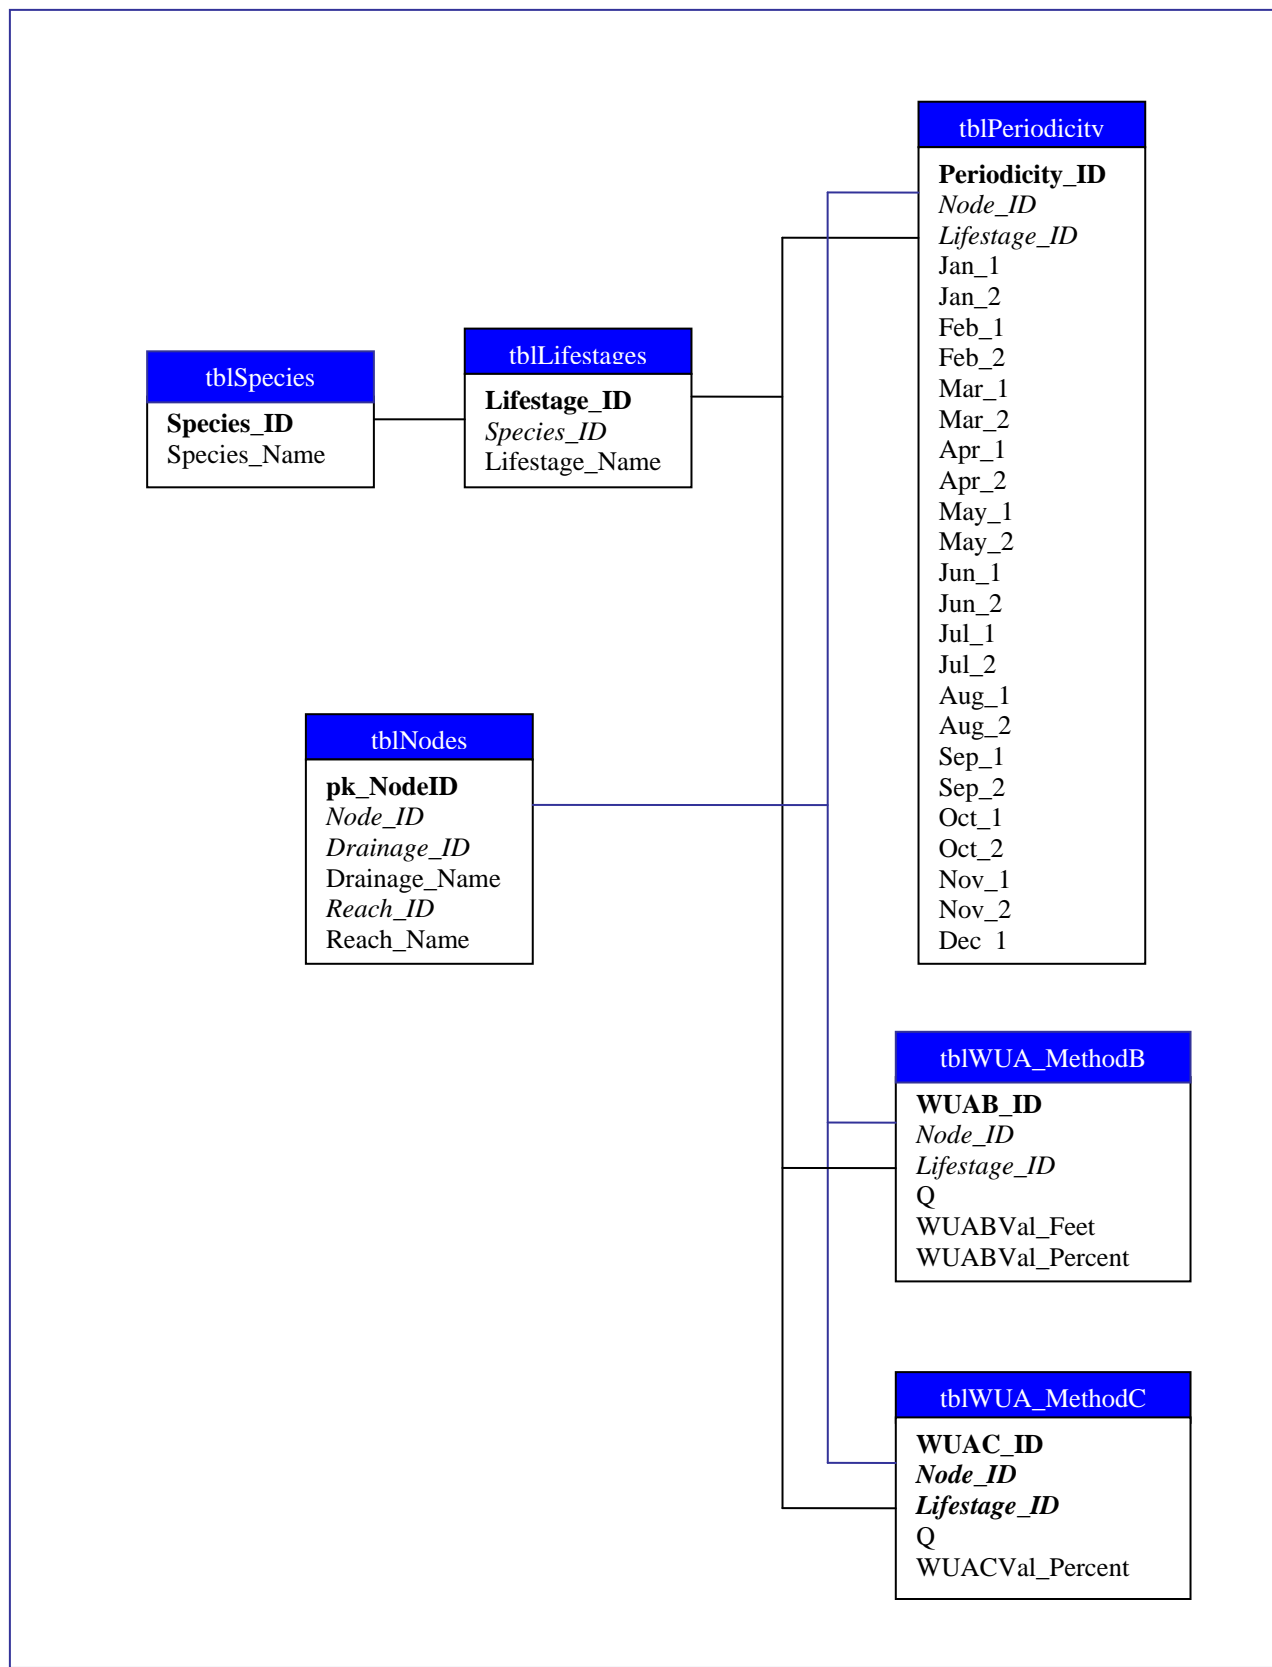

| Field        | Type        | Size                             | Key Field           | Primary Key | Comments  |
|--------------|-------------|----------------------------------|---------------------|-------------|---|
| WUAB_ID      | Auto Number | Long Integer                     | Yes (No Duplicates) | Yes         | A unique ID for each Weighted Usable Area (WUA) value.  |
| Node_ID      | Number      | Long Integer                     | Yes (Duplicates OK) | No          | The ID for the Node that this Weighted Usable Area (WUA) value belongs to. It corresponds with the <i>Node_ID</i> Field in the <i>tblNodes</i> table.           |
| Lifestage_ID | Number      | Long Integer                     | Yes (Duplicates OK) | No          | The ID for the fish that this Weighted Usable Area (WUA) value belongs to. It corresponds with the <i>Lifestage_ID</i> Field in the <i>tblLifestages</i> table. |
| Q            | Number      | Double (Fixed: 3 decimal places) | No                  | No          | The Flow value for this Weighted Usable Area (WUA) value.   |
| WUABVal_Feet | Number      | Double (Fixed: 3 decimal)        | No                  | No          | The Weighted Usable Area (WUA) value where Units = Ft/1000 Ft.  |

|                 |        |                                  |    |    |  |
|-----------------|--------|----------------------------------|----|----|--|
|                 |        | places)                          |    |    |  |
| WUABVal_Percent | Number | Double (Fixed: 3 decimal places) | No | No | The Weighted Usable Area (WUA) value where Units = Percent of Maximum. |

**Table:** tblWUA\_MethodC

**Description:** Contains the Weighted Usable Area (WUA) data for the Method C Data Extrapolation Method.

| Field           | Type        | Size                             | Key Field           | Primary Key | Comments  |
|-----------------|-------------|----------------------------------|---------------------|-------------|---|
| WUAC_ID         | Auto Number | Long Integer                     | Yes (No Duplicates) | Yes         | A unique ID for each Weighted Usable Area (WUA) value.  |
| Node_ID         | Number      | Long Integer                     | Yes (Duplicates OK) | No          | The ID for the Node that this Weighted Usable Area (WUA) value belongs to. It corresponds with the <i>Node_ID</i> Field in the <i>tblNodes</i> table.           |
| Lifestage_ID    | Number      | Long Integer                     | Yes (Duplicates OK) | No          | The ID for the fish that this Weighted Usable Area (WUA) value belongs to. It corresponds with the <i>Lifestage_ID</i> Field in the <i>tblLifestages</i> table. |
| Q               | Number      | Double (Fixed: 3 decimal places) | No                  | No          | The Flow value for this Weighted Usable Area (WUA) value.   |
| WUACVal_Percent | Number      | Double (Fixed: 3 decimal places) | No                  | No          | The Weighted Usable Area (WUA) value where Units = Percent of Maximum   |

## 2. Input Daily Flow Database Table Design and Data Needs

Following is a list of tables that must be included with the Input Daily Flow Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters.

### **Table:** Parameter\_Code Descriptions

**Description:** Contains the Code and Name for the available Parameters.

**NOTE:** The Parameters correspond with the Scenario Runs from the Water Quantity Model.

| Field          | Type   | Size         | Key Field           | Primary Key | Comments  |
|----------------|--------|--------------|---------------------|-------------|---|
| Parameter_Code | Number | Long Integer | Yes (Duplicates OK) | No          | This is a unique ID or Code for each Parameter. It corresponds with the <i>Parameter_Code</i> Field in the <i>WQData</i> table. |
| Parameter_Name | Text   | 50           | No                  | No          | This is the Name of the Parameter.<br><i>For example: ScenarioID_StreamFlow.</i>  |

### **Table:** Stations

**Description:** Contains the ID and Name for the available Stations.

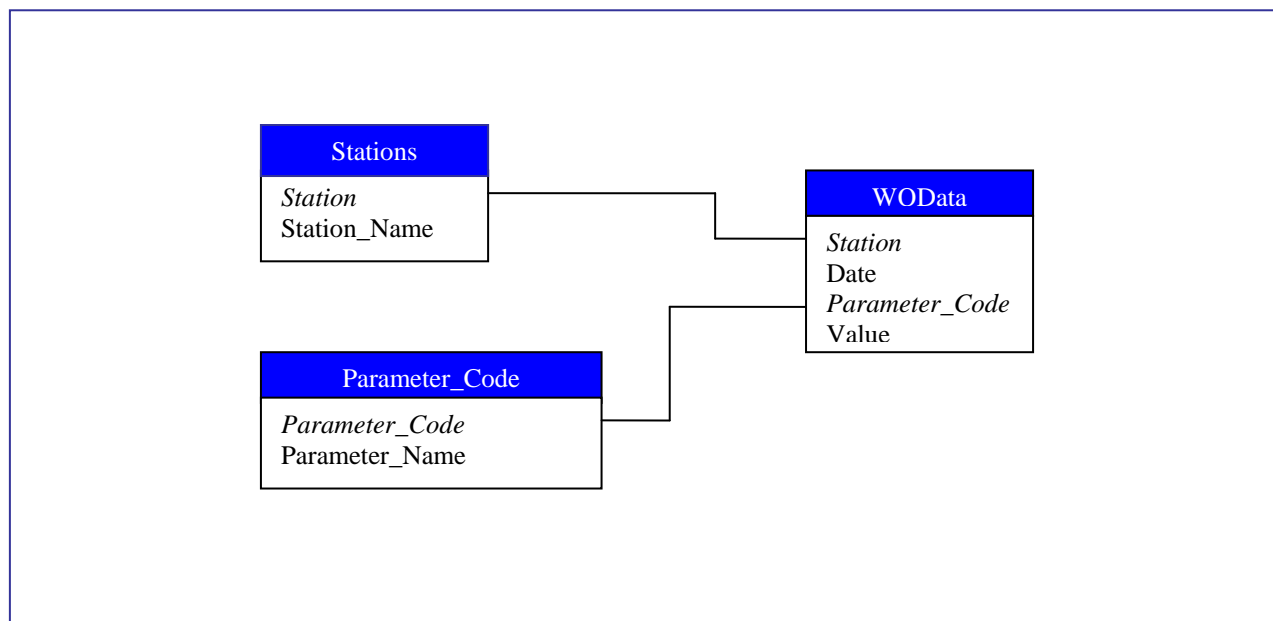

| Field        | Type | Size | Key Field           | Primary Key | Comments   |
|--------------|------|------|---------------------|-------------|--|
| Station      | Text | 50   | Yes (Duplicates OK) | No          | This is a unique ID for each Station. It corresponds with the <i>Station</i> Field in the <i>WQData</i> table. |
| Station_Name | Text | 50   | No                  | No          | This is the Name for the Station.  |

### **Table:** WQData

**Description:** Contains the modeled Daily Stream Flow data from the Water Quantity Model.

| Field   | Type      | Size | Key Field           | Primary Key | Comments   |
|---------|-----------|------|---------------------|-------------|--|
| Station | Text      | 50   | Yes (Duplicates OK) | No          | This is the Station that this value belongs to. It corresponds with the <i>Station</i> Field in the <i>Stations</i> table. |
| Date    | Date/Time |      | No                  | No          | This the Date/Time of this value.  |

|                    |        |                 |                           |    |  |
|--------------------|--------|-----------------|---------------------------|----|--|
| Parameter_<br>Code | Number | Long<br>Integer | Yes<br>(Duplicates<br>OK) | No | This is the Parameter Code for this sample. It corresponds with the <i>Parameter_Code</i> Field in the <i>Parameter_Code Descriptions</i> table. |
| Value              | Number | Double          | No                        | No | This is the Daily Streamflow value.  |

### Input Scenario Run Data Needs

The daily flow values written by the Water Quantity Model for a scenario run are all stored with the same Parameter Name. These Parameters follow the naming convention: *ScenarioID\_StreamFlow*, where the *ScenarioID* is the Scenario ID from the model run in the DSS Scenario Builder. Although the Habitat Time Series Model with most likely be run in conjunction with the Water Quantity Model and the selected Input Scenario Run, the Parameter Names in *Parameter\_Code Descriptions* table in the Input Daily Flow Database, will follow the described naming convention, it does not have to be selected from a Water Quantity Model Run, so it can be named anything.

## 3. Input Model Nodes Shapefile Data Needs

There are two types of data required for the Input Model Nodes Shapefile: a point shapefile path, and a *Node ID* shapefile field.

- Point Shapefile – this shapefile needs to be in the same project as the other shapefiles in your project. It contains the point locations of each of the Model Nodes. Connection Name – this is the name of the Time Series Analyst Connection.

- *Node ID Shapefile Field* – this field is a String field that contains the Node ID for each of the Model Nodes. It corresponds with the *Node\_ID* Field in the *tblNodes* table for the Input Habitat Database, and with the *Station* Field in the *Stations* table for the Input Daily Flow Database.  
*NOTE: If the Node ID in the shapefile is not found in either of the Input Databases, then the model will still run, values will just not be computed for those nodes, and there will be an entry in the log explaining why.*

In order to specify the Nodes to model, the Model Nodes Shapefile must be selected and added to the project. Then you can either select the which Nodes to model by specifying the Node ID's or by going to map and selecting with the Map Window Selection tools.

#### 4. Weighted Usable Area (WUA) Data Needs

To be able to compute and write results to the Output Database for the Habitat Time Series Model, the Weighted Usable Area (WUA) Data must be present in the Input Habitat Database (see *Section 1: Input Habitat Database Table Design*). If it is not present, then no data will be written to the Output Database, a message will be in the log explaining why, and the Habitat Time Series Model will complete successfully.

The Weighted Usable Area (WUA) data is located in two tables: *tblWUA\_MethodB* and *tblWUA\_MethodC*. The table *tblWUA\_MethodB* is used to store the data that was created using the Method B Data Extrapolation Method. The table *tblWUA\_MethodC* is used to store data that was created using the Method C Data Extrapolation Method. The data in these tables is stored by reference to the Node, Fish, and Flow for that Weighted Usable Area (WUA) value.

#### 5. Output Database Table Design

Following is a list of tables that must be included with the Output Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters.

**Table:** Fish

**Description:** Contains the Fish (Species and Lifestage) that have been modeled with the Habitat Times Series Model.

| Field   | Type   | Size         | Key Field           | Primary Key | Comments  |
|---------|--------|--------------|---------------------|-------------|---|
| Fish_ID | Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Fish. A Fish is a Species and Lifestage pair. This values is passed from the Habitat Time Series Model. It corresponds |

|                |      |    |    |    |  |
|----------------|------|----|----|----|--|
|                |      |    |    |    | with the <i>Lifestage_ID</i> Field in the <i>tblPeriodicity</i> table for the Input Habitat Database (see <i>Section 1: Input Habitat Database Table Design</i> ). |
| Species_Name   | Text | 50 | No | No | This is the name of the Species that this Fish belongs to.   |
| Lifestage_Name | Text | 50 | No | No | This is the name of the Lifestage that this Fish belongs to.   |

**Table:** Notes

**Description:** Contains any Notes about the Model Nodes (Stations).

| Field   | Type       | Size         | Key Field           | Primary Key | Comments   |
|---------|------------|--------------|---------------------|-------------|--|
| NoteID  | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Note.   |
| Station | Text       | 50           | Yes (Duplicates OK) | No          | This is the Node (Station) that the Note belongs to. It corresponds with the <i>Node_ID</i> Field in the <i>tblNodes</i> table for the Input Habitat Database (see <i>Section 1: Input Habitat Database Table Design</i> ) and the <i>Station</i> Field in the <i>Stations</i> table for the Input Daily Flow Database (see <i>Section 2: Input Daily Flow Database Design and Data Needs</i> ). |
| Notes   | Memo       |              | No                  | No          | The Notes about the given Node (Station).  |

**Table:** Parameter\_Code Descriptions

**Description:** Contains the Code and Name for the available Parameters.

**NOTE:** The parameters are created by the model using the *Daily Flow Scenario Run* and the *Weighted Usable Area (WUA) Units*.

| Field          | Type       | Size         | Key Field           | Primary Key | Comments  |
|----------------|------------|--------------|---------------------|-------------|---|
| Parameter_Code | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Parameter.   |
| Parameter_Name | Text       | 100          | No                  | No          | This is the Name of the Parameter.<br>Its value = " <i>Habitat Times Series Scenario Run ID</i> "_HabTS |

|  |  |  |  |  |  |
|--|--|--|--|--|--|
|  |  |  |  |  | : <i>Daily Flow Scenario Run</i><br>(“WUA Units”). |
|--|--|--|--|--|--|

**Table:** Stations

**Description:** Contains the ID and Name for the available Stations (Nodes).

| Field        | Type | Size | Key Field              | Primary Key | Comments  |
|--------------|------|------|------------------------|-------------|---|
| Station      | Text | 50   | Yes<br>(No Duplicates) | Yes         | This is a unique ID for each Station (Node). It is the NodeID for the modeled nodes in the Habitat Time Series Model. It corresponds with the <i>Node_ID</i> Field in the <i>tblNodes</i> table for the Input Habitat Database (see <i>Section 1: Input Habitat Database Table Design</i> ) and the <i>Station</i> Field in the <i>WQData</i> table for the Input Daily Flow Database (see <i>Section 2: Input Daily Flow Database Table Design and Data Needs</i> ). |
| Station_Name | Text | 50   | No                     | No          | This is the description for the Station.<br><i>NOTE: It is often the same value as the Station Field.</i>   |

**Table:** TSData

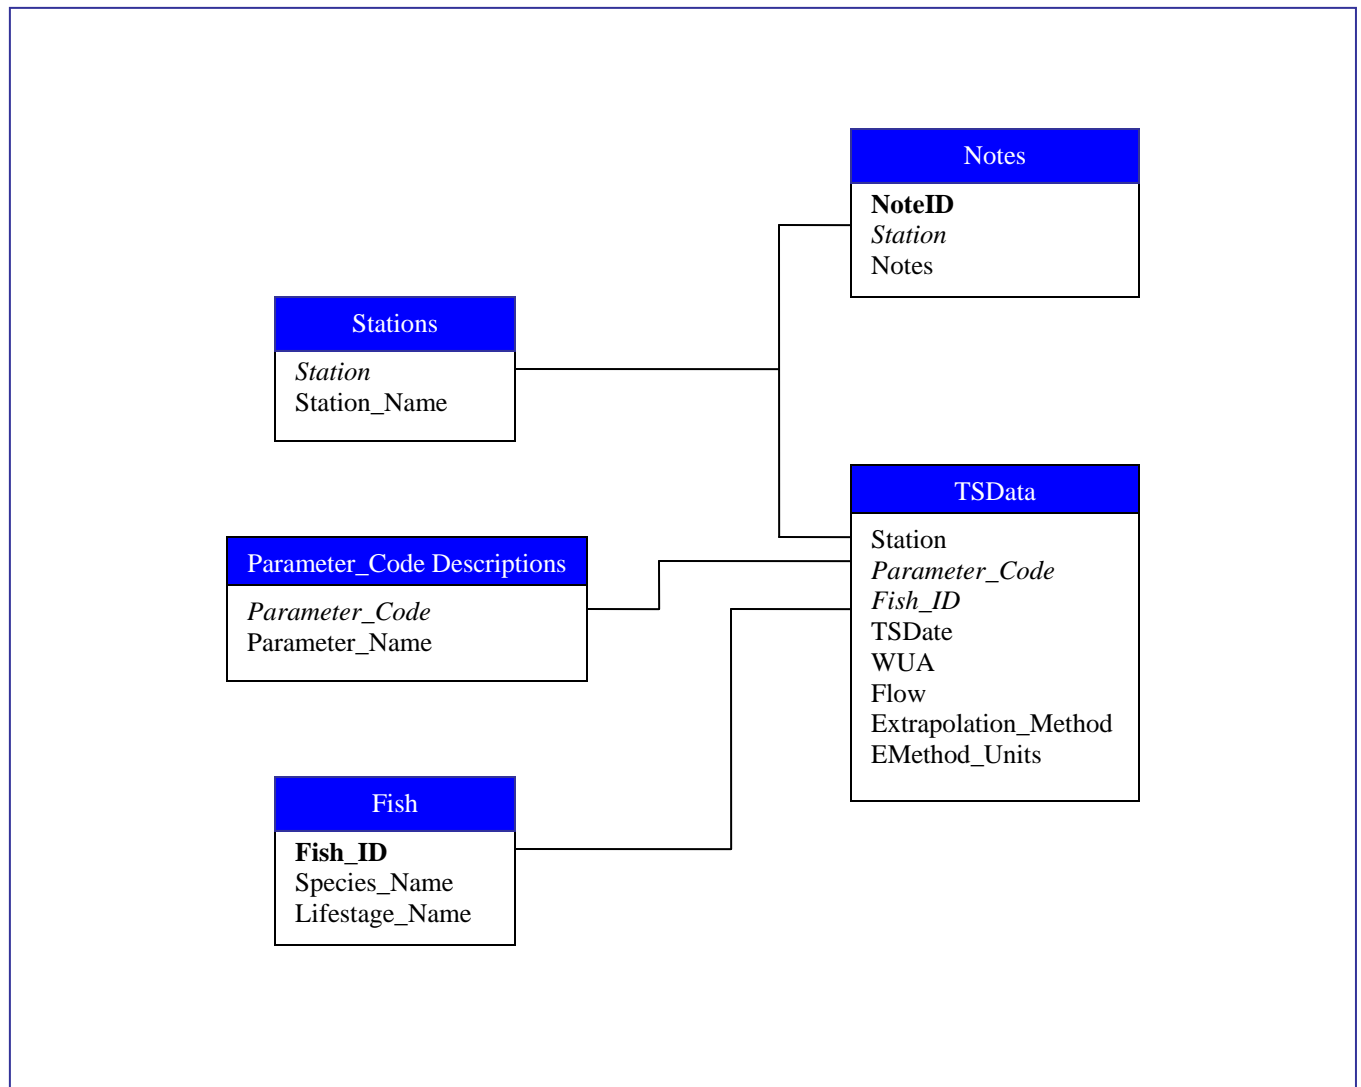

**Description:** Contains the modeled Habitat Time Series data.

| Field          | Type      | Size         | Key Field              | Primary Key | Comments  |
|----------------|-----------|--------------|------------------------|-------------|---|
| Station        | Text      | 255          | No                     | No          | This is the Station that this modeled value belongs to. It corresponds with the <i>Station</i> Field in the <i>Stations</i> table.                                  |
| Parameter_Code | Number    | Long Integer | Yes<br>(Duplicates OK) | No          | This is the Parameter Code that this modeled value belongs to. It corresponds with the <i>Parameter_Code</i> Field in the <i>Parameter_Code Descriptions</i> table. |
| Fish_ID        | Number    | Long Integer | Yes<br>(Duplicates OK) | No          | This is the Fish that this modeled value belongs to. It corresponds with the <i>Fish_ID</i> Field in the <i>Fish</i> table.   |
| TSDate         | Date/Time |              | No                     | No          | This is the Date/Time for this modeled value.   |
| WUA            | Number    | Double       | No                     | No          | This is the modeled Weighted  |

|                      |        |        |    |    |   |
|----------------------|--------|--------|----|----|---|
|                      |        |        |    |    | Usable Area (WUA) value.  |
| Flow                 | Number | Double | No | No | This is the Flow for this modeled value.  |
| Extrapolation_Method | Text   | 50     | No | No | This is the Weighted Usable Area Data Extrapolation Method used in the Input Weighted Usable Area (WUA) Data for this modeled value.<br><i>NOTE: Valid values are: Method B or Method C</i>                                       |
| EMethod_Units        | Text   | 50     | No | No | This is the units of the Weighted Usable Area Data Extrapolation Method used in the Input Weighted Usable Area (WUA) Data for this modeled value.<br><i>NOTE: Valid values are: Ft^2/1000Ft or Percent of Maximum Habitat (%)</i> |

1879

1880

## 6. Dependencies

The Time Series Analyst plug-in requires the following software components and modules to be installed:

### Software:

MapWindow 3.1  
Visual Studio .NET 2003

### Modules and Components:

DSS Interface Definitions  
MapWindow Interfaces  
MapWinGIS Components

### Integrated Development Environment (IDE)

Visual Studio .NET 2003

## 7. Setup

To begin using the Habitat Time Series Model, you must first load the Scenario Builder/DSS Plug-in into Map Window. Once it is loaded, click on the DSS Menu located on the Map Window Menu bar and select either Scenario Builder, or the name of the Scenario that you want to run. Once the Scenario Builder is and the Habitat Time Series Model is added to the current Scenario and the Run Date values selected, Run the Scenario. If all of the input and output parameters have been correctly set and they are all accessible, then the Habitat Time Series Model will run for the selected data. After it is finished the user may view the run log if they desire. If any errors occur during the run, an error log will appear explaining the error.

If the input and output data associations have not been properly set, then double click on the Habitat Time Series scenario node, and a Parameters Form will appear allowing you to edit the input and output data. Then, after the parameters have been properly associated, Run the Scenario and after it is finished, the user may view the run log if they desire or if any errors occurred, then an error log will appear explaining the error.

See the User's Manual for more information and details on setting the parameters for the Habitat Time Series Model.

## 8. Code Compiling

Compiling the Time Series Analyst is a fairly straightforward task. After ensuring that all of the required components discussed in *Section 6: Dependencies* are present, load the project into Visual Studio .Net 2003. This DSS Model was created using Visual Basic (VB).

The project needs to include the following files:

| <u>File Name</u>  | <u>Purpose</u>  |
|-------------------|---|
| AssemblyInfo.vb   | Contains information relating to the DLL assembly.<br>Generated by VB.NET.  |
| clsFlow.vb        | Contains a class for accessing and storing the Date/Flow data from the Input Daily Flow Database (see <i>Section 2: Input Daily Flow Database Table Design and Data Needs</i> ) for a fish. |
| clsMainPhabTS.vb  | Contains a class that implements the Map Window plug-in interface and the DSS Model Interface and other functions for editing the parameters for and running the Habitat Time Series Model. |
| clsPeriodicity.vb | Contains an enumeration and a class for accessing and storing the Periodicity Data from the Input Habitat Database (see <i>Section 1: Input Habitat Database Table Design</i> ).            |

|   |  |
|---|--|
| clsWUA.vb                                     | Contains a class for accessing and storing the calculated Flow and Weighted Usable Area (WUA) values (Output values) created when the model is run for a node.   |
| clsWUAInput.vb                                | Contains a class for access and storing the Weighted Usable Area (WUA) values from the Input Habitat Database (see <i>Section 1: Input Habitat Table Design</i> and <i>Section 4: Weighted Usable Area (WUA) Data Needs</i> ). It also contains a class for calculating the output WUA, Flow values.   |
| frmConfiguration.vb,<br>frmConfiguration.resx | A Database Configuration form. This form is shown when the user edits an Input or Output Database (see <i>Section 1: Input Habitat Database Table Design</i> or <i>Section 2: Input Daily Flow Database Table Design and Data Needs</i> or <i>Section 5: Output Database Table Design</i> ). It allows the user to specify settings for an SQL Database (the Server Address, User ID and Password, and Database Name) or the Path for an Access Database. The connection for the specified values can then be tested to make sure a valid database is specified. To save the selected settings, click on the Save Changes button; to cancel the changed settings, close the form with the Red X button at the top of the form. This form will only be shown if the user decides to edit any of the Input or Output databases already associated with the Habitat Times Series model. |
| frmParameters.vb,<br>frmParameters.resx       | A form that allows the user to view and edit the set the Input and Output Parameters for the Habitat Time Series Model.  |
| frmSelectLayer.vb,<br>frmSelectLayer.resx     | A form to select the Input Model Nodes point shapefile for the Habitat Time Series Model (see <i>Section 3: Input Model Nodes Shapefile Data Needs</i> ). It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk. This form will only be shown if the user decides to edit the shapefile already associated with the Habitat Time Series Model.  |
| frmSelectNodes.vb,<br>frmSelectNodes.resx     | A form that allows the user to select the nodes to model, either from the Map Window Map or from the list of available nodes (see <i>Section 3: Input Model Nodes Shapefile and Data Needs</i> ). This form will only be shown if the user decides to edit the selected nodes already associated with the Habitat Time Series Model.   |
| frmSelectWUA.vb<br>frmSelectWUA.resx          | A form that allows the user the select the Weighted Usable Area (WUA) Data Extrapolation Method and Units (see <i>Section 4: Weighted Usable Area (WUA) Data Needs</i> ). This form will only be shown if the user decides to edit the Weighted Usable Area Extrapolation Data already associated with the Habitat Time Series Model.  |
| modDatabase.vb                                | Contains functions for access and writing to the Input and Output database, and the variable definitions for the Input   |

|                  |  |
|------------------|--|
|                  | and Output Database types, table and field names, and the SQL default values.  |
| modGlobals.vb    | Contains the definitions for variables used throughout the project, such as MapWindow variables, model variables, parameter variables, error variables, and others.          |
| modParameters.vb | Contains the variable definitions for the Input Parameter Names.   |
| modShapefile.vb  | Contains the variable definitions and functions for accessing data on the associated Model Nodes Shapefiles (see <i>Section 3: Input Model Nodes Shapefile Data Needs</i> ). |
| modUtils.vb      | Contains functions used throughout the project for reporting errors, accessing files, and other functionality.   |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 6: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| ADODB                | CopyLocal = False |
| DssIntfcLib          | CopyLocal= True   |
| MapWinGIS            | CopyLocal = False |
| MapWinInterfaces     | CopyLocal = False |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |
| System.Drawing       | CopyLocal = False |
| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwPhabTimeSeriesModel.dll has now been created with Microsoft Visual Studio .NET 2003. It is created in the *mwTimeSeries* subdirectory in the *\Plugins\ModelManager\Elements\mwPhabTimeSeriesModel\* folder. Next time that MapWindow is run, if the mwPhabTimeSeriesModel.dll was built to the correct folder, the updated changes to the Habitat Time Series Model will be available.

## 1. Table Designs

Land Cover Database: LandCoverSummary.mdb

(See “Technical Documentation For Land Cover Summarizer” for table designs)

Best Management Practices Database: BestManagementPractices.mdb

(See “Technical Documentation For Best Management Practices Tool” for table designs)

Lake Whatcom Water Quality Parameters Database: LakeWhatcomWQParameters.mdb

**Table: EMCs**

| Field Name      | Data Type    | Description   |
|-----------------|--------------|---|
| DrainageID      | Long Integer | WRIA 1 Drainage ID  |
| Land_Cover_Code | Long Integer | The associated land cover class id                          |
| EMC_TN          | Text         | Expected mean concentration (EMC) for total nitrogen (mg/L) |
| EMC_NH3         | Text         | EMC for ammonia (mg/L)                                      |
| EMC_N03         | Text         | EMC for nitrate (mg/L)                                      |
| EMC_TP          | Text         | EMC for total phosphorus (mg/L)                             |
| EMC_BOD         | Text         | EMC for BOD (mg/L)  |
| EMC_FC          | Text         | EMC for fecal coliform (mg/L)                               |

**Table: Input Air Temperatures**

| Field Name     | Data Type   | Description  |
|----------------|-------------|--|
| Date           | Date / Time | The date the temperature data was recorded                   |
| AvgTemperature | Double      | Average daily temperature at Abbotsford Canada in degrees C  |
| AirTempFlag    | Text        | Flag for average daily air temperatures from Abbotsford data |

**Table: Nodes**

| Field Name | Data Type    | Description  |
|------------|--------------|--|
| DrainageID | Long Integer | WRIA 1 Drainage ID   |
| NodeID     | Long Integer | ID of water quantity model nodes contained within the drainage |

2004 **Table: Parameters**

| Field Name          | Data Type    | Description  |
|---------------------|--------------|--|
| DrainageID          | Long Integer | WRIA 1 Drainage ID   |
| DrainageName        | Text         | Name of the WRIA 1 Drainage  |
| AreaAcres           | Double       | Area of the drainage in acres  |
| Areakm2             | Double       | Area of the drainage in square kilometers  |
| StreamDOPercentSat  | Double       | Streamflow DO Percent Saturation Parameter (Calibration Parameter)   |
| SurfaceDOPercentSat | Double       | Surface Flow DO Percent Saturation Parameter (Calibration Parameter)   |
| AirSoilSlope        | Double       | Slope of Air Temperature Surface Soil Temperature Relationship (Calibration Parameter)                       |
| AirSoilIntercept    | Double       | Intercept of Air Temperature Surface Soil Temperature Relationship (Calibration Parameter)                   |
| TStreamSlope        | Double       | Slope of linear relationship between air temperature and stream flow temperature (Calibration Parameter)     |
| TStreamIntercept    | Double       | Intercept of linear relationship between air temperature and stream flow temperature (Calibration Parameter) |
| QbTemp              | Double       | Simulation Base Flow Temperature Deg. C  |
| QbDO                | Double       | Base Flow Dissolved Oxygen Concentration (mg/L)  |
| Cb_TN               | Double       | Base Flow Total Nitrogen Concentration (mg/L)  |
| Cb_NH3              | Double       | Base Flow Ammonia Concentration (mg/L)   |
| Cb_NO3              | Double       | Base Flow Nitrate Concentration (mg/L)   |
| Cb_TP               | Double       | Base Flow Total Phosphorus Concentration (mg/L)  |
| Cb_BOD              | Double       | Base Flow BOD Concentration (mg/L)   |
| Cb_FC               | Double       | Base Flow Fecal Coliform Bacteria Concentration (#/100 mL)   |

2008  
2009

## 2. Dependencies

The Lake Whatcom Water Quality Model requires the following software to be installed:

### Software:

MapWindow 3.1

DSS Model Manager

### Integrated Development Environment (IDE):

Visual Studio .NET 2003 Complete Install

The Lake Whatcom Water Quality Model requires the data output by the following DSS elements:

Land Cover Summary Tool

Best Management Practices Tool

## 3. Setup

The WRIA-1\_DSS Installation installs the Lake Whatcom Water Quality Model in the MapWindow Plugins folder.  
(This is usually located at C:\Program Files\MapWindow\Plugins\ModelManager\Elements”).

## 4. Building

To compile the Best Management Practices Tool, add the files below to a Microsoft Visual Studio .NET 2003 Visual Basic .NET Library Project.

mwLakeWhatcomWQModel project files:

| File Name                  | Purpose   |
|----------------------------|---|
| AssemblyInfo.vb            | Contains information relating to the DLL assembly.<br>Generated by VB.NET.  |
| clsLakeWhatcomWQModel.vb   | Runs the Lake Whatcom water quality model given the settings provided.  |
| DBClient.vb                | Contains the routines used to connect to a database.  |
| DirectoryPicker.vb         | Custom component which allows a user to select a directory from the computer's file system.   |
| frmConfiguration.vb        | Contains the routines used to select a database.  |
| frmInputs.vb               | Allows the user to select the location of input and output data for the model.  |
| frmSelectLayer.vb          | Contains the routines used to select a layer from MapWindow's view.   |
| frmSelectModelDirectory.vb | A form containing a DirectoryPicker component which allows the user to select a directory from the file system, or a directory to be created by the Water Quantity Model in |

|                      |   |
|----------------------|---|
|                      | the current DSS Scenario Run.   |
| WaterQualityModel.vb | Implements MapWindow Plugin and DSS Interface routines, allowing the Lake Whatcom Model to act as a MapWindow Plugin and a DSS element. |

2036

2037 Add the following references to the project:

- 2038     ▪ DssIntfcLib.dll
- 2039     ▪ MapWinGIS.ocx
- 2040     ▪ MapWinInterfaces.dll
- 2041     ▪ mwBestManagementPractice.dll
- 2042     ▪ System.dll
- 2043     ▪ System.Data.dll
- 2044     ▪ System.Drawing.dll
- 2045     ▪ System.Windows.Forms.dll
- 2046     ▪ System.Xml.dll

2047

2048 You are now ready to compile the project by clicking the Build Solution menu option under the  
2049 menu Build.

2050

2051 Lake Whatcom Waterbody Response Model project files

| File Name   | Purpose   |
|---|---|
| resenlwfpath.f95  | Lake Whatcom Waterbody Response Model Fortran 95 source file      |
| apifunctions.f95  | Library of file management routines through Windows API           |
| ConvertwsmoelOutputPath.f95   | Conversion of LWWLM output to binary format for Fortran model use |
| mapi.bat<br><br>lf95 resenlwfpath apifunctions.f95<br>ConvertwsmoelOutputPath -exe rp.exe<br>-g -trace -ml winapi | Fortran compiler script for creating LWWRM executable             |

2052

2053 The rp.exe file is built using the Lahey Professional Fortran compiler version 5.6. It has no  
2054 additional dependencies.

2055

2056 The Lake Whatcom Water Quality Model is installed in all versions of the WRIA-1 DSS  
2057 installation.

**Technical Documentation: Land Cover Changer Tool**

**Table of Contents**

- 1. *GIS Data Needs*
  - *Location of GIS Data*
  - *Tags on Layers*
  
- 2. *Dependencies*
  - *Software*
  - *Integrated Development Environment (IDE)*
  
- 3. *Setup*
  - *Setup*
  - *Customizations*
  
- 4. *Building*
  - *Code Compiling*
  - *Installations*

## 1. GIS Data Needs

The Land Cover Changer Tool makes changes to land cover grids supported by MapWindow. These grids include ASCII grids (\*.asc), and binary grids (\*.bgd). The Land Cover Changer takes a grid as input, and outputs a grid reflecting the changes selected by the user.

The Land Cover Changer Tool sets the tag of a land cover layer in MapWindow to the string value "LANDCOVER".

## 2. Dependencies

The Land Cover Changer plug-in requires the following software to be installed:

### Software:

MapWindow 3.1

Visual Studio .NET 2003 Complete Install

## 3. Setup

The WRIA-1\_DSS Installation installs the Land Cover Changer Tool in the MapWindow Plugins folder.

(This is usually located at C:\Program Files\MapWindow\Plugins\ModelManager\Elements").

## 4. Building

To compile the Land Cover Changer, add the files below to a Microsoft Visual Studio .NET 2003 Visual Basic .NET Library Project.  
mwChangeLandCover project files:

| <u>File Name</u>         | <u>Purpose</u>   |
|--------------------------|--|
| AssemblyInfo.vb          | Contains information relating to the DLL assembly.<br>Generated by VB.NET.   |
| BULLSEYE.CUR             | Bullseye cursor used for indicating the next mouse click will close the current land cover change polygon being drawn.               |
| ChangeLandCoverPlugin.vb | Implements MapWindow Plugin and DSS Interfrace routines, allowing Land Cover Changer to act as a MapWindow Plugin and a DSS element. |
| Common.vb                | Common functions used by the land cover changer.   |
| CURSOR.CUR               | Cursor used for selecting polygons in shapefile for land cover change boundaries.  |
| frmChangeLandCover.vb    | Contains the routines used to create land cover change boundary polygons.  |
| frmSelectChanges.vb      | Contains the routines used to select what land cover changes   |

|                        |  |
|------------------------|--|
|                        | to perform inside a selected boundary.   |
| frmSelectLayer.vb      | Contains the routines used to select a layer from MapWindow's view.                        |
| frmSettings.vb         | Contains the routines used to select the settings for the Land Cover Change Tool.          |
| OpenDirectoryDialog.vb | Contains the routines used to select a directory to be used by the Land Cover Change Tool. |
| PENCIL.CUR             | Pencil cursor used when drawing a land cover change boundary on MapWindow's view.          |

Add the following references to the project:

- DssIntfcLib.dll
- MapWinGIS.ocx
- MapWinInterfaces.dll
- Microsoft.VisualBasic.Compatibility.dll
- stdole.dll
- System.dll
- System.Data.dll
- System.Design.dll
- System.Drawing.dll
- System.Windows.Forms.dll
- System.Xml.dll

You are now ready to compile the project by clicking the Build Solution menu option under the menu Build.

The Land Cover Changer Tool is installed in all versions of the WRIA-1 DSS installation.

## 1. Table Designs

*Database: LandCoverSummary*

| Field Name     | Data Type |
|----------------|-----------|
| ScenarioID     | Number    |
| WatershedID    | Number    |
| WatershedName  | Text      |
| LandCoverValue | Number    |
| Area           | Number    |

## 2. GIS Data Needs

The Land Cover Summarizer Tool summarizes the land cover types within each shape in a watershed shapefile using a land cover grid supported by MapWindow. These grids include ASCII grids (\*.asc), and binary grids (\*.bgd). The Land Cover Summarizer takes a shapefile and a grid as input, and outputs a list of land cover summaries for each shape in the shapefile.

## 3. Dependencies

The Land Cover Summarizer plug-in requires the following software to be installed:

Software:

MapWindow 3.1

Visual Studio .NET 2003 Complete Install

## 4. Setup

The WRIA-1\_DSS Installation installs the Land Cover Summarizer Tool in the MapWindow Plugins folder.  
(This is usually located at C:\Program Files\MapWindow\Plugins\ModelManager\Elements”).

## 5. Building

To compile the Land Cover Summarizer, add the files below to a Microsoft Visual Studio .NET 2003 Visual Basic .NET Library Project.

Add the following references to the project:

- DssIntfcLib.dll
- MapWinGIS.ocx
- MapWinInterfaces.dll
- stdole.dll

- 2214           ▪ System.dll
- 2215           ▪ System.Data.dll
- 2216           ▪ System.Drawing.dll
- 2217           ▪ System.Windows.Forms.dll
- 2218           ▪ System.Xml.dll

2219

2220    You are now ready to compile the project by clicking the Build Solution menu option under the

2221    menu Build.

2222

2223    LandCoverSummarizer project files:

| <u>File Name</u>    | <u>Purpose</u>   |
|---------------------|--|
| AssemblyInfo.vb     | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| Common.vb           | Common functions used by the land cover changer.   |
| DBClient.vb         | Contains the routines used to connect to a database and store the computed land cover summary.   |
| frmConfiguration.vb | Contains the routines used to select a land cover summary database.  |
| frmModelProps.vb    | Contains the routines used to select the settings for the Land Cover Summarizer.   |
| frmSelectLayer.vb   | Contains the routines used to select a layer from MapWindow's view.  |
| LandCoverFilter.vb  | Implements MapWindow Plugin and DSS Interface routines, allowing Land Cover Summarizer to act as a MapWindow Plugin and a DSS element. |

2224

2225    The Land Cover Summarizer is installed in all versions of the WRIA-1 DSS installation.

**Technical Documentation: Macroinvertebrate Data Viewer**

**Table of Contents**

- 1. *Table Design*
  - *Schema, Keys, Indexes and Structure*
  - *Table Descriptions and Notes*
  - *Table Relationship Diagrams*
- 2. *Data Needs*
  - *Type/Location of Data*
- 3. *Dependencies*
  - *Software*
  - *Module and Components*
  - *Integrated Development Environment (IDE)*
- 4. *Setup*
  - *Setup*
- 5. *Code Compiling*

## 1. Table Design

Following is a list of tables that must be included with the Macroinvertebrate Data Viewer Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters. This database must be an Access or \*.mdb database.

### **Table:** Group\_Identification

**Description:** Contains the Group\_ID, Taxa, and Sorting Crew for each of the macroinvertebrate samples.

| Field     | Type | Size | Key Field           | Primary Key | Comments   |
|-----------|------|------|---------------------|-------------|--|
| Group_ID  | Text | 50   | Yes (Duplicates OK) | No          | This is an ID for each Group that processed a sample. It corresponds with the Group_ID Field in the Macroinvertebrate_Data table.<br>NOTE: <i>INSE</i> used the list with numbers, while <i>Bellingham</i> used the list with letters. |
| Taxa      | Text | 50   | No                  | No          | Name of the bugs that define this group  |
| Sorted By | Text | 50   | No                  | No          | Indicates which crew sorted the original sample  |

### **Table:** Macroinvertebrate\_Data

**Description:** Contains the MacroInvertebrate Sample data for each Site, Group pair for the sizing groups = 1-2mm, 2-4mm, 4-6mm, 6-8mm, 8-10mm, >10mm.

| Field      | Type   | Size   | Key Field           | Primary Key | Comments   |
|------------|--------|--------|---------------------|-------------|--|
| Site_ID    | Number | Double | Yes (Duplicates OK) | No          | Site Identifier for this sample. It corresponds with the Site_ID Field in the Site_Information table and the Unique_SiteID_List table. |
| Group_ID   | Text   | 50     | No                  | No          | Group Identifier for this sample. It corresponds with the Group_ID Field in the Group_Identification table.                            |
| Size1_2_mm | Number | Double | No                  | No          | Sample count for the Group Size = 1 – 2mm. The Default Value = 0 for this field.   |
| Size2_4_mm | Number | Double | No                  | No          | Sample count for the Group Size = 2 – 4mm. The Default Value = 0 for this field.   |
| Size4_6_mm | Number | Double | No                  | No          | Sample count for the Group Size = 4 – 6mm. The Default Value = 0 for this field.   |

|             |        |        |    |    |   |
|-------------|--------|--------|----|----|---|
|             |        |        |    |    | field.  |
| Size6_8_mm  | Number | Double | No | No | Sample count for the Group Size = 6 – 8mm. The Default Value = 0 for this field.  |
| Size8_10_mm | Number | Double | No | No | Sample count for the Group Size = 8 – 10mm. The Default Value = 0 for this field. |
| Size10+_mm  | Number | Double | No | No | Sample count for the Group Size = >10mm. The Default Value = 0 for this field.    |

**Table:** Site\_Information

**Description:** Contains all the information (Site ID, Site Name, Sample Name, Sample Type, Time In and Out, Velocity In and Out, Site Location, Net size, etc.) about a Site for each sample that was taken and processed.

| Field                | Type   | Size   | Key Field           | Primary Key | Comments  |
|----------------------|--------|--------|---------------------|-------------|---|
| Site_ID              | Number | Double | Yes (Duplicates OK) | No          | This is a unique ID for each Site where a sample was taken. It corresponds with the Site_ID Field in the Macroinvertebrate_Data table and the Unique_SiteID_List table. |
| Site_Name            | Text   | 255    | No                  | No          | This is the Name of the Site where the sample was taken. It corresponds with the Site_Name Field in the Unique_SiteID_List table.                                       |
| Sample_Name          | Text   | 255    | No                  | No          | This is the Name for the sample that was taken. It corresponds with the Sample_Name Field in the Unique_SiteID_List table.  |
| Fraction_Sub sampled | Number | Double | No                  | No          | This is the fraction of the sample that was actually counted.<br><i>For Example: A value = 0.5 would mean that 50% or 1/2 of the sample was counted.</i>                |
| Sample_Type          | Text   | 255    | No                  | No          | This is the Type of sample that was taken. There are two types available : <i>drift</i> and <i>benthic</i>  |
| Initials             | Text   | 255    | No                  | No          | These are the initials of the technician who dealt with the sample in house.<br><i>NOTE: The technician did not necessarily collect the sample.</i>                     |

|                            |        |        |    |    |   |
|----------------------------|--------|--------|----|----|---|
| Time_In                    | Text   | 255    | No | No | This is the Time that the net was put into the water to collect the sample. Value is in Military Time (0:00 – 24:00).<br><i>NOTE: this value is only valid if Sample_Type = drift.</i>  |
| Time_Out                   | Text   | 255    | No | No | This is the Time that the net was taken out of the water when collecting the sample. Value is in Military Time (0:00 – 24:00).<br><i>NOTE: this value is only valid if Sample_Type = drift.</i>   |
| Velocity_In_(m/s)          | Number | Double | No | No | This is the Velocity of the water when the net was put into the water to collect the sample. Value is in meters per second (m/s).<br><i>NOTE: this value is only valid if Sample_Type = drift.</i>  |
| Velocity_Out_(m/s)         | Number | Double | No | No | This is the Velocity of the water when the net was taken out of the water when collecting the sample. Value is in meters per second (m/s).<br><i>NOTE: this value is only valid if Sample_Type = drift.</i>                                 |
| Northing_(UTM_NAD83)       | Number | Double | No | No | This is the Northing value (Y-value) of the location of the Site where the sample was taken. Value is in UTM_NAD83 coordinate projection.<br><i>NOTE: this is NOT the location of the net or benthic device used to collect the sample.</i> |
| Easting_(UTM_NAD83)        | Number | Double | No | No | This is the Easting value (X-value) of the location of the Site where the sample was taken. Value is in UTM_NAD83 coordinate projection.<br><i>NOTE: this is NOT the location of the net or benthic device used to collect the sample.</i>  |
| Net_Area_(m <sup>2</sup> ) | Number | Double | No | No | This is the Area of the Net that was used to collect the sample. Value is in square meters (m <sup>2</sup> ).<br><i>NOTE: this value is only valid if Sample_Type = drift</i>   |
| Bed_Area_(                 | Text   | 255    | No | No | This is the Area enclosed by the  |

|                   |        |        |    |    |   |
|-------------------|--------|--------|----|----|---|
| m^2)              |        |        |    |    | benthic device that was used to collect the sample. Value is in square meters (m^2).<br><i>NOTE: this value is only valid if Sample_Type = benthic.</i> |
| Net_Meshsize_(um) | Number | Double | No | No | This is the Size of the mesh that is in the net or benthic device used to collect the sample. Value is in micrometers (um).                             |

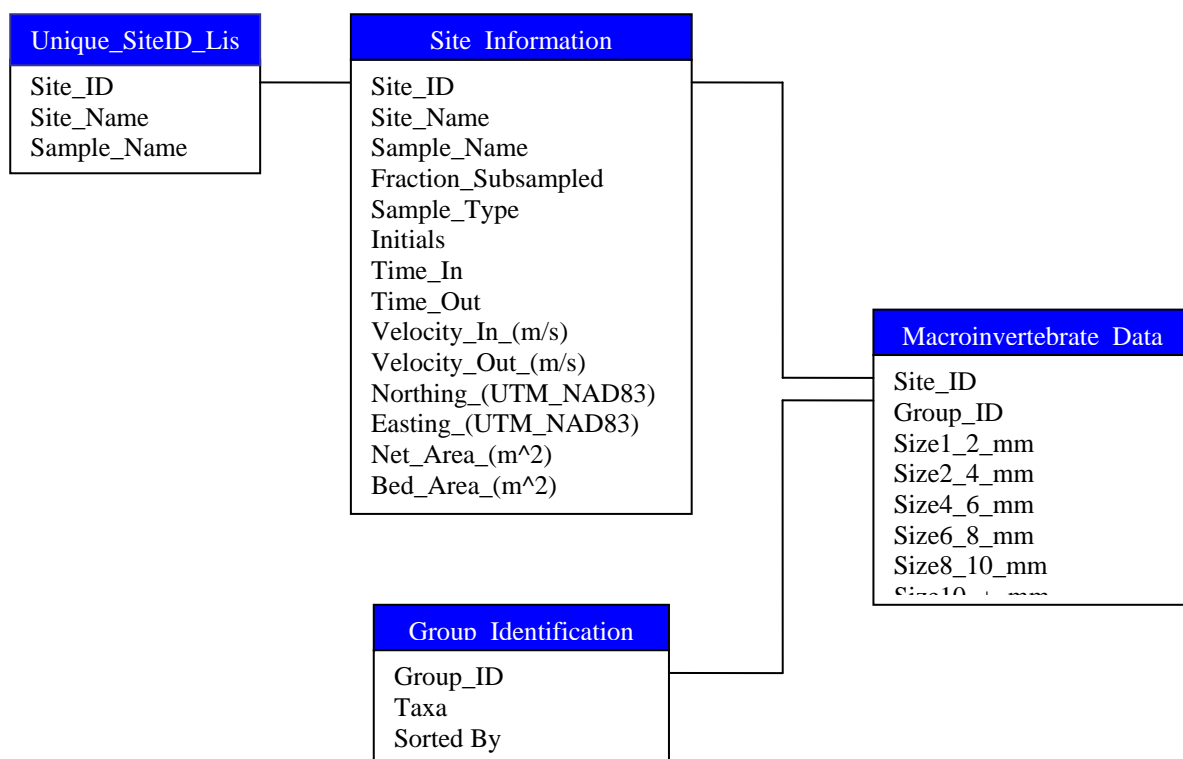

2292  
2293  
2294  
2295

**Table:** Unique\_SiteID\_List

**Description:** Contains the unique list of Site, Sample pairs available.

| Field       | Type   | Size    | Key Field           | Primary Key | Comments  |
|-------------|--------|---------|---------------------|-------------|---|
| Site_ID     | Number | Integer | Yes (Duplicates OK) | No          | This is a unique ID for each Site, Sample pair. It corresponds with the Site_ID Field in the Macroinvertebrate_Data table and the Site_Information table. |
| Site_Name   | Text   | 255     | No                  | No          | This is the Name of the Site where the sample was taken. It corresponds with the Site_Name Field in Site_Information table.                               |
| Sample_Name | Text   | 255     | No                  | No          | This is the Name for the sample that was taken. It corresponds with the Sample_Name Field in the Site_Information table.                                  |

2296  
2297  
2298

2299

2300

## 2301 2. Data Needs

2302

2303 The only data that is required for the MacroInvertebrate Viewer is the Access database  
2304 with the above defined table design. The database connection is only set up for an  
2305 Access database. The associated database should be located in the

2306 *C:\Program Files\WRIA-1\_DSS\DSS\_Data\Macroinvert Data\*

2307 file folder.

2308

2309

## 2310 3. Dependencies

2311

2312 The Macroinvertebrate Data Viewer plug-in requires the following software components  
2313 and modules to be installed:

2314 Software:

2315 MapWindow 3.1

2316 Visual Studio .NET 2003

2317

Modules and Components:

MapWindow Interfaces  
Microsoft Chart Control 6.0 (SP4) (OLEDB)  
MSDATARC

Integrated Development Environment (IDE)

Visual Studio .NET 2003

## 4. Setup

To begin using the Macroinvertebrate Data Viewer, it must first be loaded into MapWindow. Once it is loaded, click on the bug icon, , located on the Map Window toolbar. If the database associations (as described in *Section 2: Data Needs*) have been configured properly and the database is accessible, then the Macroinvertebrate Data Viewer will appear allowing the user to select and view macroinvertebrate sample data.

If the data associations have not been properly set, then a Connection Form will appear allowing you to type a path to or select the database. Then, after the database has been properly associated, select the bug icon, , from the Map Window toolbar and the viewer will appear allowing the user to view the collected data.

See the User's Manual for more information and details on associating the data with the Macroinvertebrate Data Viewer.

## 5. Code Compiling

Compiling the Macroinvertebrate Data Viewer is a fairly straightforward task. After ensuring that all of the required components discussed in *Section 3: Dependencies* are present, load the project into Visual Studio .Net 2003. This Plugin was created using C# (C Sharp).

The project needs to include the following files:

| <u>File Name</u>                            | <u>Purpose</u>  |
|---|---|
| AssemblyInfo.cs                             | Contains information relating to the DLL assembly. Generated by C#.NET.   |
| bug.ico                                     | Bug icon that is used in the MapWindow Toolbar and on the Macroinvertebrate Data Viewer.<br><i>NOTE: this file needs to be an embedded resource</i> |
| dbManager.cs                                | Class that contains variables and functions to access and read the sample data stored in the associated database.                                   |
| frmDBConnection.cs,<br>frmDBConnection.resx | Displays the Connection form that allows the user to associate the access database with the Macroinvertebrate Data Viewer plug-in.                  |

|   |  |
|---|--|
| frmErrorDialog.cs,<br>frmErrorDialog.resx         | Displays the form to display an Error Message when an error occurs in the Plugin. It allows the user to view the specific details of an error if they desire.  |
| frmMacroDataViewer.cs,<br>frmMacroDataViewer.resx | Displays the Macroinvertebrate Data Viewer form. You show the viewer by selecting the bug icon,  , from the Map Window toolbar. This form contains plots, tables to display the data contained in the associated database. |
| Globals.cs  | Contains a class that contains variables (for Map components), properties, and functions that can be used throughout the project.  |
| main.cs   | Contains a class that implements the MapWindow plugin interface.   |
| PluginInfo.cs                                     | Contains a class that implements an interface to access (read from and write to) the Project File.   |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| AxMSChart20Lib       | CopyLocal = True  |
| MapWinInterfaces     | CopyLocal = False |
| MSChart20Lib         | CopyLocal = True  |
| MSDATASRC            | CopyLocal = False |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |
| System.Drawing       | CopyLocal = False |
| system.web.services  | CopyLocal = False |
| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwMacroInvertDataViewer.dll has now been created with Microsoft Visual Studio .NET 2003. It is created in the *mwMIVViewer* subdirectory in the *\Plugins* folder. Next time that MapWindow is run, if the mwMIVViewer.dll was built to the correct folder, the updated changes to the Macroinvertebrate Data Viewer will be available.

  - *Code Compiling*
- 5. *Model Manager Elements*
  - *Model Manager Interface*

## 1. Table Designs

Database: DSSData.mdb

### **Table:** FilePaths

**Description:** This table stores the locations of the files used by models running inside the model manager. A model can request a file of a specific DataType, which will present the user with a dialog asking which of the matching datatypes should be used. They're differentiated by FileID, which can be any identifier – string, number, etc. ScenarioID refers to the scenario which added the file path to the database – scenario 0 is reserved for unedited, base data.

| Field      | Type    | Size | Indexed | Primary Key | Comments   |
|------------|---------|------|---------|-------------|--|
| RecordID   | Numeric |      | Yes     | Yes         | Internal record identifier.  |
| FileID     | Text    | 50   | Yes     | No          | Identifier for this file. For example, “Commercial Zoning”, “Comprehensive Zoning”       |
| FilePath   | Text    | 255  | No      | No          | This is the full path to the file on disk.   |
| ScenarioID | Numeric |      | Yes     | No          | The ID of the scenario which added this file path. 0 is reserved for unedited base data. |
| DataType   | Text    | 25   | No      | No          | Type of data. Can be any string, for example “zoning”, “land use”                        |

### **Table:** scenario\_logs

**Description:** This table stores the run log generated by a scenario when it is executed. The log contains information about what elements were run and with what parameters.

| Field         | Type      | Size | Indexed | Primary Key | Comments  |
|---------------|-----------|------|---------|-------------|---|
| ScenarioLogID | Numeric   |      | Yes     | Yes         | Unique identifier for this scenario log.  |
| RunDate       | Date/Time |      | No      | No          | The date that the run was executed  |
| UserName      | Text      | 50   | No      | No          | The name of the user logged in while running this scenario.                       |
| StartDate     | Date/Time |      | No      | No          | The start date for the date range of the run. Not all elements use this.          |
| EndDate       | Date/Time |      | No      | No          | The end date for the date range for this scenario run. Not all elements use this. |
| MapWinVersion | Text      | 50   | No      | No          | The version of MapWindow in use for this run.                                     |
| OSName        | Text      | 50   | No      | No          | The operating system this run was executed on.                                    |

|               |         |    |     |    |  |
|---------------|---------|----|-----|----|--|
| OSVersion     | Text    | 50 | No  | No | The version of the operating system this run was executed on.  |
| DSSVersion    | Text    | 50 | No  | No | The version of the Model Manager in use for the run.   |
| SysRAM        | Text    | 50 | No  | No | The amount of RAM in the system running this scenario.   |
| SysSpeed      | Text    | 50 | No  | No | The speed of the system running this scenario.   |
| SysOther      | Text    | 50 | No  | No | Used for other information about the computer which ran this scenario.                               |
| DataVersion   | Text    | 50 | No  | No | The version of the GIS data in use for the run.  |
| ScenarioLog   | Text    | 0  | No  | No | The textual log for the scenario run, including the results of each individual element that was run. |
| ControlFileID | Numeric |    | Yes | No | This is the scenario   |

**Table:** ScenarioControlFiles

**Description:** This table holds the actual scenarios themselves; when the user saves the scenario, it goes into this table – opening a scenario similarly lists the scenarios in this table.

| Field        | Type    | Size | Indexed | Primary Key | Comments  |
|--------------|---------|------|---------|-------------|---|
| ScenarioID   | Numeric |      | Yes     | Yes         | The ID number for this scenario, referenced by all other tables in this database. |
| ScenarioName | Text    | 50   | Yes     | No          | The textual name of the scenario.   |
| FileData     | Binary  | 0    | No      | No          | This is the actual scenario data, in a proprietary binary format.                 |
| ScenarioGUID | Text    | 50   | Yes     | No          | The GUID of the scenario – a type of unique identifier.                           |

## 2. Dependencies

The Model Manager, aka Scenario Builder, aka “DSS”, requires the following software components and modules to be installed:

Software:

Visual Studio .NET 2002

### Components:

Microsoft Common Controls 6.0  
Microsoft Common Controls-2 6.0  
Microsoft Common Controls-3 6.0  
Microsoft FlexGrid Control 6.0  
MDAC (Microsoft Data Access Components) 2.7  
AddFlow ActiveX Component Version 3.0  
DotNetBar Component for Menus and Dockable Toolbars Version 2.6.0.1

## **3. Setup**

After building the plugin DLL, create a folder called ModelManager inside the Plugins folder, which may be found wherever MapWindow is installed (typically c:\Program Files\MapWindow). Copy the compiled DLL and any other files produced by the compilation in this directory.

In this folder (ModelManager), create a folder called Elements. Inside this folder, place any compiled model element DLLs you wish to use with the Model Manager.

Start MapWindow, and start the DSS / Scenario Builder as indicated by the user's manual. You will likely be presented with the database configuration screen, which you will need to use to locate the DSSData.mdb file on your hard disk (or locate a DSSData SQL Server database). If you have installed a complete pre-assembled DSS, this will probably be set already. The model manager will save its configuration when the proper database has been located. The Model Manager will then be ready for use.

## **4. Building**

Compiling the Model Manager is a simple process, after ensuring that all of the components listed in section 2 are present. Open the mwDSS.sln project with Visual Studio, and select the Build menu; then select Build All.

The Model Manager Visual Studio project is described below:

### mwDSS Model Manager / Scenario Builder Project

| <u>File Name</u>                  | <u>Purpose</u>  |
|-----------------------------------|---|
| DataManager\DataManager.vb        | Automates the connection to the underlying DSS database.                                    |
| Images\                           | Contains various images used within forms, such as the start and stop images for scenarios. |
| ScenarioBuilder\AddFlowWrapper.vb | This is the container for the ActiveX addflow component, instantiated once for each open    |

|  |  |
|--|--|
|  | scenario.  |
| ScenarioBuilder\frmAuthenticate.vb                     | Used to set the scenario password.   |
| ScenarioBuilder\frmConfiguration.vb                    | This form is used to configure the database connection for the scenario builder.   |
| ScenarioBuilder\frmEditBaseData.vb                     | This allows editing of the file paths for the base data stored in the underlying DSS database.   |
| ScenarioBuilder\frmLogViewer.vb                        | This provides a user interface to view the scenario run log generated by a scenario run.   |
| ScenarioBuilder\frmNodeProps.vb                        | Displays the properties of the model element or node currently selected in the scenario.   |
| ScenarioBuilder\<br>frmScenarioBuilder.DockManager.xml | Settings file controlling the menu items and the attributes of those items within the scenario builder. Read by the DotNetBar ActiveX control. |
| ScenarioBuilder\frmScenarioBuilder.vb                  | Main scenario builder form. Utilizes DotNetBar and AddFlow (through the wrapper) to put together the form on initialization.                   |
| ScenarioBuilder\frmScenarioProps.vb                    | Shows and allows editing of the scenario properties, such as name and comments.  |
| ScenarioBuilder\frmSelectControlFile.vb                | This is essentially the “open scenario” dialog box.  |
| ScenarioBuilder\frmSelectFileID.vb                     | This is essentially a “select layer” dialog box, retrieving the options from the file paths stored in the underlying database.                 |
| ScenarioBuilder\ModelInfo.vb                           | A class used to hold the attributes for each model in the scenario builder.  |
| ScenarioBuilder\ModelLoader.vb                         | This is the class used to load the models from their DLL files, creating a ModelInfo class for each.   |
| Utils\Common.vb  | Contains miscellaneous common functions such as swap, append/delete attribute from XML file, etc.  |
| Utils\DBClient.vb                                      | Provides a layer of abstraction to access the database interface.  |
| Utils\FolderUtils.vb                                   | Provides the “browse for folder” dialog box as well as the CopyFolder function.  |
| Utils\frmSelectLayer.vb                                | This dialog allows the user to select a layer from a file or from layers currently loaded in MapWindow.  |
| Utils\SystemInfo.vb                                    | This class retrieves information about the system, for storage into the scenario run log.  |
| AssemblyInfo.vb  | Contains versioning information for this product.  |
| DSSPlugin.vb   | This is where the MapWindow plug-in interface is implemented, typing the scenario builder into MapWindow.                                      |

## 5. Model Manger Elements

Model Manager elements will need to implement the model interface. This is a .NET DLL interface very similar to the MapWindow interface. A model manager element will compile to a DLL, and, assuming it properly implements the model interface and is placed inside the Elements folder (located where the Model Manager DLL is located), it will appear as an element inside the Model Manager.

It's useful to note that a model element can implement both the MapWindow plug-in interface and the Model Manager interface at the same time. Any other interface which is useful to implement may also be implemented. If both MapWindow and Model Manager interfaces are implemented, some functions will overlap, such as "Author", "BuildDate", and "Version". If your programming language supports it, you may have one function implement the function from both interfaces at the same time. In VB.NET, this is accomplished by listing all desired functions to be implemented, for example: "string Author implements DssIntfc.IDssModel.Author, MapWinInterfaces.IPlugin.Author" (Exact names of the interfaces may change slightly.)

The Model Interface is described below:

### Model Manager Interface

The following functions need to be implemented in any scenario element intended to be used within the model manager. More detail and examples are given in a separate document entitled "Programmer's Tutorial: How to Create a DSS Model". The functions are shown in C syntax:

```
return_type function_name (parameter1_type parameter1_name, parameter2_type  
parameter2_name, ...)
```

```
string RevisionNotes
```

Provides notes about the scenario element. This information will appear on the "scenario properties" dialog. This is a "get" property (cannot be set). So, the Microsoft C# .NET code would look something like:

```
public string RevisionNotes  
{  
    get  
    {  
        return "This is a simple example of a get property.";  
    }  
}
```

This is the same syntax that should be followed with any other "get" property. See the reference for your particular programming language to see how to implement get properties. For most languages, it will suffice to return the appropriate value in the function body.

2527  
2528 bool Execute(DssIntfcLib.IDssManager DssManager, int TimeStep, string DataPath,  
2529 DateTime StartDate, DateTime EndDate, string ScenarioID)  
2530  
2531 The Model Manager calls this function to initiate the execution of the model. All  
2532 parameters and data that have been configured as a consequence of the  
2533 ShowDialog function (below) will have been loaded and made ready before this  
2534 function is called.  
2535  
2536 Parameters:  
2537 *DSSManager*: This is a reference to the Model Manager that called the  
2538 execute function.  
2539 *TimeStep*: This is the time step for execution in seconds. For example,  
2540 3600 would mean a timestep occurs every 5 minutes.  
2541 *DataPath*: This is the path where data should be written if the element  
2542 needs to write directly to disk.  
2543 *StartDate*: This is the start date chosen with the date range selectors in the  
2544 model manager interface. This may be ignored if your scenario element  
2545 does not use a date range.  
2546 *End Date*: This is the end date chosen as above. This also may be ignored  
2547 if you don't need to restrict operations to a particular date range.  
2548 *ScenarioID*: This is the scenario ID of the scenario which has called the  
2549 execute function. This is provided as a way for the element to mark any  
2550 output, for example naming a file with the scenario ID, so that the end user  
2551 can tell what scenario produced the file.  
2552  
2553 int ParamCount  
2554  
2555 This is a "get" property which should return the number of data items that your  
2556 scenario element needs to save and retrieve as a part of the scenario into which  
2557 the element is embedded. See also get\_ParamValue, set\_ParamValue, and  
2558 get\_ParamName.  
2559  
2560 DssIntfcLib.DssModelType ModelType  
2561  
2562 This is a "get" property which will return what type of model this is. The options  
2563 are "filter", "model", "data editor", or "other". There are no rules specifying what  
2564 makes a scenario element any one of these; it's only intended for organizational  
2565 purposes. The only thing this will affect is which tab the element will appear on  
2566 inside the model manager.  
2567  
2568 string BuildDate  
2569  
2570 This is a "get" property which will return the date that the element was last  
2571 compiled.  
2572

2573 string Description

2574

2575 This is a “get” property which will return a textual description of what the

2576 scenario element does. This will appear on the “element properties” dialog.

2577

2578 string Author

2579

2580 This is a “get” property which will return a string identifying the author of the

2581 scenario element. This may be any string – a name, an organization, or any text.

2582

2583 bool ShowDialog(bool Locked, DssIntfcLib.IDssManager DssManager, string DataPath)

2584

2585 This function is called when the scenario element is double-clicked within the

2586 model manager. This function should show a form with any configuration options

2587 or settings which need to be configured for the model to execute. The function

2588 should save the settings retrieved from the user into the properties which will be

2589 set and retrieved using set\_ParamValue, get\_ParamValue, get\_ParamName and

2590 ParamCount. The function does not need to worry about saving the settings

2591 anywhere – so long as the settings are accessible using the functions just named,

2592 the model manager will deal with saving and restoring these values automatically.

2593

2594 Parameters:

2595 *Locked:* This indicates that the scenario is locked, and changes should not

2596 be allowed. Settings may still be viewed, however.

2597 *DssManager:* This is a reference to the instance of the model manager

2598 which has called this function.

2599 *DataPath:* This is the path that the scenario element should use if the

2600 element needs to read or write directly to data on disk. This should be

2601 avoided in favor of the automatic parameter saving system.

2602

2603 string Name

2604

2605 This is a “get” parameter which should return the name of the scenario element as

2606 it will be displayed in the scenario builder. This should be fairly short.

2607

2608 string Version

2609

2610 This is a “get” parameter which should return the version of the scenario element.

2611

2612 void set\_ParamValue(int Index, string pVal)

2613

2614 This function is called by the model manager when previously saved values are

2615 being restored to the element. The model manager will call this function as many

2616 times as the function ParamCount returns, also providing the appropriate value for

2617 each parameter. These values should be saved into appropriate variables in the

2618 scenario. The index provided to this function will match the index used by  
 2619 get\_ParamValue and get\_ParamName.  
 2620  
 2621 Parameters:  
 2622 *Index*: This is the identifier for the value being restored into the element.  
 2623 *pVal*: This is the value to be restored to the element. Note that this is a  
 2624 string; this doesn't mean that only string data can be saved and restored:  
 2625 non-string data can be marshaled into a string format and saved.  
 2626  
 2627 string get\_ParamValue(int Index)  
 2628  
 2629 This function is called by the model manager when the scenario is saved. The  
 2630 function should return the value for the parameter indicated by Index, which will  
 2631 then be saved by the model manager. Like set\_ParamValue, the function will be  
 2632 called as many times as the function ParamCount returns. If ParamCount returns  
 2633 2, the function will be called twice to get both values.  
 2634  
 2635 Parameters:  
 2636 *Index*: This is the identifier for the value being saved from within the  
 2637 element.  
 2638  
 2639 object ToolBoxIcon  
 2640  
 2641 This is a "get" parameter which should return the image which will be displayed  
 2642 as the icon for this element inside the model manager toolbox. The image can be a  
 2643 bitmap or icon, and should be 32 pixels by 32 pixels. A default image will be used  
 2644 if the image provided is invalid.  
 2645  
 2646 string get\_ParamName(int Index)  
 2647  
 2648 This function should return the name of the parameter referenced by Index. This  
 2649 function yields a name for the Index values used by get\_ParamValue and  
 2650 set\_ParamValue.  
 2651  
 2652 string ResultsSummary  
 2653  
 2654 This function is a "get" parameter which should return a summary of the  
 2655 execution of the model. The model manager will call this function after calling  
 2656 Execute, to get the results of the execution. The function should return a string  
 2657 specifying any input files that were used and any output files that were created,  
 2658 and the string should also summarize any actions taken during execution. The  
 2659 summary should also contain any error string which may have been generated.  
 2660 The text returned by this function will appear in the scenario log.  
 2661  
 2662

Some of the functions in the Model Manager return an object called IDssManager. This is a reference to the Model Manager that's currently running your scenario element. The methods available on this object are as follows: (again, shown in C syntax.)

**HRESULT ReportProgress(IDssModel \* sender, BSTR Message, long PercentDone)**

This function is used to report the progress of your scenario element's execution to the Scenario Builder; the percentage done will be reflected in the progress bar along with the message you give.

The HRESULT return may be ignored in most languages.

Parameters:

*Sender:* This is a reference or a pointer to your scenario element itself.

*Message:* This is the progress message to be displayed on your progress bar.

High-level languages like most Microsoft .NET languages will interpret the BSTR type as a simple "String" type. Low-level languages like C will need to pass a B-string.

*PercentDone:* This is the percent done expressed numerically. This will be displayed on the progress bar.

**HRESULT ReportError(IDssModel \* sender, BSTR Message)**

This function is used to report an error during execution to the Scenario Builder. This will appear in the scenario run log.

Parameters:

*Sender:* This is a reference or a pointer to your scenario element itself.

*Message:* This is the error message to be placed in the run log.

High-level languages like most Microsoft .NET languages will interpret the BSTR type as a simple "String" type. Low-level languages like C will need to pass a B-string.

**HRESULT CancelWasRequested(VARIANT\_BOOL \*result)**

This function is used to ask the scenario builder if a cancel has been requested (by the user clicking the stop button in the scenario builder). This should be checked periodically during your Execute function if you're doing complex calculations; the model manager will never halt your scenario element, so it's your responsibility to check to see if the run has been cancelled and stop processing nicely.

2748  
2749  
2750  
2751  
2752  
2753  
2754

Parameters:

*Result:* This should be a pointer or a reference to a Boolean data type. This will be set by the function to True or False to indicate whether a cancel has been requested.

HRESULT ReportDialogClosing(IDssModel \* sender, VARIANT\_BOOL SaveParameters)

This function is used to report to the scenario builder that a dialog box is closing. Typically, dialog boxes in scenario elements are used to gather data – so, this is important to call at dialog closing because signaling that a dialog is closing tells the model manager that it's time to save the parameters in your scenario element (using the interface functions get\_ParamValue, set\_ParamValue, get\_ParamName, and ParamCount). Therefore, make sure that you've set the variables which get\_ParamValue is returning before calling this function.

Parameters:

*Sender:* This is a reference or a pointer to your scenario element itself.

*SaveParameters:* This tells the Scenario Builder whether you'd like your scenario element's parameters saved (using the interface functions mentioned above). Most high-level languages can pass any Boolean data type into this function.

HRESULT GetFilePath(BSTR FileID, BSTR \* result)

This function is used to get the path on disk to the file identified by the string FileID. This is used in tandem with the function ShowSelectFileDialog.

Parameters:

*FileID:* This is the string uniquely identifying the file whose path you need.

*Result:* This should be given a pointer or a reference to a string where the path to the requested file can be written. In other words, the string you provide to Result will contain the path to the file you've requested after the function call.

HRESULT AddFilePath(BSTR FileID, BSTR FilePath, BSTR DataType, VARIANT\_BOOL \* result)

This function is used to add information about a file to the Scenario Builder's database for later retrieval using GetFilePath or ShowSelectFileDialog.

2755  
 2756 Parameters:  
 2757  
 2758 *FileID:* This is the unique string identifier for this file. (Most high-level  
 2759 languages, like VB.NET, can pass a “String” data type to BSTR  
 2760 parameters).  
 2761  
 2762 *FilePath:* This is the full path to the file on disk.  
 2763  
 2764 *DataType:* This is a string representing the type of data that the file is. The  
 2765 string may be anything you desire – e.g., “Land Cover Data”, “Access  
 2766 Database”, etc.  
 2767  
 2768 *Result:* A reference or pointer to a Boolean data type should be provided for  
 2769 this parameter. After the function call, the variable passed as this  
 2770 parameter will contain True or False depending on whether the call was  
 2771 successful.  
 2772  
 2773 HRESULT ShowSelectFileDialog(BSTR AllowedDataType, BSTR \* result)  
 2774  
 2775 This function will display a dialog to the user with a list of files which match the  
 2776 parameter AllowedDataType. The user will see a list of the FileIDs for the files  
 2777 matching the data type.  
 2778  
 2779 Parameters:  
 2780  
 2781 *AllowedDataType:* This is the string representing the type of data that  
 2782 you wish the user to select. See *DataType* under the  
 2783 function AddFilePath; these two parameters correspond.  
 2784  
 2785 *Result:* A reference or pointer to a string data type should be passed as  
 2786 this argument. After the function call completes, the variable  
 2787 passed as this parameter will contain the FileID of the file that the  
 2788 user selected in the dialog.  
 2789  
 2790 HRESULT GetScenarioFilePath(BSTR ScenarioID, BSTR FileID, BSTR \* result)  
 2791  
 2792 This function returns the path to the directory where scenario data is being stored.  
 2793  
 2794 Parameters:  
 2795  
 2796 *ScenarioID:* The scenario ID for which you’d like the path to data.  
 2797  
 2798 *FileID:* The FileID of the file which you’d like the data path for.  
 2799  
 2800 *Result:* A reference or pointer to a string data type should be passed as

2801                   this argument. After the function call completes, the variable passed as  
2802                   this parameter will contain the path to the data.

2803

2804           HRESULT MinimizeModelManager()

2805

2806           This function will cause the scenario builder screen to minimize, allowing any  
2807           windows below (such as MapWindow) to become visible. This is useful when a  
2808           scenario element is implementing both the MapWindow interface and the Model  
2809           interface, and the scenario element wishes to use the MapWindow map to collect  
2810           information or interact with the user.

2811

2812           HRESULT MaximizeModelManager()

2813

2814           This function will cause the scenario builder screen to restore itself if it has been  
2815           minimized. If MinimizeModelManager has been called, then this should  
2816           eventually be called as well.

2817 Appendix

## 2874 **1. Introduction**

2875

2876 In this tutorial paper, I will discuss how to create a DSS model plug-in. The model plug-in can  
2877 be written in any language that supports COM. For this tutorial, I will give examples in Visual  
2878 Basic.net (VB.net) because I think that VB.net illustrates the concepts required to create the  
2879 plug-in more clearly than the other popular alternatives. Some alternatives are: Microsoft Visual  
2880 C++, Microsoft C#, Microsoft Visual Basic 6, Borland C++ Builder and Borland Delphi. I have  
2881 found that implementing COM interfaces is easiest to do in Visual Basic (6 or .net) and C#.

2882

2883 Before you can create a DSS Model Manager plug-in, you must have the MapWindow and DSS  
2884 Model Manager installed. You can get the MapWindow from <http://www.mapwindow.com> if  
2885 you do not already have it.

2886

2887 Before I begin the details of this tutorial, I must emphasize again that I am using VB.net for  
2888 reasons of clarity and personal preference. You may use any language that supports COM.

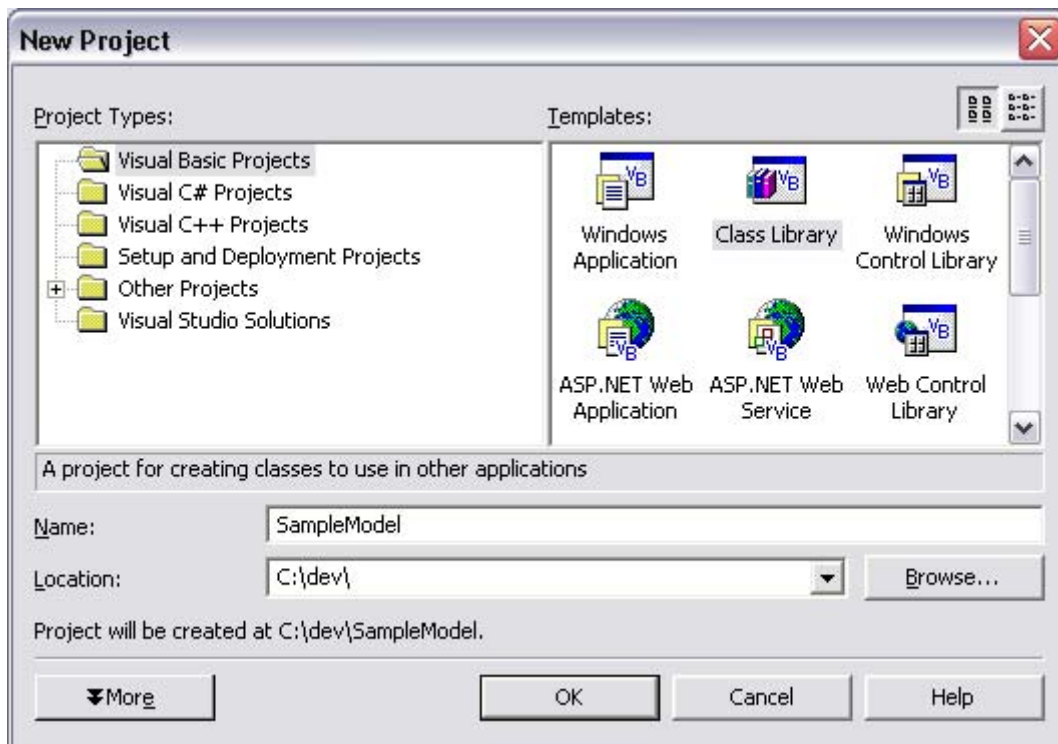

2889

## 2890 **2. Project creation**

2891

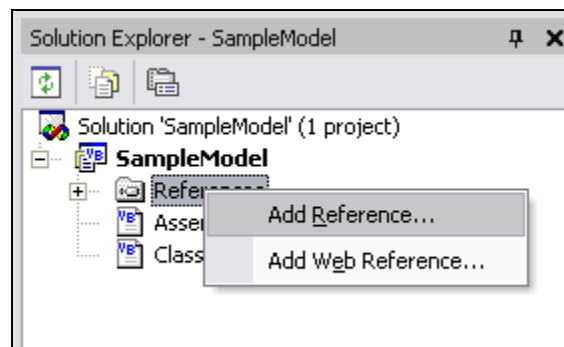

2892 In Visual Studio.net, create a new project. Create the project as a Class Library. Give the  
2893 project a name that represents the function of the model. In my case I chose to call this model  
2894 "SampleModel." After you press OK, change the name of your class from Class1 to something  
2895 more descriptive. For this tutorial I called my class "MyModel." Ideally this class name  
2896 describes your model in some way.

2897

**Figure 1- Creating a new Class Library project.**

The first step is to add references to the MapWindow Interfaces and DSS Model Manager Interfaces. The easiest way to do this is to right-click on the references item in the Solution Explorer, then select Add Reference.

**Figure 2 - Add references**

It doesn't matter which reference you add first, but since the Add Reference dialog defaults to .NET references first, I'll add the MapWinInterfaces reference first. This reference will not show up automatically in the list. You must browse to the file in order to add it. In most cases, the needed interface is installed at "C:\Program Files\MapWindow3.0\MapWinInterfaces.dll" unless the file was installed in another location.

The next reference is listed on the COM tab. The reference needed is called “DSS Interface Definitions 1.0.” Select this reference then press OK. These references contain the interfaces used to access the Model Manager and the MapWindow. (See Figure 3)

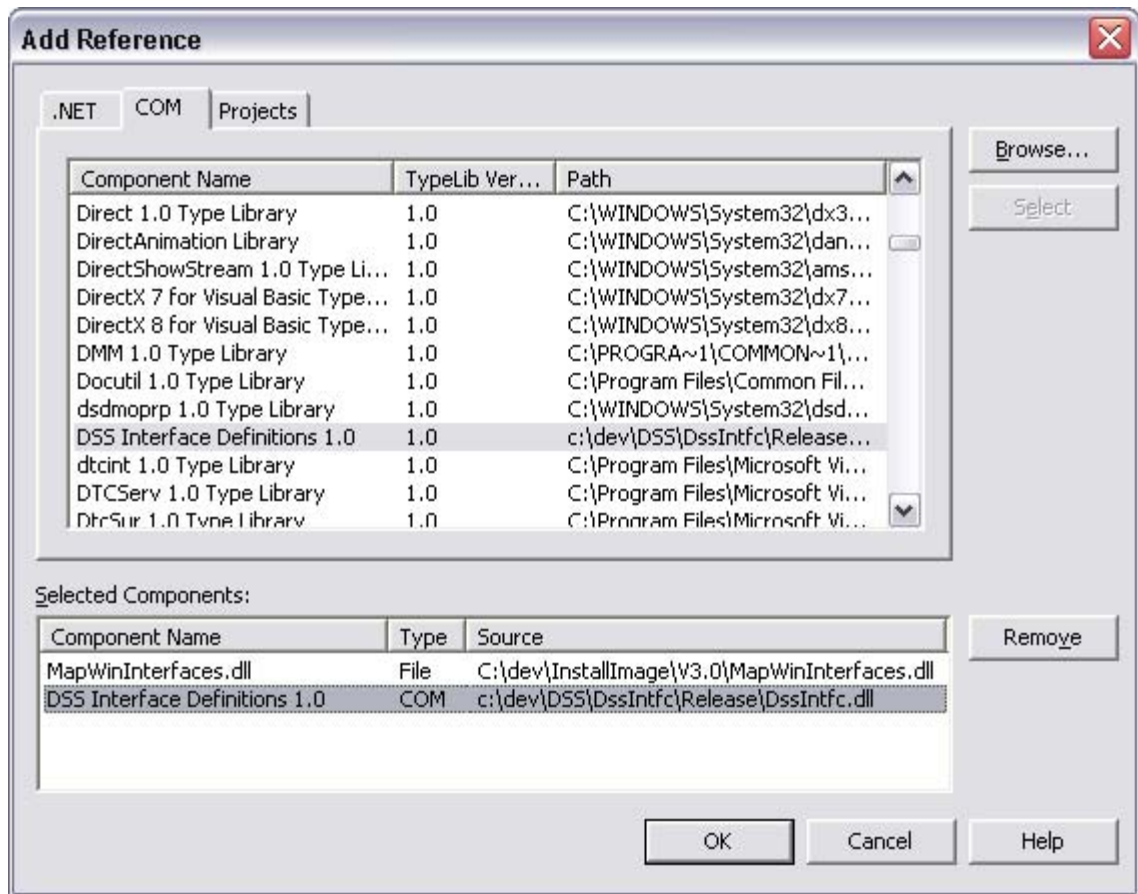

Figure 3 - Add Reference dialog

### 3. Implement Interface(s)

In order for the Model Manager to recognize your program as a model, you must implement the IDssModel interface located in the DssIntfcLib namespace. If you are not sure what this means then perhaps it would be a good time to look up the Implements statement in the Visual Studio documentation. Implement all of the methods and properties from the IDssModel interface. You can leave all of the details blank for now. We will get to them shortly.

If your model must interact with the MapWindow, it must also implement the IPlugin interface in the MapWindow.Interfaces namespace. All of the methods must be implemented from this interface also. Note, there are some properties that are shared between the IDssModel and IPlugin interfaces. In these cases it is easiest to have one property declaration that handles both interfaces, illustrated in Figure 4.

```
Public ReadOnly Property Author() As String _  
    Implements DssIntfcLib.IDssModel.Author, _  
    MapWindow.Interfaces.IPlugin.Author  
    Get  
        Return "Utah State University"  
    End Get  
End Property
```

**Figure 4 - Dual implementation**

Only having one property that returns the values shared by both interfaces reduces code duplication and makes it easier to keep your values synchronized. The properties that are shared are:

- Author
- BuildDate
- Description
- Name
- Version

For the purposes of this tutorial, I am going to keep it simple, implementing only the IDssModel interface.

Make sure that all methods and properties for the interfaces are implemented. If you forget one, the Implements statement at the top of the class will be underlined. Another way to make sure that you have implemented the interface completely is to build the project. If there are any errors, the compiler will notify you.

#### **Basic model properties:**

Now is a good time to go through the Author, BuildDate, Description, Name, Revision Notes and Version properties, returning the values you wish the user to see on the Model Properties dialog in the Model Manager.

The ModelType property determines which toolbox your model will be dropped in. This property has very little effect on how the model is treated but it does help to organize models by function. If your model simply changes data into a format that can be recognized by another model then it should be called a Filter. If your model modifies data but does not do any real analysis on the data then it should be a Data Editor. These categories are not enforced in any way, so it is really up to you to decide how you wish your model to be classified.

Along with the ModelType, you can also define a custom icon to override the default icon used in the Toolbox and Layout. This property will accept every standard image type used in Visual Studio. The supported image types are Icon, Bitmap and StdPicture. The model manager resizes the icon to make it the same size as all the other icons in the Toolbox and on the Layout.

#### **4. Inputs, Outputs and Parameters**

Before we can discuss how to implement inputs, outputs and parameters it is very important to understand the difference between them and how the Model Manager handles each of them.

Inputs and outputs are text strings that are stored in the DSS database using a “key” value. The text string can be the path to a file that used by the model while executing. This way, when the model runs it can request an input from the database using its Key, for example, “LANDCOVER”, the DSS return to the model the string value in the database stored with the Key identifier. In the example, it would probably return a file path to the land cover grid. Inputs are also stored with a scenario ID. For the raw data sets, the scenario ID is 0. However when a model runs, it can add a new record to the inputs and outputs table identifying the output data and associating a scenario number with it.

This is best illustrated with an example. Say that your scenario has a land cover data changer followed by a model that uses a land cover grid as an input. When the scenario executes, the land cover data changer is invoked. This data changer requests data from the DSS database stored with the key, “LANDCOVER”. The DSS knows that we are in the middle of a scenario run, for example, #36. When the land cover changer requests the LANDCOVER data set, the DSS looks in the table for an entry with the key, “LANDCOVER” and the scenario ID #36. Not finding it, the DSS then looks for an entry with the key, “LANDCOVER” and the scenario ID #0. Finding this entry, it returns the string data to the model. The string data in this case would contain the path and filename to the raw land cover grid file. The land cover data changer then makes specified changes to the land cover grid and saves the changes under a new filename such as “lc36.bgd”. It then stores this information as a new entry in the DSS database under the same key name, “LANDCOVER” but with the new file path and the scenario ID that created it (#36).

Next the DSS executes the model. This model requires a land cover grid as an input, so it makes a request to the DSS for this dataset. The DSS repeats the same steps performed previously for the land cover changer, looking in the database for an entry with the Key “LANDCOVER” and the scenario ID #36. Finding this entry, it returns the string value to the model – in this case it returns the string, “lc36.bgd”. Now the model has an input data file that has been edited by the

land use changer in the previous step of the same scenario. Doing this allows one to build complex scenarios with many changes to data while passing only pointers to the changed data between scenario elements.

“Parameters” are different than model inputs and outputs and are saved on a per-node basis in the scenario layout meaning that each instance of the model in a Layout can have its own set of parameter values. Parameters are typically modifiers that your model uses when executing. For example, the model mentioned above might compute sediment load from a watershed using the land cover grid as an input. However there are likely parameters that define how the model works and these are editable by the user through a parameter page that is displayed when the user double-clicks on the model element node in the DSS.

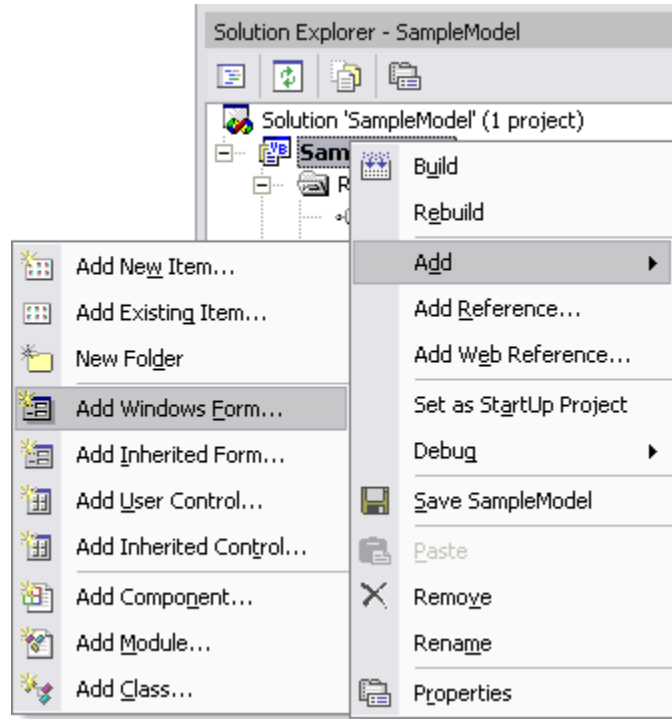

Parameters can be used to store data entered by the user for each model instance. When the model node is deleted or the layout is deleted any parameters that were set are discarded.

The sample model used in this tutorial will calculate a simple weighted average. Choosing a simple model makes it easier to see the mechanics of creating a model without cluttering things up with complicated code. The inputs to this model will be the values to average. The parameters will be the weights for the input values. The output will be the value of the weighted average.

## **5. Filling in the details**

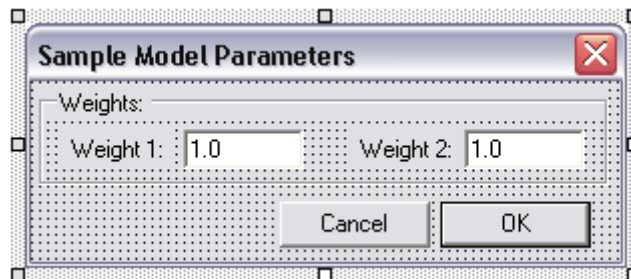

The first step I will take in this tutorial is to create the parameters page. The parameters for this tutorial are two numeric values that are the weights for the weighted average.

To create a parameters page, right click on the title of your Model in the Solution Explorer, then click on *Add*, then *Add Windows Form...* Name your parameter page whatever you like. I named mine frmParameters.

**Figure 5 - Adding parameters dialog**

Next I added two labels and text boxes for the two weights. I also grouped these in a group box for the sake of appearance. There is also an *OK* and a *Cancel* button. I changed the form's text property to *Sample Model Parameters*. A good suggestion to make your dialogs look and feel more professional is to set the form's *AcceptButton* and *CancelButton* properties. I also set the *DialogResult* properties on the *Accept* and *Cancel* Buttons to be *OK* and *Cancel* respectively. Another nice touch is to change the *FormBorderStyle* better represent the purpose of the form. In this case I decided that a *FixedDialog* style worked best. Since the dialog is not resizable I turned off the *MinimizeBox* and *MaximizeBox*. Finally, I set the *StartPosition* to be *CenterScreen*. Of course, all of these details are up to you, and depend a great deal on your needs.

**Figure 6 - Completed parameters page layout**

The only tasks for the parameters page dialog are to validate the inputs and make them accessible from the model. I will write a validate routine that makes sure the text entered is numeric. One important thing to note is that a layout can be locked and password protected so that the values

3054 on the parameter pages cannot be modified. The model manager passes a Boolean parameter in  
3055 *ShowDialog* called *Locked*. If this value is true, the model writer should make sure that his/her  
3056 parameters can be viewed but not changed.

```
3057
' The Weight_Validating Method handles the validation
' for both of the text boxes
Private Sub Weight_Validating(ByVal sender As Object, _
    ByVal e As System.ComponentModel.CancelEventArgs) _
    Handles txtWeight1.Validating, txtWeight2.Validating
    ' Make sure to catch all exceptions
    Try
        ' Cast the sender to a text box object. If this
        ' fails, an exception will be thrown
        Dim txt As System.Windows.Forms.TextBox
        txt = CType(sender, System.Windows.Forms.TextBox)
        If IsNumeric(txt.Text) = False Then
            ' Setting cancel = true makes sure that the user
            ' cannot leave until the problem is fixed
            e.Cancel = True

            ' Just to be nice, we will select all text
            ' to help the user see what went wrong
            txt.SelectAll()

            ' Exit immediately because the validation failed
            Exit Sub
        End If

        Catch ex As System.Exception
            ' There was an error, show a descriptive message
            MsgBox("The following error has occurred:" & vbCrLf & _
                ex.Message & vbCrLf & ex.StackTrace.ToString(), _
                MsgBoxStyle.Exclamation Or MsgBoxStyle.OKOnly, _
                "Error in Weight_Validating")

        End Try
    End Sub
3058
3059
```

3059 **Figure 7 - Validation Function**

3060  
3061 Now that the inputs are properly validated, the only thing left is to make the values accessible to  
3062 the model.

```

Public Property Weight1() As Double
    Get
        If IsNumeric(txtWeight1.Text) Then
            Return CDb1(txtWeight1.Text)
        Else
            Return 1.0
        End If
    End Get
    Set(ByVal Value As Double)
        If IsNumeric(Value) Then
            txtWeight1.Text = Value.ToString()
        End If
    End Set
End Property

Public Property Weight2() As Double
    Get
        If IsNumeric(txtWeight2.Text) Then
            Return CDb1(txtWeight2.Text)
        Else
            Return 1.0
        End If
    End Get
    Set(ByVal Value As Double)
        If IsNumeric(Value) Then
            txtWeight2.Text = Value.ToString()
        End If
    End Set
End Property

Public Property IsLocked() As Boolean
    Get
        Return Not grpWeights.Enabled
    End Get
    Set(ByVal Value As Boolean)
        grpWeights.Enabled = Not Value
    End Set
End Property

```

**Figure 8 – Parameter access properties**

The parameter page is now completely done so we need to go back to the model and show the dialog when the user requests it. This is done by the *ShowDialog* method that you implemented from the *IDssModel* interface. There is only one tricky thing about the *ShowDialog* method: You must tell the Model Manager when you are done showing your dialog. This is necessary because it is possible to have a non-modal dialog that interacts with the *MapWindow*. A non-modal dialog is one that allows you to interact with other forms while the dialog is open. A modal dialog does not allow the user to interact with anything else until the dialog is closed. To summarize, modal dialogs are synchronous, non-modal dialogs asynchronous. If the dialog is asynchronous you have to have your form notify the model when it closes. This can be done in a number of ways:

- Implement a callback system so that the parameter page itself notifies the model that it is closing

- Create a function in the model class that is a *FormClosing* delegate, and then before you display the dialog, add the model class *FormClosing* delegate function as a handler of the dialog form's *FormClosing* event.

Neither of these two options is really very difficult if you are familiar with delegates or callbacks. If you are not familiar with either of those two concepts it is worthwhile to learn about them because they can in some situations make a task that seems complicated simple. In the tutorial I will use a modal (synchronous) dialog to make things simpler. Note that I it is important to return true. If you do not return true, the Model Manager will not save any parameters because it assumes something went wrong.

```
Public Function ShowDialog(ByVal Locked As Boolean, _
    ByVal DssManager As DssIntfcLib.IDssManager, _
    ByVal DataPath As String) As Boolean _
    Implements DssIntfcLib.IDssModel.ShowDialog

    Try
        ' Create a new instance of the parameters form
        Dim myDialog As New frmParameters()

        ' Load the values from the model
        myDialog.Weight1 = m_Weight1
        myDialog.Weight2 = m_Weight2
        myDialog.IsLocked = Locked

        ' If the user clicks ok then save the values.
        If myDialog.ShowDialog = Windows.Forms.DialogResult.OK Then
            ' Save the values entered on the parameters page
            m_Weight1 = myDialog.Weight1
            m_Weight2 = myDialog.Weight2
            ' Report that my dialog has closed, and request
            ' that the parameters should be saved
            DssManager.ReportDialogClosing(Me, True)
        Else
            ' Don't attempt to save any parameters
            DssManager.ReportDialogClosing(Me, False)
        End If

        ' Clean up the dialog form
        myDialog.Dispose()
        myDialog = Nothing
        Return True
    Catch ex As System.Exception
        MsgBox("An error occurred in ShowDialog:" & vbCrLf & _
            ex.StackTrace.ToString(), , "Error in ShowDialog")
    End Try
End Function
```

**Figure 8 – ShowDialog function**

You might have noticed that I made references to *m\_Weight1* and *m\_Weight2* in the *ShowDialog* method. These are declared at the top of the model class along with the values from

the inputs that will be used during the model execution. Notice that there are provisions provided for default values. This is recommended so that the output is at predictable and useful in the case that the user does not actually change the values through the parameters dialog.

```
Private m_Weight1 As Double = 1.0
Private m_Weight2 As Double = 1.0

Private m_Value1 As Double
Private m_Value2 As Double

Private m_Summary As String = ""
```

**Figure 8 – Declaration of model variables**

So far we have created the model class, implemented the IDssModel interface, created the parameters page, filled in the implementation of ShowDialog and handled parameters to and from the Model Manager. We still need to handle inputs, outputs, summary reports and the actual execution of the model.

Inputs are stored in the DSSData.mdb database. The Model Manager will provide the inputs you request as long as they exist in the database. The most common place to work with inputs is in the *Execute* function. Figure 9 contains the code in the Execute function of the sample model. Notice that there are several parameters that were not used in this example:

- **TimeStep:** The TimeStep parameter is used when a loop node is utilized on the layout to execute more than once. This parameter is here for the models that require a time step to run.
- **StartDate/StopDate:** Some models require a start and stop date as an additional parameter. The user can select a start and stop date in the Model Manager that applies to all models being run.
- **ScenarioID:** Each scenario is given a unique ID so that outputs from different scenarios can be compared and analyzed side by side.

```

Public Function Execute(ByVal DssManager As DssIntfcLib.IDssManager, _
    ByVal TimeStep As Integer, ByVal DataPath As String, _
    ByVal StartDate As Date, ByVal EndDate As Date, _
    ByVal ScenarioID As String) As Boolean _
    Implements DssIntfcLib.IDssModel.Execute

    Dim input_path As String

    ' Get the input from the DSSData.mdb database
    input_path = DssManager.GetFilePath("SampleModelInputFile")

    If System.IO.File.Exists(input_path) Then
        ' Open the input file and read the data from it
        Dim stream As System.IO.StreamReader

        stream = System.IO.File.OpenText(input_path)
        m_Value1 = System.Convert.ToDouble(stream.ReadLine())
        m_Value2 = System.Convert.ToDouble(stream.ReadLine())
        stream.Close()

        ' Run the model now
        Dim result_value As Double
        result_value = (m_Weight1 * m_Value1 + m_Weight2 * m_Value2) / 2

        m_Summary = "Model run succeeded." & vbCrLf & "  "
        m_Summary &= m_Weight1 & " * " & m_Value1 & " + "
        m_Summary &= m_Weight2 & " * " & m_Value2 & " = "
        m_Summary &= result_value
        Return True
    Else
        ' If the input file was not found then report an error
        DssManager.ReportError(Me, "Could not find the input file '" & _
            input_path & "'. Model could not execute.")
        Return False
    End If
End Function

```

**Figure 9 – Execute function**

The only remaining task is to return summary reports so that the Model Manager can combine the summary reports from all the models that were run in a layout.

```

Public ReadOnly Property ResultsSummary() As String _
    Implements DssIntfcLib.IDssModel.ResultsSummary
    Get
        Return m_Summary
    End Get
End Property

```

**Figure 10 – Results summary**

The model is now complete. If you have understood the process to this point you should be able to create a Model Manager wrapper for any model that you have written.

## 1. Table Designs

There are two types of Table Designs available for the Photo Viewer. The Table Design is dependent on the type of viewer that is being used. Design #1 is correct if the data being used is organized by Location and then by Photo. Design #2 is correct if the data being used is organized by Watershed, then Stream, then Segment, then Unit, and finally by Photo.

Database: Design #1

### **Table:** Comments

**Description:** Contains the information needed to select and display the Comments and Comment Information for the selected Photo or Location. Data is selected by either Location\_ID or by Location\_ID and Photo\_ID depending on whether the user is viewing the comments for the location, or for an individual photo.

| Field        | Type    | Size | Key Field | Primary Key | Comments   |
|--------------|---------|------|-----------|-------------|--|
| Location_ID  | Numeric |      | No        | No          | The unique ID for the Location                     |
| Photo_ID     | Numeric |      | No        | No          | The unique ID for the Photo for the given location |
| Comment_ID   | Numeric |      | No        | No          | The unique ID for the comment for the given photo  |
| Author       | Text    | 50   | No        | No          | The Author of the comment                          |
| Organization | Text    | 50   | No        | No          | The Organization the Author belongs to             |
| Comment_Date | Text    | 50   | No        | No          | The date of the comment                            |
| Comment      | Memo    |      | No        | No          | The Comment  |

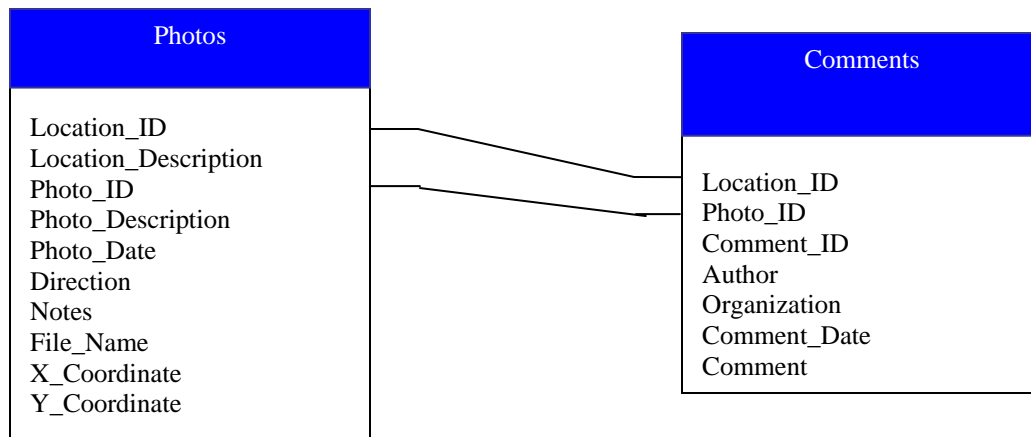

### **Table:** Photos

**Description:** Contains the information needed to select and display the Photo and Photo Information for the selected Location. Data is selected by either Location\_ID, or by Location\_ID, and Photo\_ID depending on whether a new photo is being loaded or a new location is being loaded.

| Field                | Type    | Size | Key Field | Primary Key | Comments   |
|----------------------|---------|------|-----------|-------------|--|
| Location_ID          | Numeric |      | No        | No          | The unique ID for the Location                     |
| Location_Description | Text    | 50   | No        | No          | The Location Name                                  |
| Photo_ID             | Number  |      | No        | No          | The unique ID for the Photo for the given Location |

|                   |         |     |    |    |                                    |
|-------------------|---------|-----|----|----|------------------------------------|
| Photo_Description | Text    | 255 | No | No | A description of the photo         |
| Photo_Date        | Text    | 255 | No | No | The date the Photo was taken       |
| Direction         | Text    | 50  | No | No | The direction of the Photo         |
| Notes             | Text    | 255 | No | No | Any Notes about the photo          |
| File_Name         | Text    | 255 | No | No | The filename of the Photo          |
| X_Coordinate      | Numeric |     | No | No | X-Coordinate value of the location |
| Y_Coordinate      | Numeric |     | No | No | Y-Coordinate value of the location |

Database: Design #2

**Table:** Watersheds

**Description:** Contains the Watersheds for the availablePhotos.

| Field                 | Type    | Size | Key Field | Primary Key | Comments                        |
|-----------------------|---------|------|-----------|-------------|---------------------------------|
| Watershed_ID          | Numeric |      | Yes       | Yes         | The unique ID for the Watershed |
| Watershed_Name        | Text    | 255  | No        | No          | The name for the Watershed      |
| Watershed_Description | Text    | 50   | No        | No          | A description for the Watershed |

**Table:** Streams

**Description:** Contains the Streams for the Watersheds for the available Photos.

Stream\_ID's are unique for each Watershed. This means that if there are multiple Watersheds, then there can be duplicate Stream\_ID's as long as the Watershed\_ID is different.

| Field              | Type    | Size | Key Field | Primary Key | Comments  |
|--------------------|---------|------|-----------|-------------|---|
| Watershed_ID       | Numeric |      | Yes       | No          | The ID for the Watershed that the Stream belongs to |
| Stream_ID          | Numeric |      | Yes       | No          | The unique ID for the Stream                        |
| Stream_Name        | Text    | 255  | No        | No          | The name for the Stream                             |
| Stream_Description | Text    | 255  | No        | No          | A description for the Stream                        |

**Table:** Stream\_Segments

**Description:** Contains the Segments for the Streams for available Photos. Segment\_ID's are unique for each Stream. This means that if there are multiple Streams and/or Watersheds, then there can be duplicate Segment\_ID's as long as the combination of the Stream\_ID and Watershed\_ID are different.

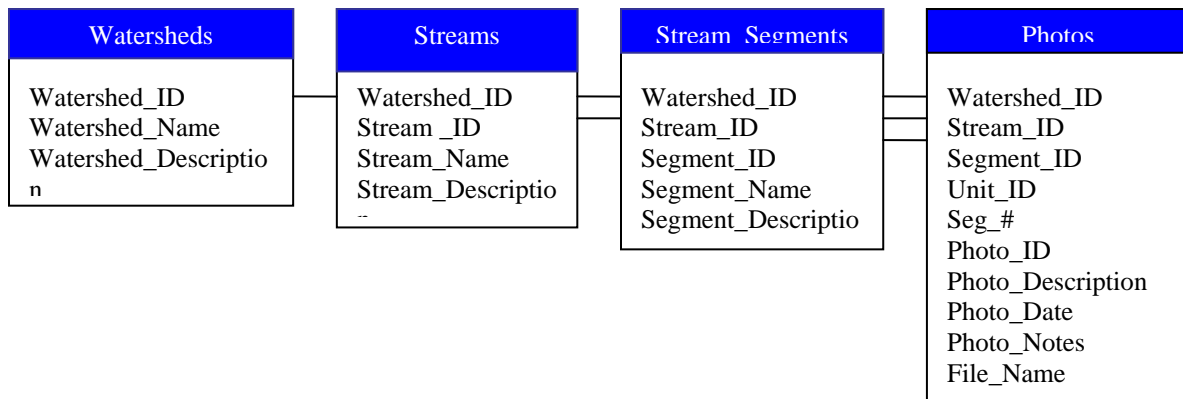

| Field               | Type    | Size | Key Field | Primary Key | Comments   |
|---------------------|---------|------|-----------|-------------|--|
| Watershed_ID        | Numeric |      | Yes       | No          | The ID for the Watershed that the Segment belongs to |
| Stream_ID           | Numeric |      | Yes       | No          | The ID for the Streams that the Segment belongs to   |
| Segment_ID          | Numeric |      | Yes       | No          | The unique ID for the Segment                        |
| Segment_Name        | Text    | 255  | No        | No          | The name for the Segment                             |
| Segment_Description | Text    | 255  | No        | No          | The description for the Segment                      |

**Table: Photos**

**Description:** Contains the information needed to select and display the Photo and Photo Information for the selected Watershed, Stream, Segment, Unit, Photo group. Photo\_ID's are unique for each Unit. This means that if there are multiple Units, Segments, Streams, and/or Watersheds, then there can be duplicate Photo\_ID's as long as the combination of the Photo\_ID, Unit\_ID, Segment\_ID, Stream\_ID and Watershed\_ID are different.

| Field             | Type      | Size | Key Field | Primary Key | Comments                                       |
|-------------------|-----------|------|-----------|-------------|--|
| Watershed_ID      | Numeric   |      | Yes       | No          | The ID for the Watershed                       |
| Stream_ID         | Numeric   |      | Yes       | No          | The ID for the Stream                          |
| Segment_ID        | Numeric   |      | Yes       | No          | The ID for the Segment                         |
| Unit_ID           | Numeric   |      | Yes       | No          | The ID for the Habitat Unit                    |
| Seg_#             | Numeric   |      | No        | No          | The ID for the Habitat Unit within the Segment |
| Photo_ID          | Numeric   |      | Yes       | No          | The unique ID for the Photo                    |
| Photo_Description | Text      | 255  | No        | No          | The description for the Photo                  |
| Photo_Date        | Date/Time |      | No        | No          | The date the Photo was taken                   |
| Photo_Notes       | Text      | 255  | No        | No          | Any notes about the Photo                      |
| File_name         | Text      | 255  | No        | No          | The Filename for the Photo                     |

## 2. Data Needs

There are three types of data needed for the Photo Viewer plug-in. It needs a point shapefile, a folder location, and a database.

- Point Shapefile – this needs to be in the same projection as the other shapefiles. It contains the point locations of where the photos were taken. This file will have a tag that will be associated with it by the plug-in or project file.
- Folder Location – this is the location of all of the images that will be viewed using the Photo Viewer plug-in.
- Database – this needs to be organized according to one of the database designs described in *Section 1: Table Design*.

The layer corresponding with the point shapefile stated above is marked with the tag “PhotoViewerShpfl”. If the user removes the layer associated with tag without first closing the Photo Viewer plug-in, then the settings for the PhotoViewer will be reset, and if the Project is then saved, then the settings in the project file will be over-written. Depending on the type of Database structure, the shapefile requires certain fields to be available. Below are the field names and how they correlate to the database.

Required data layers and fields used from each:

1. Design #1 – the following field names need to be named this way exactly.
  - a. LOC\_ID – corresponds with Location\_ID in the database
  - b. LOC\_NAME – corresponds with Location\_Description in the database
2. Design #2 – the following field names do not need to be named this way
  - a. Watershed\_Name – corresponds with Watershed\_Description in the Watersheds table in the database
  - b. Stream\_Name – corresponds with Stream\_Description in the Streams table in the database
  - c. Segment\_Name – corresponds with Segment\_Description in the Stream\_Segments table in the database
  - d. Unit\_ID – corresponds with the Unit\_ID in the Photos table in the database
  - e. Photo\_ID – corresponds with the Photo\_ID in the Photos table in the database
  - f. X\_Coordinate – used for plotting the location on the map in the viewer
  - g. Y\_Coordinate – used for plotting the location on the map in the viewer

### 3. Dependencies

The PhotoViewer plug-in requires the following software components and modules to be installed:

Software:

MapWindow 3.1  
Visual Studio .NET 2002

Modules and Components:

MapWinGIS Map Control  
MapWindow Interfaces

Integrated Development Environment (IDE)

Visual Studio .NET 2002

### 4. Setup

To begin using the Photo Viewer, it must first be loaded into MapWindow. Once it is loaded, to use the Photo Viewer simply click the camera icon, , on the toolbar. If the data associations (as described in *Section 2: Data Needs*) have been properly formed, then the Photo Viewer will appear and will be fully functional.

If the data associations have not been formed, then a Connection Form will appear allowing you to set the shapefile and associated field(s), database, and photo location folder. Then, after the data associations have been formed, when the Photo Viewer icon, , on the Map Window toolbar is clicked, the viewer will appear and can then be used.

### 5. Code Compiling

Compiling the Photo Viewer is a fairly straightforward task. After ensuring that all of the required components discussed in *Section 3: Dependencies* are present, load the project into Visual Studio .Net 2002. This Plugin was created using Visual Basic (VB).

The project needs to include the following files:

| <u>File Name</u> | <u>Purpose</u>  |
|------------------|---|
| AssemblyInfo.vb  | Contains information relating to the DLL assembly. Generated by VB.NET.       |
| camera.ico       | Camera icon for the forms and representing where photos are on the shapefile. |

|                     |  |
|---------------------|--|
|                     | <i>NOTE: this file needs to be an embedded resource</i>  |
| camera.bmp          | Camera bitmap used in the MapWindow Legend for the associated layer.<br><i>NOTE: this file needs to be an embedded resource</i>  |
| clsMainMWI.vb       | Contains a class that implements the MapWindow plugin interface.   |
| FolderUtils.vb      | Contains a class to access and browse for a folder location.   |
| frmCommentAdder.vb  | Displays the Comment form that is used to add comments to a photo or a location if using Database Design #1 (see <i>Section 1: Table Design</i> for a description).  |
| frmCommentViewer.vb | Displays the Comments available from the database for the current location or photo if using Database Design #1 (see <i>Section 1: Table Design</i> for a description).  |
| frmDBConnection.vb  | Displays the Connection form so the user can select the type of data view, the shapefile, photo location, and database.  |
| frmLocationAdder.vb | Displays the form that is used to add a new location to the shapefile through the Photo Viewer.  |
| frmPhotoAdder.vb    | Displays the form to add a photo to the current location.  |
| frmPhotoViewer.vb   | Displays the Photo Viewer form for Database Design #1 (see <i>Section 1: Table Design</i> for a description).  |
| frmPluginKey.vb     | A form to enter a Plug-in Key so that the user can specify or edit the connection settings.<br><i>NOTE: This form is no longer being shown, but is being left in the project.</i>  |
| frmSelectLayer.vb   | Displays the form to select the associated point shapefile with the Photo Viewer plug-in. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk.  |
| frmViewer2.vb       | Displays the Photo Viewer form for Database Design #2 (see <i>Section 1: Table Designs</i> for a description).   |
| globalFunctions.vb  | This module contains functions used throughout the project for accessing the database, searching shapefiles, initialization, access folder information, and other important functionality.   |
| globalStructs.vb    | This module contains the definition of data Structs used throughout the Photo Viewer.  |
| globalVariables.vb  | This module contains the variables used throughout the forms, such as the form declaration variables, MapWindow variables, and others.   |
| ImageConverter.vb   | Contains a class that implements functions that allows you to convert images to and from an IPictureDisp object. This is needed so that the VBCompatibility.dll does not need to be referenced. This class allows the Photo Viewer image,  , to be associated with the points on the associate shapefile. |
| luginInfo.vb        | Contains a class that implements an interface to access (read from and write to) the Project File.   |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2002, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| AxMapWinGIS          | CopyLocal = True  |
| MapWinGIS            | CopyLocal = True  |
| MapWinInterfaces     | CopyLocal = False |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |
| System.Design        | CopyLocal = False |
| System.Drawing       | CopyLocal = False |
| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwPhotoViewer.dll has now been created with Microsoft Visual Studio .NET 2002. It is created in the *mwPhotoViewer* subdirectory in the *\Plugins* folder. Next time that MapWindow is run, if the mwPhotoViewer.dll was built to the correct folder, the updated changes to Photo Viewer will be available.

## 1. Table Design

Following is a list of tables that must be included with the Periodicity Viewer/Editor Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters. This database must be an Access (\*.mdb) database.

**Table:** tblDistribution\_Master

**Description:** Contains the Master copy of the Fish Distribution Data for each Node, Fish pair. When the default Fish Distribution values are restored, they are restored from this table of values.

| Field             | Type        | Size         | Key Field           | Primary Key | Comments   |
|-------------------|-------------|--------------|---------------------|-------------|--|
| DM_ID             | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each record in the tblDistribution_Master table.   |
| Node_ID           | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Node that this set of Fish Distribution values belong to. It corresponds with the Node_ID Field from the tblNodes table and the tblPeriodicity table.                     |
| Lifestage_ID      | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the Lifestage ID for the Fish that this set of Fish Distribution values belong to. It corresponds with the Lifestage_ID Field from the tblLifestages table and the tblPeriodicity table. |
| Current_Known     | Yes/No      |              | No                  | No          | This is the “Current Known” Fish Distribution Set value for the given node, fish pair.<br><i>NOTE: Yes = Present, No = Absent</i>  |
| Current_Presumed  | Yes/No      |              | No                  | No          | This is the “Current Presumed” Fish Distribution Set value for the given node, fish pair.<br><i>NOTE: Yes = Present, No = Absent</i>   |
| Presumed_Historic | Yes/No      |              | No                  | No          | This is the “Presumed Historic/Potential” Fish Distribution Set value for the given node, fish pair.<br><i>NOTE: Yes = Present, No = Absent</i>  |

3375 **Table:** tblLifestages  
 3376 **Description:** Contains the Lifestage Information for each of the Species that are  
 3377 available.

| Field          | Type        | Size         | Key Field           | Primary Key | Comments   |
|----------------|-------------|--------------|---------------------|-------------|--|
| Lifestage_ID   | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | Unique ID for each Lifestage available. It corresponds with the Lifestage_ID Field in the tblDistribution_Master table, the tblPeriodicity table, and the tblPeriodicity_Master table. |
| Species_ID     | Number      | Long Integer | Yes (Duplicates OK) | No          | The ID for the Species that this Lifestage belongs to. It corresponds with the Species_ID Field in the tblSpecies table.   |
| Lifestage_Name | Text        | 255          | No                  | No          | Name of the Lifestage.   |

3378  
 3379  
 3380 **Table:** tblNodes  
 3381 **Description:** Contains the Node Information (Node ID, Drainage Info, Reach Info) for  
 3382 all available nodes.

| Field         | Type        | Size         | Key Field           | Primary Key | Comments   |
|---------------|-------------|--------------|---------------------|-------------|--|
| pk_NodeID     | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Node that has Periodicity and/or Fish Distribution available.   |
| Node_ID       | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the NodeID that is used to reference the Node. It is the value that corresponds with NodeID that stored in the associated Point Shapefile. It also corresponds with the Node_ID Field in the tblDistribution_Master table, the tblPeriodicity table, and the tbl_Periodicity_Master table. |
| Drainage_ID   | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Drainage that this node belongs to.   |
| Drainage_Name | Text        | 255          | No                  | No          | This is the Name of the Drainage that this node belongs to.  |
| Reach_ID      | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Reach that this node belongs to.  |

|            |      |     |    |    |  |
|------------|------|-----|----|----|--|
| Reach_Name | Text | 255 | No | No | This is the Name of the Reach that this node belongs to. |
|------------|------|-----|----|----|--|

**Table:** tblPeriodicity

**Description:** Contains the current Periodicity and Fish Distribution values set by the user. These are the values that are displayed by the Periodicity Viewer/Editor. *NOTE: The values are initialized to the Master data sets (values found in the tblDistribution\_Master table and the tblPeriodicity\_Master table).*

| Field          | Type        | Size         | Key Field           | Primary Key | Comments   |
|----------------|-------------|--------------|---------------------|-------------|--|
| Periodicity_ID | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of Periodicity and Fish Distribution values in the table.   |
| Node_ID        | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Node that this set of Periodicity and Fish Distribution values belong to. It corresponds with the Node_ID Field in the tblDistribution_Master table, the tblNodes table, and the tblPeriodicity_Master table.           |
| Lifestage_ID   | Number      | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Fish that this set of Periodicity and Fish Distribution values belong to. It corresponds with the Lifestage_ID Field in the tblDistribution_Master table, the tblLifestages table, and the tblPeriodicity_Master table. |
| Jan_1          | Number      | Integer      | No                  | No          | Periodicity Value for the 1 <sup>st</sup> half of January for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Jan_2          | Number      | Integer      | No                  | No          | Periodicity Value for the 2 <sup>nd</sup> half of January for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Feb_1          | Number      | Integer      | No                  | No          | Periodicity Value for the 1 <sup>st</sup> half of February for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |

|       |        |         |    |    |  |
|-------|--------|---------|----|----|--|
| Feb_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of February for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Mar_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of March for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Mar_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of March for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Apr_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of April for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Apr_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of April for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| May_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of May for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>      |
| May_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of May for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>      |
| Jun_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of June for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>     |
| Jun_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of June for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>     |
| Jul_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of July for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>     |
| Jul_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of July for the given fish, node pair.  |

|       |        |         |    |    |   |
|-------|--------|---------|----|----|---|
|       |        |         |    |    | <i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Aug_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of August for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Aug_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of August for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>    |
| Sep_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of September for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Sep_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of September for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i> |
| Oct_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of October for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Oct_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of October for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Nov_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of November for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Nov_2 | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of November for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Dec_1 | Number | Integer | No | No | Periodicity Value for the 1 <sup>st</sup> half of December for the given fish, node pair.   |

|                   |        |         |    |    |   |
|-------------------|--------|---------|----|----|---|
|                   |        |         |    |    | <i>Note: 0=Not Present, 1=Present, 2=Peak</i>   |
| Dec_2             | Number | Integer | No | No | Periodicity Value for the 2 <sup>nd</sup> half of December for the given fish, node pair.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Current_Known     | Yes/No |         | No | No | This is the “Current Known” Fish Distribution value for the given node, fish pair.<br><i>NOTE: Yes = Present, No = Absent</i>               |
| Current_Presumed  | Yes/No |         | No | No | This is the “Current Presumed” Fish Distribution value for the given node, fish pair.<br><i>NOTE: Yes = Present, No = Absent</i>            |
| Presumed_Historic | Yes/No |         | No | No | This is the “Presumed Historic/Potential” Fish Distribution value for the given node, fish pair.<br><i>NOTE: Yes = Present, No = Absent</i> |

3390

3391

**Table:** tblPeriodicity\_Master

3392

**Description:** Contains the Master copy of the Periodicity Data for each Fish pair. When the default Periodicity values are restored, they are restored from this table of values.

3393

| Field        | Type       | Size         | Key Field           | Primary Key | Comments  |
|--------------|------------|--------------|---------------------|-------------|---|
| PM_ID        | AutoNumber | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each set of Master Periodicity values in the table.   |
| Lifestage_ID | Number     | Long Integer | Yes (Duplicates OK) | No          | This is the ID for the Fish that this set of Periodicity values belong to. It corresponds with the Lifestage_ID Field in the tblLifestages table and the tblPeriodicity_Master table. |
| Jan_1        | Number     | Integer      | No                  | No          | Periodicity Value for the 1st half of January for the given fish.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |
| Jan_2        | Number     | Integer      | No                  | No          | Periodicity Value for the 2nd half of January for the given fish.<br><i>Note: 0=Not Present, 1=Present, 2=Peak</i>  |

|       |        |         |    |    |  |
|-------|--------|---------|----|----|--|
| Feb_1 | Number | Integer | No | No | Periodicity Value for the 1st half of February for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak |
| Feb_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of February for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak |
| Mar_1 | Number | Integer | No | No | Periodicity Value for the 1st half of March for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak    |
| Mar_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of March for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak    |
| Apr_1 | Number | Integer | No | No | Periodicity Value for the 1st half of April for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak    |
| Apr_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of April for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak    |
| May_1 | Number | Integer | No | No | Periodicity Value for the 1st half of May for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak      |
| May_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of May for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak      |
| Jun_1 | Number | Integer | No | No | Periodicity Value for the 1st half of June for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak     |
| Jun_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of June for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak     |
| Jul_1 | Number | Integer | No | No | Periodicity Value for the 1st half of July for the given fish.<br>Note: 0=Not Present, 1=Present,            |

|       |        |         |    |    |   |
|-------|--------|---------|----|----|---|
|       |        |         |    |    | 2=Peak  |
| Jul_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of July for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak      |
| Aug_1 | Number | Integer | No | No | Periodicity Value for the 1st half of August for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak    |
| Aug_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of August for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak    |
| Sep_1 | Number | Integer | No | No | Periodicity Value for the 1st half of September for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak |
| Sep_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of September for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak |
| Oct_1 | Number | Integer | No | No | Periodicity Value for the 1st half of October for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak   |
| Oct_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of October for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak   |
| Nov_1 | Number | Integer | No | No | Periodicity Value for the 1st half of November for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak  |
| Nov_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of November for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak  |
| Dec_1 | Number | Integer | No | No | Periodicity Value for the 1st half of December for the given fish.<br>Note: 0=Not Present, 1=Present, 2=Peak  |
| Dec_2 | Number | Integer | No | No | Periodicity Value for the 2nd half of   |

|  |  |  |  |  |   |
|--|--|--|--|--|---|
|  |  |  |  |  | December for the given fish.<br>Note: 0=Not Present, 1=Present,<br>2=Peak |
|--|--|--|--|--|---|

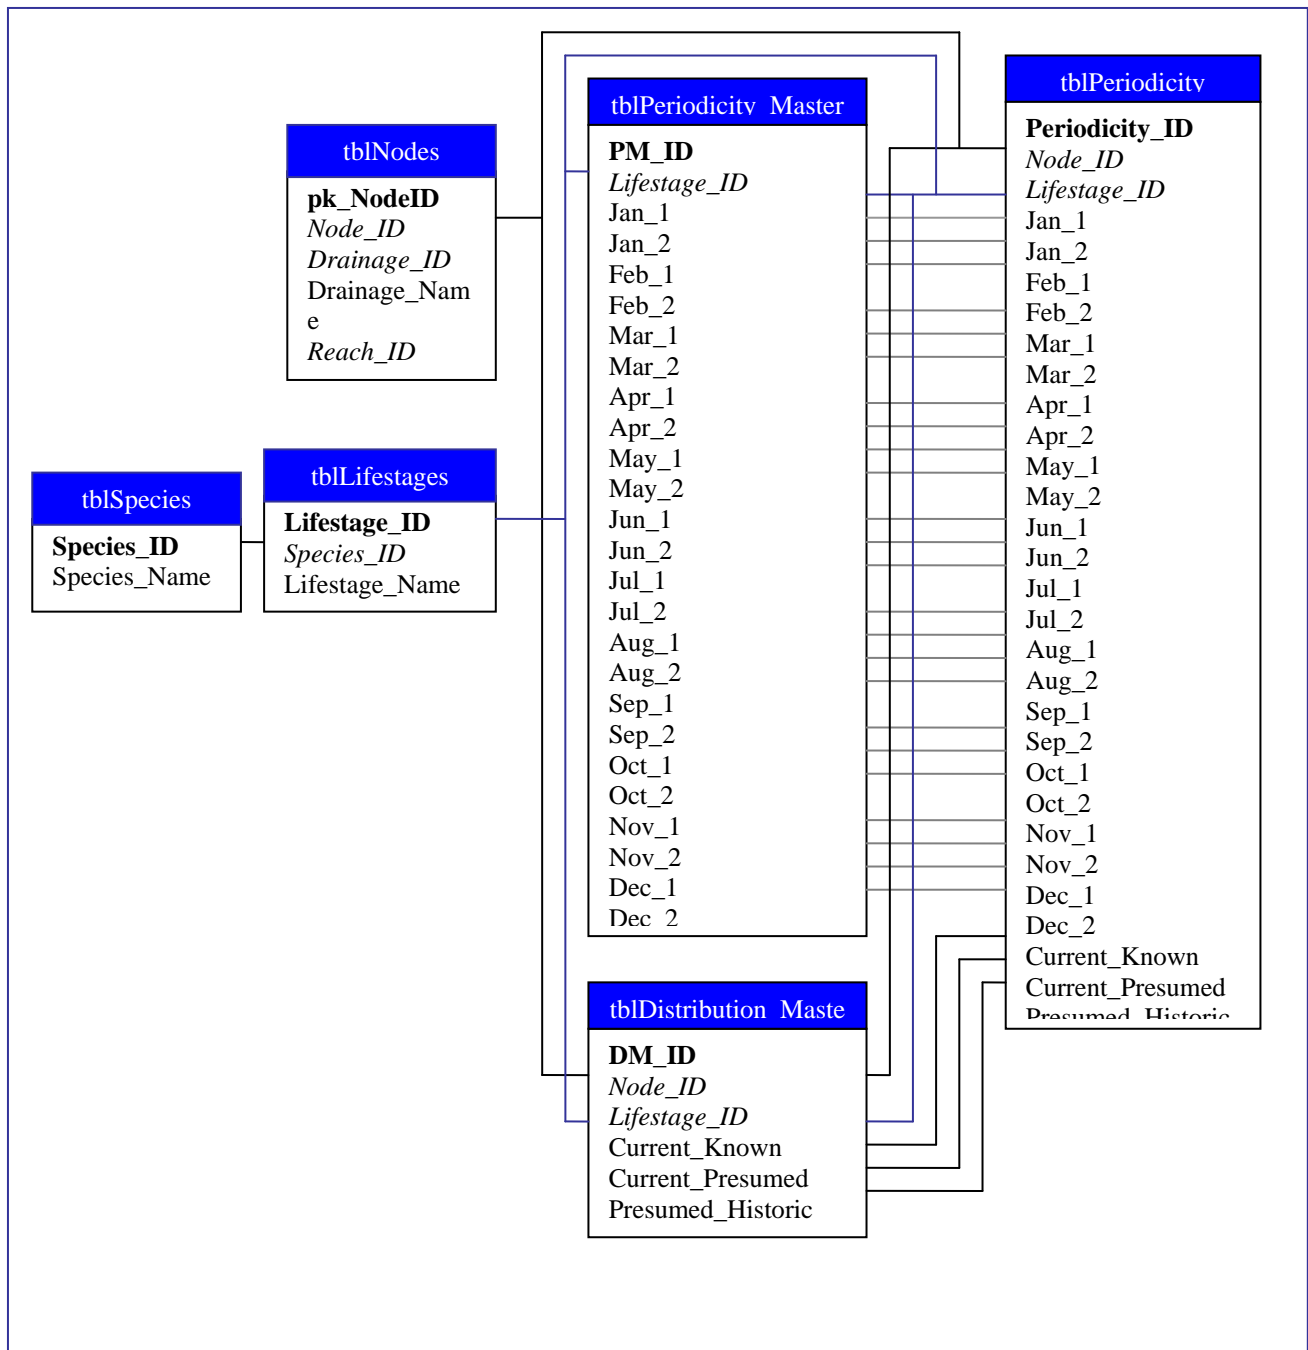

3394  
3395  
3396  
3397

**Table:** tblSpecies

**Description:** Contains the Species Information (ID, Name) for each one available.

| Field        | Type        | Size         | Key Field           | Primary Key | Comments   |
|--------------|-------------|--------------|---------------------|-------------|--|
| Species_ID   | Auto Number | Long Integer | Yes (No Duplicates) | Yes         | This is a unique ID for each Species. It corresponds with the Species_ID Field in the tblLifestages table. |
| Species_Name | Text        | 255          | No                  | No          | This is the Name of the Species.   |

3401  
3402  
3403

## 2. Data Needs

There are two type of data needed for the Periodicity Viewer/Editor: a point shapefile, and an Access Database

- Point Shapefile – this needs to be in the same projection as the other shapefiles in your project. It contains the point locations of where each of the Nodes are located. There needs to be field in this shapefile containing the Node\_ID values for each of the nodes.

- Access Database – this is the database of Periodicity and Fish Distribution data. This database needs to be organized as described in *Section 1: Table Design*.

As stated above, the shapefile requires one field to be found in the data table. Following is the description of the required Field in the shapefile (an example field name, the field type, a description of the data that gets entered into this field, and how it is associated with the database).

Required data layer field description:

- a. Node\_ID – Integer – The Node ID for the node at this location. It corresponds with the Node\_ID field in the tblNodes table in the database. Each value that is found in this field (in the shapefile) also needs to be found in the database.

### 3. Dependencies

The Periodicity Viewer/Editor plug-in requires the following software components and modules to be installed:

Software:

MapWindow 3.1  
Visual Studio .NET 2003

Modules and Components:

MapWindow Interfaces  
MapWinGIS Map Control  
Microsoft FlexGrid Control 6.0 (SP3)

Integrated Development Environment (IDE)

Visual Studio .NET 2003

### 4. Setup

To begin using the Periodicity Viewer/Editor, it must first be loaded into MapWindow. Once it is loaded, click on the periodicity icon, , located on the Map Window toolbar. If the shapefile and database associations (as described in *Section 2: Data Needs*) have been configured properly and the database is accessible, then the Periodicity Viewer/Editor will appear allowing the user to select and view Periodicity and Fish Distribution data for available nodes.

If the data associations have not been properly set, then a Connection Form will appear allowing you to set the shapefile and database. Then, after the shapefile and database have been properly associated, select the periodicity icon, , from the Map Window toolbar and the viewer will appear allowing the user to view the data.

3458 See the User's Manual for more information and details on associating the data with the  
 3459 Periodicity Viewer/Editor.  
 3460

## 3461 5. Code Compiling

3462  
 3463 Compiling the Periodicity Viewer/Editor is a fairly straightforward task. After ensuring  
 3464 that all of the required components discussed in *Section 3: Dependencies* are present,  
 3465 load the project into Visual Studio .Net 2003. This Plugin was created using Visual  
 3466 Basic (VB).  
 3467

3468 The project needs to include the following files:

| <u>File Name</u>                                    | <u>Purpose</u>   |
|---|--|
| AssemblyInfo.vb                                     | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| clsPeriodicityMain.vb                               | Contains a class that implements the MapWindow plugin interface.   |
| frmDBConnection.vb,<br>frmDBConnection.resx         | Displays the Connection form that allows the user to associate the shapefile, shapefile field, and database with the Periodicity Viewer/Editor plug-in.  |
| frmEditDistribution.vb,<br>frmEditDistribution.resx | Displays the form that allows the user to Edit the selected Fish Distribution value.   |
| frmEditPeriodicity.vb,<br>frmEditPeriodicity.resx   | Displays the form that allows the user to Edit the selected Periodicity value.   |
| frmPeriodicity.vb,<br>frmPeriodicity.resx           | Displays the Periodicity Viewer/Editor form. This form contains the table that displays the Periodicity and Fish Distribution data contained in the associated database. You show this form by selecting the periodicity icon,  , from the Map Window toolbar.  |
| frmRDESelect.vb,<br>frmRDESelect.resx               | Displays the form that allows the user to select which types of data (Periodicity and/or Fish Distribution) to either Restore Defaults for, or to Export (save, print, or copy).   |
| frmSelectLayer.vb,<br>frmSelectLayer.resx           | Displays the form to select the point shapefile associated with the Periodicity Viewer/Editor plug-in. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk.   |
| ImageConverter.vb                                   | Contains a class that implements functions that allows you to convert images to and from an IPictureDisp object. This is needed so that the VBCompatibility.dll does not need to be referenced. This class allows the periodicity image,  , to be associated with the points on the associated shapefile. |
| modColorDefinitions.vb                              | This module contains the color definitions used in the table for displaying the Periodicity Values on the main viewer form.  |
| modDBDefinitions.vb                                 | This module contains the variable definitions that hold the table and field variable names for the Periodicity database. These variables are used throughout the project so that if anything should change in the database, the value only has to be changed in 1 location.  |

|                      |   |
|----------------------|---|
| modGlobals.vb        | This module contains the variables used throughout the forms, such as the form declaration variables, MapWindow variables, and others.  |
| modPDDDefinitions.vb | This module contains the variable definitions that hold the Periodicity and Fish Distribution labels and values for displaying, exporting, and restoring the data.  |
| modUtils.vb          | This module contains functions that are used throughout the project for accessing the database, reporting errors, conversions, file functionality, and other necessary functionality.   |
| Periodicity3.bmp     | Bitmap version of the Periodicity3.ico. It is used as a custom image for the point shapefile associated with the Periodicity Viewer/Editor plug-in.<br><i>NOTE: this file needs to be an embedded resource</i>  |
| Periodicity3.ico     | Icon that is used as the Map Window Legend picture when using a custom image for the point shapefile associated with the Periodicity Viewer/Editor. It also is the icon on the Map Window Toolbar for the Periodicity Viewer/Editor plug-in.<br><i>NOTE: this file needs to be an embedded resource</i> |
| PluginInfo.vb        | Contains a class that implements an interface to access (read from and write to) the Project File.  |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| AxMapWinGIS          | CopyLocal = True  |
| AxMSFlexGridLib      | CopyLocal = True  |
| MapWinGIS            | CopyLocal = True  |
| MapWinInterfaces     | CopyLocal = False |
| MSFlexGridLib        | CopyLocal = True  |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |
| System.Drawing       | CopyLocal = False |
| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwPeriodicityViewer.dll has now been created with Microsoft Visual Studio .NET 2003. It is created in the *mwPeriodicityViewer* subdirectory in the *\Plugins* folder. Next time that MapWindow is run, if the mwPeriodicityViewer.dll was built to the correct folder, the updated changes to the Periodicity Viewer/Editor will be available.

## 1. Overview

The Water Quantity Model is comprised of two components (a) the TOPNET Fortran Executable that performs the model simulations and calculations, and (b) the Water Quantity Model Interface that configures the input to this through the decision support system. The TOPNET Model is described in the Task 4.1 report "Surface Water Quantity Model Development and Calibration". The electronic appendix to this report includes descriptions of the file formats used by this model. This documentation describes the databases and information used by the Water Quantity Model Interface as a plugin component to the DSS.

## 2. Table Designs

Land Cover Database: LandCoverSummary.mdb

(See "Technical Documentation For Land Cover Summarizer" for table designs)

Water Management Databases (For each Water Quantity Model dataset: Historic, Existing, and Full Build Out): HistoricWaterManagement.mdb, ExistingWaterManagement.mdb, FBOWaterManagement.mdb

Table: MonthlyDemand. Provides information on monthly variation of water demand.

| Field Name       | Data Type    | Description  |
|------------------|--------------|--|
| InYearDemandType | Long Integer | Index matching the InYearDemandType field in User table.   |
| Name             | Text         | Monthly Demand Name  |
| Month1           | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month2           | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month3           | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month4           | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month5           | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month6           | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |

|         |              |  |
|---------|--------------|--|
| Month7  | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month8  | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month9  | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month10 | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month11 | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |
| Month12 | Long Integer | Multipliers to adjust the daily demand for this month with respect to default daily demand rate. |

Table: Reservoir. Provides data on reservoirs to water management model.

| Field Name    | Data Type    | Description                                     |
|---------------|--------------|---|
| ReservoirID   | Long Integer | Unique identifier for reservoir                 |
| Name          | Text         | Reservoir Name                                  |
| DrainageID    | Long Integer | WRIA1 drainage where reservoir is located.      |
| InOffStream   | Long Integer | Reservoir type: 1 - Instream, 2 - Offstream     |
| RightID       | Long Integer | ID of water right for this reservoir            |
| MaxStore      | Double       | Maximum storage (m <sup>3</sup> )               |
| InitialStore  | Double       | Initial storage (m <sup>3</sup> )               |
| MinStore      | Double       | Minimum storage (m <sup>3</sup> )               |
| MaxInFlow     | Double       | Maximum inflow (m <sup>3</sup> /s)              |
| MaxWithdrawal | Double       | Maximum withdrawal (m <sup>3</sup> /s)          |
| MinEnvRelease | Double       | Minimum environment release (m <sup>3</sup> /s) |
| LossRate      | Double       | Loss rate (m <sup>3</sup> /s)                   |

Table: ReturnFlow. Provides information on return flows for the water management model.

| Field Name   | Data Type    | Description  |
|--------------|--------------|--|
| ReturnFlowID | Long Integer | Unique identifier for return flow matching ReturnFlowID in User table. |
| Name         | Text         | Return Flow Name   |

|                   |              |   |
|-------------------|--------------|---|
| NumReturnFlows    | Long Integer | Number of return flows associated with user.  |
| ReturnFlowUnits   | Long Integer | ReturnFlowUnits: 1=FracFlow, 2=FracMinDemand, 3=Volume  |
| ReturnFlowAmt1    | Double       | Amount of first return flow, fraction or volume. Units are m <sup>3</sup> /day if ReturnFlowUnits=3, volume..                                       |
| ReturnFlowType1   | Long Integer | Type of return flow:<br>1 - Surface Water,<br>2 - Ground Water,<br>3 - Reservoir.   |
| ReturnFlowLocn1   | Long Integer | WRIA1 drainage ID of drainage where first return flow occurs. Specifying 0 means the drainage associated with the user producing this return flow.  |
| ReturnFlowWWTPID1 | Long Integer | Identifier of wastewater treatment plant (WWTP) if return flow is treated.  |
| ReturnFlowAmt2    | Double       | Amount of second return flow, fraction or volume. Units are m <sup>3</sup> /day if ReturnFlowUnits=3, volume..                                      |
| ReturnFlowType2   | Long Integer | Type of return flow:<br>1 - Surface Water,<br>2 - Ground Water,<br>3 - Reservoir.   |
| ReturnFlowLocn2   | Long Integer | WRIA1 drainage ID of drainage where second return flow occurs. Specifying 0 means the drainage associated with the user producing this return flow. |
| ReturnFlowWWTPID2 | Long Integer | Identifier of wastewater treatment plant (WWTP) if return flow is treated.  |

Table: Rights. Provides information on water rights to water management model.

| Field Name    | Data Type    | Description  |
|---------------|--------------|--|
| RightID       | Long Integer | Water Rights Identifier matches RightID in User table. |
| Name          | Text         | Name of Water Right                                    |
| PriorityDate  | Date/Time    | Priority date.   |
| LegalDailyMax | Double       | Maximum daily withdrawal in cubic meters per day.      |
| LegalAnnMax   | Double       | Maximum annual withdrawal in cubic meters.             |

3555 Table: SeasonsDefn. Provides start and end day for seasons.

| Field Name      | Data Type    | Description                                      |
|-----------------|--------------|--|
| SeasonsDefnID   | Long Integer | Unique identifier for a season definition record |
| Name            | Text         | Name of Season Definition                        |
| StartDaySeason1 | Long Integer | Day to start season 1                            |
| StartDaySeason2 | Long Integer | Day to start season 2                            |
| StartDaySeason3 | Long Integer | Day to start season 3                            |
| StartDaySeason4 | Long Integer | Day to start season 4                            |

3556

3557

3558 Table: Source. Provides information on user sources to the water management model.

| Field Name       | Data Type    | Description  |
|------------------|--------------|--|
| SourceID         | Long Integer | Unique ID Number   |
| Name             | Text         | Name of source   |
| Type             | Long Integer | 1 - Surface Water,<br>2 - Ground Water,<br>3 - Reservoir |
| SourceLocationID | Long Integer | Drainage ID or Reservoir ID                              |
| PhysicalDailyMax | Double       | Physical Limitation (m <sup>3</sup> /day)                |
| PhysicalAnnMax   | Double       | Physical Limitation (m <sup>3</sup> /day)                |

3559

3560

3561 Table: SourceMixing. Provides information about the apportioning of take between the sources  
3562 that the users draw water from.

| Field Name     | Data Type    | Description   |
|----------------|--------------|---|
| SourceMixingID | Long Integer | Source mixing index from User table. There may be multiple records with the same index as there is a one (record in User) to many (records in sourcemixing) relationship. |
| Name           | Text         | Name of source mixing record  |
| UsersSourceNum | Long Integer | Matches the UsersSourceNum in UserSourceRight table   |
| Units          | Long Integer | 1 - fraction, 2 - volume  |
| Season1Amount  | Double       | How much to take from this source for season 1 in the season defined by SeasonsDefnID. If volume the units are m <sup>3</sup> /day.                                       |
| Season2Amount  | Double       | How much to take from this source for season 2 in the season defined by SeasonsDefnID. If volume the units are m <sup>3</sup> /day.                                       |
| Season3Amount  | Double       | How much to take from this source for season 3 in the season defined by SeasonsDefnID. If   |

|               |              |   |
|---------------|--------------|---|
|               |              | volume the units are m <sup>3</sup> /day.   |
| Season4Amount | Double       | How much to take from this source for season 4 in the season defined by SeasonsDefnID. If volume the units are m <sup>3</sup> /day. |
| SeasonsDefnID | Long Integer | ID of row in SeasonsDefinition Table  |

Table: SourceMixingOld. Earlier format of SourceMixing table. Not used unless importing information from water management files.

| Field Name     | Data Type    | Description   |
|----------------|--------------|---|
| SourceMixingID | Long Integer | Source mixing index from User table. There may be multiple records with the same index as there is a one (record in User) to many (records in sourcemixing) relationship. |
| Name           | Text         | Name of source mixing   |
| UsersSourceNum | Long Integer | Matches the source ID in User table   |
| Units          | Long Integer | 1 - fraction, 2 - volume  |
| Amount         | Double       | How much to take from this source. If volume the units are m <sup>3</sup> /day.   |
| SeasonNumber   | Long Integer | Number from 1 to 4  |
| SeasonsDefnID  | Long Integer | ID of row in SeasonsDefinition Table  |

Table: User. Provides information about water users and water demands to the water management component.

| Field Name | Data Type    | Description   |
|------------|--------------|---|
| UserID     | Long Integer | Unique sequential id for user   |
| Name       | Text         | Name of user  |
| UserType   | Long Integer | User type in one of the following categories:<br>1 - SoilMoistureIrrigation<br>2 - FixedDemandIrrigation<br>3 - DownstreamReservoirRelease<br>4 - PWS<br>5 - NonPWSMandI<br>6 - Dairy<br>7 - Ranch<br>8 - Poultry<br>9 - ParkGolfCemetery<br>10 - InstreamFlow<br>11 - Diversion<br>12 - ReservoirFill<br>13 - InStreamReservoirRelease<br>14 - OffStreamReservoirRelease |

|                  |              |   |
|------------------|--------------|---|
| POU_ID           | Long Integer | Place of Use. The WRIA1 Drainage Identifier DrainID where the use occurs.   |
| DemandVble       | Double       | Number of quantifiable user units (e.g. people or cows). Set to one if not relevant. (The demand is calculated by multiplying this variable with the DemandRate.)   |
| DemandRate       | Double       | The amount of water demand per unit time for one unit of activity (m <sup>3</sup> /day/unit)  |
| InYearDemandType | Long Integer | Index to record in Monthly Demand Table that specifies the monthly (seasonal) variation associated with this use. InYearDemandType may be set to zero if the use is constant over the year or to -1 if this information is not required, such as is the case for irrigation users where demand is based on soil moisture and reference evaporation. |
| ReturnFlowID     | Long Integer | Index to record in return flow table that specifies information about the return flow associated with this user.  |
| SourceMixingID   | Long Integer | Index to records in source mixing table in file sourcemixing.txt that specifies information about apportioning of take between the sources that the user draws water from. This is a one to many relationship.  |

Table: UserSourceRight. Table that associates sources and rights with users

| Field Name     | Data Type    | Description  |
|----------------|--------------|--|
| UserID         | Long Integer | User id of user associated with a source and water right   |
| SourceID       | Long Integer | Id of source used by specified user  |
| RightID        | Long Integer | Id of water right associated with the specified user   |
| UsersSourceNum | Long Integer | Id of record in Source SourceMixingTable giving the proportioning between sources associated with a user |

Water Quantity Simulated Streamflow Database: WaterQuantityStreamFlow.mdb and WaterQuantityStreamFlow.mdf  
(See “Technical Documentation For Time Series Analyst” for table designs)

### 3. Data

The Water Quantity Model requires the following input data:

- Drainages Shapefile
- TopNet Input Directory
- Land Cover Summary Database
- Water Management Database

The drainage shapefile used should be bsnwria1\_v7.shp. Only the drainage identifier (BSNWRIA1A) and drainage name (DRAIN\_NAME) are used from this shapefile. Other inputs have been created using the drainage identifiers in this shapefile. Use of another shapefile would result in incorrect names being associated with drainage identifiers. The WRIA-1 drainages shapefile is installed at the following location by default:

C:\Program Files\WRIA-1\_DSS\DSS\_Data\GIS\_Data\Shapefiles\Watershed\bsnwria1\_v7.shp

The TopNet input directory is the folder comprising input files required to run the water quantity model. Three such folders are provided, one each for historic, existing and full build out conditions. When the model is run this entire set of files is copied to the specified output working directory. The model is then run in the output working directory which serves as a record of the inputs and outputs for a specific model run scenario. The TopNet Input Directories are installed at the following locations by default:

C:\Program Files\WRIA-1\_DSS\Water Quantity TopNet Files\ModelInputFilesHistoric  
C:\Program Files\WRIA-1\_DSS\Water Quantity TopNet Files\ModelInputFilesExisting  
C:\Program Files\WRIA-1\_DSS\Water Quantity TopNet Files\ModelInputFilesFBO

The land cover summary database contains the area of each land cover type summarized for each drainage. This is created by the land cover summarizer tool. The initial land cover summary database provided includes land covers for each scenario:

- Scenario 1 = Historic conditions
- Scenario 2 = Existing conditions
- Scenario 3 = Full build out conditions

The Land Cover Summary Database is installed at the following location by default:

C:\Program Files\WRIA-1\_DSS\DSS\_Data\Model Manager  
Databases\LandCoverSummary.mdb

The water management database is a Microsoft Access database contains the information needed to populate the water quantity model water management input files. This database is changed when water management options are edited. Three initial water management databases are provided, one for each scenario. The Water Management Databases are installed at the following locations by default:

C:\Program Files\WRIA-1\_DSS\DSS\_Data\Model Manager  
Databases\HistoricWaterManagement.mdb

3624 C:\Program Files\WRIA-1\_DSS\DSS\_Data\Model Manager  
3625 Databases\ExistingWaterManagement.mdb  
3626 C:\Program Files\WRIA-1\_DSS\DSS\_Data\Model Manager  
3627 Databases\FBOWaterManagement.mdb

3628  
3629 The Water Quantity Model produces a large number of text output files. These are saved in a  
3630 folder created each time the model is run. By default these folders are created in:

3631  
3632 C:\Program Files\WRIA-1\_DSS\Model Runs.

3633  
3634 The formats of these output files are described in the electronic appendix to the Task 4.1 report  
3635 "Surface Water Quantity Model Development and Calibration". The modeled Streamflow from  
3636 this model output, from the file FlowAtStreamNodes\_cms.txt is added to the  
3637 WaterQuantityStreamflow database designated in the output tag of the Water Quantity Model  
3638 Interface. This database is in the format used by the Time Series Analyst Component and  
3639 documented in the Technical Documentation for Time Series Analyst. The Water Quantity  
3640 Interface model adds data to the WQData table and a new Parameter record identifying the  
3641 scenario simulated to the Parameter\_CodeDescriptions table. All other tables are left  
3642 unchanged.

3643  
3644 Three output databases are provided at the following locations by default:

3645  
3646 C:\Program Files\WRIA-1\_DSS\MSDEDATABASES\WaterQuantityStreamFlow.mdf  
3647 C:\Program Files\WRIA-1\_DSS\MSDEDATABASES\WaterQuantityStreamFlowSimRef.mdf  
3648 C:\Program Files\WRIA-1\_DSS\DSS\_Data\Model Manager  
3649 Databases\WaterQuantityStreamflow.mdb

3650  
3651 The first and third of these databases have no streamflow data in them, but are pre-loaded with  
3652 the station information corresponding to the nodes at which streamflow is simulated. The second  
3653 of these WaterQuantityStreamflowSimRef.mdf contains four reference simulations (Historic,  
3654 Existing without water management, Existing and Full Build out) that USU conducted for the 45  
3655 year period of record (10/1/1959 to 12/31/2005).

3656  
3657 The following GIS files are provided with the DSS to facilitate interpretation of the Surface  
3658 Water Quantity Model output:

- 3659     • points\_of\_interest\_v8.shp  
3660     • Nodes.shp  
3661     • Nooknet.shp

3662  
3663 points\_of\_interest\_v8.shp identifies the points where streamflow is simulated by the TOPNET  
3664 model, including names and station identifiers used by WRIA. Nodes.shp provides a cross  
3665 reference between the sequential node numbering that TOPNET uses internally and the node  
3666 numbering on points\_of\_interest\_v8.shp. See the Task 4.1 report "Surface Water Quantity  
3667 Model Development and Calibration" for the node numbering schema definitions. Nooknet.shp  
3668 is the stream network shapefile representing stream reaches derived during the process of setting

up the Water Quantity Model and depicting the connectivity between nodes used in the simulation. By default these shapefiles are installed in:

C:\program files\WRIA-1\_DSS\DSS\_Data\GIS\_Data\Shapefiles\Watershed

#### 4. Dependencies

The Water Quantity Model Interface requires the following software to be installed:

Software:

MapWindow 3.1

DSS Model Manager

Integrated Development Environment (IDE):

Visual Studio .NET 2003 Complete Install

The Water Quantity Model requires the data output by the following DSS elements:

Land Cover Summary Tool

The Water Quantity Model Fortran Executable is provided as a standalone executable without any dependencies.

#### 5. Setup

Water Quantity Model Interface

The WRIA-1\_DSS Installation installs the Water Quantity Model in the MapWindow Plugins folder.

(This is usually located at C:\Program Files\MapWindow\Plugins\ModelManager\Elements”).

#### 6. Building

To compile the Water Quantity Model Interface Management Practices Tool, add the files below to a Microsoft Visual Studio .NET 2003 Visual Basic .NET Library Project.

mwWaterQuantityModel project files:

| File Name          | Purpose   |
|--------------------|---|
| AssemblyInfo.vb    | Contains information relating to the DLL assembly. Generated by VB.NET.                       |
| BasinParsFile.vb   | Contains the routines used to write an updated basinpars.txt file for the TopNet model input. |
| DBClient.vb        | Contains the routines used to connect to a database.  |
| DirectoryPicker.vb | Custom component that allows a user to select a directory from the computer’s file system.    |

|                               |   |
|-------------------------------|---|
| EditMonthlyDemandData.vb      | Custom component allowing users to edit monthly demand data for water management purposes.  |
| EditReservoirData.vb          | Custom component allowing users to edit reservoir data for water management purposes.   |
| EditReturnFlowData.vb         | Custom component allowing users to edit return flow data for water management purposes.   |
| EditRightsData.vb             | Custom component allowing users to edit water rights data for water management purposes.  |
| EditSeasonsDefinitionsData.vb | Custom component allowing users to edit seasons definition data for water management purposes.  |
| EditSourceData.vb             | Custom component allowing users to edit source data for water management purposes.  |
| EditUserData.vb               | Custom component allowing users to edit user data for water management purposes.  |
| EditWatershedInfo.vb          | Custom component allowing users to view watershed information for water management purposes.  |
| FlowWriter.vb                 | Contains the routines used to write flow data output by the TopNet model to a simulated streamflow database.  |
| Folder.ico                    | An icon used in frmWaterRights to represent a group of users within a WRIA-1 Drainage.  |
| frmArtificialDrainages.vb     | Allows the user to view/edit the artificial drainage (a.k.a. agricultural drainage) values for a WRIA-1 Drainage.   |
| frmConfiguration.vb           | Contains the routines used to select a database.  |
| frmEditExistingItem.vb        | Allows the user to select an existing water management item to edit.  |
| frmEditImperviousArea.vb      | Allows the user to edit impervious area data for a WRIA-1 drainage.   |
| frmEditNewItem.vb             | Allows the user to select a new water management time to edit.  |
| frmEditSourceMixing.vb        | Allows the user to select the source mixing for a water user's sources.   |
| frmEditSourceMixingPeriods.vb | Allows the user to edit a source mixing period.   |
| frmImperviousAreas.vb         | Allows the user to edit the impervious area data for a WRIA-1 drainage.   |
| frmInputs.vb                  | Allows the user to select the data locations for the model inputs and outputs.  |
| frmProgress.vb                | A form containing a progress bar to show the progress of an activity.   |
| frmSelectLayer.vb             | Contains the routines used to select a layer from MapWindow's view.   |
| frmSelectModelDirectory.vb    | A form containing a DirectoryPicker component which allows the user to select a directory from the file system, or a directory to be created by the Water Quantity Model in the current DSS Scenario Run. |
| frmSelectScenario.vb          | Allows the user to select a previously run DSS scenario by id.  |

|                           |   |
|---------------------------|---|
| frmSelectSources.vb       | Allows the user to select water sources for a water user.   |
| frmWaterRights.vb         | Allows the user to edit water management for the Water Quantity Model.  |
| ImperviousAreas.xml       | Contains the default impervious areas and artificial drainage values. Written to disk next to mwWaterQuantityModel.dll if it doesn't exist. |
| ImperviousXMLFile.vb      | Contains the methods used to manage the impervious area data xml file.  |
| LUParsFile.vb             | Contains the methods used to read default basin parameters from the file lupars.csv.  |
| NewWaterRightsItem.vb     | Allows the user to create a new water rights item.  |
| OpenFolder.ico            | An icon used in frmWaterRights to represent a group of users within a WRIA-1 Drainage which is currently displayed.                         |
| Reservoir.ico             | An icon used in frmWaterRights to represent a reservoir.  |
| Source.ico                | An icon used in frmWaterRights to represent a water source.   |
| TopInpFile.vb             | Contains the routines used to write an updated topinp.dat file for the TopNet model input.  |
| WaterMgmtControlFile.vb   | Contains the routines used to write an updated WatermgmtControl.txt file for the TopNet model input.  |
| WaterQuantityModel.vb     | Implements MapWindow Plugin and DSS Interface routines, allowing the Lake Whatcom Model to act as a MapWindow Plugin and a DSS element.     |
| WaterRights.xml           | Contains lists of water management types used in frmWaterRights. Written to disk next to mwWaterQuantityModel.dll if it doesn't exist.      |
| WaterRightsWriter.vb      | Contains the methods to manage the water management files for the Water Quantity Model.   |
| WaterUser.ico             | An icon used in frmWaterRights to represent the root water user node.   |
| WaterUserClosedFolder.ico | An icon used in frmWaterRights to represent a water user that is not currently selected.  |
| WaterUserOpenFolder.ico   | An icon used in frmWaterRights to represent a water user that is currently selected.  |

Add the following references to the project:

- DssIntfcLib.dll
- ICSharpCode.SharpZipLib.dll
- MapWinGIS.ocx
- MapWinInterfaces.dll
- System.dll
- System.Data.dll
- System.Drawing.dll
- System.Windows.Forms.dll
- System.Xml.dll

3713  
3714 You are now ready to compile the project by clicking the Build Solution menu option under the  
3715 menu Build.  
3716  
3717 Water Quantity Model Fortran Executable  
3718  
3719 The executable topnet.exe is included in each input folder and replicated in each output folder.  
3720 Topnet.exe is compiled using the Compaq Visual Fortran version 6.6 compiler from the  
3721 following files.  
3722  
3723 Source Code

  - *Reference Settings*

## 1. Stream Response Model Output Folder Data Needs

This is the folder containing the output text files from the Waterbody Response Model. The files in this folder must be named in the following way:

**NodeTS###.txt**

Where ### represents the three digit node number for that file. If the files in this folder are not named in this way and are not the Waterbody Response Model output files, the Temperature and DO Flags Model will not run.

## 2. Watershed Loading Model Output Text File Data Needs

This text file is the output from the Watershed Loading Model. It must be a text file. It can have any name.

## 3. Input Model Nodes Shapefile Data Needs

There are two types of data required for the Input Model Nodes Shapefile: a point shapefile path, and a *Node ID* shapefile field.

- Point Shapefile – this shapefile needs to be in the same project as the other shapefiles in your project. It contains the point locations of each of the Model Nodes. Connection Name – this is the name of the Time Series Analyst Connection.
- *Station* Shapefile Field – this field is a String field that contains the Node ID for each of the Model Nodes. It corresponds with the *Station* Field in the Stations table and with the *Station* Field in the *WQData* table for the Output Temperature DO Database.

*NOTE: If the Node ID in the shapefile is not found in either of the Input Databases, then the model will not run, and there will be an entry in the log explaining why.*

In order to specify the Nodes to model, the Model Nodes Shapefile must be selected and added to the project. Then you can either select the which Nodes to model by specifying the Node ID's or by going to map and selecting with the Map Window Selection tools.

## 4. Output Temperature and DO Database Table Design

Following is a list of tables that must be included with the Output Temperature and DO Database. Other tables and information may exist, and not all the tables listed are used by the Temperature and DO Flags Model. However, these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters.

3830 **Table:** Agency\_Code Descriptions

3831 **Description:** This table is not used by the Temperature and DO Flags Model.

| Field              | Type   | Size         | Key Field           | Primary Key | Comments |
|--------------------|--------|--------------|---------------------|-------------|----------|
| Agency_ID          | Number | Long Integer | No                  | No          |          |
| Agency_Code        | Text   | 50           | Yes (No Duplicates) | Yes         |          |
| Agency_Description | Text   | 255          | No                  | No          |          |
| Contact            | Text   | 50           | No                  | No          |          |

3832

3833

3834 **Table:** Comment\_Code Descriptions

3835 **Description:** This table is not used by the Temperature and DO Flags Model and is  
3836 blank.

| Field        | Type | Size | Key Field           | Primary Key | Comments |
|--------------|------|------|---------------------|-------------|----------|
| Comment_Code | Text | 50   | Yes (No Duplicates) | Yes         |          |
| Description  | Text | 200  | No                  | No          |          |

3837

3838

3839 **Table:** Data\_Code Descriptions

3840 **Description:** This table is not used by the Temperature and DO Flags Model and is  
3841 blank.

| Field       | Type | Size | Key Field           | Primary Key | Comments |
|-------------|------|------|---------------------|-------------|----------|
| Data_Code   | Text | 50   | Yes (No Duplicates) | Yes         |          |
| Description | Text | 255  | No                  | No          |          |

3842

3843

3844 **Table:** GroupNames

3845 **Description:** This table is not used by the Temperature and DO Flags Model and is  
3846 blank.

| Field      | Type   | Size         | Key Field           | Primary Key | Comments |
|------------|--------|--------------|---------------------|-------------|----------|
| Group_ID   | Number | Long Integer | Yes (Duplicates OK) | No          |          |
| Group_Name | Text   | 50           | No                  | No          |          |

3847

3848

3849 **Table: GroupStations**

| Field    | Type       | Size         | Key Field           | Primary Key | Comments  |
|----------|------------|--------------|---------------------|-------------|---|
| Key      | AutoNumber | Long Integer | Yes (Duplicates Ok) | No          |   |
| Group_ID | Number     | Long Integer | Yes (Duplicates OK) | No          | The ID for the Group. It corresponds with the <i>Group_ID</i> Field in the <i>GroupNames</i> table. |
| Station  | Text       | 50           | No                  | No          |   |

3850

3851

3852

**Table: Parameter\_Code Descriptions**

| Field          | Type   | Size                                    | Key Field           | Primary Key | Comments                        |
|----------------|--------|---|---------------------|-------------|---------------------------------|
| Parameter_Code | Number | Long Integer (Automatic decimal places) | Yes (No Duplicates) | Yes         | A unique ID for each Parameter. |
| Parameter_Name | Text   | 255                                     | No                  | No          |                                 |

## 5. Output Temperature Flags and Warnings Shapefile Data Needs

The Temperature Flags and Warnings Shapefile must be the shapefile named Temp\_Flags\_Warnings.shp. Data is written to this shapefile whenever the Temperature and DO Flags Model is run. Any existing data is erased from the database and the new model data is written. This shapefile must contain the following fields:

- *Shape* – All data in this shapefile are Points
- *Station* – This field contains the Station name for each Node. This Field corresponds with the *Station* Shapefile Field in the Input Model Nodes Shapefile and the *Station* Field in the Stations table and with the *Station* Field in the *WQData* table for the Output Temperature DO Database
- *Station\_na* – This fields contains the Drainage information for each Node.
- *UTMX*- This is the X value for the UTM coordinates for each Node.
- *UTMY*- This is the Y value for the UTM coordinates for each Node.
- *Site\_type*- This specifies the node type, for example, if the node is a USU Intensive site or a Mixing Node, etc.
- *Num\_flags*- This field contains the number of Temperature Flags at each Node.
- *Num\_warn*- This field contains the number of Temperature Warnings at each Node.
- *Color*- If the *Num\_flags* Field has a value greater than zero, the color is Red. If the *Num\_flags* Field has a value of zero and the *Num\_warn* Field has a value greater than zero, the color is Yellow. If both *Num\_flags* and *Num\_warn* Fields contain a value of zero AND the *Station\_na* Field does not say “No WQ Data”, the color is Green. If the *Station\_na* Field says “No WQ Data”, the color is Black.

## 6. Output DO Flags and Warnings Shapefile Data Needs

The DO Flags and Warnings Shapefile must be the shapefile named DO\_Flags\_Warnings.shp. Data is written to this shapefile whenever the Temperature and DO Flags Model is run. Any existing data is erased from the database and the new model data is written. This shapefile must contain the following fields:

- *Shape* – All data in this shapefile are Points
- *Station* – This field contains the Station name for each Node. This Field corresponds with the *Station* Shapefile Field in the Input Model Nodes Shapefile and the *Station* Field in the Stations table and with the *Station* Field in the *WQData* table for the Output Temperature DO Database
- *Station\_na* – This fields contains the Drainage information for each Node.
- *UTMX*- This is the X value for the UTM coordinates for each Node.
- *UTMY*- This is the Y value for the UTM coordinates for each Node.
- *Site\_type*- This specifies the node type, for example, if the node is a USU Intensive site or a Mixing Node, etc.
- *Num\_flags*- This field contains the number of DO Flags at each Node.

- 3923
- *Num\_warn*- This field contains the number of DO Warnings at each Node.
  - *Color*- If the *Num\_flags* Field has a value greater than zero, the color is Red. If the *Num\_flags* Field has a value of zero and the *Num\_warn* Field has a value greater than zero, the color is Yellow. If both *Num\_flags* and *Num\_warn* Fields contain a value of zero AND the *Station\_na* Field does not say “No WQ Data”, the color is Green. If the *Station\_na* Field says “No WQ Data”, the color is Black.

## 3931 7. Dependencies

3932

3933 The Time Series Analyst plug-in requires the following software components and modules to

3934 be installed:

3935

3936 Software:

3937 MapWindow 3.1

3938 Visual Studio .NET 2003

3939

3940 Modules and Components:

3941 DSS Interface Definitions

3942 MapWindow Interfaces

3943 MapWinGIS Components

3944

3945 Integrated Development Environment (IDE)

3946 Visual Studio .NET 2003

3947

## 3948 8. Setup

3949

3950 To begin using the Temperature and DO Flags Model, you must first load the Scenario

3951 Builder/DSS Plug-in into Map Window. Once it is loaded, click on the DSS Menu located

3952 on the Map Window Menu bar and select either Scenario Builder, or the name of the

3953 Scenario that you want to run. Once the Scenario Builder is and the Temperature and DO

3954 Flags Model is added to the current Scenario, Run the Scenario. If all the input and output

3955 parameters have been correctly set and they are all accessible, then the Temperature and DO

3956 Flags Model will run for the selected data. After it is finished the user may view the run log

3957 if they desire. If any errors occur during the run, an error log will appear explaining the

3958 error.

3959

3960 If the input and output data associations have not been properly set, then double click on the

3961 Temperature and DO Flags Model scenario node, and a Parameters Form will appear

3962 allowing you to edit the input and output data. Then, after the parameters have been properly

3963 associated, Run the Scenario and after it is finished, the user may view the run log if they

3964 desire or if any errors occurred, then an error log will appear explaining the error.

3965

3966 See the User's Manual for more information and details on setting the parameters for the  
 3967 Temperature and DO Flags Model.  
 3968

## 3969 9. Code Compiling

3970  
 3971 Compiling the Temperature and DO Flags Model is a fairly straightforward task. After  
 3972 ensuring that all of the required components discussed in *Section 7: Dependencies* are  
 3973 present, load the project into Visual Studio .Net 2003. This DSS Model was created using  
 3974 Visual Basic (VB).  
 3975  
 3976  
 3977

The project needs to include the following files:

| <u>File Name</u>                              | <u>Purpose</u>   |
|---|--|
| AssemblyInfo.vb                               | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| clsMainPhabTS.vb                              | Contains a class that implements the Map Window plug-in interface and the DSS Model Interface and other functions for editing the parameters for and running the Temperature and DO Flags Model.   |
| frmConfiguration.vb,<br>frmConfiguration.resx | A Database Configuration form. This form is shown when the user edits an Input or Output Database. It allows the user to specify the Path for an Access Database. The connection for the specified values can then be tested to make sure a valid database is specified. To save the selected settings, click on the Save Changes button; to cancel the changed settings, close the form with the Red X button at the top of the form. This form will only be shown if the user decides to edit any of the Input or Output databases already associated with the Temperature and DO Flags model. |
| frmParameters.vb,<br>frmParameters.resx       | A form that allows the user to view and edit the set the Input and Output Parameters for the Temperature and DO Flags Model.   |
| frmSelectLayer.vb,<br>frmSelectLayer.resx     | A form to select the Input Model Nodes point shapefile for the Temperature and DO Flags Model. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk. This form will only be shown if the user decides to edit the shapefile already associated with the Temperature and DO Flags Model.  |
| frmSelectNodes.vb,<br>frmSelectNodes.resx     | A form that allows the user to select the nodes to model, either from the Map Window Map or from the list of available nodes. This form will only be shown if the user decides to edit the selected nodes already associated with the Temperature and DO Flags Model.  |
| modDatabase.vb                                | Contains functions for access and writing to the Input and Output database, and the variable definitions for the Output Database type.   |
| modGlobals.vb                                 | Contains the definitions for variables used throughout the project, such as MapWindow variables, model variables, parameter variables, error variables, and others.  |

|                  |  |
|------------------|--|
| modParameters.vb | Contains the variable definitions for the Input Parameter Names.   |
| modShapefile.vb  | Contains the variable definitions and functions for accessing data on the associated Model Nodes Shapefile.    |
| modUtils.vb      | Contains functions used throughout the project for reporting errors, accessing files, and other functionality. |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 7: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| ADODB                | CopyLocal = False |
| DssIntfcLib          | CopyLocal= True   |
| MapWinGIS            | CopyLocal = False |
| MapWinInterfaces     | CopyLocal = False |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |
| System.Drawing       | CopyLocal = False |
| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwTempDOflags.dll has now been created with Microsoft Visual Studio .NET 2003. It is created in the *mwTimeSeries* subdirectory in the

*\Plugins\ModelManager\Elements\mwTempDOFlags\* folder. Next time that MapWindow is run, if the mwTempDOflags.dll was built to the correct folder, the updated changes to the Temperature and DO Flags Model will be available.

## 1. Table Design

Following is a list of tables that must be included with the Time Series Analyst Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters.

Table: Agency\_Code Descriptions

| Field Name         | Data Type    | Size | Key Field | Primary Key | Description  |
|--------------------|--------------|------|-----------|-------------|--|
| Agency_ID          | Long Integer |      | No        | No          |  |
| Agency_Code        | Text         | 100  | No        | No          |  |
| Agency_Description | Text         | 255  | No        | No          |  |
| Contact            | Text         | 100  | No        | No          |  |
| LocallyModified    | Boolean      |      | No        | No          | Indicates that data was locally modified or locally created. |

Table: Comment\_Code Descriptions

| Field Name      | Data Type | Size | Key Field | Primary Key | Description  |
|-----------------|-----------|------|-----------|-------------|--|
| Comment_Code    | Text      | 100  | No        | No          |  |
| Description     | Text      | 400  | No        | No          |  |
| LocallyModified | Boolean   |      | No        | No          | Indicates that data was locally modified or locally created. |

Table: GroupNames

| Field Name      | Data Type    | Size | Key Field | Primary Key | Description  |
|-----------------|--------------|------|-----------|-------------|--|
| Group_ID        | Long Integer |      | No        | No          |  |
| Group_Name      | Text         | 100  | No        | No          |  |
| LocallyModified | Boolean      |      | No        | No          | Indicates that data was locally modified or locally created. |

Table: GroupStations

| Field Name      | Data Type    | Size | Key Field | Primary Key | Description             |
|-----------------|--------------|------|-----------|-------------|-------------------------|
| [Key]           | Long Integer |      | Yes       | Yes         |                         |
| Group_ID        | Long Integer |      | No        | No          |                         |
| Station         | Text         | 100  | No        | No          |                         |
| LocallyModified | Boolean      |      | No        | No          | Indicates that data was |

|  |  |  |  |  |                                      |
|--|--|--|--|--|--------------------------------------|
|  |  |  |  |  | locally modified or locally created. |
|--|--|--|--|--|--------------------------------------|

4062  
4063  
4064

Table: Parameter\_Code Descriptions

| Field Name      | Data Type    | Size | Key Field | Primary Key | Description  |
|-----------------|--------------|------|-----------|-------------|--|
| Parameter_Code  | Long Integer |      | No        | No          |  |
| Parameter_Name  | Text         | 100  | No        | No          |  |
| Class           | Text         | 100  | No        | No          |  |
| Common_Name     | Text         | 100  | No        | No          |  |
| LocallyModified | Boolean      |      | No        | No          | Indicates that data was locally modified or locally created. |

4065  
4066  
4067

Table: QAQC\_Code Descriptions

| Field Name      | Data Type | Size | Key Field | Primary Key | Description  |
|-----------------|-----------|------|-----------|-------------|--|
| QAQC_Code       | Text      | 100  | No        | No          |  |
| Description     | Text      | 300  | No        | No          |  |
| LocallyModified | Boolean   |      | No        | No          | Indicates that data was locally modified or locally created. |

4068  
4069  
4070

Table: Source\_Database Descriptions

| Field Name      | Data Type | Size | Key Field | Primary Key | Description  |
|-----------------|-----------|------|-----------|-------------|--|
| Source_Database | Text      | 100  | No        | No          |  |
| Description     | Text      | 100  | No        | No          |  |
| Source_Contact  | Text      | 100  | No        | No          |  |
| LocallyModified | Boolean   |      | No        | No          | Indicates that data was locally modified or locally created. |

4071  
4072  
4073

Table: Stations

| Field Name   | Data Type    | Size | Key Field | Primary Key | Description |
|--------------|--------------|------|-----------|-------------|-------------|
| Station      | Text         | 50   | No        | No          |             |
| Shapefile    | Long Integer |      | No        | No          |             |
| USU_Subbasin | Text         | 50   | No        | No          |             |
| Station_Name | Text         | 50   | No        | No          |             |
| Location     | Text         | 100  | No        | No          |             |
| State        | Text         | 100  | No        | No          |             |

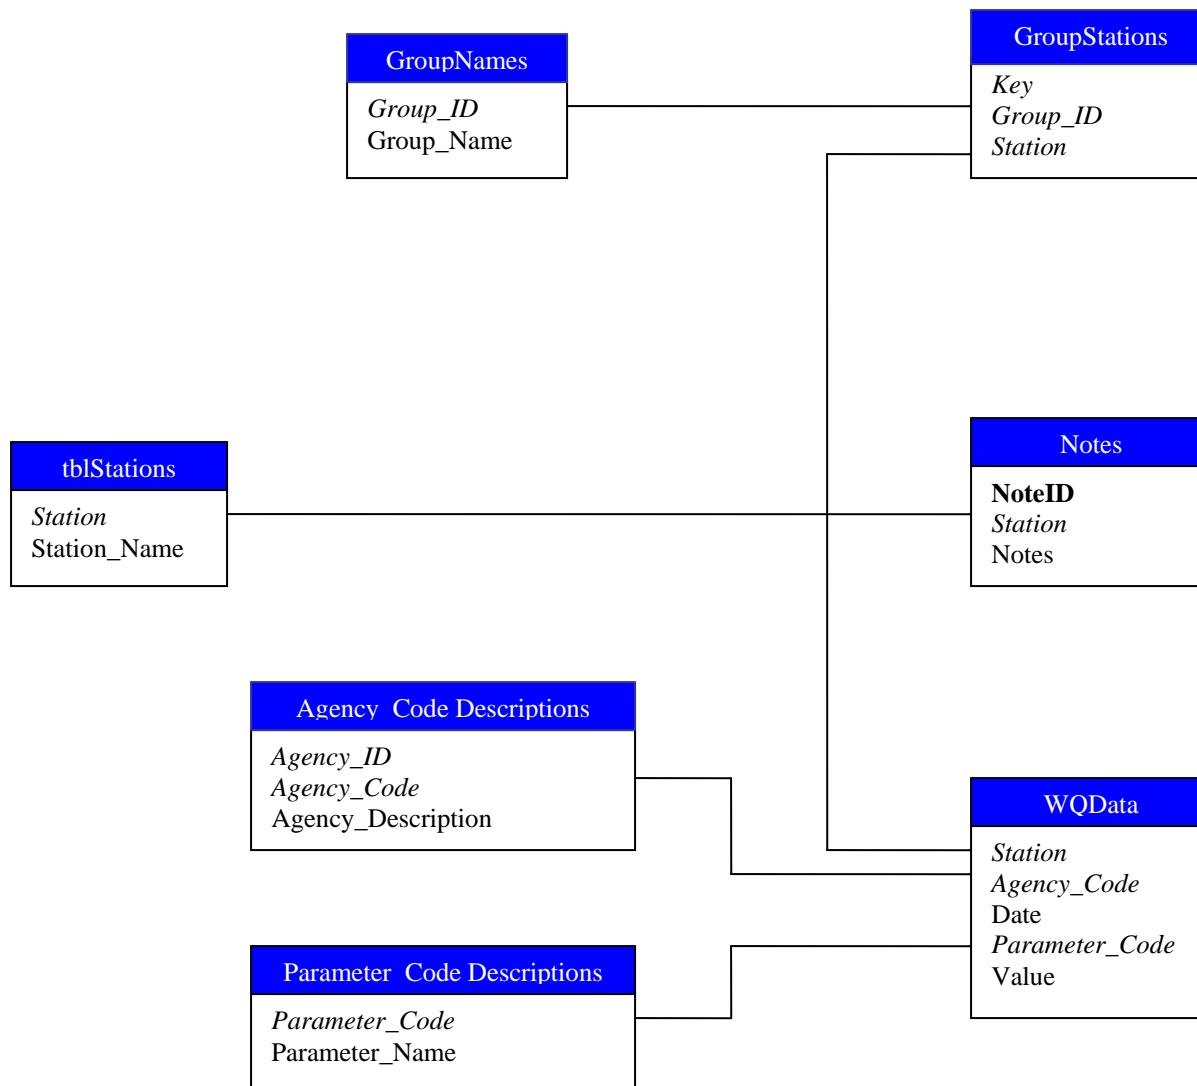

|                 |         |     |    |    |  |
|-----------------|---------|-----|----|----|--|
| County          | Text    | 100 | No | No |  |
| Latitude        | Double  |     | No | No |  |
| Longitude       | Double  |     | No | No |  |
| UTMX            | Double  |     | No | No |  |
| UTMY            | Double  |     | No | No |  |
| River_Mile      | Double  |     | No | No |  |
| Station_Type    | Text    | 100 | No | No |  |
| NHDID           | Text    | 100 | No | No |  |
| Wb_Name         | Text    | 100 | No | No |  |
| WRIA1_Shed      | Text    | 100 | No | No |  |
| LocallyModified | Boolean |     | No | No | Indicates that data was locally modified or locally created. |

Table: WQ\_Criteria

| Field Name          | Data Type    | Size | Key Field | Primary Key | Description  |
|---------------------|--------------|------|-----------|-------------|--|
| Parameter_Code      | Long Integer |      | No        | No          |  |
| Parameter_Name      | Text         | 100  | No        | No          |  |
| Primary_Criterion   | Double       |      | No        | No          |  |
| Secondary_Criterion | Double       |      | No        | No          |  |
| Criterion_Test      | Text         | 100  | No        | No          |  |
| LocallyModified     | Boolean      |      | No        | No          | Indicates that data was locally modified or locally created. |

Table: WQData

| Field Name      | Data Type    | Size | Key Field | Primary Key | Description  |
|-----------------|--------------|------|-----------|-------------|--|
| Station         | Text         | 255  | No        | No          |  |
| Agency_Code     | Text         | 255  | No        | No          |  |
| Date            | Date/Time    |      | No        | No          |  |
| Depth           | Double       |      | No        | No          |  |
| Parameter_Code  | Long Integer |      | No        | No          |  |
| Value           | Double       |      | No        | No          |  |
| Comment_Code    | Text         | 255  | No        | No          |  |
| QAQC_Code       | Text         | 255  | No        | No          |  |
| Data_Code       | Text         | 255  | No        | No          |  |
| Source_Database | Text         | 255  | No        | No          |  |
| LocallyModified | Boolean      |      | No        | No          | Indicates that data was locally modified or locally created. |

## 2. Data Needs

There are three types of data required for the Time Series Analyst: a connection name, a database type, and a database. There are also two Optional types of data that can be specified: a point shapefile, and a custom Icon.

### *Required:*

- Connection Name – this is the name of the Time Series Analyst Connection.
- Database Type – this is the type of database that you are connecting to. IE: Access, or SQL Server.
- Database – this is the database of Time Series Data. This database needs to be organized as described in *Section 1. Table Design*.

### *Optional:*

- Point Shapefile – this shapefile needs to be in the same projection as the other shapefiles in your project. It contains the point locations of where each of the Stations are located. There needs to be a field containing the *Station ID* in this shapefile. This file will have a tag that will be associated with it by the plug-in: “WQGAGES|*FieldID*|*ConnectionName*” where *FieldID* is the Field Number for the *StationID* Field in the Shapefile, and *ConnectionName* is the Connection Name described above.
- Custom Icon – this is the icon that you want to be associated with the specified Point Shapefile. Because there can be multiple connections to the Time Series Analyst, you can specify this Icon to be different for each connection created. This can only be specified if you associate a Point Shapefile with a connection.

As stated above, the point shapefile requires one field to be found in the data table. Following is the description of the required Field in the shapefile (an example field name, the field type, a description of the data that gets entered into this field, and how the field data is associated with the data in the database.

### Optional Point Shapefile field:

- a. *Station ID* – String – The ID for the Station at this location. It corresponds with the *Station* field in the *Stations* table found in the database. Each value that is found in this field (in the shapefile) also needs to be found in the database.

## 3. Dependencies

The Time Series Analyst plug-in requires the following software components and modules to be installed:

### Software:

Gigaset's ProEssentials Graphing Tools Version 4  
MapWindow 3.1  
Visual Studio .NET 2003

#### Modules and Components:

Gigasoft ProEssentials Graph v4  
Gigasoft ProEssentials Sci-Graph v4  
MapWindow Interfaces  
MapWinGIS Components  
Microsoft FlexGrid Control 6.0 (SP3)

#### Integrated Development Environment (IDE)

Visual Studio .NET 2003

## 4. Setup

To begin using the Time Series Analyst, it must first be loaded into MapWindow. Once it is loaded, click on the Time Series Analyst icon, , located on the Map Window toolbar. If the required connection name(s), database type, and database associations, and, if desired, optional shapefile and icon associations (as described in *Section 2: Data Needs*) have been configured properly and the database for the selected connection is accessible, then the Time Series Analyst will appear allowing the user to select and view the data for available stations.

If the data associations have not been properly set, then a Connection Form will appear allowing you to create or edit connections. When you create or edit a connection, a form appears that allows you to specify the required data (the connection name, the database type, and the database), and the optional data (the point shapefile and the custom icon). Then, after the required and optional data have been properly associated, select the Time Series Analyst icon, , from the Map Window toolbar and either the viewer or a form allowing the user to select which connection to view will appear, then the user can select and view the available data.

See the User's Manual for more information and details on associating the data with the Time Series Analyst.

## 5. Code Compiling

Compiling the Time Series Analyst is a fairly straightforward task. After ensuring that all of the required components discussed in *Section 3: Dependencies* are present, load the project into Visual Studio .Net 2003. This Plugin was created using Visual Basic (VB).

The project needs to include the following files:

| File Name       | Purpose   |
|-----------------|---|
| AssemblyInfo.vb | Contains information relating to the DLL assembly. Generated by VB.NET. |
| clsLine.vb      | Contains a class that defines a Line Object.                            |

|   |   |
|---|---|
| CommonFunc.vb   | Contains variables, classes, enumerations, structs, and functions used in multiple forms and classes throughout the project.  |
| DBInfoLayer.vb  | Contains classes for accessing and storing Time Series Analyst connections and their associated settings.   |
| dock.ico  | Icon used on several forms to indicate that an Options/Plot Info panel is docked.<br><i>NOTE: this file needs to be an embedded resource</i>  |
| frmAbout.vb,<br>frmAbout.resx                             | An About Form for the Time Series Analyst.  |
| frmAddCriteria.vb,<br>frmAddCriteria.resx                 | A form that allows the user to Add or Edit Criteria.  |
| frmAddMTSSStations.vb,<br>frmAddMTSSStations.resx         | A form that allows the user to add or remove Stations or Parameters, depending on the type of plot ( <i>Multiple Station, 1 Parameter</i> or <i>1 Station, Multiple Parameter</i> ) selected, for the Multiple Time Series plot.  |
| frmAddStations.vb,<br>frmAddStations.resx                 | A form that allows the user to add or remove Stations to a Group.   |
| frmBoxPlot.vb,<br>frmBoxPlot.resx                         | A form that explains the Box Plot symbols, shading, and shape.  |
| frmConfiguration.vb,<br>frmConfiguration.resx             | An SQL Server Configuration form. This form is shown when the user browses for a Database whose type = SQL. It allows the user to set the Server Address, User ID and Password, and Database Name. The connection for the specified values can then be tested to make sure a valid database is specified. |
| frmControlLine.vb,<br>frmControlLine.resx                 | A form that allows the user to add or remove Control Lines for the selected plot.   |
| frmControlLineValues.vb,<br>frmControlLineValues.resx     | A form that allows the user to specify or edit the Label, Value, and Color of a selected Control Line.  |
| frmCriteria.vb,<br>frmCriteria.resx                       | A form that displays the created Criteria and their results.  |
| frmCrossPlot.vb,<br>frmCrossPlot.resx                     | A form that plots a Correlation and Time Series Plot for two Station, Parameter pairs.  |
| frmCustomQuery.vb<br>frmCustomQuery.resx                  | A form that allows the user to find the Stations in a selected Time Series Connection that meet certain criteria. The user can search for Stations either by defining Spatial boundaries using the Map, or by defining Database Criteria that must be met.  |
| frmDataBaseConnections.vb,<br>frmDataBaseConnections.resx | A form that allows the user to Add, Edit, or Remove Time Series Analyst Connections. It displays the Connection Name, Database, and Custom Icon (if set) for the created Connections.   |
| frmDBConnection.vb,<br>frmDBConnection.resx               | The Connection form that allows the user to associate or edit the required data (the connection name, the database type, and the database) and the optional data (the point shapefile,  |

|  |  |
|--|--|
|  | Station ID field, and the custom Icon) for a Time Series Analyst Connection.   |
| frmGroup.vb,<br>frmGroup.resx                        | The form to create a new Group. It allows the user to specify the new group's Name and ID.   |
| frmHotSpot.vb,<br>frmHotSpot.resx                    | The form that displays the data for a specific point from any of the plots.  |
| frmListOfCriteria.vb,<br>frmListOfCriteria.resx      | A form that displays the list of created Criteria and their settings, and allows the user to add and edit the Criteria.  |
| frmMDBAddMTSStations.vb<br>frmMDBAddMTSStations.resx | A form that allows the user to add or remove Locations or Parameters, depending on the type of plot ( <i>Multiple Locations, 1 Parameter</i> or <i>1 Location, Multiple Parameters</i> , where a location consists of a Database Connection and Station pair) selected, for the Multiple Database, Multiple Time Series plot.                        |
| frmMDBCrossPlot.vb,<br>frmMDBCrossPlot.resx          | A form that plots a Correlation and Time Series Plot for two Location, Parameter pairs where a Location consists of a Database Connection and Station pair.  |
| frmMDBMultipleTS.vb,<br>frmMDBMultipleTS.resx        | A form that plots a Multiple Database, Multiple Time Series Plot for the selected plot type ( <i>Multiple Locations, 1 Parameter</i> or <i>1 Location, Multiple Parameters</i> where a Location consists of a Database Connection and Station pair).   |
| frmMultipleTS.vb,<br>frmMultipleTS.resx              | A form that plots a Multiple Time Series Plot for the selected plot type ( <i>Multiple Stations, 1 Parameter</i> or <i>1 Station, Multiple Parameters</i> ).   |
| frmNormalizeOptions.vb,<br>frmNormalizeOptions.resx  | A form that allows the user to specify settings for Normalizing a plot's values.   |
| frmParameterList.vb,<br>frmParameterList.resx        | A form that allows the user to specify which parameters to view on the Parameter Summary plots or table, or to use to create a summary report by parameter for all stations.   |
| frmPluginKey.vb,<br>frmPluginKey.resx                | A form to enter a Plug-in Key so that the user can specify or edit Database Connections.<br><i>NOTE: This form is no longer being shown, but is being left in the project.</i>   |
| frmSelectLayer.vb,<br>frmSelectLayer.resx            | Displays the form to select the optional point shapefile associated with a Database Connection to the Time Series Analyst plug-in. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk. This form will only be shown if the user decides to associate a shapefile with a Database Connection. |
| frmSummaryTable.vb,<br>frmSummaryTable.resx          | A form that displays a summary of the data in the database by Parameter for a selected Station.  |
| frmWaterQuality.vb<br>frmWaterQuality.resx           | Displays the Time Series Analyst form for a selected Database Connection. This form contains the different plots, tables, and summaries for available stations. You show this  |

|   |  |
|---|--|
|   | form by selecting the Time Series Analyst icon,  , from the Map Window toolbar and then selecting which Database Connection you want to view, or by selecting one or more points on an associated shapefile.  |
| frmWQStations.vb,<br>frmWQStations.resx | A form that displays plots (a <i>Number Distribution</i> plot and a <i>Time Distribution</i> plot) of the parameter summary for a selected Station.  |
| hide.ico                                | Icon used on several forms to indicate that an Options/Plot Info panel is hidden.<br><i>NOTE: this file needs to be an embedded resource</i>   |
| ImageConverter.vb                       | Contains a class that implements functions that allows you to convert images to and from an IPictureDisp object. This is needed so that the VBCompatibility.dll does not need to be referenced. This class allows the Time Series Analyst image,  , to be associated with the points on the optional shapefile if it is associated. |
| Main.vb                                 | Contains a class that implements the MapWindow plugin interface.   |
| PluginInfo.vb                           | Contains a class that implements an interface to access (read from and write to) the Project File.   |
| Statistics.vb                           | Contains a class and an enumeration to access, store, and calculate statistics, averaged values, and censored data for the plots in the Time Series Analyst.   |
| TS1.bmp                                 | Bitmap version of the TS1.ico. It is used as the default custom image for the optional point shapefile, when it is associated with a Database Connection in the Time Series Analyst plug-in.<br><i>NOTE: this file needs to be an embedded resource</i>  |
| TS1.ico                                 | Icon that is used as the Map Window Legend picture when using the default image for the optional point shapefile when it is associated with a Database Connection in the Time Series Analyst. It also is the icon on the Map Window Toolbar for the Time Series Analyst plug-in.<br><i>NOTE: this file needs to be an embedded resource</i>  |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2003, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                  |                   |
|------------------|-------------------|
| ADODB            | CopyLocal = False |
| AxMSFlexGridLib  | CopyLocal = True  |
| AxPEGO32BLib     | CopyLocal = True  |
| AxPESGO32BLib    | CopyLocal = True  |
| MapWinGIS        | CopyLocal = False |
| MapWinInterfaces | CopyLocal = False |

|      |                      |                   |
|------|----------------------|-------------------|
| 4177 | MSFlexGridLib        | CopyLocal = True  |
| 4178 | PEGO32BLib           | CopyLocal = True  |
| 4179 | PESGO32BLib          | CopyLocal = True  |
| 4180 | stdole               | CopyLocal = False |
| 4181 | System               | CopyLocal = False |
| 4182 | System.Data          | CopyLocal = False |
| 4183 | System.Drawing       | CopyLocal = False |
| 4184 | System.Windows.Forms | CopyLocal = False |
| 4185 | System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The `mwTimeSeries.dll` has now been created with Microsoft Visual Studio .NET 2003. It is created in the `mwTimeSeries` subdirectory in the `\Plugins` folder. Next time that MapWindow is run, if the `mwTimeSeries.dll` was built to the correct folder, the updated changes to the Time Series Analyst will be available.

## 1. Table Designs

Database: WRIAReportData

**Table:** 303d

**Description:** Contains data regarding 303(d) listed waterbodies. Data is selected by either wcrsNumber, wbid, or wgclNumber, depending on whether it's a waterbody, watercourse, or water grid cell.

| Field           | Type    | Size | Key Field | Primary Key | Comments   |
|-----------------|---------|------|-----------|-------------|--|
| LocallyModified | Boolean |      | No        | No          | Indicates that data was Locally modified or created. |
| wcrsNumber      | Text    | 50   | No        | No          |  |
| Parameter       | Text    | 50   | No        | No          |  |
| Medium          | Text    | 50   | No        | No          |  |
| 303d            | Text    | 50   | No        | No          |  |
| FirstListedYear | Text    | 50   | No        | No          |  |
| Basis           | Text    | 2048 | No        | No          |  |
| Remarks         | Text    | 2048 | No        | No          |  |
| ActionNeeded    | Text    | 50   | No        | No          |  |
| wbid            | Text    | 50   | No        | No          |  |
| wgclNumber      | Text    | 50   | No        | No          |  |

**Table:** CensusData-CompleteState

**Description:** Contains census data for the complete state. Data is selected by 'town or city name' field.

| Field   | Type    | Size | Key Field | Primary Key | Comments                                |
|---|---------|------|-----------|-------------|---|
| town or city name                                     | Text    | 255  | Yes       | No          |   |
| Type  | Text    | 255  | No        | No          |   |
| Index   | Numeric | 8    | No        | No          |   |
| Place (FIPS)  | Numeric | 8    | No        | No          | Federal Information Processing Standard |
| Internal Point (Latitude)                             | Numeric | 8    | No        | No          |   |
| Internal Point (Longitude)                            | Numeric | 8    | No        | No          |   |
| Total population: Total                               | Numeric | 8    | No        | No          |   |
| Occupied housing units: Average household size; Total | Numeric | 8    | No        | No          |   |

4279 **Table:** CensusData-wshed  
 4280 **Description:** This table is a way to link the CensusData-completeState table above with  
 4281 drainages in the watershed. PlaceName indicates the place in CensusData-completeState  
 4282 that falls geographically in the drainage specified by DrainName.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| PlaceName       | Text    | 50   | Yes       | No          |                              |
| DrainName       | Text    | 50   | Yes       | No          |                              |

 4284  
 4285 **Table:** DataSources  
 4286 **Description:** sectionName is the name of the heading as shown in the report. DataSource  
 4287 is the datasource text field displayed below the heading. sectionLink corresponds to the  
 4288 sectionLink number in the Crystal Reports themselves; sectionLink is used to link this  
 4289 table to the reports.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| sectionName     | Text    | 150  | No        | No          |                              |
| DataSource      | Text    | 150  | No        | No          |                              |
| sectionLink     | Numeric | 75   | Yes       | No          |                              |
| recordnumber    | Numeric | 4    | Yes       | Yes         |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

4290  
 4291  
 4292 **Table:** Disclaimer  
 4293 **Description:** Contains the USU Disclaimer text displayed near the front of the report.  
 4294 Table contains only one row of data.

| Field           | Type    | Size       | Key Field | Primary Key | Comments            |
|-----------------|---------|------------|-----------|-------------|---------------------|
| Disclaimer      | Text    | 2147483647 | No        | No          |                     |
| LocallyModified | Boolean | 1          | No        | No          | Local mod or create |

4295  
 4296  
 4297 **Table:** Discussion  
 4298 **Description:** Legacy Table for adding watershed specific ‘discussion’ comments. Not  
 4299 used by the existing watershed characterization program.

| Field     | Type | Size | Key Field | Primary Key | Comments       |
|-----------|------|------|-----------|-------------|----------------|
| Watershed | Text | 50   | Yes       | No          | Watershed Name |

|                 |         |    |    |    |                                   |
|-----------------|---------|----|----|----|-----------------------------------|
| Discussion      | Text    | 16 | No | No | New Discussion                    |
| LocallyModified | Boolean | 1  | No | No | Data locally modified or created. |

**Table: Drainages**

**Description:** Contains data regarding drainages within the watershed. All data in the report is selected from drainage name, making it a very important field and a candidate key.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| Area            | Numeric | 8    | No        | No          | Area (m^2)                   |
| BSNSWRIA1_ID    | Numeric | 8    | No        | No          | WRIA 1 Unique ID             |
| WtrUse_ID       | Numeric | 8    | No        | No          |                              |
| DrainName       | Text    | 255  | Yes       | No          | Drainage Name                |
| Acres           | Numeric | 8    | No        | No          | Acreage                      |
| SqMiles         | Numeric | 8    | No        | No          |                              |
| Description     | Text    | 255  | No        | No          |                              |
| ID              | Numeric | 8    | Yes       | Yes         |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |
| hasCoastline    | Boolean | 1    | No        | No          |                              |

**Table: FishDist**

**Description:** Contains fish distribution data by species. For each of the species names given by the field names, the value is 0, 1 or 2. 0 indicates no distribution, 1 indicates distribution, and 2 indicates critical distribution. Drain\_name is the drainage in which distribution is concerning.

| Field | Type    | Size | Key Field | Primary Key | Comments |
|-------|---------|------|-----------|-------------|----------|
| CHIN  | Numeric | 8    | No        | No          |          |
| CHUM  | Numeric | 8    | No        | No          |          |
| PINK  | Numeric | 8    | No        | No          |          |
| COHO  | Numeric | 8    | No        | No          |          |
| SOCK  | Numeric | 8    | No        | No          |          |

| segment           | Text    | 50 | Yes | No |  |

**Table:** FishUtilizationRestoration

**Description:** Text blocks of data for each drainage, describing fish utilization and any fish restoration priorities within that drainage.

| Field                            | Type    | Size | Key Field | Primary Key | Comments                     |
|----------------------------------|---------|------|-----------|-------------|------------------------------|
| UtilizationRestorationPriorities | Text    | 2048 | No        | No          |                              |
| Drainage                         | Text    | 75   | Yes       | No          |                              |
| Recordnumber                     | Numeric | 4    | Yes       | Yes         |                              |
| LocallyModified                  | Boolean | 1    | No        | No          | Locally modified or created. |

**Table:** Glossary

**Description:** This is the glossary appearing at the end of the report; for each term, a definition is provided. The contents of this table are listed in alphabetic order in the glossary.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| Term            | Text    | 75   | Yes       | No          |                              |
| Definition      | Text    | 350  | Yes       | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |
| recordnumber    | Numeric | 4    | Yes       | Yes         |                              |

**Table:** InstreamFlow

**Description:** Contains legally established and proposed Instream Flow requirements for the given stream segment, which lies in the given drainage.

| Field              | Type      | Size | Key Field | Primary Key | Comments                     |
|--------------------|-----------|------|-----------|-------------|------------------------------|
| Drainage           | Text      | 75   | Yes       | No          |                              |
| StreamSegment      | Text      | 75   | Yes       | No          |                              |
| LegallyEstablished | Boolean   | 1    | No        | No          |                              |
| Proposed           | Boolean   | 1    | No        | No          |                              |
| DateLegal          | Date/Time | 8    | No        | No          |                              |
| DateProposed       | Date/Time | 8    | No        | No          |                              |
| LocallyModified    | Boolean   | 1    | No        | No          | Locally modified or created. |

| ProposedDec  | Numeric | 8 | No  | No  |  |

**Table:** LayerData-DataTags

**Description:** Contains the layer tags from the project file for those layers which are used to extract data; the DataLayer field contains a textual description such as “Water Quality Sampling Sites” that the plug-in is looking for. TAG is the project file tag of the corresponding layer.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| DataLayer       | Text    | 50   | Yes       | Yes         |                              |
| TAG             | Text    | 50   | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

4362 **Table:** LayerData-MapTags  
 4363 **Description:** Contains the project file tags for the layers going into each map, as well as  
 4364 the order that the layer appears in inside that map.  
 4365

| Field           | Type    | Size | Key Field | Primary Key | Comments   |
|-----------------|---------|------|-----------|-------------|--|
| MapName         | Text    | 50   | Yes       | No          | Name of the map being generated; Plug-in looks for this. |
| TAG             | Text    | 70   | Yes       | No          | Project file tag of the layer going into the map.        |
| OrderInMap      | Numeric | 4    | No        | No          | Order that the layer will appear in the map.             |
| recordnumber    | Numeric | 4    | Yes       | Yes         |  |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created.                             |

4366  
 4367  
 4368 **Table:** MonthName  
 4369 **Description:** Contains the number of each month and the textual name, for lookup from  
 4370 reports.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| MonthNum        | Numeric | 4    | No        | No          |                              |
| MonthName       | Text    | 50   | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

4371  
 4372  
 4373 **Table:** Overview  
 4374 **Description:** Contains the “Report Overview” text that appears near the front of the  
 4375 report. This table contains only one row of data.

| Field           | Type    | Size       | Key Field | Primary Key | Comments                     |
|-----------------|---------|------------|-----------|-------------|------------------------------|
| Overview        | Text    | 2147483647 | No        | No          |                              |
| LocallyModified | Boolean | 1          | No        | No          | Locally modified or created. |

4376  
 4377  
 4378 **Table:** PredefinedAggregations  
 4379 **Description:** Contains the name of the drainage and the shapeindex of that drainage in  
 4380 the Watershed Delineation shapefile, along with the name of the aggregation that the  
 4381 drainage belongs to.

| Field     | Type    | Size | Key Field | Primary Key | Comments |
|-----------|---------|------|-----------|-------------|----------|
| recordnum | Numeric | 4    | Yes       | Yes         |          |

|                 |         |    |     |    |   |
|-----------------|---------|----|-----|----|---|
| AggregationName | Text    | 50 | Yes | No | [Note duplication of data violating normal form; not worth overhead to have a separate (“aggregations”) table.] |
| DrainageName    | Text    | 50 | Yes | No |   |
| ShapeIndex      | Numeric | 8  | No  | No |   |
| LocallyModified | Boolean | 1  | No  | No | Locally modified or created.  |

**Table: Recreation**

**Description:** Contains information regarding recreational activities for each drainage; the location in question, the activities available at that location, whether the activities include contact and noncontact activities, and the drainage the location falls within.

| Field           | Type    | Size | Key Field | Primary Key | Comments                         |
|-----------------|---------|------|-----------|-------------|----------------------------------|
| inDrainage      | Text    | 75   | Yes       | No          | Used to link to Drainages table. |
| Location        | Text    | 75   | Yes       | No          |                                  |
| Activities      | Text    | 250  | No        | No          |                                  |
| Contact         | Boolean | 1    | No        | No          |                                  |
| Noncontact      | Boolean | 1    | No        | No          |                                  |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created.     |

**Table: ReportFirstPage**

**Description:** Contains the data to be placed on the first page of the report. This table has only one row of data, and thus needs no primary key or other keys.

| Field            | Type    | Size | Key Field | Primary Key | Comments  |
|------------------|---------|------|-----------|-------------|---|
| FirstLine        | Text    | 255  | No        | No          | The two smaller lines above                               |
| SecondLine       | Text    | 255  | No        | No          | The main (bigger font) label.                             |
| MainTitleSubnote | Text    | 255  | No        | No          | Note to display below “Watershed Characterization Report” |
| FootnoteLine1    | Text    | 255  | No        | No          | The four lines of the footnote.                           |
| FootnoteLine2    | Text    | 255  | No        | No          | These may be left blank if they                           |
| FootnoteLine3    | Text    | 255  | No        | No          | are not needed.   |
| FootnoteLine4    | Text    | 255  | No        | No          |   |
| LocallyModified  | Boolean | 1    | No        | No          | Locally modified or created.                              |

4395       **Table:** SectionCommentary  
4396       **Description:** Table to hold report section comments.  
4397

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| SectionLink     | Number  | 4    | No        | No          |                              |
| Commentary      | Ntext   | 16   | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

4398  
4399  
4400       **Table:** SectionVisibility  
4401       **Description:** This table controls the visibility of individual report sections. When the  
4402 report is generated, all sections are hidden – only those sections listed in this table are  
4403 made visible again. This allows customization of the report (to hide sections) by editing  
4404 this table.

| Field                    | Type    | Size | Key Field | Primary Key | Comments  |
|--------------------------|---------|------|-----------|-------------|---|
| sectionLink              | Numeric | 4    | No        | No          | Corresponds to the sectionLink number in the crystal reports; also to the sectionLink in DataSources. One sectionLink generally exists for each report “section”.                   |
| isDisplayed              | Boolean | 1    | No        | No          | True/false whether section is to be displayed. If no corresponding record is found in this table, false is assumed.   |
| recordnumber             | Numeric |      | No        | Yes         |   |
| inSubreport              | Text    | 75   | No        | No          | Name of the Crystal report that this section appears in.  |
| sectionsOfSubreport      | Text    | 10   | No        | No          | Crystal section numbers of sections in report that need to be shown for this sectionLink (ie, this section). If all sections in the report file are to be displayed, place -1 here. |
| requiredHeadingSectionNo | Numeric | 4    | No        | No          | Section number of any required heading; e.g. if section 1.1 is displayed, then section 1.1 requires the section that has the 1.0 label. (May be null if desired)                    |
| requiredHeadingSubreport | Text    | 75   | No        | No          | Crystal Report name of the report where the required heading section occurs.  |

|                 |         |   |    |    |                              |
|-----------------|---------|---|----|----|------------------------------|
|                 |         |   |    |    | (May be null if desired)     |
| LocallyModified | Boolean | 1 | No | No | Locally modified or created. |

**Table:** ShellFishbyDrainage

**Description:** Contains a text block of data regarding shellfish harvesting activities for a given drainage.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| DrainName       | Text    | 255  | Yes       | No          |                              |
| ShellFish       | Text    | 255  | No        | No          |                              |
| recordnumber    | Numeric | 4    | Yes       | Yes         |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

**Table:** StreamClosures

**Description:** Contains closure status and closure period information for a given source and tributary. Includes a “LocatedInDrainage” field that’s used to select this data from the report.

| Field                      | Type    | Size | Key Field | Primary Key | Comments                     |
|----------------------------|---------|------|-----------|-------------|------------------------------|
| SourceName                 | Text    | 255  | No        | No          |                              |
| TributaryTo                | Text    | 255  | No        | No          |                              |
| FormerAdministrativeStatus | Text    | 255  | No        | No          |                              |
| StatusUnderRegulation      | Text    | 255  | No        | No          |                              |
| PeriodofClosure            | Text    | 255  | No        | No          |                              |
| recordnumber               | Numeric | 4    | Yes       | Yes         |                              |
| LocatedInDrainage          | Text    | 50   | No        | No          |                              |
| LocallyModified            | Boolean | 1    | No        | No          | Locally modified or created. |

**Table:** tmp\_FishDistComplete

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table contains the Fish Distribution data from the FishDist table, but formatted in such a way that the report may easily read it.

| Field        | Type | Size | Key Field | Primary Key | Comments |
|--------------|------|------|-----------|-------------|----------|
| DrainageName | Text | 50   | No        | No          |          |
| Species      | Text | 50   | No        | No          |          |
| Known        | Text | 6    | No        | No          |          |

|                 |         |   |    |    |                              |
|-----------------|---------|---|----|----|------------------------------|
| Presumed        | Text    | 6 | No | No |                              |
| Potential       | Text    | 6 | No | No |                              |
| Artificial      | Text    | 6 | No | No |                              |
| LocallyModified | Boolean | 1 | No | No | Locally modified or created. |

**Table:** tmp\_Report303d

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table holds data regarding listed water bodies, copied from the 303d table. This table contains only the 303(d) data that falls within the boundaries of the drainages being reported on, where the 303d table contains \*all\* 303(d) data.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| wType           | Text    | 50   | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |
| wcrsNumber      | Text    | 50   | No        | No          |                              |
| Parameter       | Text    | 50   | No        | No          |                              |

**Table:** tmp\_ReportColiform

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table holds the number of samples and average sample value for fecal coliforms at each sampling site, taken from the WaterQuality database.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| numColSamp      | Numeric | 8    | No        | No          |                              |
| AveColSamp      | Numeric | 8    | No        | No          |                              |
| stationname     | Text    | 75   | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

**Table:** tmp\_ReportDataSources

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table has one data row only; it's got a field for each possible sectionLink value. When the report reads the DataSource information, it needs to be from a table having only one record for the links to work properly; so, this table is the data from DataSources, reformatted. The numeric field names correspond to the DataSource values for the sectionLink value of the field name. The fields that are numeric but beginning with A are the section heading labels for the sectionLink of the field's name. Numbers 100+ are the major section headings. No keys or indexes are necessary, as there is only one row.

| Field | Type | Size | Key Field | Primary Key | Comments |
|-------|------|------|-----------|-------------|----------|
| 1     | Text | 255  | No        | No          |          |

**Table:** tmp\_ReportFishPeriodicity

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table stores an image with the Lifestage Periodicity information, for each species, stream segment, and drainage. The image is generated by the FishPeriodicityPlotter control.

4464 **Table:** tmp\_ReportFlowData  
 4465 **Description:** All tmp\_ tables are used for internal processing in the report, and have their  
 4466 contents deleted at the beginning of each report run. This table holds the stream flow data  
 4467 summarized from the FlowData database, but only the data that falls within the bounds of  
 4468 the drainages being reported on. The Streamflow Sampling Sites shapefile is used to  
 4469 determine which station numbers are in the bounds of the drainages.

| Drainage   | Text | 50   | No        | No          |          |
| Streamname | Text | 50   | No        | No          |          |
| Station    | Text | 50   | No        | No          |          |

|                 |         |    |    |    |                              |
|-----------------|---------|----|----|----|------------------------------|
| StationName     | Text    | 50 | No | No |                              |
| LocallyModified | Boolean | 1  | No | No | Locally modified or created. |

**Table:** tmp\_ReportingDrainages

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table stores a list of the drainage names that are being reported on; used by the report to link to the tables which use Drainage or DrainName as a selector.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| Drainage        | Text    | 50   | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

**Table:** tmp\_ReportLandCover

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table contains each of the Land Cover types (from National Land Cover Dataset Classification System), along with the percentage of the selected drainages they cover and the total area reporting on.

| Field           | Type    | Size | Key Field | Primary Key | Comments  |
|-----------------|---------|------|-----------|-------------|---|
| totalarea       | Numeric | 4    | No        | No          | This field is repeating information, but it makes the report calculations much easier to perform keeping it in this un-normalized form. |
| Level           | Text    | 50   | No        | No          |   |
| percent         | Numeric | 8    | No        | No          |   |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created.  |

**Table:** tmp\_ReportNutrients

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table holds the number of samples and average sample value for each nutrient at each sampling site, taken from the WaterQuality database.

| Field       | Type    | Size | Key Field | Primary Key | Comments |
|-------------|---------|------|-----------|-------------|----------|
| stationname | Text    | 75   | No        | No          |          |
| nutrient    | Text    | 75   | No        | No          |          |
| meanvalue   | Numeric | 8    | No        | No          |          |
| numsamples  | Numeric | 8    | No        | No          |          |

|                 |         |   |    |    |                              |
|-----------------|---------|---|----|----|------------------------------|
| LocallyModified | Boolean | 1 | No | No | Locally modified or created. |

**Table:** tmp\_ReportPassData

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table has only one row of data, similar to ReportFirstPage. Stores miscellaneous data, such as report generator version, which periodicity dataset is in use, what units are selected, et cetera. As the table has one row, no keys are necessary.

| Field              | Type    | Size | Key Field | Primary Key | Comments                     |
|--------------------|---------|------|-----------|-------------|------------------------------|
| ReportGenVersion   | Text    | 50   | No        | No          |                              |
| LocallyModified    | Boolean | 1    | No        | No          | Locally modified or created. |
| PeriodicityDataset | Text    | 25   | No        | No          |                              |

**Table:** tmp\_ReportSocioeconomicData

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. Stores the number of employed population for each socioeconomic category.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| category        | Text    | 250  | No        | No          |                              |
| value           | Numeric | 4    | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |
| recordnumber    | Numeric | 4    | No        | No          |                              |

**Table:** tmp\_ReportSwapImages

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table contains the map images used throughout the report; reportSwappedFor indicates the subreport for which this image was stored. The addtnlData fields are used in the Stream Flow report, and tell the report what stream segment, drainage, etc. the flow graph was stored for.

| Field            | Type    | Size       | Key Field | Primary Key | Comments                     |
|------------------|---------|------------|-----------|-------------|------------------------------|

 4560

4561 **Table:** tmp\_ReportTableOfContents  
 4562 **Description:** All tmp\_ tables are used for internal processing in the report, and have their  
 4563 contents deleted at the beginning of each report run. This holds the table of contents data  
 4564 after it's been generated. Group is the section name, pagenumber is the page where the  
 4565 first page of the section appears, and inOrd is an ordering indicator.

| Field           | Type    | Size | Key Field | Primary Key | Comments                     |
|-----------------|---------|------|-----------|-------------|------------------------------|
| Group           | Text    | 100  | No        | No          |                              |

| inOrd           | Numeric | 4    | No        | No          |                              |
| LocallyModified | Boolean | 1    | No        | No          | Locally modified or created. |

4566  
 4567  
 4568 **Table:** tmp\_ReportTemperature  
 4569 **Description:** All tmp\_ tables are used for internal processing in the report, and have their  
 4570 contents deleted at the beginning of each report run. This table holds the number of  
 4571 samples and average sample value for temperature at each sampling site, taken from the  
 4572 WaterQuality database.

| Field           | Type    | Size | Key Field | Primary Key | Comments                             |
|-----------------|---------|------|-----------|-------------|--------------------------------------|

**Table:** tmp\_ReportWaterUse

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table holds the water use information for all of the reporting drainages, combined and summarized from the WaterUse-\* tables.

| Field  | Type    | Size | Key Field | Primary Key | Comments               |
|--------|---------|------|-----------|-------------|------------------------|
| Flow   | Numeric | 8    | No        | No          | Flow                   |
| Precip | Numeric | 8    | No        | No          | Precipitation          |
| IndUse | Numeric | 8    | No        | No          | Landuse                |
| Evap   | Numeric | 8    | No        | No          | Evapotranspiration     |
| AgUse  | Numeric | 8    | No        | No          | Agricultural Use       |
| DomMun | Numeric | 8    | No        | No          | Domestic Municipal Use |
| month  | Numeric | 4    | No        | No          | Month of year          |

**Table:** tmp\_reportZoning

**Description:** All tmp\_ tables are used for internal processing in the report, and have their contents deleted at the beginning of each report run. This table stores the area of each zone in the selected drainages, and the name of that zone. Total area of the drainages for which zoning data is known is also stored.

| Field     | Type    | Size | Key Field | Primary Key | Comments   |
|-----------|---------|------|-----------|-------------|--|
| area      | Numeric | 8    | No        | No          |  |
| zoneName  | Text    | 50   | No        | No          |  |
| totalarea | Numeric | 8    | No        | No          | This is repeating data, but storing it makes report calculations much easier despite its deviance from normal forms. |

4594 **Table:** WaterSupplySystems  
 4595 **Description:** Stores the name, info, and contact info for each water supply system, along  
 4596 with the drainage where the supply system lives.

| Field               | Type    | Size | Key Field | Primary Key | Comments                     |
|---------------------|---------|------|-----------|-------------|------------------------------|

## 2. GIS Data Needs

MapWindow must be running with the WRIA-1 DSS project loaded. Inside this project, layers must have tags associated with them (through the project file). The names of the tags that need to be included in the project are defined in the database tables LayerData-DataTags and LayerData-MapTags.

The layers whose tags are listed in LayerData-MapTags are used only for producing maps, and do not have data extracted from them. These layers may be added and removed freely, as long as the LayerData-MapTags table is kept in sync with what's in the project file.

The layers whose tags are listed in LayerData-DataTags are those layers from which data will be extracted. The report needs to be able to find a layer for each of these data items; there must be a layer for each of these. The tag which corresponds to each of these is defined in the LayerData-DataTags table. Please see this table for a definitive list; a partial list is given below.

Required data layers and fields used from each:

1. Watershed (Shapefile)
  - a. DRAIN\_NAME – Name of drainage.
2. Zoning Data (Shapefile)
  - a. WCPLAN – Zone Type, e.g. City, Rural, etc.
3. Streamflow Gages (Shapefile)
  - a. SITEID – Sampling Site ID
  - b. STR\_NAME – Stream Name
4. Land Cover Data (Grid - Grid Value Used)
5. Main Roads (Shapefile - No Fields Used, but must be present)
6. Water Quality Stations
  - a. STATION – Station ID Number
  - b. STATION\_NAME – Station Name
7. Cities (Shapefile – No Fields Used, but must be present)
8. Railroads (Shapefile – No Fields Used, but must be present)
9. 303(d) Water Bodies (Shapefile)
  - a. WTRBDY\_NR – Waterbody Number
10. 303(d) Listed Streams (Shapefile)
  - a. WTRCRS\_NR – Watercourse Number
11. 303(d) Listed Grids (Shapefile)
  - a. WGRD\_CL\_NR – Watergrid Cell Number
12. Counties (No Fields Used, but must be present)

### 3. Dependencies

The Watershed Characterization plug-in requires the following software components and modules to be installed:

#### Software:

MapWindow 3.1

Visual Studio .NET 2003 Complete Install

--Be sure to select Crystal Reports.Net for installation--

--Crystal Reports 9.0 may be used instead.--

GigaSoft ProEssentials 3.0 Charting Components

Microsoft SQL Server 2000 (optional)

--This will provide administration tools which make management of the databases much easier.--

InstallShield Express 3.5 with Service Pack 4

#### Components:

Microsoft Common Controls 6.0

Microsoft Common Controls-2 6.0

Microsoft Common Controls-3 6.0

Microsoft FlexGrid Control 6.0

Fish Periodicity Lifestage Plotter Control (USU)

Microsoft SQL-DMO Data Object

## 4. Setup

### Setup

The LaunchPad utility, also referred to as the DBMS utility, may be used to prepare a computer to run the Watershed Characterization report. This tool is described in the DBMS Technical Documentation.

The report generator also requires that the WRIA-1 DSS project file is loaded in MapWindow. Details on this project file are given under section 3 above.

To launch the report generator, click the Graph icon on the toolbar. If the database is accessible and configured properly, the Launch Report screen will appear where you may specify report options and begin generation.

If the database could not be found or was not configured, a window will appear asking for the location of the database. This could be a Microsoft SQL Server, MSDE, or access databases. The database needs are as follows:

| Database Description                          | SQL Server DB Name  | Access Name<br>(databases may share physical files,<br>e.g. FlowDataWaterQuality.mdb) |
|---|---------------------|---|
| Report Generator database, as described above | WRIAREportGenerator | <may be any .mdb file>  |
| Stream Flow database, as described above      | FlowData            | <may be any .mdb file>  |
| Water Quality database, as described above    | WaterQuality        | <may be any .mdb file>  |

### Customizations

Customizations may be made to the report itself very easily; most text sections may be edited via the DBMS utility. Those tables which are not exposed through the DBMS may be edited via Microsoft SQL Server Enterprise Manager (a tool included with SQL Server 2000), or via any ODBC-compatible data access utility.

Adding a report section can be done in Visual Studio by following these instructions:

- Create a new blank report. Save it with the desired filename. This filename will be used as the “reportSwappedFor” string below.
- If the section has a map, place the “reportSwappedFor” string in the NoDataValidation routine inside DataGeneration.vb to ensure that a map image is always placed in the table at runtime.
- Ensure that the sectionLink number is unique. This number is also used for the section headings. Place a line for this unique number in the DataSources table

- with the section heading and name. The naming convention is that any number less than 100 is a subsection heading, and anything 100 or over is a main heading.
- d. Place the sectionLink number in the SectionVisibility table along with the report section numbers that this report portion will use. Failure to do this will result in the section never appearing.
  - e. Place any data items in the report. DO NOT use visual linking; any selection formulas must be put by hand in the selection formula editor or selection formula assistant. If the report has a map, select from the data tables based on reportSwappedFor.
  - f. Open rpt\_FullReport.rpt, and insert a new section where desired. Insert the new report here.
  - g. Add code to the DataGeneration.vb and/or ReportMain.vb source files to create a new map if necessary, and to generate or prepare any data needed.

Similarly, removing a report section permanently can be done in Visual Studio by doing the reverse of the instructions above:

- a. Make note of the sectionLink number(s) in the report. Delete the report.
- b. Remove this subreport from rpt\_FullReport.rpt.
- c. Delete any code from DataGeneration.vb and/or ReportMain.vb that was used to prepare maps and data for this report.
- d. Remove the records from SectionVisibility and DataSources where the sectionLink is equal to the number noted in step 1.

## 5. Building

Compiling the Watershed Characterization Report Generator is a fairly straightforward task. After ensuring that all of the required components discussed in item 3 above are present, load the project into Visual Studio and click the Build icon, or select Build from the menu. There are two projects which are a part of this solution. First, the Watershed Characterization MapWindow Plugin is the component loaded into MapWindow which generates all needed data. At the end of the report generation sequence, the plugin will then automatically start ReportViewer.exe, which is the second project in the solution. The report viewer will continue the process, loading crystal reports and preparing the final report. The Crystal Reports portion of the report must be done in a separate executable, because Crystal Reports will not load properly if it's loaded in the same process image as MapWindow, for unknown reasons. The solution needs to include the following files:

mwWatershedChar project:

| <u>File Name</u> | <u>Purpose</u>   |
|------------------|--|
| AssemblyInfo.vb  | Contains information relating to the DLL assembly.<br>Generated by VB.NET. |

|                                      |  |
|--------------------------------------|--|
| Camera.ico                           | Camera icon representing snapshots.  |
| Datageneration.vb                    | Contains data generation routines and routines to aggregate data from multiple locations. Also contains calls to generate Streamflow charts and fish periodicity charts.                         |
| dataGeneration-StreamFlowBoxPlots.vb | Contains generation routines for Streamflow box charts. Mostly copied from StreamFlow Analyst, but modified slightly to fit in this plug-in.   |
| DataLayerManager.vb                  | Contains a class to keep track of data layers within maps by tag or by layer handle.   |
| Datapuzzle.avi                       | File puzzle animation used on the progress meter screen.   |
| Drip16.bmp                           | Drip icon for stream sampling locations on maps.   |
| Emptylegend.bmp                      | An empty (white) bitmap, properly sized to be inserted in place of a legend should a spacer be needed.   |
| Flask16.bmp                          | Flask icon used for water quality sampling sites on maps.  |
| frmConfiguration.vb                  | Screen with database connection information, used to specify the location of the SQL or Access databases being used.   |
| frmDataGenProgress.vb                | Displays a progress meter and animation, along with a brief text description of what's happening.  |
| frmLauncher.vb                       | Displays the list of aggregations and allows the user to specify options for the report. The report is launched from here.   |
| frmMapGen.vb                         | Contains a MapWinGIS Map control. The maps for the reports are generated on this map using this class.   |
| frmPeriodicityPlotter.vb             | Contains a Fish Periodicity Plotter control; this is used by the dataGeneration class to produce images.   |
| frmReportGraphGenerator.vb           | Contains Gigasoft graphing components.   |
| frmSectionVisibility.vb              | Allows the user to change which report sections are going to be included in the report.  |
| Globals.vb                           | This module holds some commonly used functions such as ComputeSimpleArea.  |
| Graph.ico                            | This is the graph icon used on the toolbar.  |
| ImageConverter.vb                    | Performs conversions between old-style IPictureDispatch objects and newer system.drawing.bitmap objects.   |
| LabelClass.vb                        | This class is used to place labels on the maps as they are generated. This was originally copied from MapWindow, but has been extensively modified.  |
| Main.vb                              | Contains the implementation of the MapWindow Interface. Also contains shared data elements and shared functions.   |
| Nodata-*.bmp                         | These files contain empty images, with the text "No data available". These are inserted into the report when data is unavailable, so that the report sees data and can link everything together. |
| North_arrow2.gif                     | This is the north arrow placed on the corner of maps.  |

|                  |   |
|------------------|---|
| ReportMain.vb    | This contains all of the preparation the reports themselves. Maps are generated in this module as well.   |
| ScaleBarUtils.vb | Copied from MapWindow, this module contains conversion routines and factors (ie, inch to millimeter, etc). This also contains routines to generate accurate scale bars. |

#### ReportViewer.exe Project:

|                          |  |
|--------------------------|--|
| frmReportView.vb         | Contains a CrystalReportViewer object, used to examine the report if it's generated to screen rather than to a file.   |
| rpt_FullReport.rpt       | This contains page numbering formulas, report header information, and ties together all of the other reports (by pulling them in as subreports). Sections are hidden and made visible automatically from this report.            |
| rpt_Shellfish-NoData.rpt | This report is shown in place of rpt_Shellfish-1 and rpt_Shellfish-2 when no shoreline is present in the selected drainages.   |
| rpt_TOCGenerator.rpt     | This report summarizes all Table of Contents related data gathered during the first report execution. This data is written in a manner that may be easily parsed, so it may be read by the generator before the final execution. |
| Rpt_*                    | Any rpt_*.rpt file not described above contains data used in the report. Section contents are described in the DataSources and SectionVisibility database tables.  |

The Watershed Characterization installer has been created with Microsoft Visual Studio, and it creates a “merge module”, which is a single-file module which can then be inserted into other installations easily. This is the “mwWatershedChar” subdirectory in the Watershed Characterization installer directory.

To update the components in this merge module, copy the newly built mwWatershedChar.dll and related files into the Source directory in the Watershed Characterization installer directory. Open the mwWatershedChar Visual Studio project and rebuild the installer. Next, copy the merge module from the Release folder into “c:\Program Files\InstallShield\Express\Objects”.

Another installation, this one created with InstallShield Express, is also located in the Watershed Characterization installer directory. This is a “wrapper” around the merge module described above; it installs no new files, only that merge module. To rebuild this, open the WatershedChar.ise file and click the “Build” button or select “Build” from the menu. When the process has completed, the new installer will be in the WatershedChar subdirectory.

This installer may then be burned onto a CD, copied to a ZIP disk, or otherwise distributed.

## 1. Table Design for Database Stored Well Logs

Following is a list of tables that must be included with the Well Log Viewer Database. Other tables and information may exist, but these tables must follow the described naming conventions, spelling and cases, and types for each table and its parameters. This database is only necessary if you are using/associating Database Stored Well Logs.

### **Table:** Material\_Codes

**Description:** Contains the ID, Name, and an Order for each of the valid Materials. It is important that it contains the complete set of valid Materials allowed for displaying the Well Logs because this table is linked to as a Lookup field from the Well\_Material\_Data table.

| Field        | Type    | Size         | Key Field | Primary Key | Comments   |
|--------------|---------|--------------|-----------|-------------|--|
| CodeMaterial | Numeric | Long Integer | Yes       | Yes         | A unique ID for each Well Material. It does not need to be in a strict numerical order. No Duplicates may be used. <i>For Example: 1, 2, 3, ... , 20, etc.</i> |
| Material     | Text    | 50           | No        | No          | The name of the Material. This value is what is viewed in the Legend of the Viewer.  |
| order        | Text    | 50           | No        | No          | An alphabetic value that is used to indicate an ordering for selecting or viewing the valid Materials. <i>For Example: a, b ,c,..., y, z ,etc.</i>             |

### **Table:** Material\_Colors

**Description:** Contains the associated material code, an RGB-value, and a description for each color. This table needs to have a 1:1 correlation with the Material\_Codes table so that there is an assigned color for each valid material. These colors are used to display the Database Stored Well Logs in the Well Log Data Viewer.

| Field        | Type    | Size         | Key Field           | Primary Key | Comments   |
|--------------|---------|--------------|---------------------|-------------|--|
| CodeMaterial | Numeric | Long Integer | Yes (No Duplicates) | No          | A unique ID for each Well Material. It corresponds with the CodeMaterial Field in the Material_Codes table. There needs to be one entry in this table for every entry in the Material_Codes table (a 1:1 correlation). |

|                   |      |    |    |    |   |
|-------------------|------|----|----|----|---|
| RGB_Value         | Text | 50 | No | No | This is the RGB value (stored as R,G,B) for the color for the associated material. Each R,G, and B value ranges from 0 – 255.<br><i>For Example: RGB_Value = 0,0,0</i>      |
| Color_Description | Text | 50 | No | No | This is the name of the color, or some other description of what color is represented by the value in the RGB_Value Field.<br><i>For Example: Color_Description = Black</i> |

4871  
4872

4874  
4875  
4876  
4877  
4878  
4879  
4880

**Table:** Well\_Material\_Data

**Description:** Contains the WellID, three associated material codes, a depth from, and a depth to value for each soil section in the Well Log. A soil section is defined as a grouping of soil with the same materials. Each soil section in the sampled Well Log needs to have a unique entry in this Table. The second and/or third material code can be left empty if there is not a value attributed for them. The first material code must have a value for all entries. Each material code is picked from the list available that is populated by the values in the Material\_Codes table.

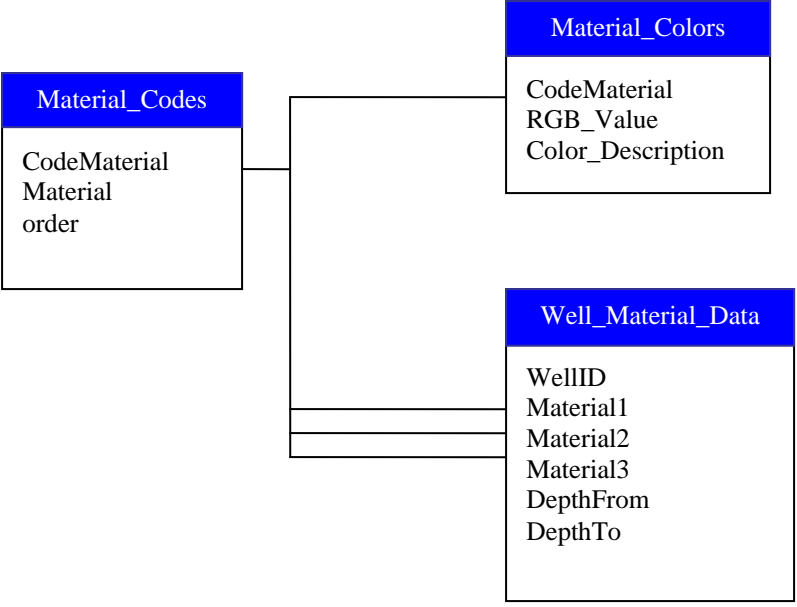

| Field     | Type    | Size         | Key Field           | Primary Key | Comments  |
|-----------|---------|--------------|---------------------|-------------|---|
| WellID    | Numeric | Long Integer | Yes (Duplicates OK) | No          | A unique ID for each Well. This value is displayed for the user to select which Well Logs(s) to view. It also corresponds with the values for the Well_ID field in the associated point shapefile.  |
| Material1 | Number  | Long Integer | Yes (Duplicates OK) | No          | This is the main soil type, or the soil type with the highest concentration, that is found in the current soil section. This field is of type Number and corresponds to the CodeMaterial field values from the Material_Codes table. This is a lookup field. The user will see the material descriptions, not the actual material codes when selecting/inputting values into this field if it is set up correctly. See below for a definition of the Lookup Values. |
| Material2 | Number  | Long Integer | Yes (Duplicates OK) | No          | This is the soil type with the second highest concentration of all of the materials in the current soil section.  |

|              |        |              |                     |    |   |
|--------------|--------|--------------|---------------------|----|---|
|              |        |              |                     |    | This field is just like Material1. It is of type Number and corresponds to the CodeMaterial field values from the Material_Codes table. If there is not a valid value for this field, it may be left empty. This is a lookup field. The user will see the material descriptions, not the actual material codes when selecting/inputting values into this field if it is set up correctly. See below for a definition of the Lookup Values.  |
| Material3    | Number | Long Integer | Yes (Duplicates OK) | No | This is the soil type with the third highest concentration of all of the materials in the current soil section. This field is just like Material1 and Material 2. It is of type Number, and corresponds to the CodeMaterial field values from the Material_Codes table. If there is not a valid value for this field, it may be left empty. This is a lookup field. The user will see the material descriptions, not the actual material codes when selecting/inputting values into this field, if it is set up correctly. See below for a definition of the Lookup Values. |
| MaterialFrom | Number | Double       | No                  | No | This value is the starting depth of the current soil section. This value signifies the beginning depth. This value is stored in Feet (ft).<br><i>For Example: If you were entering the first soil section for your WellID, MaterialFrom = 0.</i>  |
| MaterialTo   | Number | Double       | No                  | No | This value is the ending depth of the current soil section. This value signifies the ending depth. This value stored in Feet (ft).<br><i>For Example: If the current soil section started at 50ft and was 34ft deep, MaterialTo = 84.</i>   |

4881

4882

4883

4884

## 2. Data Needs

### *Scanned Well Log Images*

There are two types of data needed for the Scanned Well Log Images: a point shapefile, and a Folder Location.

- Point Shapefile – this needs to be in the same projection as the other shapefiles in your project. It contains the point locations of where each of the nodes are located. This file will have a tag that will be associated with it by the plug-in: “WellLogViewer-Scan”. There are two fields that need to be found in this shapefile: WELL\_LOG\_I, and LOG\_IMG\_NM.
- Folder Location – this is the location of all of the scanned Well Log images that will be viewed using the Well Log Data Viewer.

The layer corresponding with the point shapefile stated above is marked with the tag “WellLogViewer-Scan”. If the user removes the layer associated with this tag without first closing the Well Log Data Viewer plug-in, then the settings for the Scanned Data will be reset, and if the Project is then saved, then the settings for the Scanned Data in the project file will also be over-written.

As stated above, the shapefile requires two fields to be found in the data table. Below are the exact field names, field types, and description of the data that gets entered into these fields.

Required data layer fields:

- a. WELL\_LOG\_I – Integer – The Well ID for the Well at this location.
- b. LOG\_IMG\_NM – String – The filename for the Scanned Well Log image that goes with this Well.

### *Database Data*

There are three types of data needed for the Database Data: a point shapefile, a database type, and a database.

- Point Shapefile – this needs to be in the same projection as the other shapefiles in your project. It contains the point locations of where each of the Well Logs were sampled. This file will have a tag that will be associated with it by the plug-in: “WellLogViewer-DB”. There is one field that needs to be found in this shapefile: WELL\_ID.
- Database Type – this is the type of database that you are connecting to. IE: Access, SQL Server.
- Database – this is the database of Well Log data and needs to be organized as described in *Section 1. Table Design For Database Stored Well Logs*.

The layer corresponding with the point shapefile stated above is marked with the tag “WellLogViewer-DB”. If the user removes the layer associated with this tag without first closing the Well Log Data Viewer plug-in, then the settings for the Database Data will be reset, and if the Project is then saved, then the settings for the Database Data in the project file will also be over-written.

As stated above, the shapefile requires one field to be found in the data table. Below are the exact field name, field type, description of the data that gets entered into this field, and how it is associated with the database.

Required data layer field:

- a. WELL\_ID – Integer – The Well ID for the Well at this location. It corresponds with the WellID field in the database. Each value that is found in this field (in the shapefile) also needs to be found in the database.

### 3. Dependencies

The Well Log Data Viewer plug-in requires the following software components and modules to be installed:

Software:

Gigasoft's ProEssentials Graphing Tools Version 3  
MapWindow 3.1  
Visual Studio .NET 2002

Modules and Components:

Graph Component from ProEssentials (pegoa control).  
MapWindow Interfaces  
MapWinGIS Map Control  
Scientific Graph Component from ProEssentials (pesgoa control).

Integrated Development Environment (IDE)

Visual Studio .NET 2002

### 4. Setup

To begin using the Well Log Data Viewer, it must first be loaded into MapWindow. Once it is loaded, select one of your data layers from the Legend. If you only have one type of data associated, select the data layer that goes with this data. Now, click the Well icon, , on the MapWindow toolbar. If the data associations (as described in *Section 2: Data Needs*) have been properly set, then the Well Viewer will appear for the selected type of data, and will be fully functional.

If the data associations have not been set, then a Connection Form will appear allowing you to set the shapefile, database, and photo location folder. Then, after the data associations have been formed, select the appropriate data layer (as described above), and when the toolbar button is clicked, the viewer will show for the selected type of data, and can be used.

4974 See the User's Manual for more information and details on associating the data with the  
 4975 Well Log Data Viewer.  
 4976

## 4977 5. Code Compiling

4978  
 4979 Compiling the Well Log Data Viewer is a fairly straightforward task. After ensuring that  
 4980 all of the required components discussed in *Section 3: Dependencies* are present, load the  
 4981 project into Visual Studio .Net 2002. This Plug-in was created using Visual Basic (VB).  
 4982

4983 The project needs to include the following files:

| <u>File Name</u>                              | <u>Purpose</u>   |
|---|--|
| AssemblyInfo.vb                               | Contains information relating to the DLL assembly. Generated by VB.NET.  |
| clsMainMWI.vb                                 | Contains a class that implements the MapWindow plugin interface.   |
| FolderUtils.vb                                | Contains a class to access global functions for Folder Functions, Database Functions, and Other Functions.   |
| frmConfiguration.vb,<br>frmConfiguration.resx | Displays the Connection form for the SQL database type. This form is only displayed when adding Database Data and connecting to an SQL database. It allows the user to set the Server Address, User information, and Database Name.  |
| frmDBConnection.vb,<br>frmDBConnection.resx   | Displays the Connection form that allows the user to associate the data with the Well Log Data Viewer plug-in. There are two areas on this form, one for each type of data that can be associated: Scanned Data, and Database Data.  |
| frmSelectLayer.vb,<br>frmSelectLayer.resx     | Displays the form to select the associated point shapefile with the Photo Viewer plug-in. It allows the user to either select a shapefile already loaded into Map Window, or to select one from disk.  |
| frmWellViewer.vb,<br>frmWellViewer.resx       | Displays the Well Log Data Viewer form for the selected type of data. You select the type of data to view by selecting the appropriate data layer in the MapWindow Legend.   |
| globalStructs.vb                              | This module holds the definition of data Structs used throughout the Well Log Data Viewer.   |
| globalVariables.vb                            | This module holds the variables used throughout the forms, such as the form declaration variables, MapWindow variables, and others.  |
| ImageConverter.vb                             | Contains a class that implements functions that allows you to convert images to and from an IPictureDisp object. This is needed so that the VBCompatibility.dll does not need to be referenced. This class allows the Well Logs – Database image,  , or the Well Logs – Scanned image,  , to be associated with the points on the associated shapefile(s). |

|                 |  |
|-----------------|--|
| PluginInfo.vb   | Contains a class that has functions used to open and save Project File settings for the Well Log Data Viewer plugin.   |
| Well.ico        | Well Log icon that is used in the MapWindow Toolbar and on all of the forms.<br><i>NOTE: this file needs to be an embedded resource</i>  |
| WellLog2.bmp    | Bitmap version of the WellLog2.ico. It is used as a custom image for the point shapefile associated with the Database Data.<br><i>NOTE: this file needs to be an embedded resource</i>     |
| WellLog2.ico    | It is used as the MapWindow Legend picture when using a custom image for the point shapefile associated with the Database Data.<br><i>NOTE: this file needs to be an embedded resource</i> |
| WellReport2.bmp | Bitmap version of the WellReport2.ico. It is used as a custom image for the point shapefile associated with the Scanned Data.<br><i>NOTE: this file needs to be an embedded resource</i>   |
| WellReport2.ico | It is used as the MapWindow Legend picture when using a custom image for the point shapefile associated with the Scanned Data.<br><i>NOTE: this file needs to be an embedded resource</i>  |

Now that the files and resources are there and the project is loaded into Microsoft Visual Studio .NET 2002, please double check a couple of settings. These settings are all related to the references associated with the project (see *Section 3: Dependencies* ).

Reference Settings:

|                      |                   |
|----------------------|-------------------|
| AxPEGOALib           | CopyLocal = True  |
| AxPESGOALib          | CopyLocal = True  |
| MapWinGIS            | CopyLocal = False |
| MapWinInterfaces     | CopyLocal = False |
| PEGOALib             | CopyLocal = True  |
| PESGOALib            | CopyLocal = True  |
| stdole               | CopyLocal = False |
| System               | CopyLocal = False |
| System.Data          | CopyLocal = False |

| System.Windows.Forms | CopyLocal = False |
| System.XML           | CopyLocal = False |

Now that these settings have been set correctly, click the Build icon, or select Build from the menu. The mwWellViewer.dll has now been created with Microsoft Visual Studio .NET 2002. It is created in the mwWellViewer subdirectory in the /Plugins folder. Next time that MapWindow is run, if the mwWellViewer.dll was built to the correct folder, the updated changes to the Well Log Data Viewer will be available.

## 1. Table Designs

Land Cover Database: LandCoverSummary.mdb

(See “Technical Documentation For Land Cover Summarizer” for table designs)

Best Management Practices Database: BestManagementPractices.mdb

(See “Technical Documentation For Best Management Practices Tool” for table designs)

WRIA-Wide Water Quality Parameters Database: WRIA-WideWQParameters.mdb

**Table: Catchments**

| Field Name  | Data Type    | Description  |
|-------------|--------------|--|
| CatchmentID | Long Integer | The catchment id associated with the catchment-drainage pair       |
| DrainageID  | Long Integer | The WRIA 1 Drainage ID associated with the catchment-drainage pair |

**Table: EMCs**

| Field Name      | Data Type    | Description   |
|-----------------|--------------|---|
| DrainageID      | Long Integer | WRIA 1 Drainage ID  |
| Land_Cover_Code | Long Integer | The associated land cover class id                          |
| EMC_TN          | Text         | Expected mean concentration (EMC) for total nitrogen (mg/L) |
| EMC_NH3         | Text         | EMC for ammonia (mg/L)                                      |
| EMC_N03         | Text         | EMC for nitrate (mg/L)                                      |
| EMC_TP          | Text         | EMC for total phosphorus (mg/L)                             |
| EMC_FC          | Text         | EMC for fecal coliform (mg/L)                               |
| EMC_BOD         | Text         | EMC for BOD (mg/L)  |

**Table: Input Air Temperatures**

| Field Name     | Data Type   | Description  |
|----------------|-------------|--|
| Date           | Date / Time | The date the temperature data was recorded                   |
| AvgTemperature | Double      | Average daily temperature at Abbotsford Canada in degrees C  |
| AirTempFlag    | Text        | Flag for average daily air temperatures from Abbotsford data |

5052 **Table: Parameters**

| Field Name    | Data Type    | Description  |
|---------------|--------------|--|
| DrainageID    | Long Integer | WRIA 1 Drainage ID   |
| DrainageName  | Text         | Name of the WRIA 1 Drainage  |
| DOPercentSat  | Double       | DO Percent Saturation Parameter (Calibration Parameter)                                    |
| AirWaterSlope | Double       | Slope of Air Temperature Surface Soil Temperature Relationship (Calibration Parameter)     |
| AirWaterInt   | Double       | Intercept of Air Temperature Surface Soil Temperature Relationship (Calibration Parameter) |
| QbTemp        | Double       | Simulation Base Flow Temperature Deg. C  |
| Cb_TN         | Double       | Base Flow Total Nitrogen Concentration (mg/L)  |
| Cb_NH3        | Double       | Base Flow Ammonia Concentration (mg/L)   |
| Cb_NO3        | Double       | Base Flow Nitrate Concentration (mg/L)   |
| Cb_TP         | Double       | Base Flow Total Phosphorus Concentration (mg/L)  |
| Cb_BOD        | Double       | Base Flow BOD Concentration (mg/L)   |
| Cb_FC         | Double       | Base Flow Fecal Coliform Bacteria Concentration (#/100 mL)                                 |

5053

## 5054 2. Dependencies

5055

5056 The Course Resolution Water Quality Model requires the following software to be installed:

5057 Software:

5058 MapWindow 3.1

5059 DSS Model Manager

5060 Integrated Development Environment (IDE):

5061 Visual Studio .NET 2003 Complete Install

5062

5063 The Course Resolution Water Quality Model requires the data output by the following DSS  
5064 elements:

5065 Land Cover Summary Tool

5066 Best Management Practices Tool

5067

## 5068 3. Setup

5069

5070 The WRIA-1\_DSS Installation installs the Course Resolution Water Quality Model in the

5071 MapWindow Plugins folder.

5072 (This is usually located at C:\Program Files\MapWindow\Plugins\ModelManager\Elements”).

#### 4. Building

To compile the Best Management Practices Tool, add the files below to a Microsoft Visual Studio .NET 2003 Visual Basic .NET Library Project.

mwCourseResolutionWQModel project files:

| File Name                    | Purpose   |
|------------------------------|---|
| AssemblyInfo.vb              | Contains information relating to the DLL assembly. Generated by VB.NET.   |
| clsWRIAWideWQModel.vb        | Runs the course resolution water quality model given the settings provided.   |
| DBClient.vb                  | Contains the routines used to connect to a database.  |
| DirectoryPicker.vb           | Custom component which allows a user to select a directory from the computer's file system.   |
| frmConfiguration.vb          | Contains the routines used to select a database.  |
| frmInputs.vb                 | Allows the user to select the location of input and output data for the model.  |
| frmSelectModelDirectory.vb   | A form containing a DirectoryPicker component which allows the user to select a directory from the file system, or a directory to be created by the Water Quantity Model in the current DSS Scenario Run. |
| frmSelectScenario.vb         | Allows the user to select a DSS Scenario Run Id from a list of previously run DSS Scenarios.  |
| WRIAWideWaterQualityModel.vb | Implements MapWindow Plugin and DSS Interface routines, allowing the Course Resolution Model to act as a MapWindow Plugin and a DSS element.  |

Add the following references to the project:

- DssIntfcLib.dll
- MapWinInterfaces.dll
- mwBestManagementPractice.dll
- System.dll
- System.Data.dll
- System.Drawing.dll
- System.Windows.Forms.dll
- System.Xml.dll

You are now ready to compile the project by clicking the Build Solution menu option under the menu Build.

5093 WRIA-wide Coarse Waterbody Response Model (WWCM) project files  
5094

| File Name  | Purpose  |
|--|--|
| rqn.f95  | WRIA-wide Coarse Waterbody Response Model Fortran 95 source file           |
| rqn.bat<br><br>lf95 rqn.f95 src\apifunctions.obj<br>-exe "r.exe" -ml lf95<br>"wqlibs_c.imp"  | Fortran compiler script for creating WWCM executable – executable is r.exe |
| apifunctions.f95   | Library of file management routines through Windows API                    |
|  | Conversion of LWWLM output to binary format for Fortran model use          |
| am.bat<br>See below  | Fortran compiler script for creating WWCM executable                       |
| qsetup_n.f95   | Manager of model execution for a single time step                          |
| setscn_n.f95   | Scenario setup routine – executed for each time step                       |
| nrmodules.f95  | set of numerical routines  |
| reachstructures.f95  | coordinates watershed structure definition                                 |
| condensedll.f95  |  |
| stringfunctions.f95  | set of string manipulation routines  |
| datesubmod.f95   | set of date substitution routines  |
| utils.f95  | set of miscellaneous file access routines                                  |
| wqlibs_c.dll   | Dynamic link library holding all of the above routines                     |
| cnd.exe  | Converts NodeResultsvwxxyz.txt files to NodeTSzzz.txt                      |
| cnodestots.f95   | Source code for cnd.exe  |
| cnd.bat<br><br>lf95 cnodestots.f95<br>src\apifunctions.obj<br>src\nrmodules.obj<br>src\reachstructures.obj<br>src\utils.obj src\datesubmod.obj<br>-exe cnd.exe | Fortran compiler script for creating cnd.exe                               |

5095  
5096 The rp.exe file is built using the Lahey Professional Fortran compiler version 5.6. It has no  
5097 additional dependencies.  
5098  
5099

5100 The Course Resolution Water Quality Model is installed in all versions of the WRIA-1 DSS  
5101 installation.
