

Capture high resolution hidden video with our newest spy pen for 2010.

Write and spy in style with this virtually undetectable spy gadget. Featuring a 1280x920 image sensor for crystal clear video, 25 FPS for smooth motion capture, and pinhole lens for spying on people without suspect. This spy gadget has everything you need to capture high quality undercover videos, and without anybody knowing the better! But that's not all this spypen is capable of...

The real fun starts when you switch the motion detection to "ON". Then place it on your office desk or nightstand when you leave the room and wait for it to record video at the first sight of movement. You may be surprised at what you might capture! Or you can even clip it to your shirt pocket to capture your boss or husbands abusive behavior for legal disputes. With the easy one button operation you will always be ready to capture high quality hidden videos within a moments notice, any time any place.

The **I59** uses a MicroSD (2GB included) card slot for video storage, so memory limitations will never be a problem with this amazing spypen. Simply load a new SD card in when the current one becomes full and you can continue capturing hours of undercover spy video without suspect!
