# About This Guide

## Introduction

---

This manual provides general instructions for setting up, operating, troubleshooting, maintaining, and programming your P 300IMG Imager. The target audience is a system administrator or other personnel responsible for getting the imager up and running in its intended environment.

## Chapter Descriptions

---

The manual includes the following chapters.

- [\*Chapter 1, Getting Started\*](#), provides a product overview and information on connecting the imager to the host. It also provides scanning instructions and beeper definitions.
- [\*Chapter 2, Programming the P 300IMG\*](#), provides all the bar codes necessary to program your imager.
- [\*Chapter 3, Advanced Data Formatting \(ADF\)\*](#), describes how to customize scanned data in your imager before transmitting it to the host.
- [\*Chapter 4, Maintenance and Troubleshooting\*](#), includes tips on maintaining and troubleshooting your imager.
- [\*Appendix A, Programming Reference\*](#), provides information on AIM identifiers and prefix/suffix values.
- [\*Appendix B, P 300IMG Imager Specifications\*](#), lists the imager's technical specifications and provides decode ranges.

## Notational Conventions

---

The following conventions are used in this document:

- “You” refers to the administrator who is using this manual as a reference aid to install, configure, operate, maintain, and troubleshoot the P 300IMG Imager.
- **Bold** type is used to highlight specific items in the general text.
- *Italics* are used to identify chapters and sections in this and related documents.
- Bullets (◆) indicate:
  - action items
  - lists of alternatives
  - lists of required steps that are not necessarily sequential
- Sequential lists (e.g., those that describe step-by-step procedures) appear as numbered lists.

## Related Publications

---

- *P 300IMG Quick Reference Guide*/n 72-40804-xx  
This document provides general information to help the user get started with the imager, and includes basic operation instructions.
- *Simple Serial Interface (SSI) Programmer's Guide*/n 72-40451-xx  
This detailed technical document defines the system requirements and interface specification for Symbol Technologies' Simple Serial Interface. This guide is for programmers wishing to integrate and control the P 300IMG via serial interface commands from their host's application software.

## Service Information

---

If you have a problem with your equipment, contact the *Symbol Support Center* for your region. Refer to [page xii](#) for information. Before calling, have the model number, serial number, and several of your bar code symbols at hand.

Call the Support Center from a phone near the scanning equipment so that the service person can try to talk you through the problem. In order to help troubleshoot a scanning problem, the Support Center may request to capture a picture of test patterns or bar codes with your imager and E-Mail to our plant for analysis. If the equipment is found to be working properly and the problem is symbol readability, the Support Center may also request samples of your bar codes for further analysis.

If your problem cannot be solved over the phone, you may need to return your equipment for servicing. If that is necessary, you will be given specific directions.

---

**Note:** *Symbol Technologies is not responsible for any damages incurred during shipment if the approved shipping container is not used. Shipping the units improperly can possibly void the warranty. If the original shipping container was not kept, contact Symbol to have another sent to you.*

---

## **Warranty**

---

Symbol Technologies, Inc ("Symbol") manufactures its hardware products in accordance with industry-standard practices. Symbol warrants that for a period of twelve (12) months from date of shipment, products will be free from defects in materials and workmanship.

This warranty is provided to the original owner only and is not transferable to any third party. It shall not apply to any product (i) which has been repaired or altered unless done or approved by Symbol, (ii) which has not been maintained in accordance with any operating or handling instructions supplied by Symbol, (iii) which has been subjected to unusual physical or electrical stress, misuse, abuse, power shortage, negligence or accident or (iv) which has been used other than in accordance with the product operating and handling instructions. Preventive maintenance is the responsibility of customer and is not covered under this warranty.

Wear items and accessories having a Symbol serial number, will carry a 90-day limited warranty. Non-serialized items will carry a 30-day limited warranty.

## **Warranty Coverage and Procedure**

During the warranty period, Symbol will repair or replace defective products returned to Symbol's manufacturing plant in the US. For warranty service in North America, call the Symbol Support Center at 1-800-653-5350. International customers should contact the local Symbol office or support center. If warranty service is required, Symbol will issue a Return Material Authorization Number. Products must be shipped in the original or comparable packaging, shipping and insurance charges prepaid. Symbol will ship the repaired or replacement product freight and insurance prepaid in North America. Shipments from the US or other locations will be made F.O.B. Symbol's manufacturing plant.

Symbol will use new or refurbished parts at its discretion and will own all parts removed from repaired products. Customer will pay for the replacement product in case it does not return the replaced product to Symbol within 3 days of receipt of the replacement product. The process for return and customer's charges will be in accordance with Symbol's Exchange Policy in effect at the time of the exchange.

Customer accepts full responsibility for its software and data including the appropriate backup thereof. Repair or replacement of a product during warranty will not extend the original warranty term.

Symbol's Customer Service organization offers an array of service plans, such as on-site, depot, or phone support, that can be implemented to meet customer's special operational requirements and are available at a substantial discount during warranty period.

## **General**

Except for the warranties stated above, Symbol disclaims all warranties, express or implied, on products furnished hereunder, including without limitation implied warranties of merchantability and fitness for a particular purpose. The stated express warranties are in lieu of all obligations or liabilities on part of Symbol for damages, including without limitation, special, indirect, or consequential damages arising out of or in connection with the use or performance of the product.

Seller's liability for damages to buyer or others resulting from the use of any product, shall in no way exceed the purchase price of said product, except in instances of injury to persons or property.

Some states (or jurisdictions) do not allow the exclusion or limitation of incidental or consequential damages, so the proceeding exclusion or limitation may not apply to you.

*P 300IMG Product Reference Guide*

# *Chapter 1*

## *Getting Started*

### **Introduction**

---

The P 300IMG hand-held imager is a high-performance, durable solution for a wide variety of data collection applications using the latest digital camera technology. This system features:

- omnidirectional reading of a variety of bar code symbologies, including the most popular linear, postal, PDF417, and 2D matrix code types.
- the ability to capture and download images to a host for a variety of imaging applications.
- advanced intuitive laser aiming for easy point-and-shoot operation.
- a tough, ergonomic thermoplastic housing for comfort and durability in rugged environments.

The P 300IMG supports the following interfaces:

- Standard RS-232 interface for serial connection to a host. The imager communicates with the host through scanned bar codes.
- Simple Serial Interface (SSI) for hosts that program and communicate with the imager serially.
- Keyboard wedge via Symbol's Synapse cables, where scanned data is interpreted by the host as keystrokes.

This chapter describes how to set up the imager with your host system, how to operate the imager, and defines beeper indications.

## Unpacking

---

Remove the imager from its packing and inspect it for damage. If the imager was damaged in transit, call the *Symbol Support Center* at one of the telephone numbers listed on page xii. **KEEP THE PACKING.** It is the approved shipping container and should be used if you ever need to return your equipment for servicing.

## Setting Up the Imager

---

This section provides instructions first on connecting the interface cable to the imager, then to each supported interface.

### ***Connecting the Interface Cable to the P 300IMG***

Insert the cable into the receptacle on the bottom of the imager, and twist to the right.

**Figure 1-1. Installing the Cable**

### **Removing the Cable**

1. Turn the cable counter-clockwise to unlock.
2. Pull the cable out of the receptacle on the bottom of the imager.

## Connecting Power

If your host does not provide power to the imager, you will need to connect external power to the imager.

1. Connect the DC cable right-angle connector into the power port on the interface cable. Plug the other end of the DC cable into the power supply.
2. Connect the AC line cord into the power supply. Plug the other end into a wall outlet.

## Connecting to a Host

The P 300IMG uses RS-232 and Synapse to interface to a host system. This section describes how to make these connections.

### Standard RS-232 Interface

1. Connect the interface cable to the bottom of the imager, as described in [Connecting the Interface Cable to the P 300IMG](#) on page 1-2.
2. Connect the other end of the cable to the serial port on the host.

**Figure 1-2. RS-232 Direct Connection**

3. Plug one end of the power supply into the power receptacle on the RS-232 cable. Plug the other end into a wall outlet.

Power up the terminal. The imager powers on automatically.

## Synapse Cable Connection

Symbol's Synapse Smart Cables enable interfacing to a variety of hosts. The Synapse cable has the built-in intelligence which detects the connected host.

1. Connect the Synapse adapter cable into the bottom of the imager, as described in [Connecting the Interface Cable to the P 300IMG](#) on page 1-2.
2. Plug the other end of the Synapse adapter cable into the Synapse Smart Cable.

**Figure 1-3. Synapse Cable Connection**

3. Connect the other end of the Synapse Smart Cable to the host.

**Figure 1-4. RS-232 Connection using Synapse**

4. If needed, plug one end of the power supply into the power receptacle on the RS-232 cable. Plug the other end into a wall outlet.

## Accessories

---

Depending on your host system's configuration, the following items may be included in your imager system. These items are also available through contacting your local Symbol representative or business partner.

### ***Cables***

For a standard host PC interface requiring external power:

- 9-Pin, Female, D Connector PC: TxD on Pin 2
- 100-240VAC (50/60Hz) Universal Power Supply and AC and DC line cords

For a host PC interface having power available on Pin 9:

- 9-Pin, Female, D Connector PC: TxD on Pin 2, power on Pin 9

### ***User Documentation***

The following user documentation is provided with your imager:

- P 300IMG Quick Reference Guide
- *P 300IMG Product Reference Guide* (this manual)

## Scanning

---

The P 300IMG uses digital camera technology to take a digital picture of a bar code. It stores the resulting image in its memory, and executes software decoding algorithms to extract the data from the image. A typical bar code decoding process is as follows:

1. The user aims the imager and pulls the trigger.
2. The red laser aiming pattern turns on to assist in aiming the imager.
3. If necessary, the imager turns on its red LEDs to illuminate the target bar code.
4. The imager takes a digital picture (image) of the bar code and stores it in memory for decoding.
5. A decode beep occurs and the imager transmits the bar code data to the host.
6. The user releases the trigger.

This process usually occurs instantaneously. Steps 2 - 4 are repeated on poor or difficult bar codes, for as long as the trigger remains pressed.

You may customize features in the P 300IMG by scanning the appropriate programming bar codes in [Chapter 2, Programming the P 300IMG](#).

## Aiming the Imager

The P 300IMG Imager projects a laser aiming pattern similar to those used on cameras. The aiming pattern allows you to position the bar code or object within the field of view.

**Figure 1-5. Laser Aiming Pattern**

To scan a symbol with the P 300IMG:

1. Press the trigger. Center the symbol in any orientation within the aiming pattern. Be sure the entire symbol is within the rectangular area formed by the brackets in the pattern.

**Figure 1-6. Centering Symbol in Aiming Pattern**

The imager can also read a bar code presented within the aiming pattern but not centered, such as the figure below on the left. The figure on the right, however, can not be decoded.

**Figure 1-7. Acceptable and Incorrect Aiming**

If two bar codes are present in the aiming pattern, the imager decodes the central-most bar code.

2. Hold the P 300IMG between two and nine inches (depending on symbol density) from the symbol, centering the aiming pattern cross hairs on the symbol.
3. The aiming pattern is smaller when the P 300IMG Imager is closer to the symbol and larger when it is farther from the symbol. Scan symbols with smaller bars or elements (mil size) closer to the Imager, and those with larger bars or elements (mil size) farther from the Imager.
4. Hold the trigger until the Imager beeps, indicating the bar code has been successfully decoded.

## ***Operational Modes***

The imager has three modes of operation:

- Decode Mode
- Snapshot Mode
- Video Mode.

### **Decode Mode**

By default, when you pull the trigger the imager attempts to locate and decode enabled bar codes within its field of view. The imager remains in this mode as long as the trigger is pulled or until a bar code is decoded.

## Snapshot Mode

Snapshot Mode is used to capture a high-quality image and transmit it to the host. You may temporarily enter this mode by scanning the Snapshot Mode bar code below. While in this mode the imager blinks the yellow LED at 1-second intervals to indicate it is not in standard operating (decode) mode.

**Snapshot Mode**

When the Imager enters Snapshot Mode, it defaults to turning on its laser aiming pattern to highlight the area to be captured in the image. The next trigger pull instructs the imager to capture a high quality image and transmit it to the host. A short time may pass (less than 2 seconds) between when the trigger is pulled and the image is captured as the imager adjusts to the lighting conditions. Hold the imager steady until the image is captured, denoted by a single beep.

If you do not press the trigger within the Snapshot Mode Timeout period, the imager returns to Decode Mode. This timeout period can be adjusted using the *Snapshot Mode Timeout* parameter on page 2-24. The default timeout period is 30 seconds.

To disable the laser aiming pattern during Snapshot Mode, see [Snapshot Aiming Pattern](#) on page 2-24.

## Video Mode

While in this mode the imager behaves as a video camera as long as the trigger is pressed. When the trigger is released, the imager returns to Decode Mode. You may temporarily enter Video Capture Mode by scanning the bar code below.

**Video Mode**

## Beeper Definitions

---

The imager communicates with the user by emitting different beep tones and patterns. The following tables define what each beep sequence means.

### ***Standard Beeper Definitions***

**Table 1-1** defines general beep sequences that occur during both normal scanning and while programming the imager.

**Table 1-1. Standard Beeper Definitions**

Beeper Sequence	Indication
Standard Use	
Short high tone	A bar code symbol was decoded (if decode beeper is enabled).
Low/medium/high tone	Power-on or reset. Occurs immediately after the imager is turned on, indicating that the system software is working properly. Three beeps which occur during normal operation indicate a reset. Any work in progress may be lost. If this occurs often, contact the Symbol Support Center.
Parameter Menu Scanning	
Short high tone	Correct entry scanned or correct menu sequence performed.
High/low/high/low tone	Successful program exit with change in the parameter setting.
Low/high tone	Input error, incorrect bar code, or "Cancel" scanned, wrong entry, incorrect bar code programming sequence; remain in program mode.
Communication	
4 short high tones	Communication error.
High/high/high/low tone	Receive error.
Low/high/low tone	ADF transmit error.

## Special Beeper/Status LED Definitions

Table 1-2 define beeper and Status LED activity indicating special events.

**Table 1-2. Special Beeper and Status LED Indications**

Event	Beeper Tone	Status LEDs
Decode	Middle	Green Flash
Trigger pull	No sound	Red Flash
Bootup	Low, Middle, High	No Lights
Transmission error	Four Low	No Lights
Parity error	Three Low, Two Extra Low	No Lights
Start snapshot	Low	Blinking Yellow
Complete snapshot	Low	No Lights
Entry error	Low, High	Green Flash
Parameter entered	High, Low, High, Low	Green Flash
Defaults set	Low High, High	Green Flash
No Decode message	No sound	No Lights
Video Mode enabled	No sound	Yellow Light
Video Mode disabled	No sound	No Lights
Wakeup (from low power)	No sound	No Lights
CCD failure	Two Very Low Long	Blinking Red
Parameter scanned	Middle	Green Flash
Synapse - Invalid parameter	High, Low, High, Low	No Lights
Synapse failure	Very Low, Low, Very Low, High	Red Flash

## ADF Beeper/Status LED Definitions

See [Table 3-3 on page 3-8](#) for beeper and status LED events that occur during ADF programming.

## Chapter 2

# Programming the P 300IMG

### Introduction

---

The P 300IMG Imager can be programmed to perform various functions, or activate different features. This chapter describes each feature and provides the programming bar codes necessary for selecting these features for your imager. Before programming, follow the setup instructions in [Chapter 1, Getting Started](#).

[Table 2-1 on page 2-4](#) shows selectable programming options and their default values for the P 300IMG. Throughout the programming bar code menus, default values are indicated with asterisks (\*).

Indicates Default ————— \***Enable Feature**

Feature —————

If the default values suit your requirements, no programming is necessary. Features other than default values can be set by scanning single bar codes or short bar code sequences. These features may also be set from the host through the serial interface. Note that these settings are stored in non-volatile memory and are retained after power down.

To return all features (except Host Type) to their default values, all you need to do is scan the **Set Defaults** bar code on page 2-3.

## **Scanning Sequence Examples**

---

In most cases you need only scan one bar code to set a specific parameter. For example, if you want to set the baud rate to 9600, simply scan the **9600** bar code listed under *Baud Rate* on page 2-82. The imager issues a warble tone, signifying a successful parameter entry.

If you want to set specific code lengths or specify Serial Response Time-Out, you have to scan several bar codes. This procedure is described later in this chapter.

### ***Errors While Scanning***

If you make an error during a scanning sequence, just rescan the correct parameter.

## Set Default Parameter

---

Scan the **Set Defaults** bar code to return all parameters to the default values listed in [Table 2-1](#).

**Set Defaults**

## Parameter Selections and Defaults

Table 2-1 lists parameter selections, their defaults, and the page number they appear on.

**Table 2-1. Parameter Table**

Parameter	Param. Number	Selection	Default	Page
Set Defaults		None	Set Default Values	2-3
Host Type	8Eh	RS-232 (37h) SSI (8Fh)	RS-232 (if Synapse is not detected)	2-13
Parameter Scanning	ECh	Enabled (01h) Disabled (00h)	Enabled	2-13
Power Mode	80h	Continuous On Mode (00h) Low Power Mode (01h)	Continuous On Mode	2-14
Beeper Options				2-15
Beep After Good Decode	38h	Enabled (01h) Disabled (00h)	Enabled	2-15
Beeper Volume	8Ch	High (09h), Medium (03h), Low (00h)	Medium	2-16
Beeper Tone	91h	High (00h), Medium (01h), Low (02h)	Medium	2-17
Imaging Options				2-18
Decoding Autoexposure	F0h,29h	Enabled (01h) Disabled (00h)	Enabled	2-18
Decoding Illumination	F0h,2Ah	Enabled (01h) Disabled (00h)	Enabled	2-19
Image Capture Autoexposure	F0h,68h	Enabled (01h) Disabled (00h)	Enabled	2-19
Image Capture Illumination	F0h,69h	Enabled (01h) Disabled (00h)	Disabled	2-20
Gain Setting	F0h,37h	128 (0080h), 192 (00C0h), 256 (0100h), 320 (0140h), 384 (0180h), 448 (01C0h)	192	2-21

**Table 2-1. Parameter Table (Continued)**

Parameter	Param. Number	Selection	Default	Page
Exposure Time	F0h,38h	5 ms (004Fh), 10 ms (009Dh), 15 ms (00ECh), 20 ms (013Bh), 25 ms (018Ah), 30 ms (01D8h)	20 ms	2-22
Decode Aiming Pattern	F0h,32h	Enabled (02h) Disabled (00h)	Enabled	2-23

## Host Type

---

### *Parameter # 8Eh*

If you are using a Synapse cable, there's no need to scan a host bar code, as the imager autodetects your host. If you are not using Synapse, scan a bar code below to select either an RS-232 host, or Simple Serial Interface (SSI) host type.

**\*RS-232 Host  
(37h)**

**SSI Host  
(8Fh)**

## Parameter Scanning

---

### *Parameter # ECh*

To disable decoding of parameter bar codes, scan the bar code below. Note that the Set Defaults parameter bar code will still be decoded. To enable decoding of parameter bar codes, either scan [Enable Parameter Scanning](#), [Set Defaults](#) or set this parameter to 01h via a serial command.

**Enable Parameter Scanning**

**Disable Parameter Scanning**

## Power Mode

---

### *Parameter # 80h*

There are two power modes available for the imager. If Continuous On Mode is selected, the imager draws power continuously, even when idle. This mode is recommended when external power is applied.

If Low Power Mode is selected, the imager draws power only when active, and removes power when idle. This mode is recommended when the imager is attached to a battery-powered hand-held terminal.

**\*Low Power Mode  
(01h)**

**Continuous On Mode  
(00h)**

## Beeper Options

---

### ***Beep After Good Decode***

#### ***Parameter # 38h***

This parameter determines if the imager's beeper sounds during normal scanning. By default, the beeper sounds after a decode. In all cases, the beeper operates during parameter menu scanning and indicates error conditions. See [Beeper Definitions](#) on page 1-9.

Select whether or not to beep after a successful decode. If you select to beep, set the beeper volume and tone.

**\*Beep After Good Decode  
(01h)**

**Do Not Beep After Good Decode  
(00h)**

## ***Beeper Volume***

### ***Parameter # 8Ch***

This parameter sets the decode beep volume — low, medium, or high.

**Low  
(00h)**

**\*Medium  
(03h)**

**High  
(09h)**

## ***Beeper Tone***

### ***Parameter # 91h***

This parameter sets the decode beep frequency or tone — low, medium, or high.

**Low Tone  
(02h)**

**\*Medium Tone  
(01h)**

**High Tone  
(00h)**

## Imaging Options

---

The following parameters control image capture characteristics. Image capture occurs in all modes of operation, including decode, video, and snapshot.

Generally, to brighten an image turn on illumination first, increase exposure time second, then increase gain. To darken an image, reduce gain first, remove illumination second, and reduce exposure time last.

To determine the optimal setting for manual exposure control:

1. Set the exposure time to 20 ms, the gain to 256, and the illumination on.
2. If these settings are too bright, reduce the gain. If it is still too bright, remove illumination. If it is still too bright, reduce the exposure time.
3. If the settings are too dark, increase the exposure time if this does not result in blurred images (e.g., if the P 300IMG is in a fixed mount). If the images are blurry, restore the exposure time to 20 ms. If the images are still too dark, increase the gain.

This procedure produces images that are optimized to only one light setting, so if the amount of ambient light changes, the quality of the images change. To avoid these problems, we recommend that you enable the Autoexposure feature. When Autoexposure is enabled, you can still control illumination.

### ***Decoding Autoexposure***

#### ***Parameter # F0h,29h***

Select Enable Decoding Autoexposure to allow the imager to control gain settings, exposure (integration) time, and illumination to best capture an image for the selected operation mode.

Select Disable Decoding Autoexposure to manually adjust the gain, exposure time, and illumination (see the following pages). This option is only recommended for advanced users with difficult image capture situations.

**\*Enable Decoding  
Autoexposure**

**Disable Decoding  
Autoexposure**

## ***Decoding Illumination***

### **Parameter # F0h,2Ah**

This parameter is only available when Decoding Autoexposure is disabled. If you select Enable Decoding Illumination, the imager flashes on every decode. Select Disable Decoding Illumination to prevent the imager from using its internal illumination source.

Enabling illumination usually results in superior images. The effectiveness of the illumination decreases as the distance to the target is increased.

**\*Enable Decoding  
Illumination**

**Disable Decoding  
Illumination**

## ***Image Capture Autoexposure***

### **Parameter # F0h,68h**

Select Enable Autoexposure to allow the imager to control gain settings and exposure (integration) time to best capture an image for the selected operation mode.

Select Disable Autoexposure to manually adjust the gain and exposure time (see the following pages). This option is only recommended for advanced users with difficult image capture situations.

**\*Enable Image Capture  
Autoexposure**

**Disable Image Capture  
Autoexposure**

## ***Image Capture Illumination***

### **Parameter # F0h,69h**

If you select Enable Illumination, the imager flashes on every image capture. Select Disable Illumination to prevent the imager from using its internal illumination source.

Enabling image capture illumination brightens images taken in a poorly lit environment. The effectiveness of the illumination decreases as the distance to the target is increased.

**Enable Image Capture  
Illumination**

**\*Disable Image Capture  
Illumination**

## Gain

### Parameter # F0h,37h

This parameter is only available when Autoexposure is disabled. Gain is a means of amplifying the raw image data before it is converted into 256 gray-scale values. Increasing the gain increases brightness and contrast, but also increases noise (undesired electrical fluctuations in the image) which makes the image less attractive and/or harder to decode. You may set the manual gain to one of the following values: 128, 192, 256, 320, 384 or 448.

**Gain 128**  
**(0080h)**

**\*Gain 192**  
**(00C0h)**

**Gain 256**  
**(0100h)**

**Gain 320**  
**(0140h)**

**Gain 384**  
**(0180h)**

**Gain 448**  
**(01C0h)**

## Exposure Time

### Parameter # F0h,38h

This parameter is only available when Autoexposure is disabled. Exposure Time controls the amount of time the CCD is allowed to collect light, much like the shutter speed for a camera. Generally, the brighter the environment, the lower the exposure time. You may set the manual exposure time to one of the following values: 5 ms, 10 ms, 15 ms, 20 ms, 25 ms or 30 ms. As the exposure time is increased past 20 ms, there is a risk of blurring the image due to hand jitter.

**5 ms**  
**(004Fh)**

**10 ms**  
**(009Dh)**

**15 ms**  
**(00ECh)**

**\*20 ms**  
**(013Bh)**

**25 ms**  
**(018Ah)**

**30 ms**  
**(01D8h)**

## ***Decode Aiming Pattern***

### ***Parameter # F0h,32h***

This parameter only applies when in Decode Mode. Select Enable Decode Aiming Pattern to project the aiming pattern during bar code capture, or Disable Decode Aiming Pattern to turn the aiming pattern off.

**\*Enable Decode Aiming Pattern  
(02h)**

**Disable Decode Aiming Pattern  
(00h)**

## ***Snapshot Mode Timeout***

### ***Parameter # F0h,43h***

This parameter sets the amount of time the imager remains in Snapshot Mode. The imager exits Snapshot Mode when you pull the trigger, or when the Snapshot Mode Timeout elapses. To set this timeout value, scan the bar code below followed by a bar code from [Numeric Bar Codes](#) on page 2-96. The default value is 0 which represents 30 seconds; values increment by 30. For example, 1 = 60 seconds, 2 = 90 seconds, etc.

**Snapshot Mode Timeout**

## ***Snapshot Aiming Pattern***

### ***Parameter # F0h,2Ch***

Select Enable Snapshot Aiming Pattern to project the aiming pattern when in Snapshot Mode, or Disable Snapshot Aiming Pattern to turn the aiming pattern off.

**\*Enable Snapshot Aiming Pattern  
(01h)**

**Disable Snapshot Aiming Pattern  
(00h)**

## ***Image Cropping***

### **Parameter # F0h,2Dh**

This parameter allows you to crop a captured image. If Disable Image Cropping is selected, the full 640 x 480 pixels are presented. If Enable is selected, the imager crops the image to the pixel addresses set in [Crop to Pixel Addresses](#) on page 2-26.

**Enable Image Cropping  
(01h)**

**\*Disable Image Cropping  
(Use Full 640 x 480 Pixels)  
(00h)**

## **Crop to Pixel Addresses**

**Parameter # F0h,3Bh (Top)**

**Parameter # F0h,3Ch (Left)**

**Parameter # F0h,3Dh (Bottom)**

**Parameter # F0h,3Eh (Right)**

If Enable Image Cropping is selected, set the pixel addresses from (0,0) to (639,479) to crop to.

Columns are numbered from 0 to 639, rows from 0 to 479. Specify four values for Top, Left, Bottom, and Right, where Top and Bottom correspond to row pixel addresses, and Left and Right correspond to column pixel addresses. For example, for a 4 row x 8 column image in the extreme bottom-right section of the image, set the following values:

Top = 476, Bottom = 479, Left = 631, Right = 639

To set the pixel address to crop to, scan each Pixel Address bar code followed by three bar codes from *Numeric Bar Codes* beginning on page 2-96 which represent the value. Leading zeros are required, so to enter a value of 3, for example, scan **0, 0, 3**.

## *Crop to Pixel Addresses (continued)*

**Top Pixel Address**  
**(0 - 479 Decimal)**

**Left Pixel Address**  
**(0 - 639 Decimal)**

**Bottom Pixel Address**  
**(0 - 479 Decimal)**

**Right Pixel Address**  
**(0 - 639 Decimal)**

## ***Image Resolution***

### ***Parameter # F0h,2Eh***

This option alters image resolution before compression. Multiple pixels are combined to one pixel, resulting in a smaller image containing the original content with reduced resolution.

The following values can be selected:

**Table 2-2. Image Resolution**

<b>Resolution Value</b>	<b>Image Size</b>
Full	640 x 480
1/2	320 x 240
1/3	214 x 160
1/4	160 x 120

**\*Full Resolution  
(00h)**

**1/2 Resolution  
(01h)**

**1/3 Resolution  
(02h)**

**1/4 Resolution  
(03h)**

## ***JPEG Image Options***

### ***Parameter # F0h,2Bh***

JPEG images may be optimized for either file size or for image quality. Scan the Quality Selector bar code to enter a quality value; the imager then selects the corresponding image

size. Scan the Size Selector bar code to enter a size value; the imager then selects the best image quality.

**\*JPEG Image Quality Selector**  
(01h)

**JPEG File Size Selector**  
(00h)

## ***JPEG Quality and Size Value***

***JPEG Quality = Parameter # F0h,31h***

***JPEG Size = Parameter # F0h,33h***

If JPEG Quality Selector is selected, scan the **JPEG Image Quality Value** bar code followed by 3 bar codes from *Numeric Bar Codes* beginning on page 2-96 corresponding to a value from 5 to 100, where 100 represents the highest quality image.

If JPEG Size Selector is selected, scan **JPEG File Size Value** followed by 3 bar codes from *Numeric Bar Codes* beginning on page 2-96 corresponding to a value from 1 to 150 which represents the file size in multiples of 1024 bytes (1K). For example, setting this value to 8 (008) permits the file size to be as large as 8192 bytes.

**JPEG Image Quality Value**  
(Default: 065)  
(5 - 100 Decimal)

**JPEG File Size Value**  
(Default: 040)  
(1 - 150 Decimal)

## ***Image File Format Selector***

### ***Parameter # F0h,30h***

Select an image format appropriate for your system (BMP, TIFF, or JPEG). The imager stores captured images in the format you select.

**BMP File Format  
(03h)**

**\*JPEG File Format  
(01h)**

**TIFF File Format  
(04h)**

## ***Bits per Pixel***

### ***Parameter # F0h,2Fh***

Select the number of significant bits per pixel (BPP) to use when capturing an image. Select 1BPP for a black and white image, 4BPP to assign 1 of 16 levels of grey to each pixel, or 8BPP to assign 1 of 256 levels of grey to each pixel. The imager ignores these settings for JPEG files, which always use 8BPP.

**1 BPP  
(00h)**

**4 BPP  
(01h)**

**\*8 BPP  
(02h)**

## Video Options

---

### ***Video View Finder***

#### ***Parameter # F0h,44h***

Select Enable Video View Finder to project the aiming pattern while in Video Mode, or Disable Video View Finder to turn the aiming pattern off.

**\*Disable Video View Finder  
(00h)**

**Enable Video View Finder  
(01h)**

## **Target Video Frame Size**

### **Parameter # F0h,48h**

Select the number of 100-byte blocks. Values range from 800 to 3300 bytes. Selecting a smaller value allows more frames to be transmitted per second; selecting a larger value increases video quality.

To set the Target Video Frame Size, scan the bar code below followed by 2 bar codes from *Numeric Bar Codes* beginning on page 2-96 corresponding to the 100-byte value from 800 to 3300 bytes. For example, to select 1500 bytes, enter 1, 5. To select 900 bytes, enter 0, 9.

**Target Video Frame Size**

## **Video View Finder Image Size**

### **Parameter # F0h,49h**

Select the number of 100-byte blocks. Values range from 800 to 3300 bytes. Selecting a smaller value allows more frames to be transmitted per second; selecting a larger value increases video quality.

To set the Target Video Frame Size, scan the bar code below followed by 2 bar codes from *Numeric Bar Codes* beginning on page 2-96 corresponding to the 100-byte value from 800 to 3300 bytes. For example, to select 1500 bytes, enter 1, 5. To select 900 bytes, enter 0, 9.

**Video View Finder Image Size**

## Bar Code Symbolologies

---

The imager can decode any or all of the following symbolologies. Select the symbolologies you need to scan using the bar codes in this section.

- UPC Versions A and E (EAN 8 and 13) ♦ Code 128
- Code 39 ♦ UCC/EAN 128
- Code 39 Full ASCII ♦ ISBT 128
- Trioptic Code 39 ♦ Interleaved 2 of 5
- Code 93 ♦ Discrete 2 of 5
- MSI Plessey ♦ Codabar
- PDF417 ♦ US Postnet
- MicroPDF ♦ US Planet
- MacroPDF ♦ UK Postal
- Australian Postal ♦ Japan Postal
- Maxicode ♦ DataMatrix (ECC 200)
- QR Code ♦ Bookland EAN

The integrated decoder autodiscriminates between all these symbolologies, except between Code 39 and Code 39 Full ASCII.

### **Code 39/Code 39 Full ASCII**

The ASCII character set assigns a code to letters, punctuation marks, numerals, and most control keystrokes on the keyboard.

The first 32 codes are non-printable and are assigned to keyboard control characters, such as **BACKSPACE** and **RETURN**. The other 96 are called printable codes because all but **SPACE** and **DELETE** produce visible characters.

Code 39 Full ASCII interprets the bar code control character (\$ + % /) preceding a Code 39 symbol and assigns an ASCII character value. For example, when Code 39 Full ASCII is enabled and a **+B** is scanned, it is interpreted as **b**, **%J** as **?**, and **\$H** emulates the keystroke **BACKSPACE**. Scanning **ABC\$M** outputs the keystroke equivalent of "ABC ENTER".

## 1D Symbolologies

**\*Enable QR Code**

**Disable QR Code**

## Macro PDF Features

---

Macro PDF is a special feature for concatenating multiple PDF symbols into one file. The imager can decode symbols that are encoded with this feature, however, the 64K version cannot buffer large sets of macro PDF symbols.

### ***Caution***

When printing, keep each Macro PDF sequence separate, as each sequence has unique identifiers. Do not mix bar codes from several Macro PDF sequences, even if they encode the same data. When scanning Macro PDF sequences, scan the entire Macro PDF sequence without interruption. If you scan a mixed sequence, you get two long low beeps (Lo Lo) for inconsistent file ID or inconsistent symbology error.

### ***Flush Macro Buffer***

This flushes the buffer of all decoded Macro PDF data stored to that point, transmits it to the host device, and aborts from Macro PDF mode.

**Flush MacroPDF Buffer**

### ***Abort Macro PDF Entry***

This clears all currently-stored Macro PDF data in the buffer without transmission and aborts from Macro PDF mode.

**Abort MacroPDF Entry**

## Code Lengths

Code lengths for certain one-dimensional code types (i.e., Code 39, Codabar, etc.) may be set for any length, one or two discrete lengths, or lengths within a specific range. The length of a code refers to the number of characters (i.e., human readable characters) the code contains.

**Table 2-3. Code Length Options**

Length Option	Description
Length Within Range	This option allows you to decode a 1D symbol within a specified range. For example, to decode a Code 39 symbol containing between 4 and 12 characters, first scan Code 39 Length Within Range. Then scan 0, 4, 1 and 2 (single-digit numbers must always be preceded by a leading zero).
One Discrete Length	This option allows you to decode only 1D codes containing a selected length. For example, if you select <b>Codabar - One Discrete Length</b> , then scan <b>1</b> and <b>4</b> , only Codabar codes containing 14 characters are decoded. No discrete lengths can be set for Code 128.
Two Discrete Lengths	This option allows you to decode only 1D codes containing two selected lengths. For example, if you select <b>I 2 Of 5 Two Discrete Lengths</b> , then scan <b>0, 2, 1, 4</b> , only Interleaved 2 of 5 codes containing 2 or 14 characters are decoded. No discrete lengths can be set for Code 128.
Any Length	Scanning this option allows you to decode the selected 1D code type containing any number of characters. For example, if you scan <b>Codabar Any Length</b> , you can decode a Codabar symbol containing any number of characters.

To select lengths for each code type:

1. Scan the desired option.
2. Scan two *Numeric Bar Codes* beginning on page 2-96 for each desired length. For example, for a length of "12", scan "1" then "2". For a length of "3", scan "0", then "3". You must always scan two bar codes for each length.
3. If you make an error, or wish to change your selection, scan **Cancel** on page 2-97.

## **Code 39 Lengths**

**L1 = Parameter # 12h; L2 = Parameter # 13h**

**Code 39 Any Length**

**\*Code 39 Length Within Range  
(0 - 55 decimal)**

**Code 39 1 Discrete Length  
(0 - 55 decimal)**

**Code 39 2 Discrete Lengths  
(0 - 55 decimal)**

## **Code 93 Lengths**

***L1 = Parameter # 1Ah; L2 = Parameter # 1Bh***

**Code 93 Any Length**

**\*Code 93 Length Within Range  
(0 - 55 decimal)**

**Code 93 1 Discrete Length  
(0 - 55 decimal)**

**Code 93 2 Discrete Lengths  
(0 - 55 decimal)**

## **Codabar Lengths**

***L1 = Parameter # 18h; L2 = Parameter # 19h***

**Codabar Any Length**

**\*Codabar Length Within Range  
(0 - 55 decimal)**

**Codabar 1 Discrete Length  
(0 - 55 decimal)**

**Codabar 2 Discrete Lengths  
(0 - 55 decimal)**

## ***Interleaved 2 of 5 Lengths***

***L1 = Parameter # 16h; L2 = Parameter # 17h***

**I 2 Of 5 - Any Length**

**I 2 Of 5 - Length Within Range  
(0 - 55 decimal)**

**\*I 2 Of 5 1 Discrete Length  
(14 Characters)  
(0 - 55 decimal)**

**I 2 Of 5 2 Discrete Lengths  
(0 - 55 decimal)**

## ***Discrete 2 of 5 Lengths***

***L1 = Parameter # 14h; L2 = Parameter # 15h***

**D 2 Of 5 Any Length**

**D 2 Of 5 Length Within Range  
(0 - 55 decimal)**

**\*D 2 Of 5 1 Discrete Length  
(12 Characters)  
(0 - 55 decimal)**

**D 2 Of 5 2 Discrete Lengths  
(0 - 55 decimal)**

## ***MSI Plessey Lengths***

***L1 = Parameter # 1Eh; L2 = Parameter # 1Fh***

**MSI Plessey - Any Length**

**\*MSI Plessey - Length Within Range  
(0 - 55 decimal)**

**MSI Plessey 1 Discrete Length  
(0 - 55 decimal)**

**MSI Plessey 2 Discrete Lengths  
(0 - 55 decimal)**

## Decode Options

---

### ***Transmit UPC-A Check Digit***

#### ***Parameter # 28h***

Select if decoded UPC-A symbols are transmitted with or without a check digit.

**\*Transmit UPC-A Check Digit**

**Do Not Transmit UPC-A Check Digit**

### ***Transmit UPC-E Check Digit***

#### ***Parameter # 29h***

Select if decoded UPC-E symbols are transmitted with or without a check digit.

**\*Transmit UPC-E Check Digit**

**Do Not Transmit UPC-E Check Digit**

## ***Transmit UPC-E1 Check Digit***

### ***Parameter # 2Ah***

Select if decoded UPC-E1 symbols are transmitted with or without a check digit.

**\*Transmit UPC-E1 Check Digit**

**Do Not Transmit UPC-E1 Check Digit**

## ***Convert UPC-E to UPC-A***

### ***Parameter # 25h***

This parameter converts UPC-E (zero suppressed) decoded data to UPC-A format before transmission. After conversion, data follows UPC format and is affected by UPC-A programming selections (e.g., Preamble, Check Digit).

**Convert UPC-E To  
UPC-A**

**\*Do Not Convert  
UPC-E To UPC-A**

## **Convert UPC-E1 to UPC-A**

### **Parameter # 26h**

This parameter converts UPC-E1 (zero suppressed) decoded data to UPC-A format before transmission. After conversion, data follows UPC format and is affected by UPC-A programming selections (e.g., Preamble, Check Digit).

**Convert UPC-E1  
To UPC-A**

**\*Do Not Convert  
UPC-E1 To UPC-A**

## **Decode UPC/EAN Supplementals**

### **Parameter # 10h**

Supplementals are additionally appended characters (2 or 5) according to specific code format conventions (e.g., UPC A+2, UPC E+2, EAN 8+2). Three options are available.

- If UPC/EAN with supplemental characters is selected, the imager does not decode UPC/EAN symbols without supplemental characters.
- If UPC/EAN without supplemental characters is selected, and the imager is presented with a UPC/EAN plus supplemental symbol, it decodes the UPC/EAN and ignores the supplemental characters.
- An autodiscriminate option is also available. If you scan this option, also select a value for [Decode UPC/EAN Supplemental Redundancy](#) on page 2-57. A value of 5 or more is recommended.

---

**Note:** *To minimize the risk of invalid data transmission, we recommend that you select whether to read or ignore supplemental characters.*

---

Select the desired option by scanning one of the following bar codes.

**Decode UPC/EAN With  
Supplementals**

**\*Ignore UPC/EAN With  
Supplementals**

**Autodiscriminate UPC/EAN Supplementals**

## ***Decode UPC/EAN Supplemental Redundancy***

### ***Parameter # 50h***

With Autodiscriminate UPC/EAN Supplementals selected, this option adjusts the number of times a symbol without supplementals is decoded before transmission. The range is from 2 to 20 times. Five or above is recommended when decoding a mix of UPC/EAN symbols with and without supplementals.

Scan the bar code below to select a decode redundancy value. Next scan two numeric bar codes beginning on page 2-96. Single digit numbers must have a leading zero. If you make an error, or wish to change your selection, scan the *Cancel* bar code on page 2-97.

**Decode UPC/EAN  
Supplemental Redundancy**

## ***EAN-8 Zero Extend***

### ***Parameter # 27h***

This parameter adds five leading zeros to decoded EAN-8 symbols to make them compatible in format to EAN-13 symbols.

**Enable EAN-8  
Zero Extend**

**\*Disable EAN-8  
Zero Extend**

## ***Convert EAN-8 to EAN-13 Type***

### ***Parameter # E0h***

When EAN Zero Extend is enabled, this parameter gives you the option of labeling the extended symbol as either an EAN-13 bar code, or an EAN-8 bar code. This affects [\*Transmit Code ID Character\*](#) and *DECODE\_DATA* message.

When EAN Zero Extend is disabled, this parameter has no effect on bar code data.

Type Is EAN-8

Type Is EAN-13

## ***UPC/EAN Coupon Code***

### ***Parameter # 55h***

When enabled, this parameter decodes UPC-A, UPC-A with 2 supplemental characters, UPC-A with 5 supplemental characters, and UPC-A/EAN128 bar codes. Autodiscriminate UPC/EAN Supplementals must be selected.

Enable UPC/EAN  
Coupon Code

\*Disable UPC/EAN  
Coupon Code

## ***UPC-A/UPC-E Preamble***

There are three options for the lead-in characters of decoded UPC-A, UPC-E, or UPC-E1 symbols transmitted to the host device. Select a preamble for each of the UPC decodes (UPC-A, UPC-E, and UPC-E1). These lead-in characters are considered part of the symbol itself. The three options are:

- a system character only
- the country code and system character

- no preamble.

The system character is the digit printed to the extreme left of a UPC symbol. The country code for UPC is always zero, and it cannot be transmitted without the system character.

## **UPC-A Preamble**

### **Parameter # 22h**

Select an option for the UPC-A preamble by scanning the appropriate bar code.

**None**

**\*System Character**

**System Character &  
Country Code**

## **UPC-E Preamble**

### **Parameter # 23h**

Select an option for the UPC-E preamble by scanning the appropriate bar code.

**None**

**\*System Character**

**System Character &  
Country Code**

## **UPC-E1 Preamble**

### **Parameter # 24h**

Select an option for the UPC-E1 preamble by scanning the appropriate bar code.

**None**

**\*System Character**

**System Character &  
Country Code**

## ***Code 39 Check Digit Verification***

### ***Parameter # 30h***

When enabled, this parameter checks the integrity of a Code 39 symbol to ensure that it complies with specified algorithms. Only those Code 39 symbols which include a modulo 43 check digit are decoded when this parameter is enabled.

**Enable Code 39  
Check Digit**

**\*Disable Code 39  
Check Digit**

## ***Transmit Code 39 Check Digit***

### ***Parameter # 2Bh***

When Code 39 Check Digit Verification is enabled, select if you want to transmit data with or without the check digit.

**Transmit Code 39 Check  
Digit (Enable)**

**\*Do Not Transmit Code 39  
Check Digit (Disable)**

## **Convert Code 39 to Code 32**

### **Parameter # 56h**

Scan the appropriate bar code below to enable or disable converting Code 39 to Code 32.

---

**Note:** *Code 39 must be enabled in order for this parameter to function.*

---

**Convert Code 39 to Code 32**

**Do Not Convert Code 39 to Code 32**

## **Code 32 Prefix**

### **Parameter # E7h**

Scan the appropriate bar code below to enable or disable adding the prefix character “A” to all Code 32 bar codes.

---

**Note:** *Convert Code 39 to Code 32 must be enabled for this parameter to function.*

---

**Code 32 Prefix Enable**

**Code 32 Prefix Disable**

## ***I 2 of 5 Check Digit Verification***

### ***Parameter # 31h***

When enabled, this parameter checks the integrity of an I 2 of 5 symbol to ensure it complies a specified algorithm, either Uniform Symbology Specification (USS), or Optical Product Code Council (OPCC).

**\*Disable**

**USS Check Digit**

**OPCC Check Digit**

## ***Transmit I 2 of 5 Check Digit***

### ***Parameter # 2Ch***

Select if decoded I 2 of 5 symbols are transmitted with or without a check digit.

**Transmit I 2 Of 5  
Check Digit**

**\*Do Not Transmit  
I 2 Of 5 Check Digit**

## **Convert I 2 of 5 to EAN-13**

### **Parameter # 52h**

This parameter converts a 14 character I 2 of 5 code into EAN-13, and transmits to the host as EAN-13. To accomplish this, the I 2 of 5 code must be enabled, one length must be set to 14, and the code must have a leading zero and a valid EAN-13 check digit.

**Convert I 2 Of 5 To  
EAN-13**

**\*Do Not Convert I 2 Of 5 To  
EAN-13**

## **MSI Plessey Check Digits**

### **Parameter # 32h**

These check digits at the end of the bar code verify the integrity of the data. At least one check digit is always required. Check digits are not automatically transmitted with the data.

**\*One MSI Plessey  
Check Digit**

**Two MSI Plessey  
Check Digits**

## ***Transmit MSI Plessey Check Digit***

### ***Parameter # 2Eh***

Select if you want to transmit data with or without the check digit.

**Transmit MSI Plessey  
Check Digit**

**\*Do Not Transmit MSI  
Plessey Check Digit**

## ***MSI Plessey Check Digit Algorithm***

### ***Parameter # 33h***

When two MSI Plessey Check Digits are selected, an additional verification is required to ensure integrity. Select either the Mod 10/Mod 10 or Mod 10/Mod 11 algorithm.

**MOD 10/MOD 11**

**\*MOD 10/MOD 10**

## ***Transmit US Postal Check Digit***

### ***Parameter # 5Fh***

Select if you want to transmit US Postal data with or without the check digit

**\*Transmit US Postal  
Check Digit**

**Do Not Transmit US  
Postal Check Digit**

## ***CLSI Editing***

### ***Parameter # 36h***

When enabled, this parameter strips the start and stop characters and inserts a space after the first, fifth, and tenth characters of a 14-character Codabar symbol.

---

**Note:** *Symbol length does not include start and stop characters.*

---

**Enable CLSI Editing**

**\*Disable CLSI Editing**

## ***NOTIS Editing***

### ***Parameter # 37h***

When enabled, this parameter strips the start and stop characters from a decoded Codabar symbol.

**Enable NOTIS Editing**

**\*Disable NOTIS Editing**

## **Code 128 Emulation**

### **Parameter # 7Bh**

When this parameter is enabled, the imager transmits data from certain MicroPDF417 symbols as if it was encoded in Code 128 symbols. Transmit AIM Symbology Identifiers must be enabled for this parameter to work.

If Code 128 Emulation is enabled, these MicroPDF417 symbols are transmitted with the one of the following prefixes:

**]C1**if the first codeword is 903-907, 912, 914, 915

**]C2**if the first codeword is 908 or 909

**]C0**if the first codeword is 910 or 911

If disabled, they are transmitted with one of the following prefixes:

**]L3**if the first codeword is 903-907, 912, 914, 915

**]L4**if the first codeword is 908 or 909

**]L5**if the first codeword is 910 or 911

Scan a bar code below to enable or disable Code 128 Emulation.

**Enable Code 128 Emulation**

**\*Disable Code 128 Emulation**

## Transmit Code ID Character

### Parameter # 2Dh

A code ID character identifies the code type of a scanned bar code. This may be useful when the imager is decoding more than one code type. If a prefix is selected, the code ID character is sent after the prefix and before the decoded symbol.

You may select no code ID character, a Symbol code ID character, or an AIM ID character. Symbol code ID characters are listed below. AIM ID characters are listed in [AIM Code Identifiers](#) on page A-1.

**Table 2-4. Symbol Code ID Characters**

Code Type	Symbol Identifier
UPC-A, UPC-E, UPC-E1, UPC-E0, EAN-13, EAN-8	A
Code 39, Code 39 Full ASCII, Code 32	B
Codabar	C
Code 128, ISBT 128	D
Code 93	E
Interleaved 2 of 5	F
Discrete 2 of 5, D 2 of 5 IATA	G
MSI Plessey	J
UCC/EAN 128	K
Bookland EAN	L
Trioptic Code 39	M
UPC/EAN Coupon Code	N
PDF417	X

<b>Code Type</b>	<b>Symbol Identifier</b>
Australian Postal	P09

## ***Transmit Code ID Character (continued)***

**Transmit Symbol Code ID Character**

**Transmit AIM Code ID Character**

**\*Do Not Transmit Code ID Character**

## **Transmit “No Decode” Message**

### **Parameter # 5Eh**

When this feature is enabled, the imager transmits “NR” (No Read), along with enabled prefixes and suffixes, if the trigger is released before a successful decode.

**Transmit “No Decode” Message**

**\*Do Not Transmit  
“No Decode” Message**

## **LRC Checksum**

### **Parameter # 7Eh**

When this option is enabled, it allows an LRC checksum character to be appended at the end of a decode transmission. The format of output data is as follows:

<STX> <DATA...> <ETX> <LRC>.

If <**DATA...**> contains the special characters STX, ETX, and DLE, a DLE character is added as an escape character before each special character, to instruct the host not to interpret the special characters in the data as control characters. The LRC character is the exclusive OR of all characters (including STX, ETX, and any DLE escape characters inserted) except for the LRC character itself.

**Enable LRC Checksum**

**\*Disable LRC Checksum**

## ***Prefix/Suffix Values***

### ***Prefix = Parameter # 69h; Suffix = Parameter # 68h***

A prefix/suffix may be appended to scanned data for use in data editing. Set these values by scanning a four digit number (i.e., four bar codes) that correspond to ASCII characters for various terminals. See [Table A-3 on page A-7](#) for ASCII values.

To set a Prefix/Suffix value:

1. Scan the Scan Suffix or Scan Prefix bar code.
2. Scan four *Numeric Bar Codes* beginning on page 2-96 which correspond to the ASCII value or keystroke value you wish to assign (see [Table A-3 on page A-7](#)). The **Enter** key is the default for all options.
3. If you make an error, or wish to change your selection, scan **Cancel** on page 2-97.

**Scan Suffix (Value 1)**

**Scan Prefix (Value 2)**

## Data Transmission Formats

### Parameter # EBh

You may select one of the following scan data format options:

Standard:<data>

Option 1:<data> <SUFFIX>

Option 2:<PREFIX> <data> <SUFFIX>

Option 3:<PREFIX> <data>

<data> = scanned bar code data

<PREFIX> and <SUFFIX> as selected by the user.

To select a data transmission format:

1. Scan the **Scan Options** bar code.
2. Scan the bar code corresponding to the desired converted data format.
3. Scan **Enter**. If you make a mistake, scan **Cancel** on the next page.

---

**Note:** RS-232C hosts treat the extended keypad default suffix (7013) as ASCII data.

---

Scan Options

\*Data As Is

<DATA> <SUFFIX>

## Data Transmission Formats (continued)

<PREFIX> <DATA> <SUFFIX>

<PREFIX> <DATA>

Enter

Cancel

## Security Options

---

### ***Linear Code Type Security Level***

#### ***Parameter # 4Eh***

---

**Note:** *This option does not apply to Code 128.*

---

The P 300IMG offers four levels of decode security for linear code types (e.g., Code 39, Interleaved 2 of 5). Select higher security levels for decoding poor quality bar codes. As security levels increase, the imager's aggressiveness decreases to prevent misdecodes. Select the security level appropriate for your bar code quality.

#### **Linear Security Level 1**

The following code types must be successfully read twice before being decoded:

Code Type	Length
Codabar	All
MSI Plessey	4 or less
D 2 of 5	8 or less
I 2 of 5	8 or less

**Linear Security Level 1**

## Linear Security Level 2

All code types must be successfully read twice before being decoded.

**\*Linear Security Level 2**

## Linear Security Level 3

Code types other than the following must be successfully read twice before being decoded.  
The following codes must be read three times:

Code Type	Length
MSI Plessey	4 or less
D 2 of 5	8 or less
I 2 of 5	8 or less
Codabar	8 or less

**Linear Security Level 3**

## Linear Security Level 4

All code types must be successfully read three times before being decoded.

**Linear Security Level 4**

## UPC/EAN Security Level

### Parameter # 4Dh

The P 300IMG offers four levels of decode security for UPC/EAN bar codes. Select higher security levels for decoding poor quality bar codes. As security levels increase, the imager's aggressiveness decreases to prevent misdecodes, so be sure to choose only that level of security necessary for your application.

**Table 2-5. UPC/EAN Security Levels**

UPC/EAN Security Level	Description
UPC/EAN Security Level 0	This is the default setting which allows the imager to operate in its most aggressive state, while providing sufficient security in decoding "in-spec" UPC/EAN bar codes.
UPC/EAN Security Level 1	As bar code quality levels diminish, certain characters become prone to misdecodes before others (i.e., 1, 2, 7, 8). If you are experiencing misdecodes of poorly printed bar codes, and the misdecodes are limited to these characters, select this security level.
UPC/EAN Security Level 2	If you are experiencing misdecodes of poorly printed bar codes, and the misdecodes are not limited to characters 1, 2, 7, and 8, select this security level.
UPC/EAN Security Level 3	If you have tried Security Level 2, and are still experiencing misdecodes, select this security level. Be advised, selecting this option is an extreme measure against misdecoding severely out of spec bar codes. Selection of this level of security significantly impairs the decoding ability of the imager. If this level of security is necessary, you should try to improve the quality of your bar codes.

## ***UPC/EAN Security Level (continued)***

**\*UPC/EAN Security Level 0**

**UPC/EAN Security Level 1**

**UPC/EAN Security Level 2**

**UPC/EAN Security Level 3**

## Host Communication Options

---

### ***Baud Rate***

#### ***Parameter # 9Ch***

Baud rate is the number of bits of data transmitted per second. The imager's baud rate settings should match the data rate settings of the host and auxiliary devices. If not, data may not reach the devices or may reach them in distorted form.

---

**Note:** *You must select a baud rate of 4800 or above when using an SSI host interface.*

---

Set the baud rate for transmission.

**600**  
**(2 decimal)**

**1200**  
**(3 decimal)**

**2400**  
**(4 decimal)**

**4800**  
**(5 decimal)**

## ***Baud Rate (continued)***

**\*9600  
(6 decimal)**

**19200  
(7 decimal)**

**28800  
(9 decimal)**

**38400  
(8 decimal)**

**57600  
(10 decimal)**

**115200  
(11 decimal)**

## Parity

### Parameter # 9Eh

A parity check bit is the most significant bit of each ASCII coded character and is helpful in detecting transmission errors.

If you select **Odd** parity, the parity bit has a value 0 or 1, based on data, to ensure that an odd number of 1 bits are contained in the coded character. If you select **Even** parity, the parity bit has a value 0 or 1, to ensure that an even number of 1 bits are contained in the coded character.

Set the type of parity for data transmission.

**Odd**

**Even**

**\*None**

## Check Parity

### Parameter # 97h

Select whether or not the parity of received characters is checked. The type of parity used is selectable through the **Parity** parameter.

**\*Check Parity**

**Do Not Check Parity**

## Stop Bit Select

### Parameter # 9Dh

The stop bit(s) at the end of each transmitted character marks the end of transmission of one character and prepares the receiving device for the next character in the serial data stream. The number of stop bits (one or two) selected depends on the number the receiving terminal is programmed to accommodate. Set the number of stop bits to match host device requirements.

Select the desired number of stop bits for serial communications.

**\*1 Stop Bit**

**2 Stop Bits**

## Hardware Handshaking

### Parameter # A0h

The host exchanges data with the imager via a serial port, either with or without the hardware handshaking lines, *Request to Send (RTS)*, and *Clear to Send (CTS)*.

### Standard RTS/CTS

If Standard RTS/CTS handshaking is selected, scanned data is transmitted according to the following sequence:

- The CTS line must initially be deasserted by the host. If the imager detects that CTS is asserted (indicating that the host may still be receiving a previous transmission), the imager waits up to 2 seconds for the host to deassert the CTS line. If, after 2 seconds (default), the CTS line is still asserted, the imager sounds a transmit error and any scanned data is lost.
- When the CTS line is deasserted, the imager asserts the RTS line and waits up to 2 seconds for the host to assert CTS. When the host asserts CTS, the imager transmits the data. If, after 2 seconds (default), the CTS line is not asserted, the imager sounds a transmit error and discards the data.

- When data transmission is complete, the imager deasserts RTS 10 msec after sending the last character.
- The host responds by deasserting CTS. The imager checks for a deasserted CTS upon the next transmission of data.

During data transmission, the CTS line is asserted. If CTS is asserted for less than 50 ms between characters, the transmission is aborted, the imager sounds a transmission error, and the data is discarded.

If the previous communications sequence fails, the imager issues an error beep. In this case, the data is lost and must be rescanned.

---

**Note:** The *DTR* signal is jumpered active.

---

## Other RTS/CTS Options

The following options offer alternatives to Standard RTS/CTS Handshaking.

- **RTS/CTS Option 1:** The imager asserts RTS before transmitting and ignores the state of CTS. The imager deasserts RTS when the transmission is complete.
- **RTS/CTS Option 2:** RTS is always high or low (user-programmed logic level). However, the imager waits for CTS to be asserted before transmitting data. If CTS is not asserted within two seconds, the imager issues an error beep and discards the data.
- **RTS/CTS Option 3:** The imager asserts RTS before transmitting, regardless of the state of CTS. The imager waits up to two seconds for CTS to be asserted. If CTS is not asserted during this time, the imager issues an error beep and discards the data. The imager deasserts RTS when transmission is complete.
- **RTS/CTS PC:** Standard RTS/CTS hardware handshaking used by the PC. The host can deassert CTS to prevent the imager from transmitting, and the imager can deassert RTS to prevent the host from transmitting.

## Hardware Handshaking

**\*None**

**Standard RTS/CTS**

**RTS/CTS Option 1**

**RTS/CTS Option 2**

**RTS/CTS Option 3**

**RTS/CTS PC**

## Software Handshaking

### Parameter # 9Fh

This parameter offers control of the data transmission process, and may be used in conjunction with hardware handshaking. **ACK/NAK** handshaking may be combined with **ENQ** handshaking.

Select the type of software handshaking protocol:

- **No Software Handshaking:** Data is transmitted immediately.
- **ACK/NAK Only:** When this option is selected, after transmitting data, the imager expects either an ACK or NAK response from the host. If a NAK is received, the imager transmits the same data again and waits for either an ACK or NAK. After three unsuccessful attempts to send data when NAKs are received, the imager issues an error beep and discards the data.
- **ENQ Only:** When this option is selected, the imager waits for an ENQ character from the host before transmitting data. If an ENQ is not received within 2 seconds, the imager issues an error beep and discards the data. The host must transmit an ENQ character at least every 2 seconds to prevent transmission errors.
- **ACK/NAK with ENQ:** This combines the two previous handshaking options.
- **XON/XOFF:** An XOFF character turns the imager transmission off until the imager receives an XON character. There are two situations for XON/XOFF:
  - XOFF is received before the imager has data to send. When the imager has data to send, it then waits for an XON character before transmission. The imager waits up to 2 seconds to receive the XON. If the XON is not received within this time, the imager issues an error beep and discards the data.
  - XOFF is received during a transmission. Data transmission then stops after sending the current byte. When the imager receives an XON character, it sends the rest of the data message. The imager waits indefinitely for the XON.

## Software Handshaking (continued)

**\*None**

**ACK/NAK**

**ACK/NAK with ENQ**

**ENQ Only**

**XON/XOFF**

## ***Decode Data Packet Format***

### ***Parameter # EEh***

This parameter selects whether decoded data is transmitted in raw format (unpacked), or transmitted with the packet format defined by the serial protocol.

If the raw format is chosen, ACK/NAK handshaking is disabled for decode data.

**Send Raw Decode Data**

**Send Packeted Decode Data**

## ***Intercharacter Delay***

### ***Parameter # 6Eh***

Select the intercharacter delay option matching host device requirements. The intercharacter delay gives the host system time to service its receiver and perform other tasks between characters. Select from no delay to a 99 ms delay between the transmission of each character.

To set a host communications intercharacter delay:

1. Scan the **Intercharacter Delay** bar code below.
2. To set the desired delay, scan two *Numeric Bar Codes* beginning on page 2-96. You must always scan two bar codes.
3. If you make an error, or wish to change your selection, scan **Cancel** on page 2-97.

**Intercharacter Delay**  
**(Default: 0)**

## ***Host Serial RTS Line State***

### ***Parameter # 9Ah***

This parameter sets the default host serial RTS line state to either high or low.

To select **Low RTS**, scan the bar code below.

**\*Host: Low RTS**

To select **High RTS**, scan the bar code below.

**Host: High RTS**

## ***Serial Response Timeout***

### ***Parameter # 9Bh***

This parameter specifies how long the imager waits for an ACK, NAK or CTS from the host before determining that a transmission error has occurred. This only applies when one of the ACK/NAK software handshaking modes, or RTS/CTS hardware handshaking options, is selected. The delay period can range from 0.0 to 8.0 seconds in 0.1 second increments.

To set a serial response timeout:

1. Scan the **Serial Response Timeout** bar code below.
2. Scan two *Numeric Bar Codes* beginning on page 2-96 to select the desired timeout. You must always scan two bar codes.
3. If you make an error, or wish to change your selection, scan **Cancel** on page 2-97.

**Serial Response Timeout**  
**(Default: 2.0)**

## **Beep On <BEL>**

### **Parameter # 96h**

When this parameter is enabled, the imager issues a beep when a <BEL> character is detected on the serial data line. <BEL> is used to alert the user of an illegal entry or other important event.

Select whether to enable or disable this parameter.

**Beep On <BEL> Character**

**\*Do Not Beep On <BEL> Character**

## **Data Transmission - 7 or 8-Bit ASCII Data Format**

### **Parameter # A2h**

This parameter determines whether data transmissions occur in the 7-bit or 8-bit ASCII format. Select this parameter according to the requirement of the receiving device. The default value is 8-bit ASCII.

**7-Bit**

**\*8-Bit**

## ***Report Version***

Scan the bar code below to report the version of software currently installed in the imager.

**Report Software Version**

## Chapter 3

# Advanced Data Formatting (ADF)

### Introduction

---

Advanced Data Formatting (ADF) is a means of customizing, or editing, the data scanned by the imager before transmitting the data to your host device. Scanned data can be edited to suit your particular requirements.

ADF is implemented by scanning a related series of bar codes to create rules to apply to the scanned data. These bar codes appear later in this chapter.

### Rules: Criteria Linked to Actions

---

In ADF, data is customized through **rules**. These rules perform specific actions when the data meets certain criteria. One rule may consist of single or multiple actions applied to single or multiple criteria.

For instance, a data formatting rule could be the following:

**Criteria:** *When scan data is Code 39, length 12,  
and data at the start position is the string "129",*

**Actions:** *pad all sends with zeros to length 8,  
send all data up to X,  
send a space.*

In this example, if a Code 39 bar code of 1299X1559828 is scanned, the following is transmitted: 00001299<space>. If a Code 39 bar code of 1299X15598 is scanned, this rule is ignored because the length (10 characters) does not pass the criteria.

The rule specifies the editing conditions and requirements before data transmission occurs.

## Using ADF Bar Codes

---

When you program a rule, make sure the rule is logically correct. Plan ahead before you start scanning.

To program each data formatting rule:

1. **Start the Rule.** Scan the **Begin New Rule** bar code on page 3-11.
2. **Criteria.** Scan the bar codes for all pertinent criteria. Criteria can include code type (e.g., Code 128), code length, or data that contains a specific character string (e.g., the digits “129”). These options are described in [Criteria](#) on page 3-14.
3. **Actions.** Scan all actions related to, or affecting, these criteria. The actions of a rule specify how to format the data for transmission. These options are described in [Actions](#) on page 3-28.
4. **Save the Rule.** Scan the **Save Rule** bar code on page 3-11. This places the rule in the “top” position in the rule buffer.

If you make errors during this process, some special-purpose bar codes may be useful: **Erase Criteria and Start Again**, **Erase Actions and Start Again**, **Erase Previously Saved Rule**, and **Erase All Rules**. See [Erase](#) on page 3-12.

[Beeper Definitions for ADF](#) on page 3-8 help guide you through the programming steps.

## ADF Bar Code Menu Example

---

This section provides an example of how to enter an ADF rule to apply to scanned data.

An auto parts distribution center wants to encode manufacturer ID, part number, and destination code into their own Code 128 bar codes. The distribution center also has products that carry UPC bar codes, placed there by the manufacturer. The Code 128 bar codes have the following format:

MMMMMPPPPDD

Where:M = Manufacturer ID

P = Part Number

D = Destination Code

The distribution center uses a PC with dedicated control characters for manufacturer ID <CTRL M>, part number <CTRL P>, and destination code <CTRL D>. At this center the UPC data is treated as manufacturer ID code.

The following rules need to be entered:

When scanning data of code type Code 128, send the next 5 characters, send the manufacturer ID key <CTRL M>, send the next 5 characters, send the part number key <CTRL P>, send the next 2 characters, send the destination code key <CTRL D>.

When scanning data of code type UPC/EAN, send all data, send the manufacturer ID key <CTRL M>.

To enter these rules, follow these steps:

## Rule 1: The Code 128 Scanning Rule

**Table 3-1. Code 128 Scanning Rule**

Step	Bar Code	On Page	Beep Indication
1	Begin New Rule	3-11	High High
2	Code 128	3-14	High High
3	Send next 5 characters	3-29	High High
4	Send <CTRL M>	3-56	High High
5	Send next 5 characters	3-29	High High
6	Send <CTRL P>	3-56	High High
7	Send next 2 characters	3-28	High High
8	Send <CTRL D>	3-54	High High
9	Save Rule	3-11	High Low High Low

## Rule 2: The UPC Scanning Rule

**Table 3-2. UPC Scanning Rule**

Step	Bar Code	On Page	Beep Indication
1	Begin New Rule	3-11	High High
2	UPC/EAN	3-15	High High
3	Send all remaining data	3-28	High High
4	Send <CTRL M>	3-56	High High
5	Save Rule	3-11	High Low High Low

If you made any mistakes while entering this rule, scan the **Quit Entering Rules** bar code on page 3-12. If you already saved the rule, scan the **Erase Previously Saved Rule** bar code on page 3-12.

## **Alternate Rule Sets**

ADF rules may be grouped into one of five alternate sets that can be turned on and off when needed. This is useful when you want to format the same message in different ways. For example, a Code 128 bar code contains the following information:

Class (2 digits), Stock Number (8) digits, Price (5 digits)

This bar code might look like this:

245671243701500

where:

Class = 24

Stock Number = 56712437

Price = 01500

Ordinarily you would send this data as follows:

24 (class key)

56712437 (stock key)

01500 (enter key)

But, when there is a sale, you may want to send only the following:

24 (class key)

56712437 (stock key)

and the cashier keys the price manually.

To implement this, first enter an ADF rule that applies in the normal situation. This rule may look like this:

When scanning a bar code of length 15, send the next 2 characters, send the class key, send the next 8 characters, send the stock key, send the data that remains, send the Enter key.

The “sale” rule may look like this:

When scanning a bar code of length 15, send the next 2 characters, send the class key, send the next 8 characters, send the stock key.

To switch between the two sets of rules, a “switching rule” must be programmed. This rule specifies what type of bar code must be scanned to switch between the rule sets. For

example, in the case of the “sale” rule above, the rule programmer wants the cashier to scan the bar code “M” before a sale. To do this, a rule can be entered as follows:

**When scanning a bar code of length 1 that begins with “M”, select rule set number 1.**

Another rule could be programmed to switch back.

When scanning a bar code of length 1 that begins with “N”, turn off rule set number 1. The switching back to normal rules can also be done in the “sale” rule. For example, the rule may look like this:

When scanning a bar code of length 15, send the next 2 characters, send the class key, send the next 8 characters, send the stock key, turn off rule set 1.

It is recommended that you scan the **Disable All Rule Sets** bar code after programming a rule belonging to an alternate rule set.

In addition to enabling and disabling rule sets within the rules, you can disable them by scanning the appropriate bar codes in [Disable Rule Set](#) on page 3-13.

## ***Rules Hierarchy (in Bar Codes)***

The order of programming individual rules is important. The most general rule should be programmed first.

All programmed rules are stored in a buffer. As they are programmed, they are stored at the “top” of a rules list. If three rules have been created, the list would be configured as follows:

Third Rule

Second Rule

First Rule

When data is scanned, the rules list is checked from top to bottom to determine if the criteria matches (and therefore, if the actions should occur). Input is modified into the data format specified by the first matching set of criteria it finds. Be sure that your most general rule is the first one programmed.

For example, if the THIRD rule states:

When scanning a bar code of any length, send all data, then send the ENTER key.

And the SECOND rule states:

When scanning a Code 128 bar code of length 12, send the first four characters, then send the ENTER key, then send all remaining data.

If a Code 128 bar code of length 12 were scanned, the THIRD rule would be in effect. The SECOND rule would appear to not function.

Note also that ADF rules are actually created when you use the standard data editing functions. Scan options are entered as ADF rules, and the hierarchy mentioned above also applies to them. For the P 300IMG, this applies to prefix/suffix programming in the parameter *Scan Data Transmission Format*.

These rules reside in the same “rule list” as ADF Rules, so the order of their creation is also important.

## ***Default Rules***

Every unit has a default rule to send all scan data. Units with custom software may have one or more default rules burned in. The rules hierarchy checks user programmable rules first, then the default rules. Default rules can be disabled by entering the following general rule in the user programmable buffer:

When receiving scan data, send all data.

Since this rule always applies, ADF will never go into the default rules.

## Beeper Definitions for ADF

---

The following table defines beep sequences that occur during rule entry.

**Table 3-3. Beeper Definitions**

Beeper Sequence	Indication
<b>Normal Data Entry. Duration of tones are short.</b>	
High-Low	Entry of a number is expected. Enter another digit. Add leading zeros to the front if necessary.
Low-Low	Entry of an alphabetic character is expected. Enter another character or scan the End of Message bar code.
High-High	Entry of Criterion/Action is expected. Enter another criterion or action, or scan the Save Rule bar code.
High-Low-High-Low	Rule saved. Rule entry mode exited.
High-Low-Low	All criteria or actions were cleared for rule currently being entered; continue entry of rule.
Low	Last saved rule was successfully deleted. The rule presently being entered is left intact.
Low-High-High	All rules are now deleted. The rule presently being entered is left intact. (This beep sequence has a different meaning outside of ADF.)
<b>Error Indications. Duration of tones are very long.</b>	
Low-High-Low-High	Out of rule memory. Erase some existing rules, then try to save rule again. (The current rule need not be re-entered.)
Low-High-Low	Cancel rule entry. Rule entry mode exited because of an error or the user asked to exit rule entry.
Low-High	Entry error, wrong bar code scanned. Re-enter criterion or action. All previously entered criteria and actions are retained. Criteria or action list is too long for a rule.

## ADF Bar Codes

---

The following table helps you locate the bar codes you need to create an ADF rule.

**Table 3-4. ADF Bar Codes**

Bar Code	Description	Page
<b>Special Commands</b>		
Begin New Rule	Starts data formatting rule.	3-11
Save Rule	Completes and saves rule.	3-11
Erase	Erases criteria, actions, or rules.	3-12
Quit Entering Rules	Quits entering rules.	3-12
Disable Rule Set	Disables rule sets.	3-13
<b>Criteria</b>		
Code Types	Selects code types to be affected by rule.	3-14
Code Lengths	Defines the number of characters each code type must contain.	3-17
Message Containing A Specific Data String	Select whether formatting affects data that begins with or contains a specific character or data string.	3-23
Numeric Keypad	Used for specifying a data string.	3-25
Rule Belongs To Set	Selects which set a rule belongs to.	3-27
<b>Actions</b>		
Send Data	Sends all data that remains, sends all data up to a specific character, or sends N characters.	3-28
Setup Field(s)	Moves the cursor in relation to a specified character.	3-32
Send Preset Value	Sends prefix and suffix values.	3-39

**Table 3-4. ADF Bar Codes**

Bar Code	Description	Page
Modify Data	Modifies data as follows:	3-40
♦ Remove All Spaces	♦ Removes all spaces in the send commands.	<a href="#">3-40</a>
♦ Crunch All Spaces	♦ Leaves one space between words.	<a href="#">3-40</a>
♦ Stop Space Removal	♦ Stops space removal.	<a href="#">3-40</a>
♦ Remove Leading Zeros	♦ Removes all leading zeros.	<a href="#">3-41</a>
♦ Stop Zero Removal	♦ Stops removal of zeros.	<a href="#">3-41</a>
♦ Pad Data With Spaces	♦ Pads data to the left with spaces.	<a href="#">3-42</a>
♦ Pad Data With Zeros	♦ Pads data to the left with zeros.	<a href="#">3-47</a>
Beeps	Selects beep sequence for each rule.	3-52
Send Keystroke	Specifies control and keyboard characters to send.	3-53
♦ Control Characters	♦ Sends control characters.	<a href="#">3-54</a>
♦ Keyboard Characters	♦ Sends keyboard characters.	<a href="#">3-59</a>
♦ Send ALT Characters	♦ Sends ALT characters.	<a href="#">3-71</a>
♦ Send Command Characters	♦ Sends command characters.	<a href="#">3-75</a>
♦ Send Special Characters	♦ Sends special characters.	<a href="#">3-77</a>
♦ Send Keypad Characters	♦ Sends keypad characters.	<a href="#">3-78</a>
♦ Send Function Keys	♦ Sends function keys.	<a href="#">3-82</a>
Turn On/Off Rule Sets	Turns rule sets on and off.	3-88
Alphanumeric Keyboard	Used to specify characters and strings when creating a rule.	3-89

## Special Commands

---

Bar codes and explanations of the following special commands are provided on the next few pages.

- Begin New Rule
- Save Rule
- Erase
- Quit Entering Rules
- Disable Rule Set

### ***Begin New Rule***

Scan this bar code to start entering a new data formatting rule.

**Begin New Rule**

### ***Save Rule***

Scan this bar code to complete and save the rule you entered.

**Save Rule**

## **Erase**

Use these bar codes to erase criteria, actions, or rules.

**Erase Criteria And  
Start Again**

**Erase Actions And  
Start Again**

**Erase Previously  
Saved Rule**

**Erase All Rules**

## **Quit Entering Rules**

Scan this bar code to quit entering rules.

**Quit Entering Rules**

## ***Disable Rule Set***

Use these bar codes to disable rule sets.

**Disable Rule Set 1**

**Disable Rule Set 2**

**Disable Rule Set 3**

**Disable Rule Set 4**

**Disable All Rule Sets**

## Criteria

---

### ***Code Types***

Select any number of code types to be affected. All selected codes must be scanned in succession, prior to selecting other criteria. If you don't select a code type, all code types are affected.

**Code 39**

**Codabar**

**Code 128**

**I 2 Of 5**

**EAN 128**

***Code Types (continued)***

**UPC-A**

**UPC-E**

**EAN-8**

**EAN-13**

**PDF417**

## ***Code Types (continued)***

**US Postnet**

**US Planet**

**UK Postal**

**Japan Postal**

**Australian Postal**

**MaxiCode**

**Datamatrix**

## ***Code Lengths***

Define the number of characters the selected code type must contain. Select one length per rule only. If you don't select a code length, selected code types of any length are affected.

---

**Note:** *These codes are used to set the code length only; this is not a keypad.*

## Message Containing A Specific Data String

Select whether the formatting affects data that begins with a specific character or data string, or contains a specific character or data string.

### Specific String at Start

To apply formatting to data that begins with a specific character or data string:

1. Scan the bar code below.
2. Enter a string representing the desired character or characters (up to a total of 8) using the [Alphanumeric Keyboard](#) beginning on page 3-89.
3. Scan **End Of Message** on page 3-98.

Specific String At Start

### Specific String, Any Location

To apply formatting to data that contains a specific character or data string:

1. Scan the bar code below.
2. Scan a two-digit number representing the **position** (include a leading “zero” if necessary) using the [Numeric Keypad](#) on page 3-25.
3. Enter the desired character or characters (up to a total of 8) using the [Alphanumeric Keyboard](#) beginning on page 3-89.
4. Scan **End Of Message** on page 3-98.

Specific String Any Location

## **Any Message OK**

By not scanning any bar code, all selected code types are formatted, regardless of information contained.

## ***Numeric Keypad***

Bar codes on this page should not be confused with those on the alphanumeric keyboard.

**0**

**1**

**2**

**3**

**4**

**5**

## ***Numeric Keypad (continued)***

Bar codes on this page should not be confused with those on the alphanumeric keyboard.

**6**

**7**

**8**

**9**

**Cancel**

## ***Rule Belongs To Set***

Scan a bar code below to select which set a rule belongs to.

**Rule Belongs To Set 1**

**Rule Belongs To Set 2**

**Rule Belongs To Set 3**

**Rule Belongs To Set 4**

## Actions

---

Select how to format the data meeting the defined criteria before transmission.

### ***Send Data***

Use the following bar codes to send all data that remains, send all data up to a specific character selected from the [Alphanumeric Keyboard](#) on page 3-89, or send the next N characters. N = any number from 1 to 254, selected from the [Alphanumeric Keyboard](#) on page 3-89.

**Send Data Up To  
Character**

**Send All Data  
That Remains**

**Send Next Character**

**Send Next 2 Characters**

**Send Next 3 Characters**

## ***Send Data (continued)***

**Send Next 4 Characters**

**Send Next 5 Characters**

**Send Next 6 Characters**

**Send Next 7 Characters**

**Send Next 8 Characters**

**Send Next 9 Characters**

**Send Next 10 Characters**

**Send Next 11 Characters**

## ***Send Data (continued)***

**Send Next 12 Characters**

**Send Next 13 Characters**

**Send Next 14 Characters**

**Send Next 15 Characters**

**Send Next 16 Characters**

**Send Next 17 Characters**

## ***Send Data (continued)***

**Send Next 18  
Characters**

**Send Next 19  
Characters**

**Send Next 20  
Characters**

**Send Next 50  
Characters**

**Send Next 100  
Characters**

**Send Next 150  
Characters**

**Send Next 200  
Characters**

**Send Next 250  
Characters**

## Setup Field(s)

Use the following bar codes to move the cursor in relation to a specified character.

---

**Note:** *If there is no match when the rule is interpreted and the rule fails, the next rule is checked.*

---

### Move Cursor To a Character

Scan the **Move Cursor To Character** bar code, then any printable ASCII character from the [Alphanumeric Keyboard](#) on page 3-89. This moves the cursor to the position after the matching character. If the character is not there, the rule fails and ADF tries the next rule.

**Move Cursor To  
Character**

### Move Cursor to Start of Data

Scan this bar code to move cursor to the beginning of the data.

**Move Cursor To Start**

## Move Cursor Past a Character

This parameter moves the cursor past all sequential occurrences of a selected character. Scan the **Move Cursor Past Character** bar code on page 3-33, then select a character from the [Alphanumeric Keyboard](#) on page 3-89. If the character is not there, the cursor does not move (i.e., has no effect).

**Move Cursor Past  
Character**

## Skip Ahead “N” Characters

Scan one of these bar codes to select the number of positions ahead you wish to move the cursor.

**Skip Ahead 1  
Character**

**Skip Ahead 2  
Characters**

**Skip Ahead 3  
Characters**

**Skip Ahead 4  
Characters**

## Skip Ahead (continued)

**Skip Ahead 5  
Characters**

**Skip Ahead 6  
Characters**

**Skip Ahead 7  
Characters**

**Skip Ahead 8  
Characters**

**Skip Ahead 9  
Characters**

**Skip Ahead 10  
Characters**

## Skip Ahead (continued)

**Skip Ahead 50  
Characters**

**Skip Ahead 100  
Characters**

**Skip Ahead 150  
Characters**

**Skip Ahead 200  
Characters**

**Skip Ahead 250  
Characters**

## **Skip Back “N” Characters**

Scan one of these bar codes to select the number of positions back you wish to move the cursor.

**Skip Back 1  
Characters**

**Skip Back 2  
Characters**

**Skip Back 3  
Characters**

**Skip Back 4  
Characters**

## Skip Back (continued)

**Skip Back 5  
Characters**

**Skip Back 6  
Characters**

**Skip Back 7  
Character**

**Skip Back 8  
Characters**

**Skip Back 9  
Characters**

**Skip Back 10  
Characters**

## **Skip Back (continued)**

**Skip Back 50  
Characters**

**Skip Back 100  
Characters**

**Skip Back 150  
Characters**

**Skip Back 200  
Characters**

**Skip Back 250  
Characters**

## ***Send Preset Value***

Send Values 1 through 6 by scanning the appropriate bar code. These values must be set using [Prefix / Suffix Values](#) on page A-7. Values 1, 2, and 3 are reserved for the following:

Value 1 = Scan Suffix

Value 2 = Scan Prefix

Value 3 = Scan Suffix 2

Use these bar codes to send preset values.

**Send Value 1**

**Send Value 2**

**Send Value 3**

**Send Value 4**

**Send Value 5**

**Send Value 6**

## Modify Data

Modify data in the ways listed. The following actions work for all send commands that follow it within a rule. If you program *pad zeros to length 6, send next 3 characters, stop padding, send next 5 characters*, three zeros are added to the first send, and the next send is unaffected by the padding. These options do not apply to the **Send Keystroke** or **Send Preset Value** options.

### Remove All Spaces

To remove all spaces in the send commands that follow, scan this bar code.

**Remove All Spaces**

### Crunch All Spaces

To leave one space between words, scan this bar code. This also removes all leading and trailing spaces.

**Crunch All Spaces**

### Stop Space Removal

Scan this bar code to disable space removal.

**Stop Space Removal**

## **Remove Leading Zeros**

Scan this bar code to remove all leading zeros.

**Remove Leading  
Zeros**

## **Stop Zero Removal**

Scan this bar code to disable the removal of zeros.

**Stop Zero Removal**

## **Pad Data With Spaces**

To pad data to the left, scan the bar code containing the desired number of spaces. This parameter is activated by Send commands.

**Pad Spaces To  
Length 1**

**Pad Spaces To  
Length 2**

**Pad Spaces To  
Length 3**

**Pad Spaces To  
Length 4**

**Pad Spaces To  
Length 5**

**Pad Spaces To  
Length 6**

## Pad Data with Spaces (continued)

**Pad Spaces To  
Length 7**

**Pad Spaces To  
Length 8**

**Pad Spaces To  
Length 9**

**Pad Spaces To  
Length 10**

**Pad Spaces To  
Length 11**

**Pad Spaces To  
Length 12**

## Pad Data with Spaces (continued)

**Pad Spaces To  
Length 13**

**Pad Spaces To  
Length 14**

**Pad Spaces To  
Length 15**

**Pad Spaces To  
Length 16**

**Pad Spaces To  
Length 17**

**Pad Spaces To  
Length 18**

## Pad Data with Spaces (continued)

**Pad Spaces To  
Length 19**

**Pad Spaces To  
Length 20**

**Pad Spaces To  
Length 21**

**Pad Spaces To  
Length 22**

**Pad Spaces To  
Length 23**

**Pad Spaces To  
Length 24**

## Pad Data with Spaces (continued)

**Pad Spaces To  
Length 25**

**Pad Spaces To  
Length 26**

**Pad Spaces To  
Length 27**

**Pad Spaces To  
Length 28**

**Pad Spaces To  
Length 29**

**Pad Spaces To  
Length 30**

**Stop Pad Spaces**

## **Pad Data With Zeros**

To pad data to the left, scan the bar code containing the desired number of zeros. This parameter is activated by Send commands. Use these bar codes to pad data with zeros.

**Pad Zeros To  
Length 1**

**Pad Zeros To  
Length 2**

**Pad Zeros To  
Length 3**

**Pad Zeros To  
Length 4**

**Pad Zeros To  
Length 5**

**Pad Zeros To  
Length 6**

## Pad Data With Zeros (continued)

**Pad Zeros To  
Length 7**

**Pad Zeros To  
Length 8**

**Pad Zeros To  
Length 9**

**Pad Zeros To  
Length 10**

**Pad Zeros To  
Length 11**

**Pad Zeros To  
Length 12**

## Pad Data With Zeros (continued)

**Pad Zeros To  
Length 13**

**Pad Zeros To  
Length 14**

**Pad Zeros To  
Length 15**

**Pad Zeros To  
Length 16**

**Pad Zeros To  
Length 17**

**Pad Zeros To  
Length 18**

## Pad Data With Zeros (continued)

**Pad Zeros To  
Length 19**

**Pad Zeros To  
Length 20**

**Pad Zeros To  
Length 21**

**Pad Zeros To  
Length 22**

**Pad Zeros To  
Length 23**

**Pad Zeros To  
Length 24**

## Pad Data With Zeros (continued)

**Pad Zeros To  
Length 25**

**Pad Zeros To  
Length 26**

**Pad Zeros To  
Length 27**

**Pad Zeros To  
Length 28**

**Pad Zeros To  
Length 29**

**Pad Zeros To  
Length 30**

**Stop Pad Zeros**

## ***Beeps***

Select a beep sequence for each ADF rule.

**Beep Once**

**Beep Twice**

**Beep Three Times**

## ***Send Keystroke (Control Characters and Keyboard Characters)***

Scan the "Send \_\_\_" bar code for the keystroke you wish to send.

## **Control Characters**

Scan these bar codes to send control characters.

**Send Control 2**

**Send Control A**

**Send Control B**

**Send Control C**

**Send Control D**

**Send Control E**

## Control Characters (continued)

**Send Control F**

## *Chapter 4*

# *Maintenance and Troubleshooting*

### **Maintenance**

---

The only maintenance required for the imager is periodic cleaning of the exit window.

- Do not allow any abrasive material to touch the window.
- Do **not** spray water or other cleaning liquids directly into the window.
- Remove any dirt particles with a damp cloth.
- Wipe the window using a tissue moistened with ammonia/water.

## Troubleshooting

---

If your imager is not functioning properly, review the following table to try to identify the problem.

Problem	Possible Cause	Suggested Action
The aiming pattern in the imager does not illuminate when the trigger is pressed.	The interface cable is loose.	Check that the cable is connected properly.
	Power is not applied.	Be sure that power is supplied to the imager via the host or a power supply.
	The aiming pattern is not enabled in the imager.	Enable the laser aiming parameter.
The imager is having trouble reading symbols.	The symbology you are scanning is not enabled.	Enable the symbology.
	The symbol is damaged.	Be sure the symbols aren't smeared, rough, scratched, or exhibiting voids.
	Environmental conditions inhibit the symbol's quality.	Be sure the symbols aren't coated with frost or water droplets on the surface.
	The symbol is not within the aiming pattern.	Be sure the symbol is completely within the area outlined by the aiming pattern.
Scanned data is not displayed, or displays incorrectly.	Communication parameters are inconsistent between the imager and host.	Check that the communication parameters (baud rate, parity, stop bits, etc.) are set properly for your host device.
Captured images appear darker than normal.	Image capture illumination is not enabled.	Enable image capture illumination.
	Insufficient area lighting.	Use an external light source to increase area illumination.

## Appendix A

### Programming Reference

#### AIM Code Identifiers

---

AIM is the industry standard for identifying the code type of a scanned bar code. You may choose to transmit the AIM identifier with each bar code scanned using the *Transmit Code ID Character* bar codes on page 2-71. Each AIM Code Identifier contains the three-character string **jcm** where:

j=Flag Character (ASCII 93)  
c=Code Character  
m=Modifier Character

**Table A-1. AIM Code Identifiers**

Code Character	Code Type
A	Code 39
C	Code 128
d	Data Matrix
E	UPC/EAN
F	Codabar
G	Code 93
I	Interleaved 2 of 5
L	PDF417

**Table A-1. AIM Code Identifiers (Continued)**

Code Character	Code Type
M	MSI Plessey
S	D 2 of 5, IATA 2 of 5
U	MaxiCode
X	Code 39 Trioptic, Bookland EAN, Postal Codes

The modifier character is the sum of the applicable option values based on [Table A-2](#).

**Table A-2. Modifier Characters**

Code Type	Option Value	Option
<b>Code 39</b>	0 1 2 4	No Check character or Full ASCII processing. Reader has checked one check character. Reader has stripped check character. Reader has performed Full ASCII character conversion. Example: A Full ASCII bar code with check character W, <b>A+I+MI+DW</b> , can be transmitted as <b>J A7</b> AimId where 7 = (1+2+4).
<b>Trioptic Code 39</b>	0	No option specified at this time. Always transmit 0. Example: A Trioptic bar code 412356 is transmitted as <b>J X0</b> 412356.
<b>Code 93</b>	0	No option specified at this time. Always transmit 0. Example: A Code 39 bar code 012345678905 is transmitted as <b>J G00</b> 12345678905.
<b>Code 128</b>	0 1 2	Standard data packet, No Function code 1 in first symbol position. Function code 1 in first symbol character position. Function code 1 in second symbol character position. Example: A Code (EAN) 128 bar code with Function 1 character in the first position, <sup>Fcnt1</sup> AimId is transmitted as <b>J C1</b> AimId.

**Table A-2. Modifier Characters (Continued)**

Code Type	Option Value	Option
<b>EAN/UPC</b>	0	Standard packet in full EAN country code format, which is 13 digits for UPC-A and UPC-E (not including supplemental data).
	1	Two digit supplement data only.
	2	Five digit supplement data only.
	4	EAN-8 data packet. Example: A UPC-A bar code 012345678905 is transmitted as <b>J</b> E00012345678905.
<b>Interleaved 2 of 5</b>	0	No check digit processing.
	1	Reader has checked check digit.
	2	Reader has stripped check digit before transmission. Example: An I 2 of 5 bar code without check digit, 4123, will be transmitted as <b>J</b> I04123.
<b>Discrete 2 of 5</b>	0	No option specified at this time. Always transmit 0. Example: A D 2 of 5 bar code 4123 is transmitted as <b>J</b> S04123.
<b>MSI Plessey</b>	0	Single check digit checked.
	1	Two check digits checked.
	2	Single check digit verified and stripped before transmission.
	3	Two check digits verified and stripped before transmission. Example: An MSI Plessey bar code 4123, with a single check digit checked, is transmitted as <b>J</b> M04123.
<b>Bookland EAN</b>	0	No option specified at this time. Always transmit 0. Example: A Bookland EAN bar code 123456789X is transmitted as <b>J</b> X0123456789X.

**Table A-2. Modifier Characters (Continued)**

Code Type	Option Value	Option
<b>PDF417</b>	0	Reader set to conform to protocol defined in 1994 PDF417 symbology specifications. <b>Note:</b> When this option is transmitted, the receiver cannot reliably determine whether ECIs have been invoked or whether data byte 92 <sub>DEC</sub> has been doubled in transmission.
	1	Reader set to follow the ECI protocol (Extended Channel Interpretation). All data characters 92 <sub>DEC</sub> are doubled.
	2	Reader set for Basic Channel operation (no escape character transmission protocol). Data characters 92 <sub>DEC</sub> are not doubled. <b>Note:</b> When decoders are set to this mode, unbuffered Macro symbols and symbols requiring the decoder to convey ECI escape sequences cannot be transmitted.
	3	The bar code contains a UCC/EAN-128 symbol, and the first codeword is 903-907, 912, 914, 915.
	4	The bar code contains a UCC/EAN-128 symbol, and the first codeword is in the range 908-909.
	5	The bar code contains a UCC/EAN-128 symbol, and the first codeword is in the range 910-911. Example: A PDF417 bar code ABCD, with no transmission protocol enabled, is transmitted as J12ABCD
<b>MaxiCode</b>	0	Mode 4 or 5.
	1	Mode 2 or 3.
	2	Mode 4 or 5 with ECI.
	3	Mode 2 or 3 with ECI.

**Table A-2. Modifier Characters (Continued)**

Code Type	Option Value	Option
<b>Data Matrix</b>	0	ECC 000-140 (not supported).
	1	ECC 200.
	2	ECC 200, FNC1 in first or fifth position.
	3	ECC 200, FNC1 in second or sixth position.
	4	ECC 200 supporting ECI protocol.
	5	ECC 200, FNC1 in first or fifth position, supporting ECI protocol.
	6	ECC 200, FNC1 in second or sixth position, supporting ECI protocol.

### ***Enable AIM ID Characters***

To enable or disable AIM code ID characters, scan a bar code below. These bar codes can also be found in [Transmit Code ID Character](#) on page 2-71.

**Transmit AIM Code ID Character**

**\*Do Not Transmit Code ID Character**

## Prefix / Suffix Values

The following values can be assigned as ASCII prefixes or suffixes to scanned data (see [Prefix/Suffix Values](#) on page 2-75, and [Send Preset Value](#) on page 3-39).

**Table A-3. Prefix/Suffix Values**

Prefix/Suf-Full ASCII Code	ASCII		Prefix/Suf-Full ASCII Code	ASCII

## Host Qualification of Trigger, RS-232 Host Mode

---

When enabled, the host application controls when the imager responds to a physical trigger pull by sending a SYN (ASCII 22) character to the imager. This ensures that the imager only responds to the trigger when the host is expecting data.

---

**Note:** *If this mode is enabled accidentally or when not connected to a host that provides the SYN character, hold the trigger for 5 seconds to override the SYN character requirement, and enable scanning.*

---

**Enable Host Qualification  
of Trigger**

**\*Disable Host Qualification  
of Trigger**

*P 300IMG Product Reference Guide*

## Appendix B

### *P 300IMG Imager Specifications*

#### Technical Specifications

---

Table B-1 lists the specifications for the imager.

**Table B-1. P 300IMG Imager Specifications**

Item	Description
Power Requirements: Low Power Mode Current Normal Current Peak Current	+4.75V to 5.25V 1.0 ma 450 ma 930 ma, duration 10 ms typical
Laser Diode Output Power	0.8 mW, max.
Focal Point Standard: High Density:	6.5 in. / 16.5 cm from nose of scanner 2.5 in. / 6.4 cm from nose of scanner
Imaging Options (user selectable):	
File Formats	JPEG, TIFF, BMP
Resolution	Full (640x480 pixels), 1/2 (320x240), 1/3 (214x160), 1/4 (thumbnail 160x120)
Grayscale Level	256, 16, 2, shades of gray
Angular Orientation Tolerances:	
Pitch Tolerance	$\pm 60^\circ$ ("front to back")

**Table B-1. P 300IMG Imager Specifications (Continued)**

Item	Description
Skew	$\pm 50^{\circ}$ from plane parallel to symbol ("side-to-side")
Rotational Tolerance	$\pm 180^{\circ}$
Print Contrast Resolution	25% (1-D symbologies) or 35% (PDF417) absolute dark/light reflectance differential, measured at 650 nm.
Ambient Light Immunity	Up to 9000 ft-candles of sunlight / 96,890 lux
Humidity	5 - 95% (non-condensing)
Shock	Multiple 6-ft / 1.8m drops to concrete over entire temperature range
Operating Temperature	$-30^{\circ}$ to $50^{\circ}$ C; $-22^{\circ}$ to $122^{\circ}$ F
Storage Temperature	$-40^{\circ}$ to $70^{\circ}$ C; $-40^{\circ}$ to $158^{\circ}$ F
Imager Connector	10-pin modular connector at base of handle <b>Pin 1:</b> Reserved <b>Pin 2:</b> +5V power supply <b>Pin 3:</b> Ground <b>Pin 4:</b> Reserved for Synapse control data <b>Pin 5:</b> Reserved for Synapse control clock <b>Pin 6:</b> Receive (RxD) <b>Pin 7:</b> Transmit (TxD) <b>Pin 8:</b> Data Terminal Ready (DTR) <b>Pin 9:</b> Clear to Send (CTS) <b>Pin 10:</b> Request to Send (RTS)
Coil Cable Length	8 ft. / 2.4m extended
Weight	11.7 oz / 332 g (without cable)
Height	6.8 in. / 17.3 cm
Length	5.9 in. / 15.0 cm
Width	2.9 in. / 7.4 cm

**Table B-1. P 300IMG Imager Specifications (Continued)**

Item	Description
Decode Capability	<p><b>1-D Symbologies:</b> UPC-A, UPC-E, UPC-E1, EAN-8, EAN-13, Bookland EAN, Code 39, Code 39 Full ASCII, Trioptic Code 39, Code 93, Code 128, UCC/EAN 128, ISBT 128, Codabar, Interleaved 2 of 5, Discrete 2 of 5, UPC Coupon Code, MSI Plessey. Cannot autodiscriminate between Code 39 and Code 39 Full ASCII.</p> <p><b>2-D Symbologies:</b> PDF417, DataMatrix (ECC 200), Maxicode</p> <p><b>Postal Codes:</b> US Postnet, US Planet, UK Postal, Japan, Australian.</p>
Memory	4MB RAM, 1MB Flash

# P 300IMG Decode Zones

Typical performance at 68°F (20°C) on high quality symbols.

# *Glossary*

<b>ASCII</b>	American Standard Code for Information Interchange. A 7 bit-plus-parity code representing 128 letters, numerals, punctuation marks, and control characters. It is a standard data transmission code in the U.S.
<b>Asymmetric Width Growth</b>	Non-uniform growth of elements in a printed symbol.
<b>Autodiscrimination</b>	The ability of an imager to determine the code type of a scanned bar code. After this determination is made, the information content can be decoded.
<b>Average Bar Width Growth</b>	Average deviation of bars from nominal widths over the entire symbol.
<b>Bad Check Digit</b>	Error message resulting from failure of the check digit to calculate properly.
<b>Bad Data Character</b>	Error message caused by failure of one or more data characters to decode properly.
<b>Bar</b>	The dark element in a printed bar code symbol.
<b>Bar Code Data Density</b>	The number of characters represented per unit of measurement (e.g., characters per inch in one-dimensional symbologies, characters per square inch in PDF417).
<b>Bar Code Print Density</b>	The bar width of the smallest (thinnest) element in the bar code.

<b>Bar Height</b>	The dimension of a bar measured perpendicular to the bar width.
<b>Bar Width</b>	Thickness of a bar measured from the edge closest to the symbol start character to the trailing edge of the same bar.
<b>Bar Width Deviation</b>	Increase or decrease in bar width as compared with nominal bar width.
<b>Baud Rate</b>	A measure of the data flow or number of signaling events occurring per second. When one bit is the standard "event," this is a measure of bits per second (bps). For example, a baud rate of 50 means transmission of 50 bits of data per second.
<b>Bidirectional Reading Capability</b>	The ability to decode a symbol successfully by reading in complementary (opposite) directions across bars and spaces.
<b>Bit</b>	Binary digit. One bit is the basic unit of binary information. Generally, eight consecutive bits compose one byte of data. The pattern of 0 and 1 values within the byte determines its "meaning."
<b>Buffer</b>	An area of memory allocated for data storage. In this context, a buffer's data storage capacity is needed when data can flow into the device more quickly than the device can process that data. Buffering the data preserves it until it can be processed.
<b>Byte</b>	On an addressable boundary, eight adjacent binary digits (0 and 1) combined in a pattern to represent a specific character or numeric value. Bits are numbered from the right, 0 through 7, with bit 0 the low-order bit. One byte in memory can be used to store one ASCII character.
<b>Character</b>	A pattern of bars and spaces which either directly represents data or indicates a control function, such as a number, letter, punctuation mark, or communications control contained in a message.
<b>Character Set</b>	Those characters available for encodation in a particular bar code symbology.

<b>Check Digit</b>	A digit used to verify a correct symbol decode. The scanner inserts the decoded data into an arithmetic formula and checks that the resulting number matches the encoded check digit. Check digits are required for UPC and Code 128 but are optional for other symbologies. Using check digits decreases the chance of substitution errors when a symbol is decoded.
<b>Cluster</b>	One of three subsets of mutually exclusive codeword definitions within PDF417.
<b>Codabar</b>	A discrete self-checking code with a character set consisting of start/stop characters (A B C D or * T N E), digits 0 to 9, and these additional characters: ( - \$ : / , +).
<b>Code</b>	Set of unambiguous rules specifying the way in which data may be represented.
<b>Codeword</b>	In PDF417, a single group of bars and spaces (4 bars and 4 spaces, for a total of 17 module widths) which represents one or more numbers, letters, or other symbols.
<b>Codeword Pd (Codeword Percent Decode)</b>	Within a PDF417 symbol, the percentage of codewords which decoded successfully; the number of good codewords divided by the total number of codewords (data codewords plus error correction codewords).
<b>Code Length</b>	Number of data characters in a bar code between the start and stop characters, not including those characters.
<b>Code 128</b>	A high density symbology which allows the interface controller to encode all 128 ASCII characters without adding extra symbol elements.
<b>Code 3 Of 9 (Code 39)</b>	A versatile and widely used alphanumeric bar code symbology with a set of 43 character types, including all uppercase letters, numerals from 0 to 9, and 7 special characters ( - . / + % \$ and space). The code name is derived from the fact that 3 of 9 elements representing a character are wide, while the remaining 6 are narrow.

<b>Continuous Code</b>	A bar code or symbol in which all spaces within the symbol are parts of characters. There are no intercharacter gaps in a continuous code. The absence of gaps allows for greater information density.
<b>Country Flag</b>	In EAN-8 and EAN-13 codes, two or three digits which appear immediately following the left guard bar pattern.
<b>Dead Zone</b>	An area within a scanner's field of view, in which specular reflection may prevent a successful decode.
<b>Decode</b>	To recognize a bar code symbology (e.g., UPC/EAN) and then analyze the content of the specific bar code scanned. To translate the bar/space pattern into defined characters within a defined symbology.
<b>Decode Algorithm</b>	A decoding scheme that converts pulse widths into data representation of the letters or numbers encoded within a bar code symbol.
<b>Depth Of Field</b>	The range between minimum and maximum distances at which a scanner can read a symbol with a certain minimum element width.
<b>Discrete Code</b>	A bar code or symbol in which the spaces between characters (intercharacter gaps) are not part of the code (e.g., Code 39).
<b>Discrete 2 Of 5</b>	A binary bar code symbology representing each character by a group of five bars, two of which are wide. The location of wide bars in the group determines which character is encoded; spaces are insignificant. Only numeric characters (0 to 9) and START/STOP characters may be encoded.
<b>EAN</b>	European Article Number. This European/International version of the UPC provides its own coding format and symbology standards. Element dimensions are specified metrically. EAN is used primarily in retail. Main variants are EAN-8 and EAN-13.
<b>Edge Roughness</b>	Edge irregularities as compared with a nominal bar edge.
<b>Element</b>	Generic term for a bar or space.

<b>Encoded Area</b>	Total linear dimension occupied by all characters of a code pattern, including start/stop characters and data.
<b>Error Correction</b>	In addition to error detection, the recovery capability of PDF417 over missing, destroyed, or misdecoded codewords. Error correction capability is based on the level of security (0 - 8) selected when the PDF417 label is printed.
<b>Extraneous Ink</b>	Ink in a scan area not intended to be there (i.e., tracking and splatter).
<b>First Read Rate</b>	Percentage of correct readings obtainable by one pass of a scanning device over a bar code.
<b>Flash</b>	Derived from EEPROM, this is a type of memory that holds its content without power but must be erased in bulk — or in a “flash.” Typically, these memory chips are less expensive and provide higher bit densities.
<b>Guard Bars</b>	The start, stop, and center delimiting bars of UPC and EAN symbols.
<b>Host Computer</b>	A computer that serves other terminals in a network, providing such services as computation, database access, supervisory programs, and network control.
<b>Intercharacter Gap</b>	The space between two adjacent bar code characters in a discrete code.
<b>Interleaved Bar Code</b>	A bar code in which characters are paired together, using bars to represent the first character and the intervening spaces to represent the second.
<b>Interleaved 2 Of 5</b>	A binary bar code symbology representing character pairs in groups of five bars and five interleaved spaces. Interleaving provides for greater information density. The location of wide elements (bar/spaces) within each group determines which characters are encoded. This continuous code type uses no intercharacter spaces. Only numeric (0 to 9) and START/STOP characters may be encoded.

<b>Laser</b>	An acronym for Light Amplification by Stimulated Emission of Radiation. The laser is an intense light source. Light from a laser is all the same frequency, unlike the output of an incandescent bulb. Laser light is typically coherent and has a high energy density.
<b>Led Indicator</b>	A semiconductor diode (LED - Light Emitting Diode) used as an indicator, often in digital displays. The semiconductor uses applied voltage to produce light of a certain frequency determined by the semiconductor's particular chemical composition.
<b>Mil</b>	1 mil = 1 thousandth of an inch.
<b>Minimum Reflectance Difference (MRD)</b>	The difference in percentage between light reflected from spaces ( $R_S$ ) and light reflected from bars ( $R_B$ ). <b>MRD = <math>\%R_S - \%R_B</math>.</b>
<b>Misread (Misdecode)</b>	A condition which occurs when the data output of a reader or interface controller does not agree with the data encoded within a bar code symbol.
<b>Module</b>	The narrowest bar or space (unit of measure) in a code. The term is used by the Uniform Code Council in its description of UPC/EAN code; it is also used in the description of Code 128. Contiguous modules are used to form bars or spaces which are wider than one unit.
<b>Module Aspect Ratio</b>	The ratio of height to width of the narrowest bar or space, or unit of measure, in a bar code.
<b>Nanometre</b>	A unit of measure used to define the wavelength of light. Equal to $10^{-9}$ metre.
<b>Nominal</b>	The exact (or ideal) intended value for a specified parameter. Tolerances are specified as positive and negative deviations from this value.
<b>Nominal Size</b>	Standard size for a bar code symbol. Most UPC/EAN codes can be used over a range of magnifications (e.g., from 0.80 to 2.00 of nominal).

<b>Number System Character</b>	In the UPC/EAN code used in a retail application, the mandatory, first encoded character, after the left guard bars. The corresponding human readable character identifies the coded character and appears at the bottom left-hand margin of the symbol. The assigned system number corresponds to a usage category for the bar coded item.
<b>One-dimensional Symbology</b>	Symbologies which encode data only in a linear or horizontal dimension (X-dimension); the symbol's vertical height (Y-dimension) is redundant (e.g., UPC/EAN, Code 39).
<b>Opacity</b>	The capacity for material to interfere with transmission of light.
<b>Overhead</b>	The number of characters required for start, stop, and checking for a given symbol (in PDF417, also left and right row indicators and error correction codewords). For example, a one-dimensional symbol requiring start/stop and two check characters contains four characters of overhead. Thus, to encode three data characters, seven characters are required.
<b>Parameter</b>	A variable that can have different values assigned to it.
<b>Parity Type</b>	A parity check bit is the most significant bit of each ASCII coded character. The parity should be set to help detect transmission errors. The parity should be set to match that of the receiving device. If even parity is selected, the parity bit has a value (0 or 1) to ensure that an even number of 1 bits are contained in the coded character. If odd parity is selected, the parity bit will have a value (0 or 1) to ensure that an odd number of 1 bits are contained in the coded character. If 0 parity is selected, the parity bit always will be set to 0. If 1 parity is selected, the parity bit always will be set to 1.

**PDF417**

A two-dimensional, or stacked, bar code symbology which can encode over one kilobyte of data per label and which represents data in the form of codewords (values 0 - 928). Each codeword consists of four bars and four spaces, for a total of 17 module widths; modules vary in width from one to six element widths. The symbology permits encoding up to 30 data columns and from 3 to 90 data rows. For ease of reading while still maintaining high data density, codewords are encoded in three mutually-exclusive encodation sets, or clusters, with the same cluster repeating sequentially each third row.

**Percent Decode**

The average probability that a single scan of a bar code would result in a successful decode. In a well-designed bar code scanning system, that probability should approach near 100%.

**Print Contrast Signal (PCS)**

Measurement of the contrast (brightness difference) between the bars and spaces of a symbol. A minimum PCS value is needed for a bar code symbol to be scannable.  $PCS = (RL - RD) / RL$ , where RL is the reflectance factor of the background and RD the reflectance factor of the dark bars.

**Prom**

Acronym for Programmable Read Only Memory. An integrated circuit which can be programmed through special processes and accessed at random during normal operation. Reprogramming is possible, but only through processes such as ultraviolet light erasing and electrical rewriting of data.

**Protocol**

For a specific signaling type, a set of recognized rules governing the format and timing of message exchange. Between data communications devices, this includes an exchange of predetermined signals arranged for both establishing connection and for disconnecting.

**Quiet Zone**

A clear space, containing no dark marks, which precedes the start character of a bar code symbol and follows the stop character.

**Reflectance**

Amount of light returned from an illuminated surface.

<b>Resolution</b>	The narrowest element dimension which can be distinguished by a particular reading device or printed with a particular device or method.
<b>Row Indicators</b>	To help synchronize a PDF417 symbol's structure, codewords which collectively indicate which row a particular one is, which is the left and right side of that row, how many rows are in the symbol, what security level is encoded in the symbol, and how many data columns are in the rows. Left Row Indicators occur in each row immediately after the Start pattern; Right Row Indicators occur in each row immediately before the Stop pattern.
<b>Scan</b>	Search for a symbol to be optically recognized.
<b>Scan Area</b>	Area intended to contain a symbol.
<b>Scanner</b>	<p><b>An electronic device used to scan bar code symbols and produce a digitized pattern that corresponds to the bars and spaces of the symbol. Its three main components are:</b></p> <ol style="list-style-type: none"><li><b>1. Light source (laser or photoelectric cell) - illuminates a bar code.</b></li><li><b>2. Photodetector - registers the difference in reflected light (more light reflected from spaces).</b></li><li><b>3. Signal conditioning circuit - transforms optical detector output into a digitized bar pattern.</b></li></ol>
<b>Self-checking Code</b>	A symbology that uses a checking algorithm to detect encoding errors within the characters of a bar code symbol.
<b>Show-through</b>	The generally undesirable property of a substrate that permits underlying markings to be seen.
<b>Space</b>	The lighter element of a bar code formed by the background between bars.
<b>Specular Reflection</b>	The mirror-like reflection of light from a surface, which can "blind" a scanner.
<b>Spot Size</b>	Size of the scanning aperture.

<b>Spots</b>	The presence of ink in a bar code's spaces or clear areas. These generally reduce the percent decode.
<b>Start/stop Character</b>	A pattern of bars and spaces that provides the scanner with start and stop reading instructions and scanning direction. The start and stop characters are the first and last encoded characters of a bar code.
<b>Substrate</b>	A foundation material on which a substance or image is placed.
<b>Substrate Scattering</b>	Optical phenomenon which causes bars to appear larger and spaces narrower than they are actually printed. It is caused by the scattering of incident light rays within the medium.
<b>Symbol</b>	A scannable unit that encodes data within the conventions of a certain symbology, usually including start/stop characters, quiet zones, data characters, and check characters.
<b>Symbol Aspect Ratio</b>	The ratio of symbol height to symbol width.
<b>Symbol Height</b>	The distance between the outside edges of the quiet zones of the first row and the last row.
<b>Symbol Length</b>	Length of symbol measured from the beginning of the quiet zone (margin) adjacent to the start character to the end of the quiet zone (margin) adjacent to a stop character.
<b>Symbology</b>	The structural rules and conventions for representing data within a particular bar code type (e.g. UPC/EAN, Code 39).
<b>Symmetric Bar Width Growth</b>	Uniform growth of bars evenly distributed.
<b>Tolerance</b>	Allowable deviation from the nominal bar or space width.
<b>Two-dimensional Symbology</b>	Designed for high information density and higher encoding capability than one-dimensional bar codes, a symbology which encodes data in both the horizontal (X-dimension) and vertical dimensions, usually in a "stacked" or multi-row arrangement.

<b>UPC</b>	Universal Product Code. A relatively complex numeric symbology. Each character consists of two bars and two spaces, each of which can be any of four widths. The standard symbology for retail food packages in the United States.
<b>Visible Laser Diode (VLD)</b>	A solid state device which produces visible laser light. Depending on the type of diode used, the emitted laser light has a wavelength between 635 to 670 nanometers.
<b>Void</b>	Absence of ink within printed bars.
<b>X-dimension</b>	Width of the narrowest element (bar or space) in a bar code symbol.
<b>Y-dimension</b>	Element height, as applied to a two-dimensional symbology, which must equal or exceed a required minimum.
<b>Zero-suppressed Code</b>	A version of UPC/EAN which reduces the number of characters in the code. The resulting code combines the manufacturer's code and the product's code of Version A in a retail application.

User's Manual Title: \_\_\_\_\_  
(please include revision level)

How familiar were you with this product before using this manual?

☐ Very familiar    ☐ Slightly familiar    ☐ Not at all familiar

Did this manual meet your needs? If not, please explain. \_\_\_\_\_  
\_\_\_\_\_

What topics need to be added to the index, if applicable? \_\_\_\_\_  
\_\_\_\_\_

What topics do you feel need to be better discussed? Please be specific.  
\_\_\_\_\_

What can we do to further improve our manuals? \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Thank you for your input—We value your comments.
