

ED12 Considerations for Implementing PlantPAx
Batch and Sequence
Manager
by
John R. Parraga

THINKING PROCESS

Rockwell Automation Process Solutions User Group (PSUG) November 14-15, 2011 Chicago, IL - McCormick Place West

Agenda

Batch and Sequencing processes

Batch and sequencing S88 design basis

Batch and Sequencing Solutions

Batch and Sequencing scalability

Scalable solution example

Selection Considerations

Summary

Agenda

Batch and Sequencing processes

Batch and sequencing S88 design basis

Batch and Sequencing Solutions

Batch and Sequencing scalability

Scalable solution example

Selection Considerations

Summary

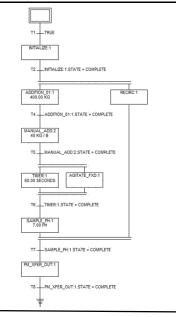

Terms used to describe sequencing activities

Workflow-

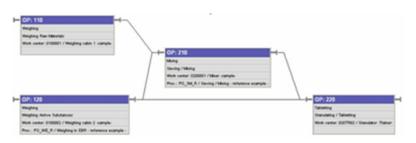

- Common term used in describing
- MES system or
- MOM (Manufacturing Operations Management)

- Procedure well defined in the ISA-88
 - Batch procedure
 - Unit procedure
 - Operation

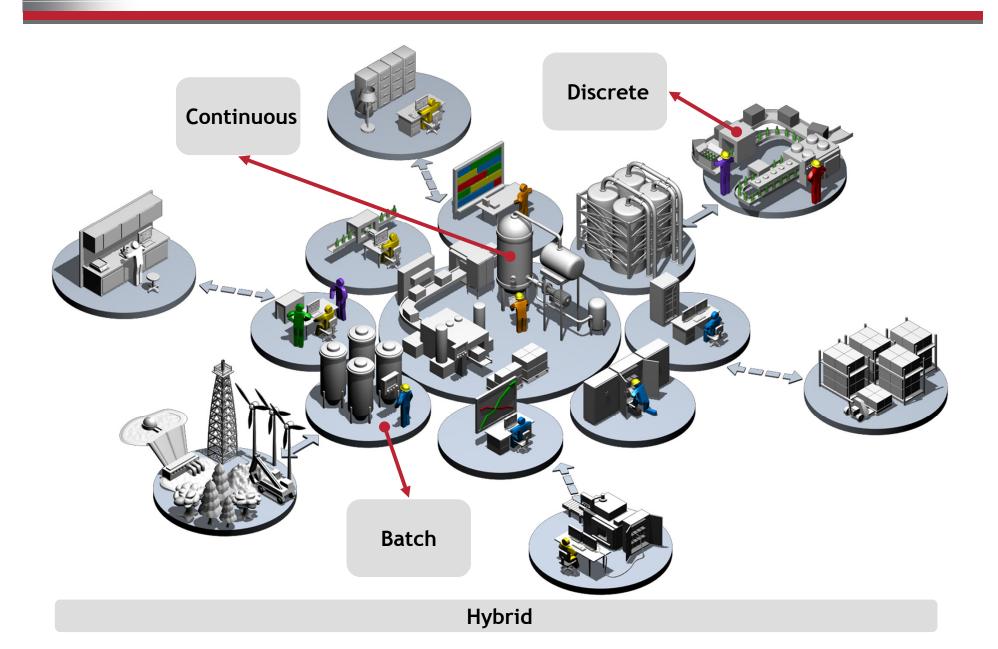

Routing

Work instructions

| Section I - Piece Part Lot Traveler GAP-9419 | | | EP-QC | -534 |
|--|---------------|---------------|----------------|------|
| Battery Traveler | | | | Rev. |
| LotE | ffective Aug | ust 25, 2 | 005 | Page |
| 11.0 ASSEMBLY PREPARATION - (Ref. Procedures 9213-5,) | PM-IIO-20 | 47 PM | -UO-54 | 01) |
| | Qty's Pass | Qty's Fail | Date & Initial | CA |
| NOTE: SECTION NEEDS TO BE FOLLOWED IN THE EXACT SEQUENCE. | | | | |
| NOTE: CHECK PROCEDURE REVISIONS DURING ASSEMBLY. | | | | |
| 11.1 Perform Low Top test on the preassembly system if test fails Supervisor and Q.I. must sign and date | | Supervisor | O.A. | |
| 11.2 Check out material sub assembly and record lot number | | Soperisor | OA. | |
| 11.3 Perform Plasma weld on subassembly record time complete | | Supervisor | O.A. | |
| 11.4 Perform Low Top test on the preassembly system if test fails Supervisor and QA must sign and date | | Sperior | OA. | |
| 11.5 Verify that the electrolyte passageways are open (air gage) per EP-MP-2047 Rev , Section 4, (7.4). | System | vaporatil | Va. | |

Types of processes

Discrete manufacturing

Assembly sequencing

Parts processing

- Engines
- Power Train

Semiconductor

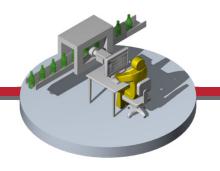

- Cleaning
- Etching
- Deposition

Assembly

- Electronics
- Appliances

Coating

- Galvanizing
- Plating
- Chemical milling...

Continuous processing

Petrochemical . .

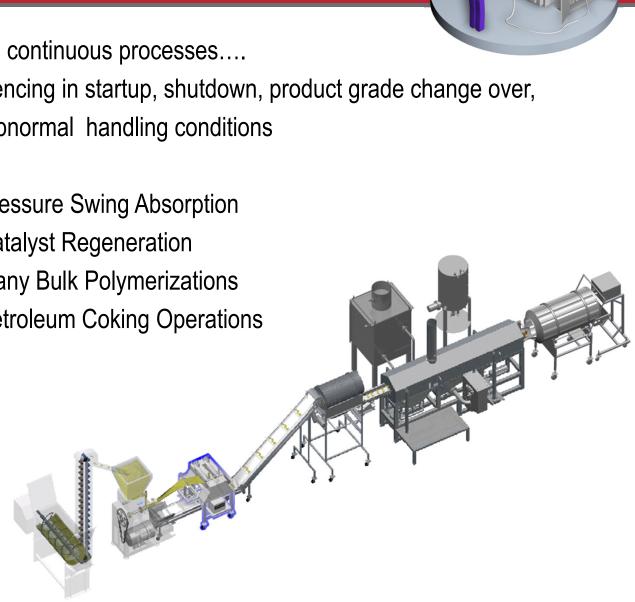

For all continuous processes....

Sequencing in startup, shutdown, product grade change over, and abnormal handling conditions

Pressure Swing Absorption Catalyst Regeneration Many Bulk Polymerizations **Petroleum Coking Operations**

Food extruders Continuous ovens Continuous coaters Distillation towers

Batch processing

Pharmaceutical & Chemical

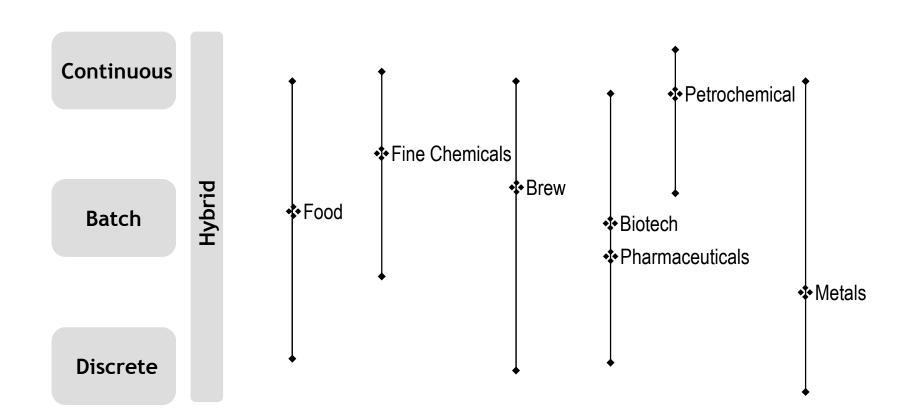

Food and Beverage

- Making discrete quantities of products
- Typically, the most comprehensive sequencing
 - May be up to 4 different layers in manufacturing process alone
 - Often very complex sequencing paths with many 'and' & 'or' divergences
 - Often requires constant changes for agile manufacturing requirements
 - The procedure drives production.
 Completing the procedure completes the product
- ISA-88 standard gives comprehensive guidance in designing a modular, flexible system

Industries and types of processes

Requirements Complexity factors (some)

| Cost |
|---|
| Single-unit execution or Multi-unit coordination |
| Large system |
| Procedures size & sophistication |
| Equipment allocation and arbitration |
| Operator Simple prompting or Electronic Work Instructions |
| Data collecting, reporting, analysis |
| Redundancy |
| Safety |
| Security & regulatory compliance |
| Material Management |
| Information enabled |
| ERP/MES connectivity |

Agenda

Batch and Sequencing processes

Batch and sequencing S88 design basis

Batch and Sequencing Solutions

Batch and Sequencing scalability

Scalable solution example

Selection Considerations

Summary

Automation for the Process Industry

Copyright © 2010 Rockwe

Engineering Aspects (Modularity)

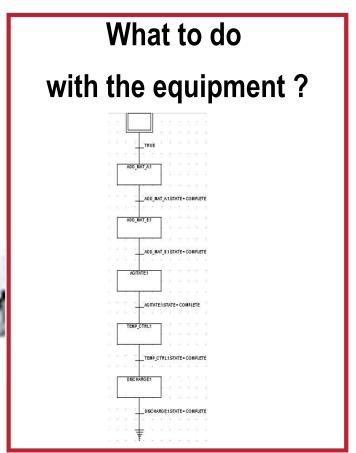

FUNDAMENTAL ISA-S88 CONCEPT

Equipment

What is the equipment capable of?

" SEPARATE "

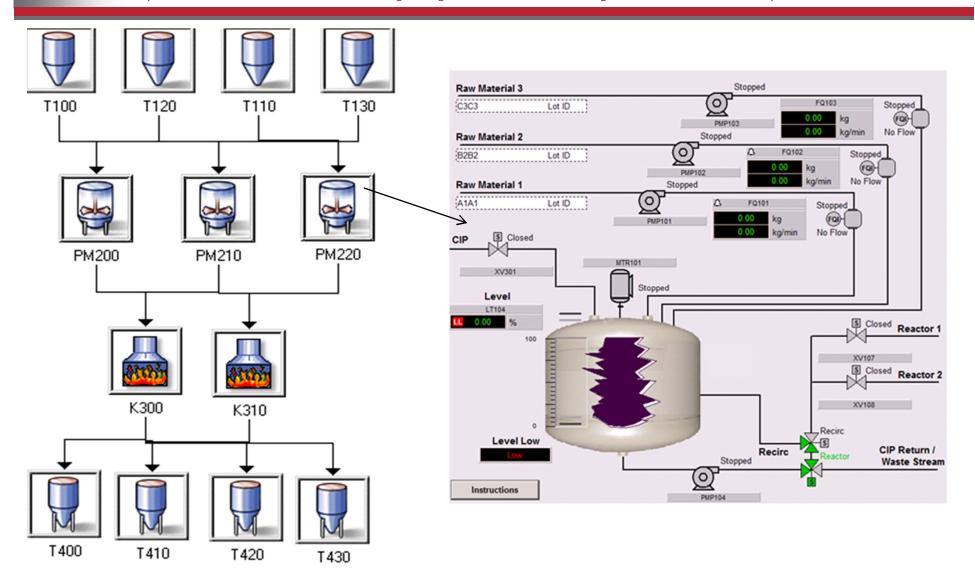

Procedure

Engineer

Formulator

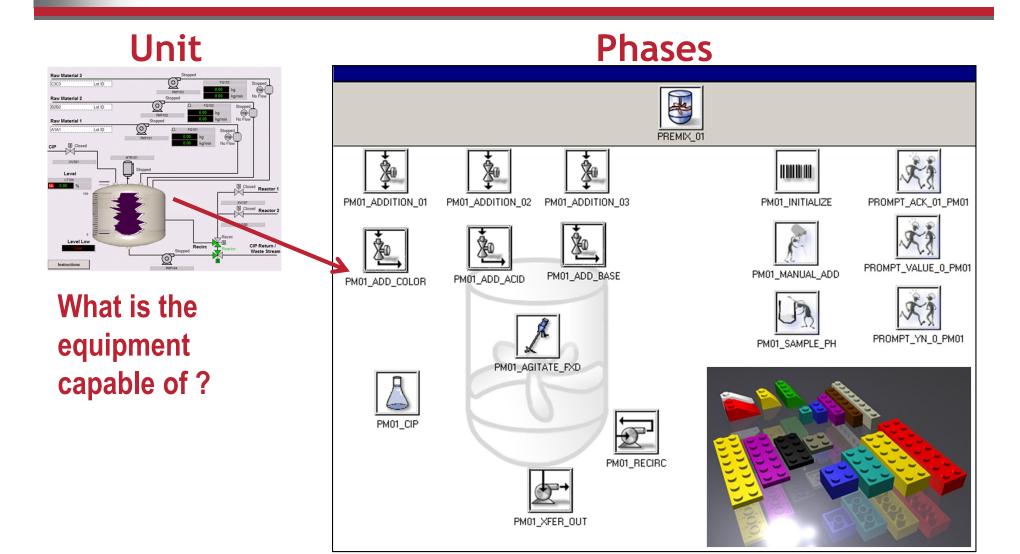

Engineering Aspects (What is the equipment capable of ?)

Process

Unit

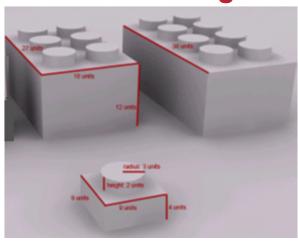

Engineering Aspects (Modularity) Programming

Phases are the building blocks of a modular solution

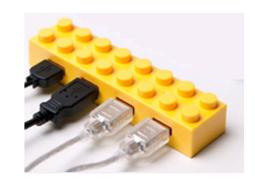

Phase Manager

Phase Manager

- Controller firmware
- Phase infrastructure
- Phase tags
- State transition logic
- Phase logic interface

Logic definition

- Parameters
- Report Values
- Execution logic

- Reusable
- Modular code

Rockwell's response to market demand for modular solutions

- Encapsulated basic equipment functionality (Agitate, Add, Heat, Cool, Transfer, etc.)
- · Product or procedure independent
- Sequencing engine independent

Formulator Aspects

What can I do with this equipment (phases)?

Formulator

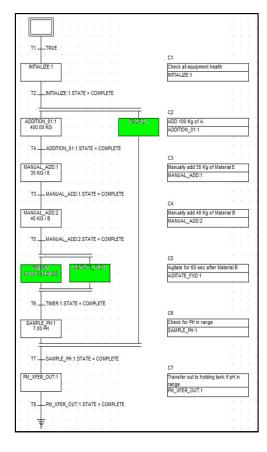

Formulator Aspects (Modularity) Configuration

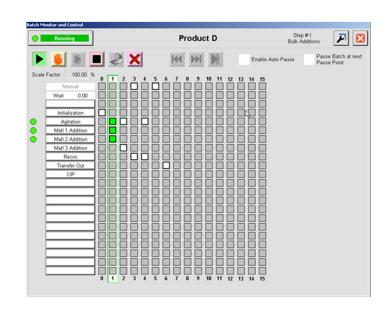

What to do with the equipment?

Research & Development

- □ Product recipes□ Experimental Recipes
- □ Cleaning (CIP) recipes
- **■** Material Qualification recipes
- **□**Equipment setup procedures
- **□**Dispensing procedures
- **□**Startup sequences
- **□**Shut down sequences
- □Etc.

Agenda

Batch and Sequencing processes

Batch and sequencing S88 design basis

Batch and Sequencing Solutions

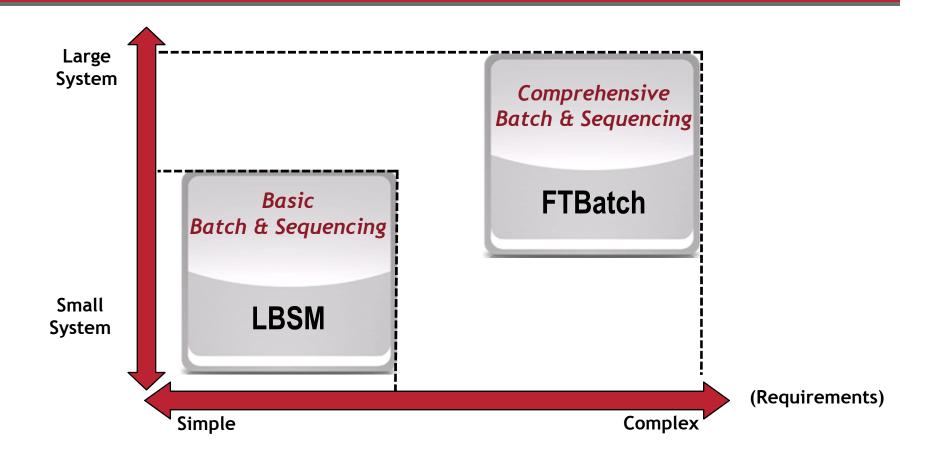

Batch and Sequencing scalability

Scalable solution example

Selection Considerations

Summary

Scalable Batch and Sequencing

Rockwell's response to market demand for scalable solutions

• Scalable to meet a wide range of batch and sequencing requirements

Controller-Based Batch and Sequencing

Logix Batch & Sequence Manager (LBSM)

Recipe Management and Procedural Control

ControlLogix

<u>CompactLogix</u>

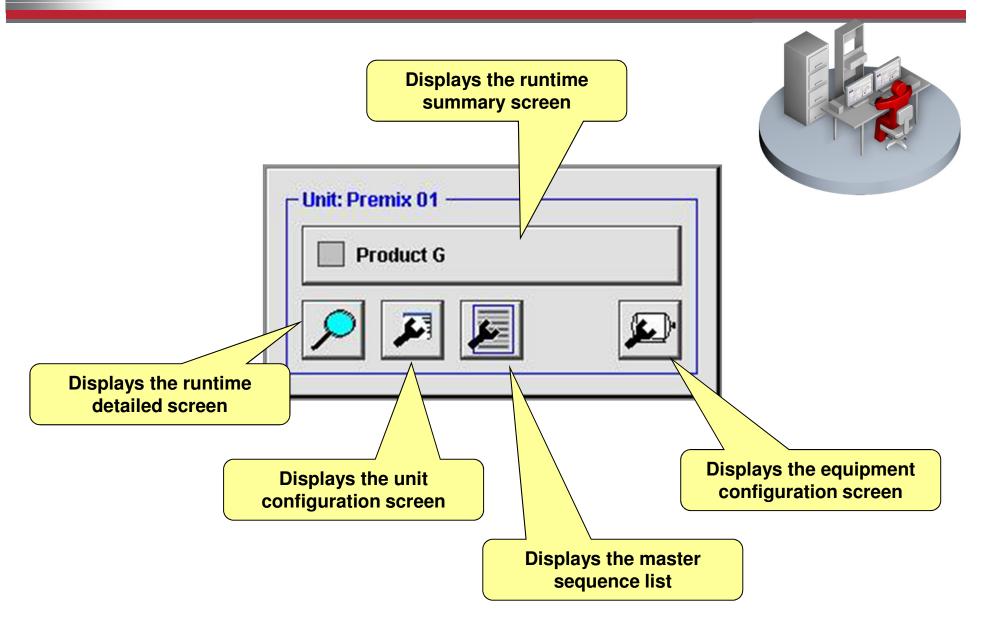

FTView SE

FTViewME

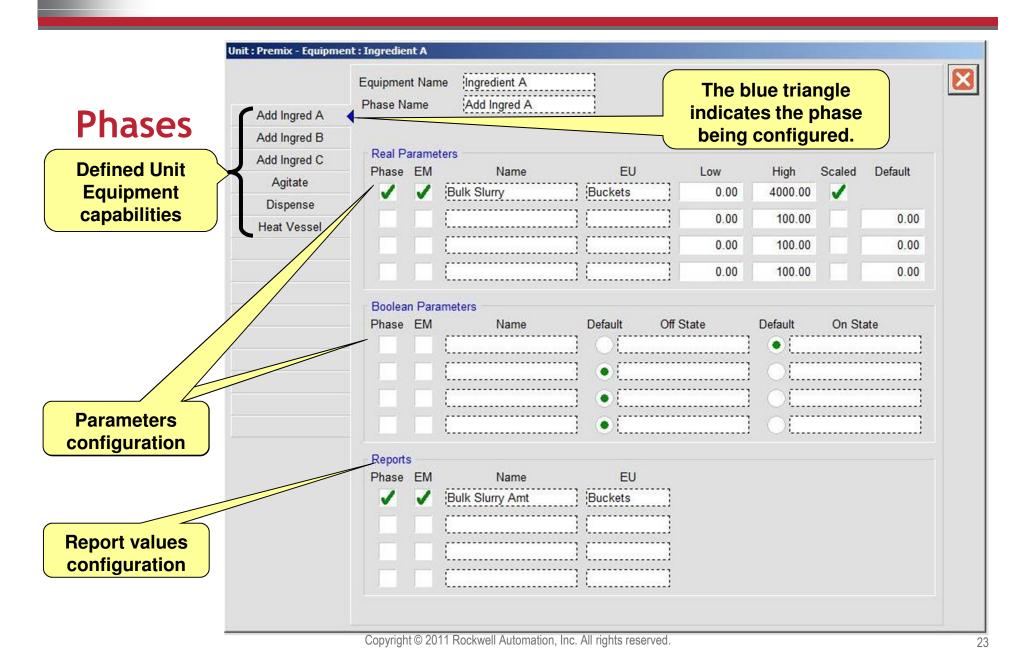

What it Offers

- Simplify your system with core system functions (controller & HMI) for batch & sequence control
- Enable flexible recipe management with configurable equipment model
- Adopt industry standard procedural control following ISA-88 state model (running, holding, stopping, etc)
- Reduce engineering with pre-built application solution

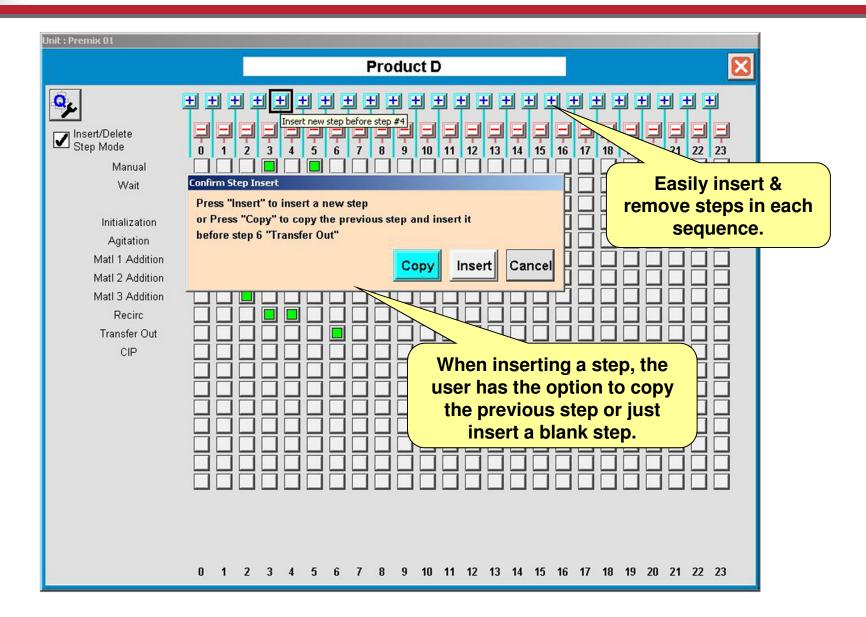

Runtime & Engineering Configuration

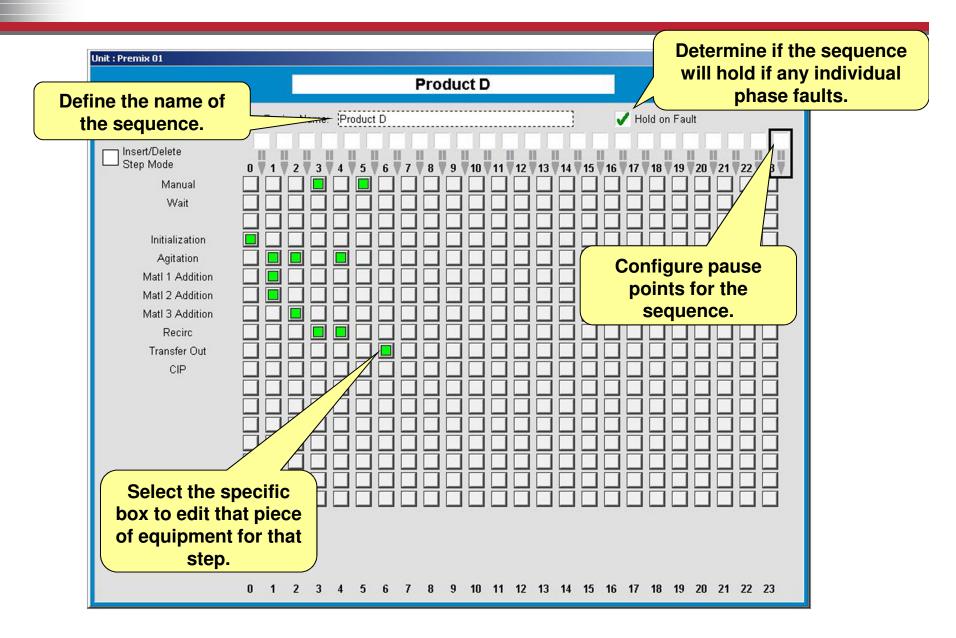

Configure the Unit Equipment Model

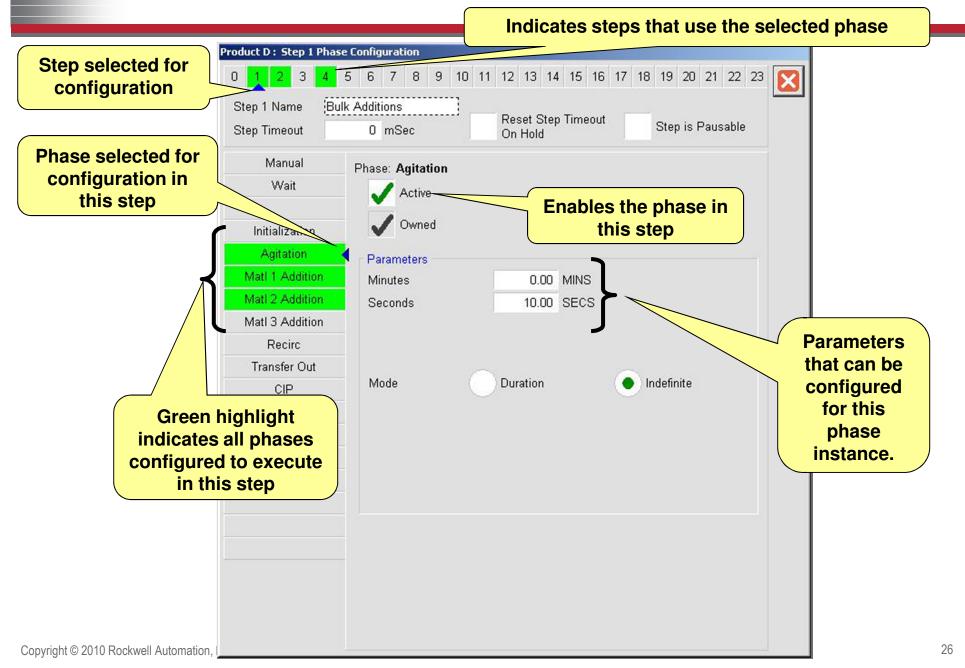

Insert or Remove Steps

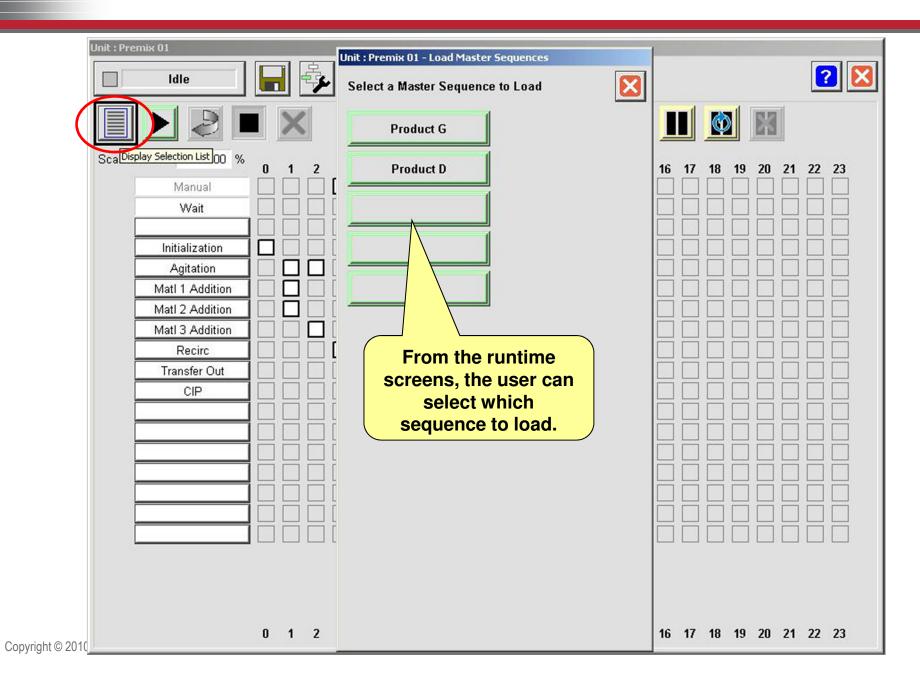

Sequence Configuration

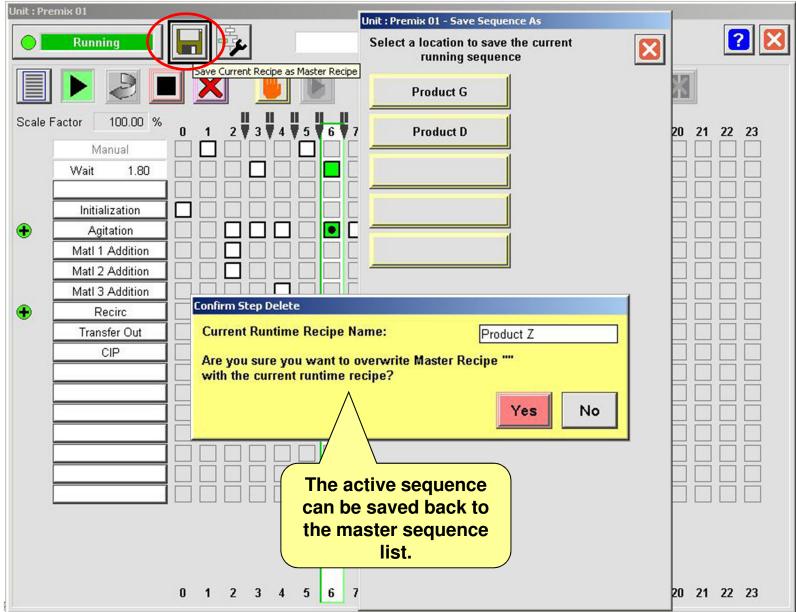

Configure the Sequence Details

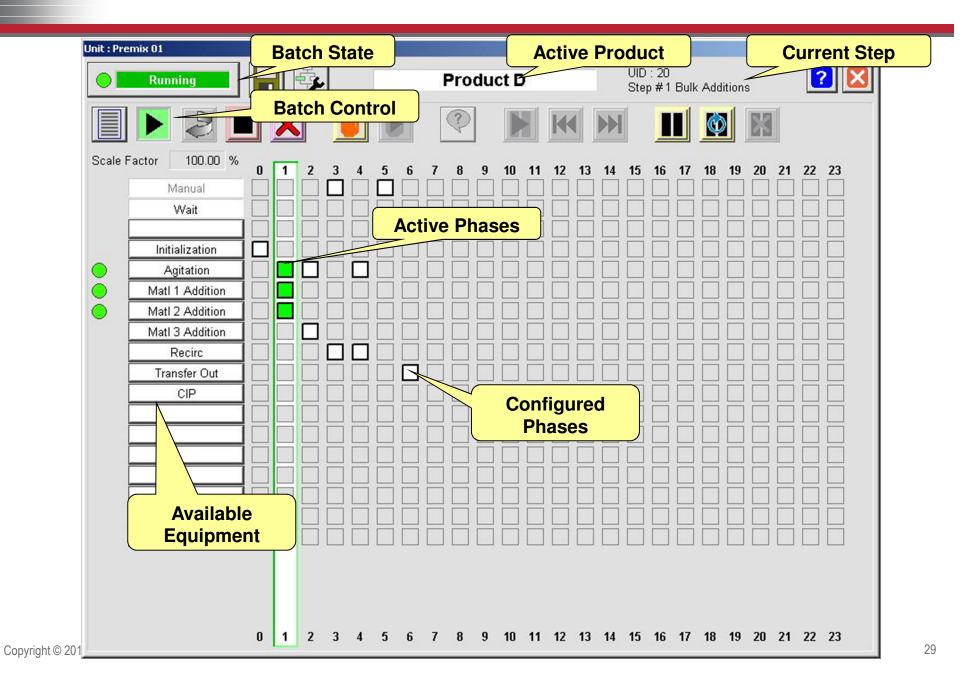

Select Master Sequence

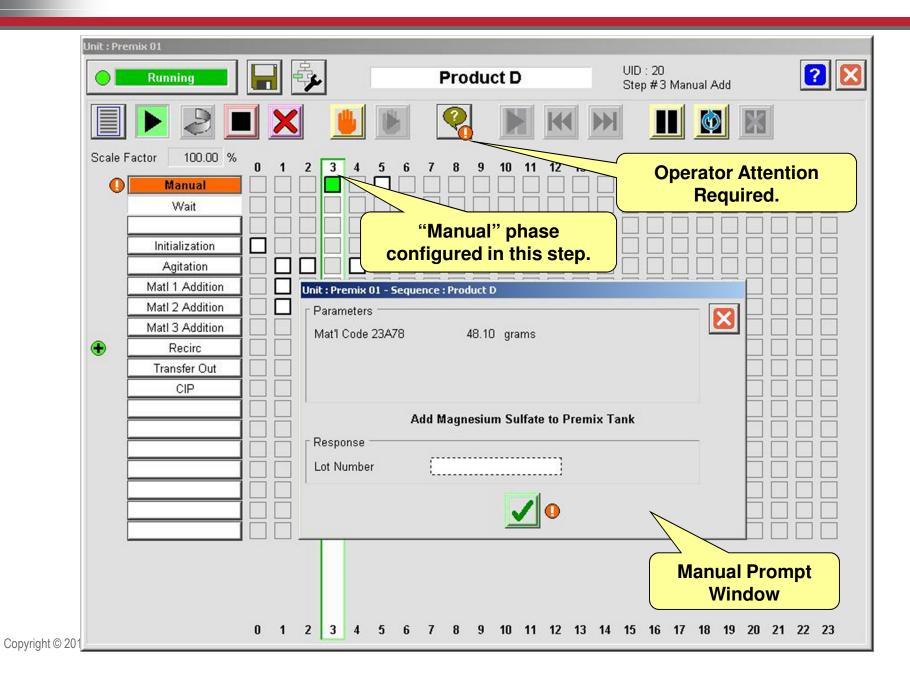

Save Runtime Sequence

Intuitive Runtime Operation

Standard Manual Operator Prompting

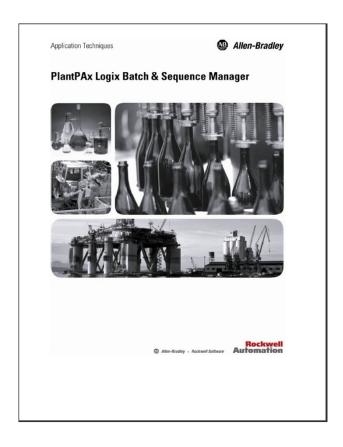

LBSM Application availability and Documentation

- "Logix Batch & Sequence Manager" is available for download through the Rockwell Automation Knowledgebase, Answer ID: 68709
- http://rockwellautomation.custhelp.com/app/answers/detail/a_id/68709

Documentation includes:

- 1. Installation Guide
- 2. Configuration Guide
- 3. Runtime User's Manual
- 4. Example project

Comprehensive Batch & Sequencing

Software/Server Batch

 Integrated solution supports flexible manufacturing, secure recipe management, improved product consistency, & enables regulatory compliance through use of <u>product software & application servers</u>.

Comprehensive Functionality

- Enables business system connection, multi-vessel coordination, shared resources, manual operations, & material management

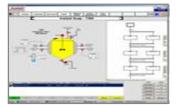

Built in Security & Diagnostics

- Supports regulatory compliance, secure user environment, & historical change tracking.

Data Collection & Reporting

 Out of the box data collection & reporting to solve common batch report, track & trace, material usage, and exception reporting needs.

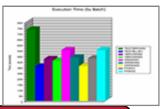

Integrated Visualization

- Integrated HMI environment enables the user to do more

Batch Analysis & Optimization

 Provides tools to analyze batch cycle time, better understand the process, and correlate process trends

Comprehensive capabilities enable you to meet your demanding requirements

Graphical configuration of Equipment Model

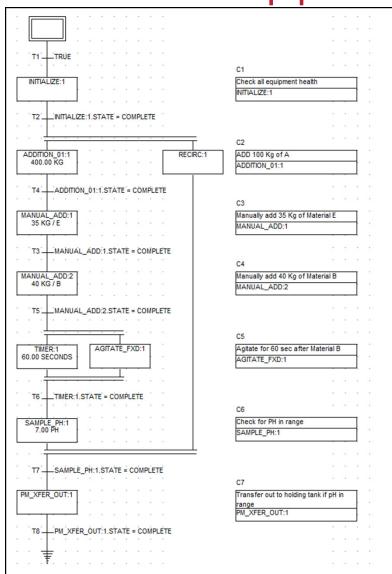

What is the equipment capable of?

Formulator Aspects (Modularity) Configuration

What to do with the equipment?

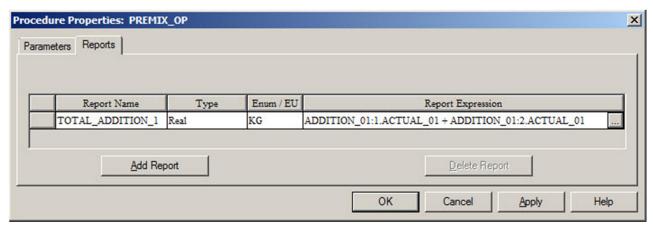

Research & Development

- **□**Product recipes
- **□**Experimental Recipes
- □Cleaning (CIP) recipes
- **□**Material Qualification recipes
- **□**Equipment setup procedures
- **□**Dispensing procedures
- □Etc.

Formulator aspects (Intelligent recipe features)

- Recipe author's can write parameter, transition, & binding expressions to create "intelligent" recipes that reference unit tags, attributes, input/output parameters.
- Options to define report parameters at all levels of the recipe including phase, operation, unit procedure, and procedure.
- Phase report parameters give you the ability to accumulate values uploaded by phase logic.

Quality Aspect (Configuration Auditing)

Audits on Equipment and Recipe Editor

Types of Audits Messages

Security Events

Operator tried to Log On at 1:13 pm on January 2, 2009

Configuration Change Events

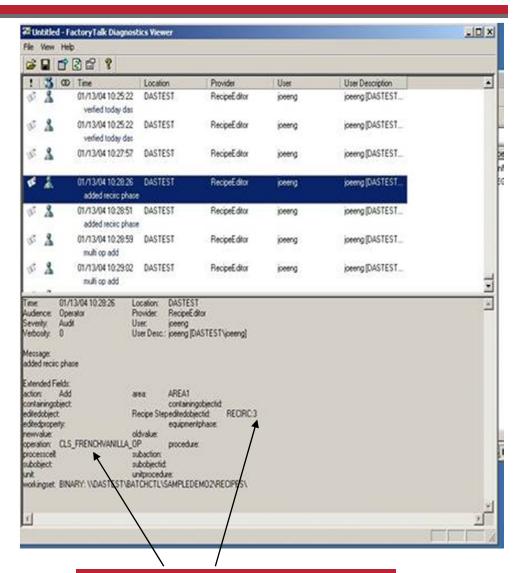

Report Parameter Added to MIXER_22

Explanation Events

Why a change was made

i.e. Set of changes to implement new mixing line.

Audits enabled by Factory Talk Diagnostics

Added a "circulation" phase to the "French Vanilla" recipe.

Operations aspects (Batch Security)

Application security

User authentication at Logon

Command Authorization security

Full access control to operations

Ensures that personnel are prompted for signatures when commands are executed.

Parameter and Report deviation authorization

Manual and Automatic Phases

Three Levels of limit values can be secured

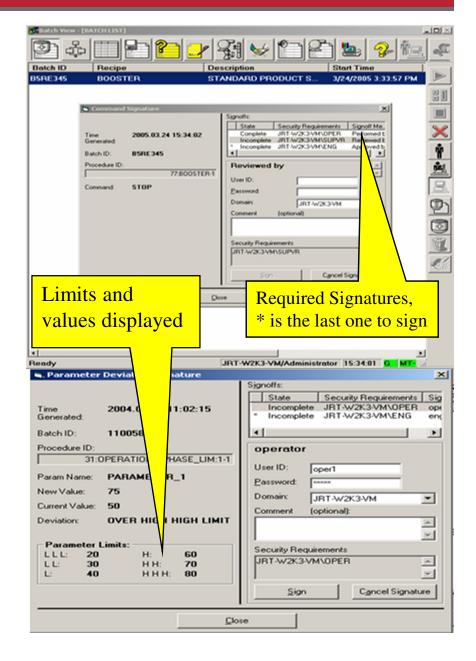

Electronic Signatures

Up to three signatures for authorization

Logs intent of each signature

Full names logged in event journal

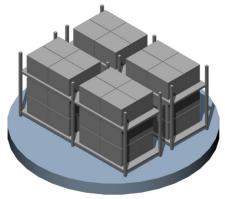

Available in Batch View and active X's

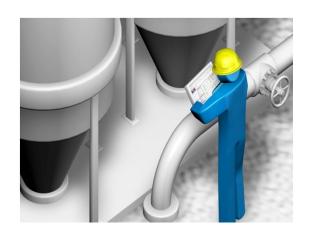

Batch Material Manager

- Provides an active material management / inventory system
 - Defines storage locations, containers, and materials
 - Records critical data about material and equipment usage
 - Provides for lot tracking & material genealogy
- Enables material based phase definitions in batch execution
 - Enables just-In-time material & equipment selection to provide flexible batch manufacturing & real-time production scheduling

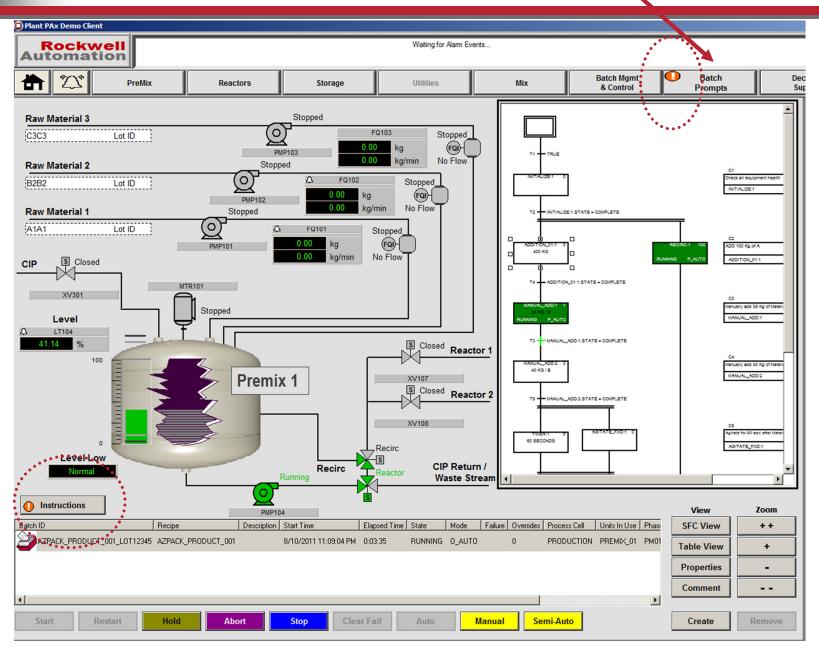

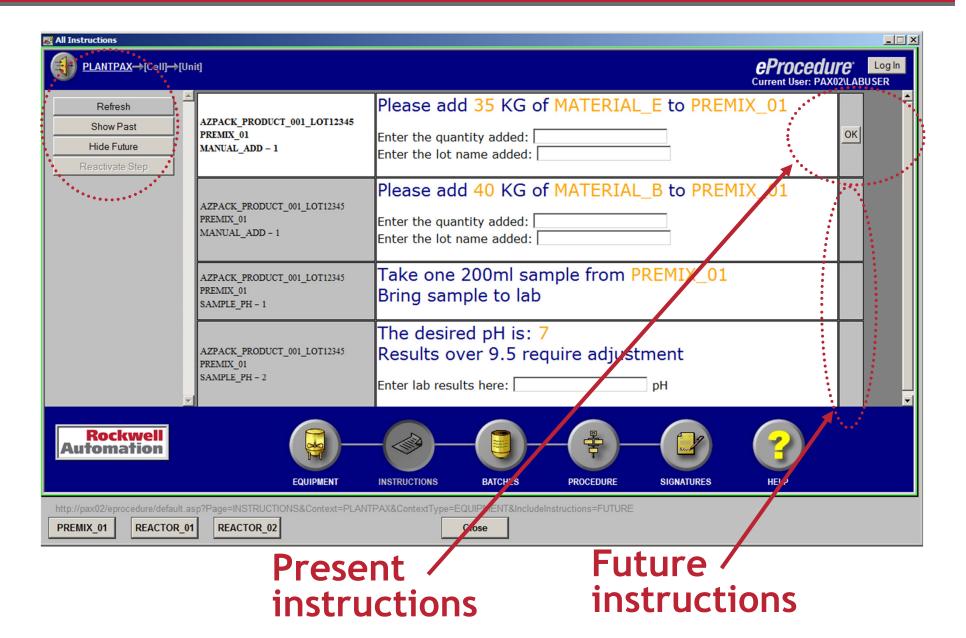

Used to solve material management requirements

Operator Aspects (Operator attention required) <

Operator Aspects (Present / Future instructions)

Electronic work instructions

Provides automated operator instructions for manual processes

- Automates the process without the need to automate the equipment
- Provides secure and reliable instructions to your operators using web technology
- Leverage manual SOP's, documents, video, and/or pictures within instructions

Integrates manual instructions into automatic batch recipe execution

- Provides manual prompts, data acquisition, & SOP's during running sequence.
- Connect to bar code scanner, databases, controllers within instructions
- Integrates directly into HMI applications
- Comprehensive Electronic Signatures

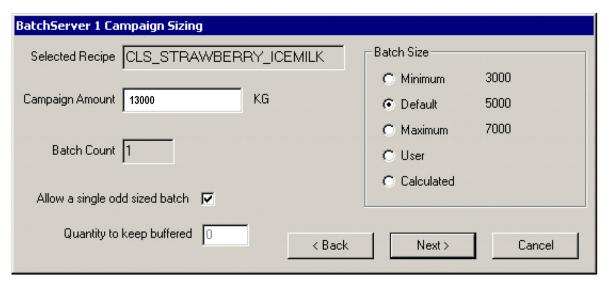

Typical procedures that can be automated

- Manual batch execution and prompts
- Complex standard operating procedures
- Portable hand held applications
- Product changeover and packaging line changes
- Equipment startup and shutdown sequences
- Abnormal condition handling
- Cleaning and maintenance procedures

Logistics and Scheduling Aspects (Batch campaign)

Batch Campaign features

- ☐ Flexible batch/campaign creation
- ☐ Add individual batches you can specify the size of each batch in the campaign.
- □ Create campaigns with multiple batches you can automatically generate the campaign of batches using the quantity/size or a value in between that is applied to all batches in the campaign.

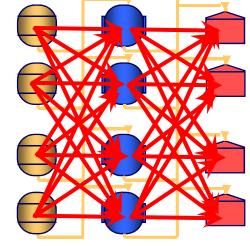

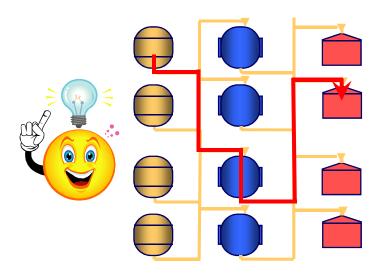

For example, A 13,000 liter campaign size is created with a batch size of 5,000 liters. With **Allow Single Odd-Sized Batch** selected, there will be two batches at 5,000 liters and a single (third) batch created with a batch size of 3,000 liters, thus fulfilling the campaign size specified (2*5,000) + 3,000 = 13,000 liters.

Smart Binding (Equipment auto selected)

- The enabling technology to build equipment (unit) binding requirements and preferences into procedures.
- Decisions can be based on:
 - Preference
 - Requirement
- Use "Smart Binding" to address:
 - Cost Concerns (use the "warmest" reactor)
 - Clean-in-place Requirements ("peanut-free" product)
 - Out-of-Service Status (scheduled maintenance)
 - Unit/Recipe Compatibility (Glass Lined Reactors)
 - Avoid using Unit with unneeded functionality (recipe doesn't need agitator)

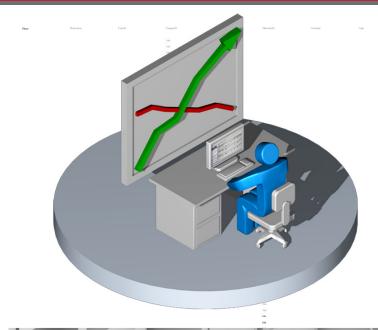

Batch execution and process data is generated and stored

Planning and Logistics

Plant Management

- •010 Batch Listing List of batches that meet a user's search criteria
- •020 Batch Summary Batch specific summary information on batch data like set point vs. actual
- •030 Batch Detail Batch specific detailed information on batch data (step times, parameters, reports), abnormal state changes, batch failures, FactoryTalk alarms & events, set point vs. actual, and out of tolerance values.
- •040 Material Usage Material specific consumption information including: batch that consume it, quantity & lot consumed, total consumption over period of search.
- •050 Forward Tracking Find all batches that consumed a material lot or used a piece of equipment.
- •060 Backward Tracing Trace all ingredients consumed and equipment used by a specific batch.
- •070 Batch Execution Review a specific batch's step execution times in a bar chart format.
- •080 **Duration Comparison** Compare the durations of multiple batches in a bar chart format.
- •090 Batch Exceptions Review all batches with exceptions. Includes abnormal state changes, FactoryTalk alarms & events, batch failures, out of tolerance values

Summary

Scalable Batch and Sequencing

Scalable Batch & Sequencing Solution

- Leverage Logix PhaseManager technology.
- Use LBSM to sequence single Unit simple operations
- Use FTBatch to coordinate multi unit recipe procedures and complex recipes

Configure LBSM Operations

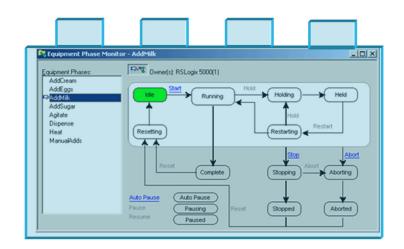

Phase Manager

- PhaseManager embeds standardized (Equipment)
 Phase State Model and management in the Logix controller
 - Provides a modular framework for executing Phases in a controller
 - Phase control executed as state machine model, using Phase State Routines (Running, Stopping, etc.)
 - Manages transitions between these standard, allowable States Useful for
 - Batch Control (simple to complex)
 - Machine Control
 - Other places where simple operations should be standardized
- Phase Monitor provides a monitoring and troubleshooting view of individual phases

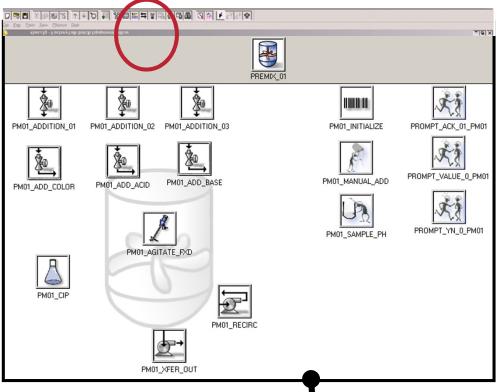

Standard Phase Interface

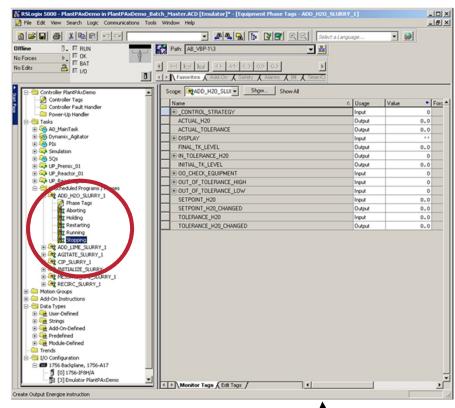

Equipment Phases, built with PhaseManager, Become the Building Blocks

Selection Considerations

Summary

OEM Equipment

Benefit:

All 4 OEM solutions utilize the same process control foundation, the code structure does not have to change. This allows the OEM to maintain a single process control solution independent of the sequencing engine used, thus reducing engineering costs and delivery time.

Benefit:

The OEM equipment can be delivered as a fully functioning skid that can seamlessly integrate into the end users overall control system. Complete factory acceptance tests using LBSM or FTBatch sequence managers. But at the site, you can perform direct integration into the higher level batch and sequence management software such as FactoryTalk Batch to reduce startup time and validation effort.

Benefit:

If the OEM skid uses PhaseManager, it can be integrated directly into FactoryTalk Batch at a higher level through synchronization. If the OEM skid uses Logix Batch & Sequence Manager, it can execute operation level sequence that is initiated from this higher level batch software. Both options offer reduce startup time and validation effort.

Selection Considerations

Summary

Fundamental differences

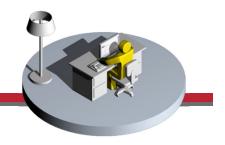

PC Based Solution (FTBatch):

- Sequences are store and directed using a PC.
- Multiple forms of graphical user interfaces exist to interact with operators(web browser, active X, FTBatch view) other GUIs are used by formulators and engineering.

Controller Based Solution (LBSM and SILC):

- Sequences are executed and stored using a Controller (CLX).
- Human Machine interphase (Vie SE or ME) is used to interact with operators, formulators and engineering.

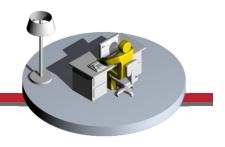

Cost:

| Controller Based (LBSM) | | PC Based (FTBatch) | | | |
|--|---|--|--|--|--|
| (+) | (-) | (+) | (-) | | |
| Free sequencing engine HMI and CLX Application code. | Requires View SE or ME Requires a Controller | Includes: Sequencer engine Operator electronic work instructions Material management Batch campaigning Formulation management Electronic journal Web based reporting No controller required No HMI required (batch view) | • List Price Units 1 3 10 30 60 US\$ 3k 8k 24k 47k 68k | | |

Equipment requirements:

| Controller Based (LBSM) | | PC Based (FTBatch) | | |
|--|---|---|---|--|
| (+) | (-) | (+) | (-) | |
| Does not require a windows sever operating system | Requires a CLXRequires View SE or ME | User interface Batch View, Active X, web browser or View SE, ME. Does not require a CLX Multi controller interface and coordination | Requires a Server OS to run Batch Server Requires an OS to run Clients | |

Robustness:

| Controller B | ased (LBSM) | PC Based (FTBatch) | | |
|---|--|--|--|--|
| (+) | (-) | (+) | (-) | |
| Recipe will continue to run in the controller without HMI or Network. | Recipe will continue to run in the controller without HMI or Network. No operation view if loss of network. Loss of power will cause loss of current sequence state | Components detect loss of network or server and bring recipe and phases to held safe state. Upon system restore the recipes reconstruct and recipes continue were they left off after operator restart. | Requires the PC and the network in order to continue sequence No built in redundancy, rely on third party | |

Reporting:

| Controller Based (LBSM) | | PC Based (FTBatch) | | |
|-------------------------------|---|---|------------------------------|--|
| (+) | (-) | (+) | (-) | |
| (Reporting under development) | Custom reporting required Cost of implementation Only "Real" values type data is captured no strings nor enumerations | Comprehensive data collection performed by Batch server Ability to move data to multiple data bases Free existent predefined reports Interaction with FTHistorian provide the ability to correlate Batches with batch historical data such as trends | Requires an operating system | |

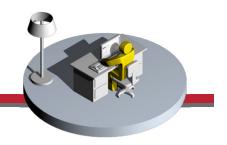

Equipment definition and specification:

| Controller Based (LBSM) | | PC Based (FTBatch) | | |
|--|---|---|---|--|
| (+) | (-) | (+) | (-) | |
| All equipment model configuration is performed via HMI Ability to add equipment phases to definition without affecting running recipes Simple to understand and deploy Controller memory usage tool available Ability to add or remove Units, Phases, parameters and report values on the go Only requires HMI and CLX know how to maintain | Parameters of type Real and Boolean and report values of type real limited to 4 of each No strings nor enumerations parameters nor report values All equipment definition require the same controller memory overhead to be reserved whether it is used or not Maximum of 32 independent Units Maximum of 32 Phases per unit Consumes CLX processor memory estimating tool available | Non limited number of parameters and report values Each equipment definition can be different for units, phases, parameters and reports Types integer, real, strings, enumerations Unit attributes allows equipment to be automatically selected based on equipment conditions Phases have the ability to acquire shared resources Equipment allocation and arbitration is performed by Batch Server not in the controller CLX not required to run Equipment phase logic can be distributed among multiple controllers or varying types Unit and Phase class definition | Addition of new equipment require stopping and restarting batch server service, no online equipment definition changes allowed. | |

Recipe definition and usability:

| Controller Based (LBSM) | | PC Based (FTBatch) | | |
|--|--|---|---|--|
| (+) | (-) | (+) | (-) | |
| Very intuitive user interface for operator and formulators Ability to modify existent running recipe on the go Ability to save running recipe as master recipe. Simple to step forward or backwards to predefined pausing points All recipe definition is performed via HMI All recipes definition reside in the CLX controller | Single unit recipes No class based recipes, each one needs to be maintained individually One operation per recipe No recipe structure reusability Maximum of 32 steps per recipe Maximum of 32 recipes All recipes reserve the same amount of controller memory regardless of number of steps or recipes per unit Recipe step transitions are based on phase completion No looping or branching in recipe always performs the same steps of a sequence Risk of losing recipe intellectual property by exposing CLX code to anyone working in the controller | Multiple unit recipe coordination Reusable recipes operations and unit procedures that can be called by other recipes Ease of creating, saving and replicating recipes Class based recipes allow one recipe to run in multiple units at the same time, simplifying recipe management and control Number of recipes virtually unlimited, recipes may contain many steps Recipes do not reside in the controller and do not consume controller memory Recipes are transportable (copy paste) Recipes changes are audited Phase parameters and reports can be calculations that reference other parameters and report values, unit tags, etc. Recipe step transitions can be configure to be the result of calculate values, unit conditions, recipe conditions, reported values, parameters, equipment states, etc, or simply phase complete Looping and branching ok | Changes made to running recipe can not be store as the master recipe. Steps can not be added nor removed from running control recipes. | |

Material Management:

| Controller Based (LBSM) | | PC Based (FTBatch) | | |
|-------------------------|----------------|--|--|--|
| (+) | (-) | (+) | (-) | |
| | • Not in scope | Ability to determine location of sources of material required by recipes. Ability to manage raw material, intermediate and finished product inventory Ability to define material types and properties, to be used by recipe in order to dynamically adjust parameters based on material properties. Ability to define storage container usage priorities for supply as well as consume Ability to switch material storage location based on incomplete or insufficient material in containers. | Required Data base to store material information | |

Selection Considerations

Summary

Summary

PlantPAx offers a scalable continuum of solutions to cover the wide range of system sizes (small to large) and range of user requirements (simple to complex). Basic capabilities allow you to start small and expand if needed. Comprehensive capabilities enable you to meet your demanding requirements.

Phase Manager

Controller based phase infrastructure

 PhaseManager embeds standardized (Equipment) Phase State Model and management in the Logix controller

Basic Batch & Sequencing

Configured Batch & Sequencing LBSM

Provides <u>configurable</u> batch & sequencing through standard <u>controller and HMI</u> functions

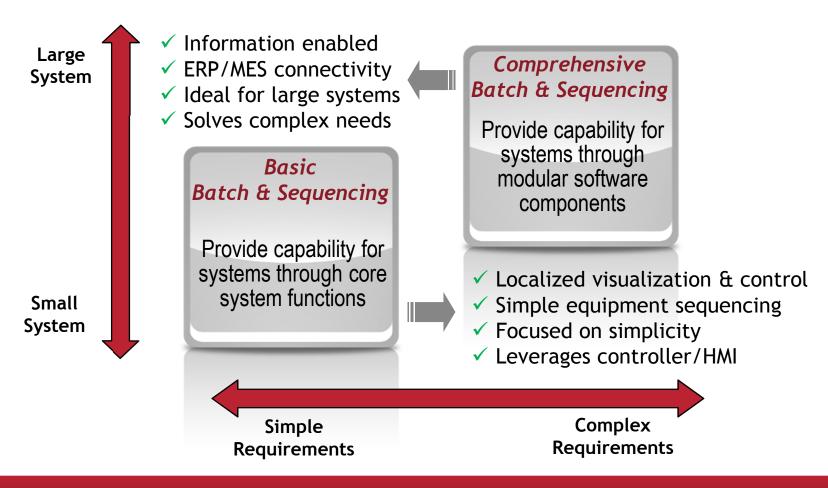

Comprehensive Batch & Sequencing

Application Server Batch & Sequencing FTBatch

Provides <u>pc-based</u> solution for maximum flexibility for <u>large</u> systems

Batch/Sequence Management & Control

- Scalable to meet a wide range of batch and sequencing requirements
- Improve yield, increase throughput, reduce costs, and improve quality

Rockwell's response to market demand for scalable solutions

Thank you!
