FCC Caution

FCC Part 15.19 Caution:

- This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:
 - this device may not cause harmful interference and
 - this device must accept any interference received, including interference that may cause undesired operation
- This device and its antenna(s) must not be co-located or operating in conjunction with any other antenna or transmitter.
- Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user authority to operate the equipment.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

The antennas used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter.

FCC Statement in User's Manual (for calss B) FCC Section 15.105

"Federal Communications Commission (FCC) Statement"

This equipment has been tested and found to comply with the limits for a lass B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

• Reorient or relocate the receiving antenna.

- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

CE Statement of Conformity

Our product has been tested in typical configuration by Ecom Sertech Corp and was found to comply with the essential requirement of "Council Directive on the Approximation of the Laws of the Member States relating to Electromagnetic Compatibility" (89/336/EEC; 92/31/EEC; 93/68/EEC)

2 System and Network Setup

The BRB73n is a built-in 3.5G mobile router , it allows user to share the wireless network on a moving vehicle and be an alternative or backup to fixed broadband as well.

To begin with BRB73n , you must have the following minimum system requirements. If your system can't correspond to the following requirements, you might get some unknown troubles on your system.

- Internet Account for XDSL/Cable Modem/3.5G
- One Ethernet (10/100mbps) network interface card or wireless dongle
- TCP/IP and at least one web browser software installed (E.g.: Internet Explorer、Firefox、Safari、Chrome latest version)
- 802.11b、g、n wireless adapter for wireless mobile cliens
- Recommended OS: WinXP, Visata or Win7 / Linux

2.1 Build Network Connection

Administrator can manage the settings for WAN, LAN, Wireless Network, NTP, password, VPN, Firewall, etc.

Please confirm the network environment or the purpose before setting this product.

2.2 Connecting BRB73n

- Prepare the followings before the connection:
- PC or Notebook for setup
- Wireless connection (Ethernet port default is for internet)
- Make sure you are under "Router Mode".
- Turn on your Computer.
- Connect BRB73n to xDSL/ Cable modem with the Ethernet cable, or put in 3.5G SIM card
- After your computer obtained an IP address from wireless router, please start your web browser, and input the IP address of the wireless router (192.168.1.1) in address bar, and the following message should be shown. Default account and password are "admin"

🌪 English	•	
💄 User Name		(default:admin)
 Password 		(default:admin)
Login	Change Password	

- Users can set or change user name and password used for accessing the web management interface in this section.
- Input User Name and New Password, then input Confirm Password again.

(default:admin)
(default:admin)

3 Function introduction

Open a Web browser, and enter <u>http://192.168.1.1</u> (Default Gateway)

Local IP Address Protocol Public Port Range Private Port Range Select

ltem	Description
Enable Port	Select to enable Port Forwarding service or not.
Forwarding	
Address	Specify the IP address which receives the incoming
	packets.
Protocol	Select the protocol type.
Public Port Range	Enter the port number, for example 80-80.
Private Port Range	Enter the port number, for example 20-22.
Current Port	It will display all port forwarding regulation you
Forwarding	made.
Table	
Delete Selected &	Click Delete Selected will delete the selected item. Click
Delete All	Delete All will delete all items in this table.

Please find the following figure to know that what the virtual server is. The web server is located on 192.168.1.100, forwarding port is 80, and type is TCP+UDP.

3.11.2 DMZ

The DMZ feature allows one local user to be exposed to the Internet for specialpurpose applications like Internet gaming or videoconferencing. When enabled, this feature opens all ports to a single station and hence renders that system exposed to intrusion from outside. The port forwarding feature is more secure because it only opens the ports required by that application.

DMZ

4.2.2 LAN

් Refresh

Save Save

Use this page to set up the local IP address and subnet mask for your router. Please select LAN Interface Setup under the IP Config menu and follow the instructions below to enter the LAN setting page to configure the settings you want.

LAN Interface Setup

IP Address:	192.168.1.1		
Subnet Mask:	255.255.255.0		
Gateway:	0.0.0		
DHCP:	Server V		
DHCP Client Range:	192.168.1.100	- 192.168.1.200	Show Client
DHCP Lease Time:	480	(1 - 10080 mir	nutes)
Static DHCP:	Set Static DHC	P	
Domain Name:	Sapido_Router		
802.1d Spanning Tree:	Disabled 🗸		
Clone MAC Address:	000000000000		

Apply

Item	Description
IP Address	The default value of LAN IP address is 192.168.1.1 for
	this router.
Subnet Mask	Input Subnet Mask, normally it is 255.255.255.0.
Gateway	Input ISP Default Gateway Address. If you don't know,
	please check with your ISP.
DHCP	Enable or disable DHCP services. The DHCP server
	will automatically allocate an unused IP address from
	the IP address pool to the requesting computer if
	enabled.
DHCP Client Range	Define the DHCP client range and then the DHCP
	server will assign an IP to the requesting computer
	from this range. The Show Client will display every
	assigned IP address, MAC address, and expired time.
	The default range is 192.168.1.100 - 192.168.1.200.
DHCP Lease Time	IP avaliable time
Static DHCP	Please refer IP Binding
Domain Name	The name of device
802.1d Spanning Tree	IEEE 802.1d Spanning Tree Protocol (STP) is a link
	layer network protocol that ensures a loop-free
	topology for any bridged LAN. The main purpose of
	STP is to ensure that you do not create loops when you
	have redundant paths in your network. Loops are

	deadly to a network.
Clone MAC Address	Copy the MAC address from the device you had registered to your ISP if your ISP asks for the specific MAC Address.

4.2.3 DDNS

You can assign a fixed host and domain name to a dynamic Internet IP address. Each time the router boots up, it will re-register its domain-name-to-IP-address mapping with the DDNS service provider. This is the way Internet users can access the router through a domain name instead of its IP address.

Note: make sure that you have registered with a DDNS service provider before enabling this feature.

Dynamic DNS

Enable DDNS	
Service Provider :	0 dyndns 🗸
Domain Name :	host.dyndns.org
User Name/Email :	
Password/Key :	
Note: For TZO, you can have a 30 <u>panel</u> For DynDNS, you can create	days free trial <u>here o</u> r manage your TZO account in <u>control</u> e your DynDNS account
ື Refresh 🔲 Save	Apply

Please enter Domain Name, User Name/Email, and Password/Key. After entering, click on Apply Changes to save the setting, or you may click on Reset to clear all the input data.

Item	Description	
Enable/Disable DDNS	Select enable to use DDNS function. Each time your IP	
	address to WAN is changed, and the information will be	
	updated to DDNS service provider automatically.	
Service Provider	Choose correct Service Provider from drop-down list,	
	here including DynDNS, TZO, ChangeIP, Eurodns, OVH,	
	NO-IP, ODS, Regfish embedded in BRB73n.	
User Name/Email	User name is used as an identity to login Dynamic-DNS	
	service.	
Password/Key	Password is applied to login Dynamic-DNS service.	
Save & Apply	Click on "Save" to save the setting data. The "Apply"	
	button can execute current configuration

Item	Description	
Disable Wireless	Turn off the wireless service.	
Band	Select the frequency. It has 6 options: 2.4 GHz	
	(B/G/N/B+G/G+N/B+G+N).	
Mode	Select the mode. It has 3 modes to select: (AP, Client, WDS, AP+WDS).	
	Multiple AP: Please check Section 4.1.2.1.	
	* In Wi-Fi AP mode only support Client mode.	
Network Type	 Infrastructure : one of the two methods for connecting to wireless networks with Wi-Fi enabled devices such as laptops, Pda's I-phone etc. These devices are connected to wireless network with the help of Access point (AP). Wireless Access Points are usually routers or switches which are connected to internet by Ethernet port. Ad hoc : By using ad hoc mode, devices are capable for communicating directly with each other. No Access point (routers / switches) is required for communication between devices 	

	and all devices in the range connect in peer to	
	peer communication mode.	
SSID		
3310	Service Set identifier, users can define to any or keep	
	as default.	
Channel Width	Please select the channel width, it has 3 options:	
	20MHz / 40MHz / Auto	
Control Sideband	Enable this function will control your router use lower or	
	upper channel.	
Channel Number	Please select the channel; it has Auto, 1, 2~11 or 13	
	options.	
Broadband SSID	User may choose to enable Broadcast SSID or not.	
WMM	Enable / Disable Wi-Fi Multimedia	
Data Rate	Please select the data transmission rate.	
Associate Clients	Check the AP connectors and the Wireless connecting	
	status.	
Enable MAC Clone	Clone the MAC address for ISP to identify.	
(Single Ethernet Client)		
Enable Universal	Allow to equip with the wireless way conjunction upper	
Repeater Mode (Acting	level, provide the bottom layer user link in wireless and	
as AP and Client	wired way in the meantime.	
simultaneously)	(The IP that bottom layer obtains is from upper level.)	
	Please also check Section 4.1.2.2	
SSID of Extended	While linking the upper level device in wireless way,	
Interface	you can set SSID to give the bottom layer user search.	
Multiple AP	BRB73n can register up to 4 SSIDs (wireless LAN	
	group). It can be used as if there are multiple wireless	
	LAN access points with one product. Each SSID could	
	be set with different data rate, WMM and access type	
Save & Apply	Click on "Save" to save the setting data. The "Apply"	
	button can execute current configuration	

4.4.2 Advanced Settings

Wireless Advanced Settings

(i) Help

Fragment Threshold:	2346	(256-2346)
RTS Threshold:	2347	(0-2347)
Beacon Interval:	100	(20-1024 ms)

20/40MHz Coexist:	Enabled	Disabled
RF Output Power:	• 100%	70% 50% 35% 15%

් Refresh

Save

Apply

Item	Description
Fragment Threshold	To identify the maxima length of packet, the over length packet will be fragmentized. The allowed range is 256-2346, and default length is 2346.
RTS Threshold	This value should remain at its default setting of 2347. The range is 0~2347. Should you encounter inconsistent data flow, only minor modifications are recommended. If a network packet is smaller than the present RTS threshold size, the RTS/CTS mechanism will not be enabled. The router sends Request to Send (RTS) frames to a particular receiving station and negotiates the sending of a data frame. After receiving an RTS, the wireless station responds with a Clear to Send (CTS) frame to acknowledge the right to begin transmission. Fill the range from 0 to 2347 into this blank.
Beacon Interval	Beacons are packets sent by an access point to synchronize a wireless network. Specify a beacon interval value. The allowed setting range is 20-1024 ms
Preamble Type	PLCP is Physical layer convergence protocol and PPDU is PLCP protocol data unit during transmission, the PSDU shall be appended to a PLCP preamble and header to create the PPDU. It has 2 options: Long Preamble and Short Preamble.
IAPP	Inter-Access Point Protocol is a recommendation that describes an optional extension to IEEE 802.11 that provides wireless access-point communications among multivendor systems.
Protection	Please select to enable wireless protection or not.
Aggregation	Enable this function will combine several packets to one and transmit it. It can reduce the problem when mass

	packets are transmitting.
Short GI	Users can get better wireless transmission efficiency
	when they enable this function.
WLAN Partition	Shut down the communication between the connected wireless LAN devices. If you set up as "Enabled", devices connected
	with the router, such as a printer, will not be able to use.
	Default Setting: "Disabled"
20/40MHz Coexist	Configure 20/40MHz coexisting scheme. If you set up as "Enabled", "20MHz" and "40MHz" will coexist. Normally use as "Disabled". Default Setting: "Disabled"
RF Output Power	Users can adjust RF output power to get the best wireless network environment. Users can choose from 100%, 70%, 50%, 35%, and 15%.

4.4.3 Security

Here users define the security type and level of the wireless network. Selecting different methods provides different levels of security. Please note that using any encryption may cause a significant degradation of data throughput on the wireless link. There are five Encryption types supported: "None", "WEP", "WPA", "WPA2", and "WPA-Mixed". Enabling WEP can protect your data from eavesdroppers. If you do not need this feature, select "None" to skip the following setting

Wireless Security

①Help

Select SSID:	Root AP - Sapido_Router 🗸
Encryption:	WPA-Mixed V
Authentication Mode: WPA Cipher Suite: WPA2 Cipher Suite:	 Enterprise (RADIUS) Personal (Pre-Shared K TKIP AES TKIP AES
Pre-Shared Key Format:	Passphrase V
Pre-Shared Key:	
ວ Refresh 🛛 🗟 Save	Apply

ltem	Description
WEP	WEP is the most general encryption scheme among wireless LAN security, configure the common encrypted key (WEP Key) for access point and wireless LAN handset. WEP key length are "64bit", "128bit", and "256bit" (This product corresponds up to 128bit), larger the value is, more the character can be set, and encryption strength will enhanced.
	 * If you configure the encryption key as "5 letters in half-width alphabets and numbers" or "Hexadecimal in 10 digits", please select "64-bit". * If you configure the encryption key as "13 letters in half-width alphabets and numbers" or "Hexadecimal in 26 digits", please select "128- bit".
WPA / WPA2	WPA/WPA2 is wireless LAN security standard which is strengthen over WEP. On WPA- PSK/WPA2-PSK, uses encrypted key called pre- shared key, and set up common encryption key for access point and wireless LAN handset like WEP. There are "AES" and "TKIP" as encryption scheme. "TKIP" automatically updates the key at regular intervals, check and approve the communication, so it can communicate safer than WEP key which uses single encryption key for

	long time. "AES" is harder to decode comparing to "TKIP", so it can say tougher encryption scheme than "TKIP"			
WPA-Mixed	Support WPA and WPA2 at the same time			
802.1x Authentication	For radius server authentication			
Radius				
Personal (Pre-Shared	* If you configure Pre-Shared Key as			
Key)	"Hexadecimal in 64 digits", please select "Hex			
	(64 characters) ".			
	* If you configure encryption key in "8 to 63			
	letters in half-width alphabets and numbers",			
	please select "Passphrase			

4.4.4 Access Control

Please refer <u>Wireless Access Control</u>

4.4.5 WPS

This page allows user to change the setting for WPS (Wi-Fi Protected Setup). Using this feature could let your wireless client atomically synchronize it's setting and connect to the Access Point in a minute without any hassle. SAPIDO BRB73n could support both Self-PIN or PBC modes, or use the WPS button (at real panel) to easy enable the WPS function.

PIN model, in which a PIN has to be taken either from a sticker label or from the web interface of the WPS device. This PIN will then be entered in the AP or client WPS device to connect.

PBC model, in which the user simply has to push a button, either an actual or a virtual one, on both WPS devices to connect.

BRB73n WPS only support no encryption and WPA2

Please follow instructions below to enable the WPS function.

Setup Wireless LAN with WPS PIN :

• Get the WPS PIN number from wireless card and write it down.

• Click PIN from Adapter Utility to complete the WPS process with the wireless router.

- Wireless dongle should connect to BRB73n
- Start PBC:
 - Press the BRB73n WPS button and wait for WPS LED blinking
 - Press the dongle WPS button
 - Wireless dongle should connect to BRB73n

4.4.6 WDS

When selected in the Basic Settings page and enabled here, Wireless Distribution System (WDS) enables the router to be used as a wireless bridge. Two Wireless-N Routers in bridge mode can communicate with each other through their wireless interfaces. To accomplish this, all wireless routers should be set to the same channel and the MAC address of other AP / Routers should be entered in the table.

The WDS explanation is as the following picture

Router A :

a Set the connection mode to "AP+WDS" from "Wireless Basic Setting", and then select the channel number (in this example is "11"). Click Apply Changes to save the setting.

Disable Wireless Band: 2.4 GHz (B+G+N) 💌 Mode: AP+WDS 💌 Network Type: Infrastructure 💌 SSID: Sapido_Router 40MHz 💌 Channel Width: Control Sideband: Upper 💌 11 Channel Number: -

Тад	Add VLAN tag to packet			
VID	Set VLAN ID (1~4096)			
Priority	It indicates the frame priority level. Values are from 0 (best effort) to 7 (highest); 1 represents the lowest priority			
CIF	Enable or Disable CIF			

4.8 System Management

This section including Wake on LAN, Change Username/Password, Upgrade Firmware, Profiles Save, Remote Management, Time Zone, UPnP, Route Setup, VPN Passthrough, and Wan Type Auto Detection. It is easy and helpful for users making more detailed settings

4.8.1 Wake on LAN

Switch your computer ON through your LAN or the Internet . To support WOL you must have a computer with Motherboard that supports WOL, as well as a Network Controller (NIC) supporting this function. Most of the newer Motherboard (circa 2002 and On), have an On Board NIC that supports WOL. Otherwise you need to install a PCI NIC that is WOL capable.

(i) Help

Wake on Lan Schedule

Enable Wake on LAN Schedule Active Now Enable Time MAC Address Day × Sun \checkmark 00 🗸 : 00 🗸 V Sun V 00 🗸 : 00 🗸 V 00 🗸 : 00 🗸 Sun \sim V Sun \sim 00 🗸 : 00 🗸 00000000000000

4.8.2 Change Password

Users can set or change user name and password used for accessing the web management interface in this section.

Change Password

User Name:			ədmin
New Password:			•••••
Confirmed Password:		•••••	
Refresh Save Apply			

Input User Name and New Password, then input Confirm Password again.

4.8.3 Firmware Upgrade

Please refer Firmware Upgrade

4.8.4 Profiles Save

Users can create a backup file that contains current router settings. This backup file can be used to restore router settings. This is especially useful in the event you need to reset the router to its default settings.

Save/Reload Settings

Save Settings to File:	Save
Load Settings from File:	瀏覽
Upload	

4.8.5 Remote Management

This page allows you to access the GUI on WAN

Remote manager

HTTP Conn	ection Po	ort: 80	
Enable Web Server Access on WAN:		Enable	•
Refresh	Save	Apply	

Item	Description	
HTTP Connection Port	Users can access GUI by this port, default is 80	
Enable Web Server	Allow user access GUI from WAN side	
Access on WAN		

4.8.6 Time Zone

Users can select time zone and synchronize the local clock on the router.

Time Zone Setting

Time Zone Select : (GMT+08:00)Taipei	~
Enable NTP client update	
Automatically Adjust Daylight Saving	
NTP server : 220.130.158.71 - Taiwan	✓
(Manual IP	Setting)
© Refresh	

4.8.7 UpnP

Universal Plug and Play (UPnP) is a standard of networking protocols promulgated by the UPnP Forum. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components. BR070N supports UPnP function, and can cooperate with other UPnP devices. When you activate UPnP, please click My Network Places. Users will see an Internet Gateway Device icon. By click the icon, users can enter the GUI of the router. If you do not wish to use UPnP, you can disable it.

UPnP Setting

4.8.8 Router Setup

Dynamic routing is a distance-vector routing protocol, which employs the hop count as a routing metric. RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops allowed for RIP is 15

Static routing is a data communication concept describing one way of configuring path selection of routers in computer networks. It is the type of routing characterized by the absence of communication between routers regarding the current topology of the network. This is achieved by manually adding routes to the

router routing table.

Item	Description	
Enable Dynamic Route	Enable or Disable dynamic route	
NAT	Enable or Disable NAT function	
Transmit	There are 3 options :	
	1. Disable : do not send any RIP packet out	
	2. Send RIP1 packet out	
	3. Send RIP2 packet out	
Receive	There are 3 options :	
	4. Disable : do not receive any RIP packet	
	5. Only receive RIP1 packet	
	6. Only receive RIP2 packet	
Enable Static Route	Enable or Disable dynamic route	
IP Address	Destination IP address	
Subnet Mask	Destination IP subnet mask	
Gateway	Gateway IP address for destination	
Metric	Metric number on router's routing table	
Interface	Static route rule for LAN or WAN interface

4.8.9 VPN Passthrough

Virtual Private Networking (VPN) is typically used for work-related networking. For VPN tunnels, the router supports IPSec, Pass-through, PPTP Pass-through, and L2TP Pass-through.

VPN Passthrough Setting

Enable/Disable IPSec Passthrough:	Enabled Disabled
Enable/Disable PPTP Passthrough:	Enabled Disabled
Enable/Disable L2TP Passthrough:	Enabled Disabled
Enable/Disable IPV6 Passthrough:	Enabled Disabled

Apply

ා Refresh

Save Save

Item	Description
IPSec Pass-through	Internet Protocol Security (IPSec) is a suite of protocols
	used to
	implement secure exchange of packets at the IP layer.
	To allow
	IPSec tunnels to pass through the router, IPSec Pass-
	through is
	enabled by default. To disable IPSec Pass-through,
	select Disable
PPTP Pass-through	Point-to-Point Tunneling Protocol is the method used to
	enable
	VPN sessions to a Windows NT 4.0 or 2000 server. To
	allow PPTP
	tunnels to pass through the router, PPTP Pass-through
	is enabled
	by default. To disable PPTP Pass-through, select
	Disable.
L2TP Pass-through	To allow the L2TP network traffic to be forwarded to its
	destination
	without the network address translation tasks.
IPV6 Pass-through	Allow IPV6 packet to be forwarded to its destination
	without the network address translation tasks.

5 Q&A

5.1 Installation

- Where is the XDSL Router installed on the network? A:In a typical environment, the Router is installed between the XDSL line and the LAN. Plug the XDSL Router into the XDSL line on the wall and Ethernet port on the Hub (switch or computer).
- Why does the throughput seem slow?

A: To achieve maximum throughput, verify that your cable doesn't exceed 100 meter. If you have to do so, we advise you to purchase a bridge to place it in the middle of the route in order to keep the quality of transmitting signal. Out of this condition you would better test something else.

- Verify network traffic does not exceed 37% of bandwidth.
- Check to see that the network does not exceed 10 broadcast messages per second.
- Verify network topology and configuration.

5.2 LED

- Why doesn't BRB73n power up? A:Check if the output voltage is suitable, or check if the power supply is out of order.
- The Internet browser still cannot find or connect to BRB73n after verifying the IP address and LAN cable, the changes cannot be made, or password is lost. A:In case BRB73n is inaccessible; you can try to restore its factory default settings. Please press the "Reset" button and keep it pressed for over 7 seconds and the light of STATUS will vanish. The LEDs will flash again when reset is successful.
- Why does BRB73n shut down unexpectedly? A:Re-plug your power adapter. Then, check the STATUS indicator; if it is off, the internal flash memory is damaged. For more help, please contact with your provider.

5.3 Installation

- What is the default IP address of the router for LAN port? A:The default IP address is 192.168.1.1 with subnet mask 255.255.255.0
- I don't know my WAN IP.
 A:There are two ways to know.
 Way 1:Check with your Internet Service Provider.
 Way 2:Check the setting screen of BRB73n . Click on Status & Log item to select Network Configuration on the Main Menu. WAN IP is shown on the WAN interface.
- How can I check whether I have static WAN IP Address?
 A:Consult your ISP to confirm the information, or check Network Configuration in BRB73n 's Main Menu.
- Will the Router allow me to use my own public IPs and Domain, or do I have

to use the IPs provided by the Router?

A:Yes, the Router mode allows for customization of your public IPs and Domain.

5.4 OS Setting

- Why can't my computer work online after connecting to BRB73n ?

 A: It's possible that your Internet protocol (TCP/IP) was set to use the following IP address. Please do as the following steps. (Windows 2000 & XP) Start > Settings > Network and Dial-up Connections > double click on Internet Protocol(TCP/IP) > select obtain IP address automatically > Click on OK button. Then, open Internet browser for testing. If you still can't go online, please test something else below.
 - Verify network configuration by ensuring that there are no duplicate IP addresses.
 - Power down the device in question and ping the assigned IP address of the device. Ensure no other device responds to that address.
 - Check that the cables and connectors or use another LAN cable.
- Why can't I connect to the router's configuration utility? A:Possible Solution 1: Make sure that your Ethernet connect properly and securely. Make sure that you've plugged in the power cord. Possible Solution 2: Make sure that your PC is using an IP address within the range of 192.168.1.2 to 192.168.1.254. Make sure that the address of the subnet mask is 255.255.255.0. If necessary, the Default Gateway data should be at 192.168.1.1. To verify these settings, perform the following steps:

Windows 2000, or XP Users:

- Click on Windows Start > click on Run > input cmd > click on OK button.
- At the DOS prompt, type ipconfig/all.
- Check the IP Address, Subnet Mask, Default Gateway data. Is this data correct? If the data isn't correct. Please input ipconfig/release > press Enter > input ipconfig/renew > press Enter.

Possible Solution 3: Verify the connection setting of your Web browser and verify that the HTTP Proxy feature of your Web browser is disabled. Make these verifications so that your Web browser can read configuration pages inside your router. Launch your Web browser.

Internet Explorer Users:

- Click on Tools > Internet Options > Connections tab.
- Select never dial a connection, click on Apply button, and then click on OK button.
- Click on Tools and then click on Internet Options.
- Click on Connections and then click on LAN Settings.
- Make sure none of the check boxes are selected and click on OK button.
- Click on OK button.

Netscape Navigator Users:

- Click on Edit > Preferences > double-click Advanced in the Category window.
- Click on Proxies > select Direct connection to the Internet > click on OK button.
- Click on Edit again and then click on Preferences.
- Under category, double-click on Advanced and then click on Proxies.
- Select Direct connection to the Internet and click on OK button.
- Click on OK button.
- Web page hangs, corrupt downloads, or nothing but junk characters is being displayed on the screen. What do I need to do?
 A:Force your NIC to 10Mbps or half duplex mode, and turn off the "Autonegotiate" feature of your NIC as a temporary measure. (Please look at the Network Control Panel, in your Ethernet Adapter's Advanced Properties tab.)
- Why can't I connect to the Web Configuration? A:you can remove the proxy server settings in your web browser.

5.5 BRB73n Setup

- Why does BRB73n 's setup page shut down unexpectedly? A:If one of the pages appears incompletely in BRB73n 's setup pages, please click on Logout item on the Main Menu before shutting it down. Don't keep it working. Then, close Internet browser and open it again for going back to the previous page.
- I don't know how to configure DHCP. A:DHCP is commonly used in the large local network. It allows you to manage and distribute IP addresses from 2 to 254 throughout your local network via BRB73n. Without DHCP, you would have to configure each computer separately. It's very troublesome. Please Open Internet browser > Input 192.168.1.1 in the website blank field > Select DHCP Server under the IP Config Menu. For more information, please refer to Router Mode or AP Mode).
- How do I upgrade the firmware of BRB73n ?
 A:Periodically, a new Flash Code is available for BRB73n on your product supplier's website. Ideally, you should update BRB73n 's Flash Code using Firmware Upgrade on the System Management menu of BRB73n Settings.
- Why is that I can ping to outside hosts, but cannot access Internet websites? A:Check the DNS server settings on your PC. You should get the DNS servers settings from your ISP. If your PC is running a DHCP client, remove any DNS IP address setting. As the router assign the DNS settings to the DHCP-client-enabled PC.
- BRB73n couldn't save the setting after click on Apply button?
 A:BRB73n will start to run after the setting finished applying, but the setting isn't written into memory. Here we suggest if you want to make sure the setting would be written into memory, please reboot the device via Reboot under System Management directory.

5.6 Wireless LAN

 Why couldn't my wireless notebook work on-line after checking?
 A:Generally, Wireless networks can sometimes be very complicated to set up, particularly if you're dealing with encryption and products from different vendors. Any number of variables can keep your workstations from talking to each other. Let's go over some of more common ones.

For starters, verify that your router and your workstation are using the same SSID descriptions. SSID acts as a password when a mobile device tries to connect to the wireless network. The SSID also differentiates one WLAN from another, so all access points and all devices attempting to connect to a specific WLAN must use the same SSID. A workstation will not be permitted to connect to the network unless it can provide this unique identifier. This is similar to the function of your network's Workgroup or Domain name. When you're experiencing conductivity problems, it is always best to keep things simple. So next you are going to do is that, please disable any WEP encryption you might have configured.

Successful implementation of encryption also includes the use of a shared key. A HEX key is the most common, but other formats are also used. This key identifies the workstation to the router as a trusted member of this network. Different manufacturers can implement this key technology in ways that might prevent them from working correctly with another vendor's products. So pay attention to detail is going to be the key to a successful installation.

Next make sure the router and the NIC are configured to use the same communications channel. There are normally 11 of them, and the default channel can also vary from vendor to vendor. You might also want to confirm that the router has DHCP services enabled and an address pool configured. If not, the NIC won't be able to pick up an IP address. I have run across a few access points that offer DHCP services but do not assign all of the needed IP information to the NIC. As a result, I was able to connect to the network, but could not browse the web. The point is, don't assume anything. Verify for yourself that all of the required settings are being received by the workstation.

Finally, you might want to keep the system you're trying to configure in the same room as the router, at least during the initial configuration, in order to minimize potential interference from concrete walls or steel beams.

- My PC can't locate the Wireless Access Point.
 - A:Check the following:
 - Your PC is set to Infrastructure Mode. (Access Points are always in Infrastructure Mode.)
 - The SSID on your PC and the Wireless Access Point are the same. Remember that the SSID is case-sensitive. So, for example "Workgroup" does NOT match "workgroup".
 - Both your PC and the Wireless Access Point must have the same setting for WEP. The default setting for the Wireless Router is disabled, so your wireless station should also have WEP disabled.
 - If WEP is enabled on the Wireless Router, your PC must have WEP enabled, and the key must match.

- If the Wireless Router's Wireless screen is set to Allow LAN access to selected Wireless Stations only, then each of your Wireless stations must have been selected, or access will be blocked.
- To see if radio interference is causing a problem, see if connection is possible when close to the Wireless Access Point. Remember that the connection range can be as little as 100 feet in poor environments.
- Wireless connection speed is very slow.
 A: The wireless system will connect at highest possible speed, depending on the distance and the environment. To obtain the highest possible connection speed, you can experiment with following:
 - Access Point location: Try adjusting the location and orientation of the Access Point.
 - Wireless Channel: If interference is the problem, changing to another channel may show a marked improvement.
 - Radio Interference: Other devices may be causing interference. You can experiment by switching other devices off, and see if this helps. Any "noisy" devices should be shielded or relocated.
 - RF Shielding: Your environment may tend to block transmission between the wireless stations. This will mean high access speed is only possible when close to the Access Point.
- Some applications do not run properly when using the Wireless Router. A:The Wireless Router processes the data passing through it, so it is not transparent. Use the Special Application feature to allow the use of Internet applications which do not function correctly. If this does solve the problem, you can use the DMZ function. This should work with almost every application, but:
 - It is a security risk, since the firewall is disabled.
 - Only one (1) PC can use this feature.
- I can't connect to the Wireless Router to configure it.

A:Check the following:

- The Wireless Router is properly installed, LAN connections are OK, and it is powered ON.
- Make sure that your PC and the Wireless Router are on the same network segment.
- If your PC is set to "Obtain an IP Address automatically" (DHCP client), restart it.
- If your PC uses a Fixed (Static) IP address, make sure that it is using an IP Address within the range 192.168.1.129 to 192.168.1.253 and thus compatible with the Wireless Router's default IP Address of 192.168.1.254. Also, the Network Mask should be set to 255.255.255.0 to match the Wireless Router. In Windows, you can check these settings by using Control Panel ~ Network to check the Properties for the TCP/IP protocol.
- The WinXP wireless interface couldn't communicate the WEP with SAPIDO BRB73n's wireless interface.

A:The default WEP of WinXP is Authentication Open System - WEP, but the WEP of SAPIDO BRB73n is only for Shared Key - WEP, it caused both sides couldn't communicate. Please select the WEP of WinXP from Authentication Open System to Pre-shared Key - WEP, and then the WEP wireless interface between WinXP and SAPIDO BRB73n would be communicated.

5.1 Support

• What is the maximum number of IP addresses that the XDSL Router will support?

A:The Router will support to 253 IP addresses with NAT mode.

 Is the Router cross-platform compatible? A:Any platform that supports Ethernet and TCP/IP is compatible with the Router.

5.2 Others

- Why does the router dial out for PPPoE mode very often? A:Normally some of game, music or anti-virus program will send out packets that trigger the router to dial out, you can close these programs. Or you can set the idle time to 0, then control to dial out manually.
- What can I do if there is already a DHCP server in LAN? A:If there are two DHCP servers existing on the same network, it may cause conflict and generate trouble. In this situation, we suggest to disable DHCP server in router and configure your PC manually.

6 Appendices

6.1 Operating Systems

- Microsoft : Windows 2000, XP, Vista, Windows 7.
- Apple : Mac OS X 10.4.7, Leopard and the following related versions.
- Linux : Redhat 9, Fedora 6 & 7, Ubuntu 7.04 and the following related versions.

6.2 Browsers

- Internet Explorer ver. 6 and 7 and the following related versions.
- FireFox ver. 2.0.0.11 and the following related versions.3.
- Safari ver. 3.04 and the following related versions.

6.3 Communications Regulation Information

Should any consumers need to learn more information, services and supports, please contact the supplier of your product directly.
