1. Introduction

1.1 Getting Started

A Tutorial for Digitizing Images with SewArt

SewArt is software for converting digital graphics images - which may be stored either in raster (bitmap) or vector format - to a *stitch* file that can be sewn on an embroidery machine. For a list of image formats that **SewArt** can read, see [File Open](#). This process will be referred to as *embroidery digitizing* and the software for doing that (**SewArt**) is called an *auto-digitizer*.

It is advisable to familiarize yourself with the **SewArt** [workspace](#) and the associated [toolbar](#) buttons. Most of the important operations for the conversion process are accessible by clicking these buttons. The key to obtaining a high-quality embroidery file is to first create an image comprised of uniformly-colored regions. For that reason, **SewArt** has numerous image-processing tools on its toolbar to help in creating images suitable for sewing. Such images will be called *clean images*.

The steps below outline the general procedure for using **SewArt** to convert a digital image into an embroidery file. By clicking the following links in order, you can follow the step-by-step process of image conversion, starting from an image file and ending with an embroidery pattern file. When using this help in such a tutorial fashion, remember to click on the *Home* symbol at the top right of each subtopic page to return to this main page and then proceed to the next step.

Steps for converting a digital image to an embroidery file

Step 1. From the File menu, click [Open](#) (or from the Edit menu, [paste](#) from the clipboard) to *import* the graphics image to be converted. You may also draw your own graphic image on the [blank canvas](#).

Step 2. If the image is a photograph (jpg, gif) then it may be helpful to [posterize](#) it (eliminate subtle color gradations) before proceeding. Vector clipart images generally can skip this step since they already are segmented into solid-color regions.

Step 3. Click on the image processing [wizard](#) toolbar button. This will guide you through a sequence of steps designed to further reduce color numbers and blend speckles (that lead to erratic sewing) in a controllable fashion.

Step 4. Use individual graphics editing tools to process the image to make it suitable for sewing. There are three groups of image processing tools, described below:

A. Size and position tools

- [Resize](#) the image. This allows you to work with an image of the same size as the embroidery pattern size to be sewn.
- [Rotate](#) the image (by 90-degree increments) if it is more conveniently viewed in a different orientation.
- [Crop](#) the image if it has excessive white space around it. Working with a smaller image is usually easier.

B. Color reduction tools

- [Reduce](#) the number of colors in the image.
- [Merge](#) and despeckle colors individually or in specified ranges based on the amount of area in the image covered.

C. Image editing tools

SewArt

All these tools can also be used in conjunction with the [magnifier](#) to allow editing of very localized regions of the image.

- Use the [paintbrush](#) to fill (blend) small regions of isolated pixels or gaps in the image
- Use the [pencil](#) to darken lines and fill individual pixels in the image
- [Bucket fill](#) larger regions of the image to uniformly blend colors and avoid any fine-scaled (dithering) effects.

Step 5. [Save](#) the edited graphic image to a file on disk

Step 6. [Convert](#) the graphics image to stitches by clicking on the different color regions to be sewn, possibly using the auto-sew feature, and save the stitch list to an embroidery pattern file. You may edit entries in the stitch list or right-click a color stop to delete it or insert another stop before it in the list. The next region clicked will be entered at the inserted stop. SHIFT-Left-Click a stop to reposition it in the stitch list.

Step 7. Edit the embroidery file to join or reorder color blocks, or eliminate short thread runs (this can to be done with an embroidery editor, such as **SewWhat-Pro**©).

1.2 Contacting Us

If you have any questions or comments about the **SewArt** auto-digitizing application, please contact us at the following support email:

support@sandscomputing.com

1.3 FAQ

Frequently Asked Questions

How To . . .

- [Avoid Sewing the Background Color](#)
- [Change the color of a painting tool](#)
- [Change the fill pattern](#)
- [Get help if you have questions about SewArt](#)
- [Purchase SewArt](#)
- [Remove outlier points to create an image suitable to be sewn](#)
- [Resize or change the density of a design created by SewArt](#)
- [Undo a previous operation](#)
- [Use a "Blank Canvas" to draw your own images](#)

Some frequently asked questions about **SewArt** are answered below:

How can I tell if I have the latest version of Sew Art?

Go to the Help/About menu item and compare the version there with the one that is available for download on our website. You can use to *Update* button to go to our website and check there for the most recent version.

*Can I install **SewArt** on more than one computer?*

The license grants you the privilege to install on one desktop and one laptop, as long as you are the sole user of **SewArt** on all the computers.

SewArt

*How do I put a copy of **SewArt** onto a laptop that has no internet capability?*

Transfer the installer file (the file you downloaded originally) onto the laptop, using a USB or other transferable drive. Then double-click that file on the laptop and enter your registration information. Alternatively you can purchase **SewArt** on a CD.

*If my computer crashes, how do I get **SewArt** working again?*

You can download the latest version of **SewArt** from the S & S website at

<http://www.sandscomputing.com>

Just download from the **SewArt** INSTALL button there. It is a good idea to keep a copy of your registration information in a separate, safe location.

SewArt Menus

- [File menu](#)
- [Edit menu](#)
- [View menu](#)
- [Image menu](#)
- [Options menu](#)
- [Window menu](#)
- [Help menu](#)

1.4 Purchase SewArt

You may purchase **SewArt** from the Shop-Online page of the S & S website:

<http://www.sandscomputing.com>

or any of our reseller websites. Scroll down to the **SewArt** product listing and click the *Add-to-Cart* button there to purchase the license. If you want to order a CD, use the down-arrow on the Add-to-Cart button to select the CD version of the software.

To update to the latest version of the software, use the *INSTALL* link (to the right of the Add-to-Cart button) for either the 32 and 64-bit version of the product (depending on your Operating System).

There is a 30 day DEMO period during which you may use the software (with no restrictions). After that, you can either uninstall the software or purchase a license (*Add-to-Cart*). After purchasing the license, the registration information will be emailed to you and you can register the DEMO to make it a licensed copy. You DO NOT have to uninstall the DEMO if you want to keep the software, but only register it after receiving the license information.

2. Menus

2.1 File menu

The File menu offers the following commands:

New	Creates a new blank sewing pattern file.
Open	Opens an existing sewing pattern file.
Close	Closes the presently active pattern file.
Save	Saves an opened image file, using the same file name.
Save As	Saves an opened image file to a specified file name.
Print Patterns	Prints a catalog of all the patterns available with pattern numbers and names
Exit	Exits the SewArt application.

2.2 Edit menu

The Edit menu offers the following commands:

Undo	Reverses (undo) previous editing operation.
Cut	Cuts (deletes) part of image in selection rectangle
Copy	Copies (for drag/drop operation) part of image in selection rectangle
Paste	Pastes an image from the Windows clipboard into the SewArt workspace.

2.3 View menu

The View menu offers the following commands:

Toolbar	Shows or hides the main toolbar.
Resize Toolbar Icons	Increases (or reduce) the size of the icons on the main toolbar
Grid	Shows a grid for accurate positioning of the image

2.4 Tools menu

The Tools menu offers the following image-manipulation commands:

Rotate	Rotate image in 90-degree increments
Reflect	Reflect (mirror) image left to right
Crop	Remove unwanted areas of an image for easier editing.
Resize	Resize image to width of desired embroidery pattern
Posterize	Posterize (cartoonize) an image
Wizard	Starts image-processing wizard
Reduce Colors	Reduce number of distinct colors in image
Merge Colors	Merge and despeckle individual colors (or range of colors) in the image
Paint Brush	Blends existing colors
Pencil	Fills in single pixels or lines
Fill Region	Fills in a large region with a uniform color
Eraser	Erases parts of the image

Shapes	Add various shapes to canvas or image
Convert to Redwork	Converts the graphics image to redwork pattern
Convert to Stitches	Converts the graphics image to an embroidery pattern file
PAS Editor	Creates and edits Programmable Stitch (PAS) files

2.5 Options menu

The Options menu offers the following commands for setting project options:

Grid	Choose grid spacing, line thickness and color
Units	Choose to use metric or Imperial units of length
Parity	Choose between left- and right-handed tool icons
Canvas	Select Default Width and Height for Blank Canvas
Language Support	Select the language for this SewArt session

2.6 Window menu

The Window menu offers the following commands, which enable you to arrange multiple views of multiple documents in the application window:

New	Creates a new window that views the same document.
Cascade	Arranges windows in an overlapped fashion.
Tile	Arranges windows in non-overlapped tiles.
All Windows.	Open specified window.

2.7 Help menu

The Help menu offers the following commands, which provide assistance for using **SewArt**:

Help topics	Provides you an index to topics on which you can get help.
Auto Update	Allow (if checked) or prevent automatic daily checking for updates
Update Now	Checks the website for available updates and updates automatically
About SewArt	Displays program information, version number and copyright
Change (History) Log	Change log

3. File commands

3.1 New

SewArt

Use this command to create a new document workspace for opening a new [blank canvas](#). You can open an existing image with the [Open command](#).

Shortcuts

Toolbar:

Keys:

CTRL+N

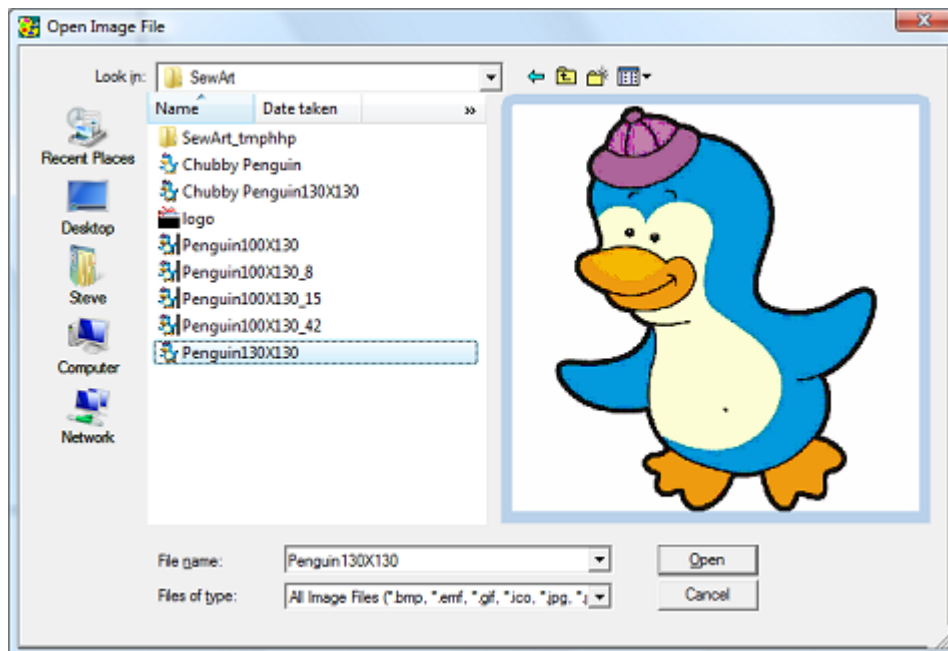

3.2 Open

Use this command to open an existing graphic file in a new window. You can open multiple files at once, and each will occupy a separate window. Use the Window menu to switch among the multiple open images.

SewArt will allow you to open several raster file types (*.bmp, *.png, *.jpg, *.gif, *.tif) as well as vector formats (*.emf, *.wmf). When you use this command, **SewArt** displays a file open dialog so you can select the pattern file(s) to open.

Alternatively, you can open an existing document by selecting it from the most recently used (MRU) file list in the File menu, if it was recently opened.

The figure below shows a preview of the image file *Penguin130X130.png*. (This image is used for the tutorial with permission from [Clipartpolis](#). It is available for use with this tutorial in the *Samples* folder of the **SewArt** installation folder. It is advisable to copy this file to another folder before you begin using it for this tutorial.) The image is surrounded by a *bounding rectangle* which shows the editable region of the image. We have chosen a (*raster*) PNG file because it illustrates many of the necessary image reduction features that **SewArt** can apply. Beginning users might consider using simpler *vector* graphics files that are available for free download - and without copyright restrictions - from several websites. They will require less image manipulation to produce a suitable image for sewing.

SewArt

If you have graphics files in formats that are not currently supported by **SewArt**, you can import them into **SewArt** by using the Edit menu [paste](#) command.

You can create a new blank workspace "canvas" with the [File New command](#).

Shortcuts

Toolbar:
Keys:

CTRL+O

3.3 Close

Use this command to close all windows containing the active document. **SewArt** suggests that you save changes to your document before you close it. If you close a document without saving, you lose all changes made since the last time you saved it. Before closing an untitled document, **SewArt** displays the file save-as dialog and suggests that you name and save the document.

Shortcuts

You can also close a document by using the Close icon on the document's window (upper right of the workspace screen), as shown below:

Keys: CTRL+F4 closes a document window
ALT+F4 closes the **SewArt** window or dialog box

3.4 Save

Use this command to save both image files and stitch files. Which one gets saved depends on the active mode of operation of **SewArt** at the time the Save command is issued.

1. For any **SewArt** mode *except* the stitching mode, Save will write the edited image to either a compressed image (png) file or a Windows bitmap (*.bmp) file. When you save a document for the first time, **SewArt** displays the [File Save As](#) dialog so you can name your image file and select the type to save to.
2. When **SewArt** is in *Stitch Mode*, Save will write the stitches you have created to an embroidery pattern file. You may choose from one of three popular file formats Brother® (*.pes), Janome® (*.jef) or Singer® (*.xxx): (This can be converted later in an embroidery file editor to whatever convenient format you need.) Along with this embroidery file, a file containing the stitch list information will also be saved with the extension *.saf. When you reopen the image file at some later time, the previous stitch listed can be loaded, too. The first time that Save is used from *Stitch Mode*, **SewArt** will display a special form of the [File Save As](#) dialog to allow you to choose the name for the pattern file and select its format and its size (if it should be different from the image size).

Shortcuts

SewArt

Toolbar:
Keys:

CTRL+S

3.5 Save As

In **SewArt**, the Save As command performs a dual role, depending on the active *mode* at the time the command is issued.

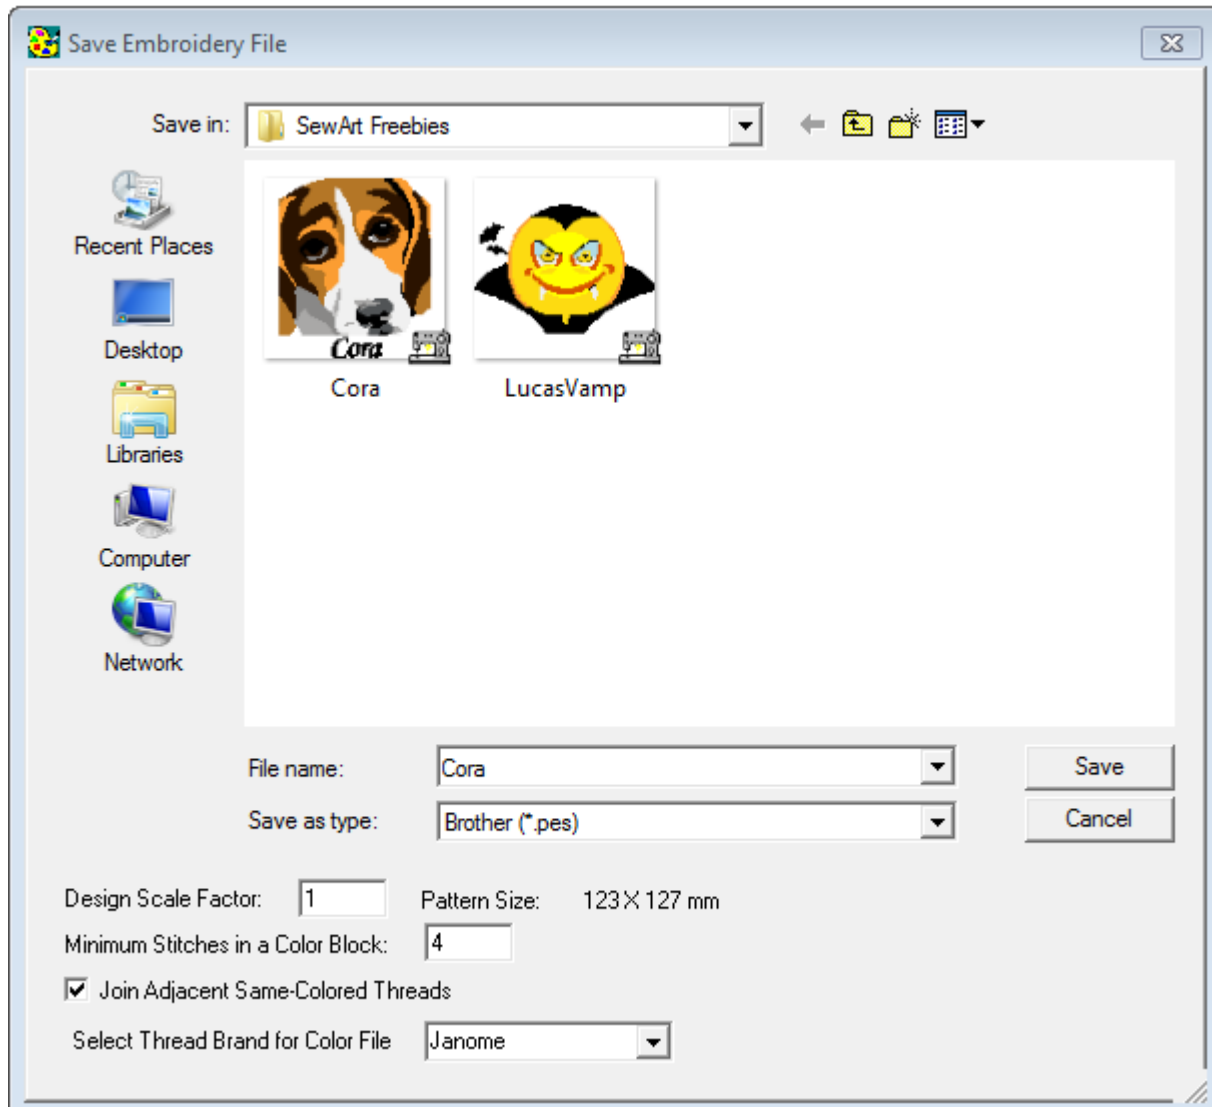

1. When **SewArt** is in any mode *except* for the *Stitch Mode*, use this command to save and name the image as either a compressed image file (*.png), Tagged Information File (*.tif), or a Windows bitmap (*.bmp) file. Best results (in terms of preserving color content and minimizing file size) is usually obtained saving to TIF format. **SewArt** displays the standard file save-as dialog box so you can name your image file and select its file type. It is **strongly** recommended to save using the *.png (portable network graphics©) format, which compresses the file by as much a 100 times, compared to the *.bmp bitmap format.

2. When **SewArt** is in *Stitch Mode*, use this command to save and name the stitch pattern file (see the dialog below). Both the File name and its type (*.pes, *.jef, or *.xxx) can be set here. In addition there are two further options that effect how the pattern file is saved:

- **Design Scale Factor** for scaling the pattern file relative to the image file. The pattern size will be displayed next to the box where you enter this numerical factor. A value larger than 1.0 will create a pattern file larger than the image file, and vice versa.
- **Minimum Stitches in a Color Block** that **SewArt** will stitch out to the pattern file. The default is 4. Color blocks in the pattern with fewer than this number of stitches will not be sewn.
- **Join Adjacent Same-Colored Threads** can be checked (the default) or unchecked. When checked, same-colored threads (blocks) in the image thread list will be automatically joined when they are written out to the pattern file. This is desirable to limit the number of thread stops in the embroidery file.
- **Select Thread Brand for Color File:** use this combo drop-down box to select the thread manufacturer use to write out the color text file associated with the saved embroidery file.

SewArt

To save an image or a pattern file with its existing name and directory, use the [Save command](#).

Shortcuts

Toolbar:

3.6 Print Patterns

Use this command to print a catalog of the various patterns available for fill stitches in **SewArt**.

3.7 Exit

Use this command to end your **SewArt** session. You can also use the Close command on the application Control menu. **SewArt** prompts you to save documents with unsaved changes.

SewArt

Shortcuts

Mouse: Click the application's Exit (close **SewArt**) menu button.

Keys: ALT+F4

4. Edit commands

4.1 Undo

Use this command to reverse the last editing action, if possible. **Important:** The Undo command is dimmed on the menu or toolbar (it is unavailable) if there are no actions to reverse or if you are in Stitch Mode. In **SewArt**, the following operations may be undone (the last several - usually up to 10 - operations can be reversed this way):

Undo Operation	Effect of Undo
Cut	Restores the delete part of the image
Copy	Removes the copied image area
Rotate	Rotate image by -90 degrees
Resize	Restore image to previous size
Reduce Colors	Restore previous number of colors
Merge Colors	Restore color state prior to merge
Paint Brush	Erase last paint operation
Pencil	Erase last pencil click (or line drag)
Bucket Fill	Erase last filling operation

Shortcuts

Toolbar:

Keys: CTRL+Z

4.2 Cut

Use this command to delete the part of the image inside the selection rectangle. This command is unavailable (dimmed out) if a selection rectangle has not been dragged out in the workspace.

This command deletes part of the image. For example, if your image is a two-eyed, two-horned flying purple people eater and you want a one-eyed, one-horned one, select one of the eyes (and one of the horns) by dragging your mouse over those items (with the left button down). Release the mouse button and click this menu item to delete the selected part of the image.

SewArt

The deleted part(s) of the image is placed on the clipboard so you can [Paste](#) it back and move it somewhere else if you wish.

Shortcuts

Toolbar:

Keys:

CTRL+X

4.3 Copy

Use this command to copy a part of the image for a subsequent [Paste](#) operation. This command is unavailable (dimmed out) if a selection rectangle has not been dragged out in the workspace.

This command copies the selected part of an image for later duplication. To select a portion of the image, hold down the left-mouse button and drag out a *selection rectangle* around it. Then press the Copy toolbar button (or Ctrl+C shortcut key) to copy the selection to the Clipboard. After copying, you can paste and move the duplicated part of the image to another location in the **SewArt** workspace.

Helpful Note: You can drag the selected part of the image even *without* copying it to the clipboard. This is an easy way to duplicate an image and saves the steps of copying and pasting. If you find you no longer need the copy, just press the *Delete* key to remove it while it is still selected. Copying to the clipboard is a more general operation, in that the image you copy will be available for use in other **SewArt** image files, too (not just the current workspace).

Shortcuts

Toolbar:

Keys:

CTRL+C

4.4 Paste

Use this command to insert a graphic of an image that was *copied* to the clipboard from either another application (like MS® Paint) or from the **SewArt** workspace. This command is unavailable (dimmed out) if the clipboard is empty.

This command may be used to copy (or merge) an image from a file type that is not supported by **SewArt** into an empty or existing workspace. Parts of the image that have been [Cut](#) or [Copied](#) can be pasted as well. Pasted objects appear in the upper right corner of the workspace, and appear with a *selection* rectangle around them. To move them, you **must** click *inside* the selection rectangle and move the pasted object to the desired location.

Shortcuts

Toolbar:

Keys:

CTRL+V, SHIFT+INS

SewArt

5. View commands

5.1 Toolbar

Use this command to display and hide the main , which includes buttons for some of the most common commands in **SewArt**, such as File Open. A check mark appears next to the menu item when the [Toolbar](#) is displayed. It is checked by default.

5.2 Resize Toolbar icons

Use this menu item to toggle the size of the icons on the main toolbar.

5.3 Grid

When checked, this command displays a grid on top of the image.

In the tutorial figure below, the penguin image is shown with the grid option checked and the [grid spacing](#) set to 5 mm. The presence of the grid is useful for editing individual pixels or regions of an image with the [Paint Brush](#) or [Pencil](#) tools, and for drawing lines to fill-in borders and boundaries.

The grid is drawn on top of the image on the screen and will not be sewn.

6. Tools commands

6.1 Crop

Use this toolbar command to crop (remove) parts of the image or to expand the image space to paste additional components from the clipboard. For example, if there is excessive white space around the image that is not to be sewn, it can be cropped with this tool.

After clicking this toolbar button, a moveable and resizable cropping-rectangle will appear surrounding the image. (See figure below.) Drag the corner or side handles to resize the rectangle, and click the rectangle and drag to move it to the desired position. When the part of the image you wish to retain appears inside the cropping rectangle, press the *End Crop* button in the Crop Mode pane to perform the cropping operation on the image and return to normal editing mode. If the cropped image is *not* what you wanted, press *Ctrl-Z* (or click the Edit/Undo menu item) to reverse the cropping operation.

The tutorial example in the figure below shows the cropping rectangle (grayed out line) around the original image. The width of the cropping rectangle has been reduced to fit tightly around the image. When the *OK* button is clicked, it will eliminate the white space outside the image (the region that appears to be behind a translucent "screen" to indicate it will be cut out).

At this point, it is advisable to [Save](#) the edited image file. Since cropping has reduced the image width from 130 to 110 mm, we save it to a compressed image file called *Penguin110X130.png*.

SewArt

If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

Shortcuts

Toolbar:

6.2 Rotate

Use this toolbar command to rotate the image in 90-degree increments for easier viewing. If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

Shortcuts

Toolbar:

6.3 Reflect

Use this toolbar command to reflect the image about a vertical line (left to right). If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

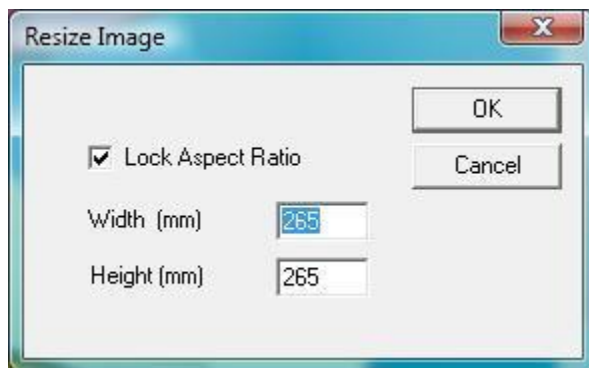

Shortcuts

Toolbar:

6.4 Resize

Use this toolbar command to open a dialog (shown below) for resizing the image. This is a useful option if you want to work in **SewArt** with an image of comparable size to the final stitched pattern.

SewArt

The present size of the image will appear initially in the Width (265 mm for this example) and Height (265 mm) boxes. Edit these by entering the desired sizes for the image (in mm). If the *Lock Aspect Ratio* option is checked, then you only need to edit one or the other of these items and the other will be updated to keep the original height-to-width ratio (the aspect ratio of the image).

If you wish to return to the previous size, press *Ctrl-Z* to *Undo* this operation.

If you are using this help as a tutorial, click on the Home button (upper right) to return to the main tutorial page.

Shortcuts

Toolbar:

6.5 Posterize

Use this toolbar command (or menu item) to *posterize* (or *cartoonize*) an image. **Posterization** of an image occurs when a region of an image with a continuous gradation of color tone is replaced with several regions of fewer tones, resulting in abrupt changes from one tone to another. This generally reduces the number of distinct colors and speckles in an image. (This is in contrast to [color reduction](#) quantization alone, which preserves many fine-scale features of an image.) Posterization produces broad solid color areas of an image which are ideally suited for stitching.

Posterize Mode opens a set of three slider control that can be independently adjusted to control the degree of despeckling, contour smoothing, and posterization applied to the image. See Fig. 1, which shows the **SewArt** workspace in Posterize Mode. The sliders can be dragged from 0 (no effect) towards 1 (maximum effect) to see the impact on the image. The optimal levels are image-dependent and depend on the effect desired. Default values of 0.5 and 0.4 for the despeckle and smoothing values are used, with no posterization applied (value of 0).

In Posterize Mode, a thumbnail of the original image will automatically appear in the upper right corner of the image workspace. This makes a comparison with the modified image easier. The thumbnail can be resized or moved at your convenience by dragging on its resize handles or clicking/dragging on the resize rectangle.

SewArt

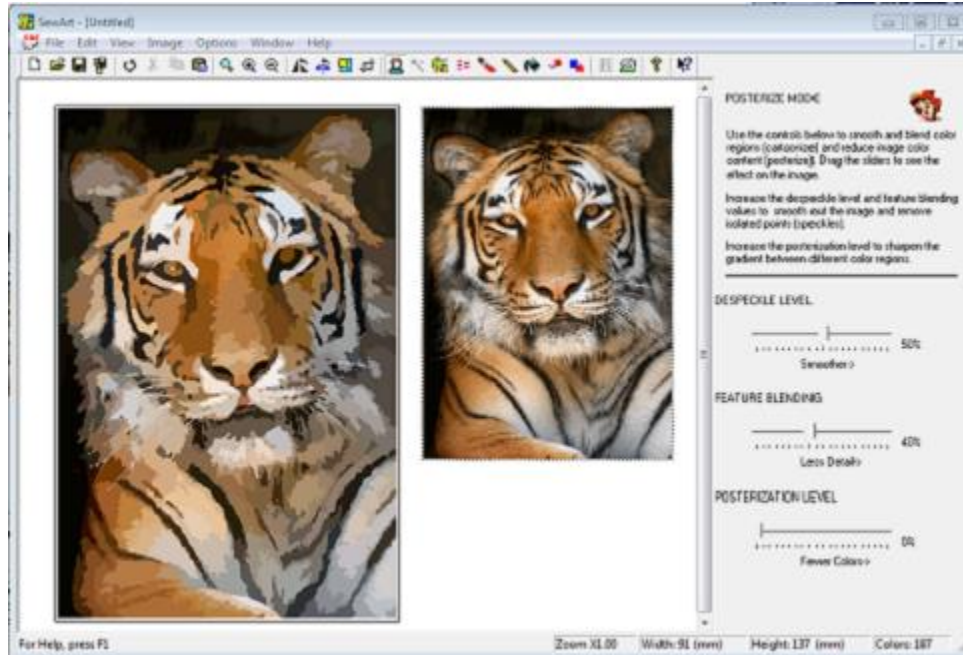

Figure 1: Posterization Mode showing an enlarged thumbnail of the original jpeg image (right) and the posterized image (left) for the default settings.

For the photograph (JPEG file) of a tiger (which was imported from MS Word ClipArt) shown in Fig. 1, the thumbnail has been enlarged to make the effects of posterization more apparent. This original image would be very tedious to stitch because of all the small-scale color gradations (for example, the individual hairs and whiskers on the tiger), and would lead to very poor quality of the stitch-out.

After the default despeckling and feature blending were applied (displayed in the image on the left), there is *less* continuous gradations of color and *more* solid color regions which can be more easily converted to stitches. Some of the very fine-scale details has been sacrificed (such as individual hairs), but these would generally not sew-out well anyhow.

The color number can be further [reduced](#) to 49 without any degradation of the image (see Fig. 2) by either increasing the posterization level to 0.70 *or* by reducing the number of palette colors directly.

SewArt

Figure 2. Reducing the color number to 49 by increasing the posterization level to 0.70 has little impact on the quality of the image.

Shortcuts

Toolbar:

6.6 Wizard

Use this toolbar command to enter the Wizard mode. This starts the image-processing wizard to guide you through the steps to convert the image into a form amenable for a high-quality stitch-out.

The basic principle of the Wizard is to choose various values (color numbers, despeckling or merge percentages) in a way that will both reduce the color number and preserve the image integrity. There are up to eight selections per page. To leave the image unchanged click the "Original Image" radio (selection) button and then proceed to the next Wizard page.

Each page of the Wizard (after the introduction) allows you to perform a different image-processing operation as noted in the caption title bar. The Wizard has *navigation* buttons at the bottom of each page to allow you to proceed to the next page (the *Next* button), to return to a previous page (the *Back* button), or to Cancel the Wizard and return to the main **SewArt** screen. Note that any operations performed in the Wizard mode may be *undone* when you have returned to normal mode.

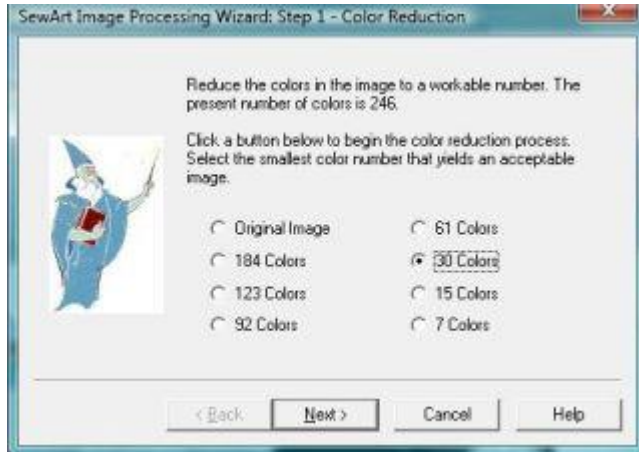

There are 4 steps (distinct types of processing) performed by the Wizard and described below. At each step you may choose from one of up to 7 reduction values (including the option to keep the unprocessed image). The choice is guided by the basic principle stated above: try to choose the value closest to the end of each list (which produced the biggest image processing effect) which leaves the visual integrity of the image intact.

Step 1: Color Reduction

The Wizard dialog for this case (we use the Penguin bitmap example, with 246 colors initially, throughout

SewArt

this discussion) is shown above. After reducing the color number a few times, one arrives at an image which is no longer acceptable (see figures below).

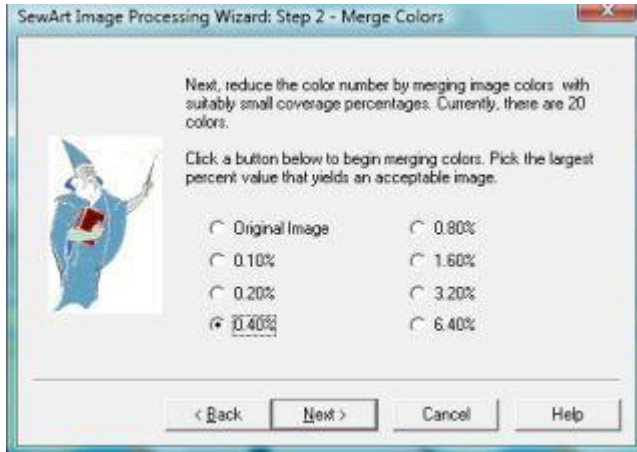

Note that the two-tone color of the penguin bill has disappeared. So the 61 color button was clicked, leading to an acceptable image. The *Next* button was then clicked to proceed to the next page of the Wizard. (NOTE: the color numbers shown on this dialog depend on the number of initial colors in the image. Also, the color numbers specified are only target values and the final reduction is only guaranteed to be equal to or less than the number clicked. In this case, clicking 61 colors yields 56 colors in the processed image. If the *Back* button would be clicked from the next page, the color numbers would then be based on 56 colors and not the original 246.)

Step 2: Merge Colors

The Wizard dialog for this case is shown below:

SewArt

In this case, the list of percentages represent the fractional coverage in the image required before a color will be merged. The 0.40% button was clicked, indicating that colors that cover no more than 0.40% of the image area were merged. Even with this small percentage coverage, the image deteriorated so that it was unacceptable (see Figure below):

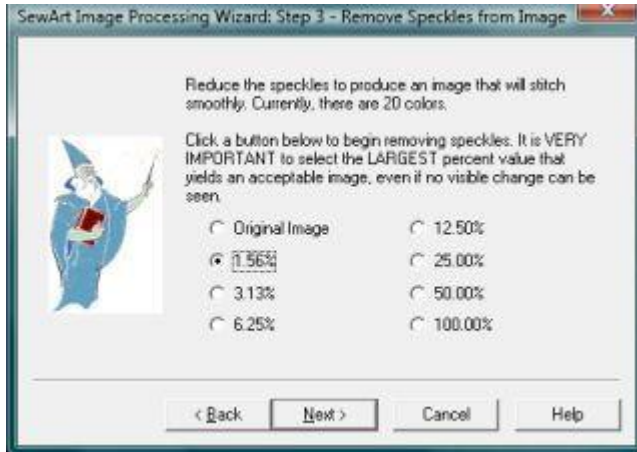

In particular the merge from 56 colors to 15 colors leaves *most* of the image intact but the outline of the bill began to disappear. (Note that the apparent discoloration of the cap is due to reducing the size of the figure and does not actually occur in the full-size image.) Thus, the 0.20% button was clicked to maintain the image integrity, while reducing the color number to 20.

Step 3: Remove speckling

The Wizard dialog for this case is shown below:

SewArt

In this case, pressing the lowest available color coverage fraction (1.56%) already produced an unacceptable image (see below), where the *thin* dark contours were broken up by the despeckling operation:

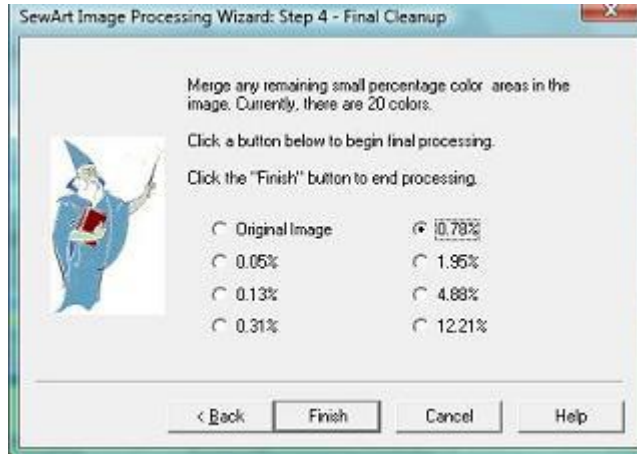

This is unusual and due to the graininess of the thin, dark outline contours. A much more typical case would be for a substantial color fraction (50-100%) to be despeckled without any noticeable degradation of the image. For this case, the thin outline colors were *individually merged* once the image-processing Wizard completed. Therefore, it was necessary at this step to click the "Original Image" radio button on the present Wizard page and then move to the next and final Wizard page.

Step 4: Final Image Processing

The Wizard dialog for this case is shown below:

SewArt

This final step presents the opportunity to do a "clean-up" of any remaining small-coverage colors. In this case, clicking the 0.78% button gave an acceptable image with a further color reduction to 12 colors:

While *most* of the solid black outline is preserved by this final processing, some of the outlines in the cap seem to break up. We nevertheless chose to accept this reduction (by clicking the "Finish" button). Once the Wizard was finished, we were able to merge a thin layer of yellowish pixels from the merge dialog, thus recovering the black outlining in the cap. If this had not been possible, we would have *undone* (Ctrl-Z) this last processing step.

Once you have finished these Wizard steps, you may want to view the individual colors of the image in the [Merge](#) utility. In particular, make sure all the speckling has been removed, before trying to sew out the image.

Shortcuts

Toolbar:

6.7 Reduce Colors

Use this toolbar command to reduce the number of distinct colors in the image. The color reduction is done through the same sophisticated *color quantization* process that **SewArt** uses to reduce the potentially 16 million image colors (in a 32-bit display) to only 256 when the image file is opened. This tool, in conjunction with [color merging](#), provides the capability to smooth small-scale color variations in the image which would be very difficult to sew-out well.

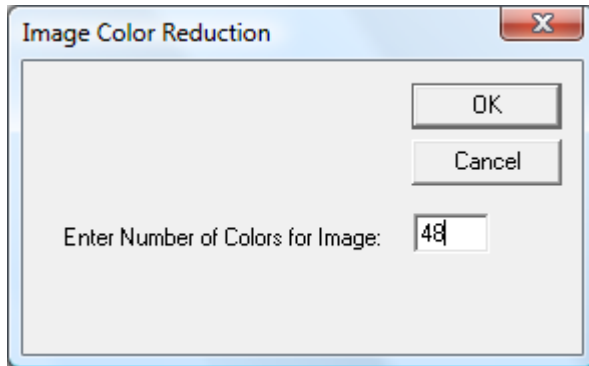

Why is color reduction important when converting an image to stitches? Below is a 10-fold magnification of the tutorial file *penguin130X130.png* (which originally had 246 distinct colors). Many of these colors are barely distinguishable shades of the seven or eight different solid colors that are clearly visible in the (unmagnified) image. For example, note the various shades of blue in what *appears* to be a solid blue region, particularly at the boundaries between the blue and the other colors. If each of these shades were stitched as a separate color, there would be many small, disconnected regions. That will lead to a very low quality embroidery stitch-out. The goal of the color reduction tools in **SewArt** is to reduce these small variations and create a solid region that can be sewn in a single color shade without distorting the visual appearance of the image.

When the *Reduce Colors* toolbar button is clicked, the *Image Color Reduction* dialog box appears (see the figure below). Enter the desired number of colors for the image in the edit box. In this example, the initial 246 colors were changed in a series of steps. (In order to maintain the appearance of the image, it is best to reduce the colors in steps.) Typically, halving the number of colors is a good way to proceed. In this case, the image color number was reduced from 246 to 128 to 64, without any substantial change in the image appearance. Reducing the colors to 32 removed some of the essential color variation, so *Ctrl-Z (undo)* was used to restore the color number to 48 (for this image, **SewArt** reduced the final color number to 42 even though 48 were requested).

SewArt

It is interesting to ask: what happened to the other 204 colors (remember there were 246 colors originally)? The answer is they have been color-merged ("quantized") with the remaining colors to form the final visible, approximately solid color regions. As noted above, this reduction is important for the eventual uniform sewing of the image.

If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

Shortcuts

Toolbar:

6.8 Merge Colors

Use this toolbar command to further decrease (after applying the [reduce color](#) tool) the number of distinct colors in the image by merging colors that are very close to each other in appearance (i.e., close in *Red-Green-Blue* color space). This dialog also has a **despeckle** button which removes speckles (scattered, generally unconnected points). An example of image despeckling, and how it differs from color merging, is presented in the [speckle removal](#) topic.

When the merge toolbar button is clicked, a list of all the colors appearing in the image will be presented in the *Merge Mode* pane (just below the information pane on the right of the **SewArt** workspace). The label under each button is the percentage of the image area covered by each color. See the Fig. 1 below.

SewArt

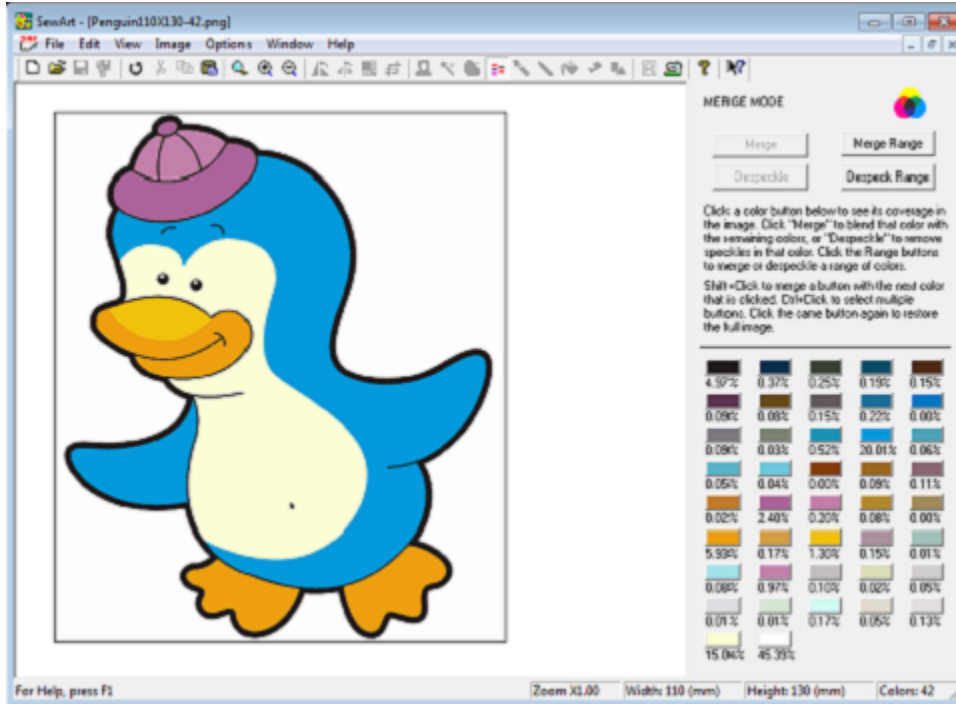

Fig. 1 Color Merge dialog.

The merge and despeckle buttons are disabled until you click one (or several, by holding down the Control key) of the color buttons. When you click on a color button, the part of the image covered by that color is highlighted. (**Note:** this is a **toggle** operation - if you click the same color button twice in a row, the original complete image will reappear.) In the Figure 2a below, the orange color was clicked (5.93% coverage, left side of figure), corresponding to the penguin's lower bill, mouth and feet, and then the yellow color (1.30% coverage), corresponding to the penguin's upper bill. Obviously these are solid color features which should be retained as part of the image to be sewn: that is, they should *not* be merged since they are distinctive features of the image.

The remaining orange and yellow color stops display very low coverage percentages. Control-clicking on the 0.08% and 0.17% (right) orange buttons will show a barely discernable, diffuse pattern of scattered points that tend to follow the outline of the well-defined features in the image (Fig 2b below). Such points arise because of the imperfect color quantization of a real JPG image and would generally be absent in vector clipart images. These *speckles*, or diffuse unconnected points, must be eliminated from the image, since they would not sew smoothly. Indeed, the embroidery needle would have to jump from one unconnected point to another, which is undesirable. They should therefore be **discarded** by *blending* them with the higher-percentage colors.

SewArt

Fig. 2a Solidly filled image parts.

Fig. 2b Speckled outline of image.

The process of removing speckles is called *despeckling*. It can be accomplished by clicking the **Despeckle** button. When a particular color button has been selected (or a group of colors is selected by holding down the Control key when clicking the colors), then only the highlighted color(s) will be despeckled. Parts of the selected color can be selectively despeckled by moving the cursor over those parts and clicking over those areas. The cursor changes to a rectangular despeckle-tool when it hovers over the selected color, with a size that can be controlled by right-clicking and selecting from three available sizes (see Fig. 3) Otherwise, the despeckling operation can be applied to a range of colors in the entire image (by clicking the **Despeck(le) Range** button). Note that in contrast to the merge operation (described in the next paragraph), despeckling *blends* the speckles with the local neighboring colors. In contrast, merging a color will change *all* the points of the color to a single existing color which is closest in RGB space. If the result of the despeckle blending is unacceptable, it can be undone by clicking the *Undo* toolbar button or entering *Ctrl-Z*.

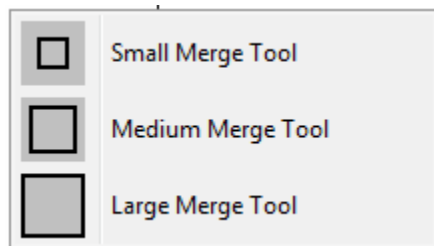

Fig 3. Menu to select the size of the despeckle tool.

Low coverage speckles may also be eliminated by clicking on a color button to activate the *Merge* button. Then clicking the *Merge* button will merge the chosen color with an existing color resulting in a decrease in the number of colors by 1. Also, the color button will become inactive (*dimmed*) corresponding to the elimination of that color from the pattern. If for some reason the effect of this merge is unacceptable, it can be undone by clicking the *Undo* toolbar button (or *Ctrl-Z*).

If you desire control over *which* color the chosen one is merged with (*Merge* will automatically determine the nearest color in *RGB* space to the selected one), you can hold down the Shift (or Ctrl) key when you click the color button to be merged. Then, the *next* color button that is clicked will be the one that is used for the merge. This extra control might be useful in the following circumstance: suppose one of the colors consists largely - but not entirely - of a solid region, but has some speckles as well. This is fairly typical, with the speckles following a boundary between two colored regions of the figure. Then, you could use the [Bucket Fill](#) tool to fill the solid region with a *slightly* different color. When Merge Mode is entered, you will have two color buttons of nearly the same color, one with a relatively high percentage coverage (corresponding to the solid region that was just bucket-filled) and one with a low percentage coverage corresponding

to the speckles that you wish to merge. Hold down the Shift key and select that speckle color button and then click on a color (usually black, but not always) corresponding to the solid boundary that you wish to merge the speckles with. Note that a simple *Merge* button click would **not** have worked in this case: it would have simply re-merged the speckles with the solid color region!

A useful technique to eliminate an entire group of speckles is by choosing the *Merge Range* option. This will open the *Color Merge Range* dialog shown in Fig. 4.

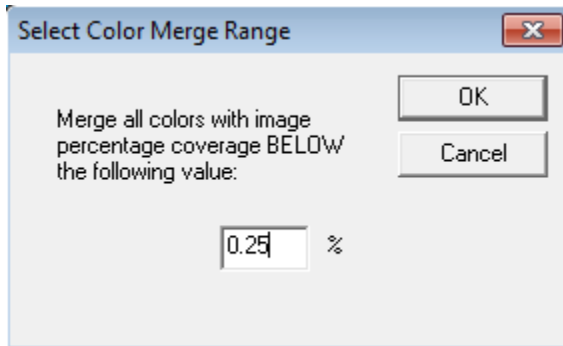

Fig 4. Dialog for merge a range of colors

All colors with an image coverage *below* the specified percentage will be merged when the *OK* button is clicked. The default value is 0.50%. In the tutorial example, using this value causes parts of the black outline to disappear, which is unacceptable. Experimenting a bit (using *Undo* to restore colors), we found that 0.25% works well for this example (shown here). This leads to a color reduction from 42 colors to 15 colors, as shown in Fig 5. Note that the buttons for *all* the colors that have been merged are now *disabled* (that is, they are grayed-out and can no longer be clicked) and are thus labeled as having 0% coverage.

Fig 5. Color merge view showing the image after a range of colors has been merged.

After completing the merge operations, click the *Merge* button again (*toggle* it) to exit Merge

SewArt

Mode. At this point in the image editing process, it is advisable to [Save](#) your changes, possibly renaming the file at the same time so you have a record of all the changes made.

If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

Shortcuts

Toolbar:

6.9 Paint Brush

Use this toolbar command to draw on the image with a colored brush. After pressing this button to activate *Paintbrush Mode*, the cursor will change to a paint brush whenever your mouse is over the image. The paint brush tool options will appear in the tool pane (see the figure below). You may select different properties for the brush: free-hand strokes, constrained lines; or filled rectangle or ellipse. These latter brush operations are useful for filling larger areas in a single click, and for drawing figures on a [blank canvas](#). The usual application of this command is to fill in gaps or blend small regions with the brush color. You may reverse a paint operation by pressing *Ctrl-Z* to *Undo* it.

There are several ways to select the brush color: control-click on a region of the image; click on the color palette bar at the bottom of the **SewArt** workspace; or click on the *eye-dropper* tool and drag it over the image and click on the desired image color.

SewArt

PAINT BRUSH MODE 

Drag the brush to paint with the selected color.

Select the brush color from the palette bar, or Ctrl-click a color in the existing image, or click the eye-dropper and drag it over the desired image color and click.

Brush Styles

- Freehand Stroke
- Line
- Filled Rectangle
- Filled Ellipse

Brush Widths (Zoom=1)

To perform the actual brushing, hold down the left mouse button while dragging the brush to blend that color into the region of the image. The tip of the brush is the *hot spot* where the drawing occurs. The width of the brush can be chosen by clicking on one of the line-width buttons. In the figure above, the color red has been chosen and the selected line-width has a dotted rectangle around it. Note that the size displayed on the screen for the brush width will depend on the magnification ([zoom](#)) that is in effect during the blending procedure.

To exit Paintbrush Mode, click on the paint brush toolbar button again (toggle it) or any one of the other available toolbar buttons.

If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

Shortcuts

Toolbar:

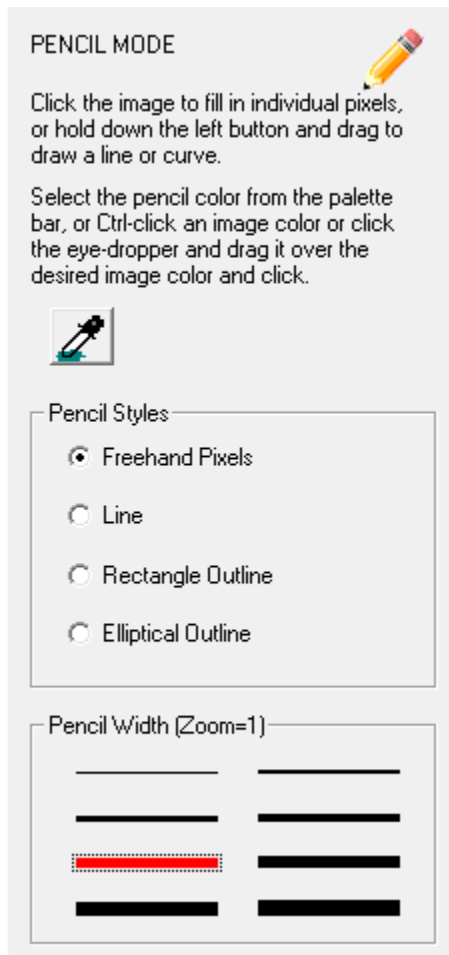

6.10 Pencil

SewArt

Use this toolbar command to draw individual points with a colored pencil. After clicking this button to activate the pencil drawing mode (see figure below), hold down the Control key and click on a region of the image, or click on the color palette at the bottom of the **SewArt** workspace screen, to select the pencil color. You can also use the eye-dropper icon to select a color. Either click the left mouse button to draw individual points with this color, or drag the pencil to draw a line with the chosen color.

The default width of the pencil is one pixel. Its appearance on the screen depends on the chosen magnification [zoom](#) level. You may click one of the line width buttons to create a pencil up to 8 pixels wide. The red line shown in the figure below indicates both the width and color of the pencil. When using the pencil tool, it may be convenient to magnify the region being edited until individual pixels can be viewed .

Drawing with the pencil can be done either in *free-hand* mode, or in one of the constrained modes used to create straight lines, rectangular or elliptical outlines. The usual application of this command is to fill in individual points (isolated *outliers*) with the dominant color of the chosen region, or to straighten and/or thicken lines in the image. When drawing on the [blank canvas](#), the pencil is useful for free-hand sketching or drawing lines and outlines. The pencil complements the paint brush and can be used where very small (pixel-size) details of the image need to be adjusted. To erase lines entered with the pencil, press *Ctrl-Z* to *Undo* the last drawing operation.

SewArt

To exit *Pencil Mode*, either re-click the pencil toolbar button or click one of the other available buttons on the toolbar.

Shortcuts

Toolbar:

6.11 Bucket Fill

Use this toolbar command to uniformly fill a region with a solid color. After clicking this button to activate *Fill Mode*, you may choose the fill color in several ways (see Fig. 1):

1. Click the eye-dropper icon and drag the resulting cursor with your mouse onto the part of the image containing the desired color. Click that region with the eye-dropper cursor to select that color for the fill.
2. Hold down the *Ctrl*-key and click on the color in the image to use for the fill.
3. Click on one of the pre-defined palette colors appearing at the bottom of the workspace screen.
4. Create your own custom fill color using the hue-saturation-luminance (HSL) picker tool. Drag the little square to a part of the Hue-Saturation square and then adjust the luminance slider. The resulting RGB color value will appear below the square.

In either case, the bucket fill color will appear below the *Color Matching Tolerance* slider (which will be described below). To reverse a recent fill, press *Ctrl-Z* to *Undo* it.

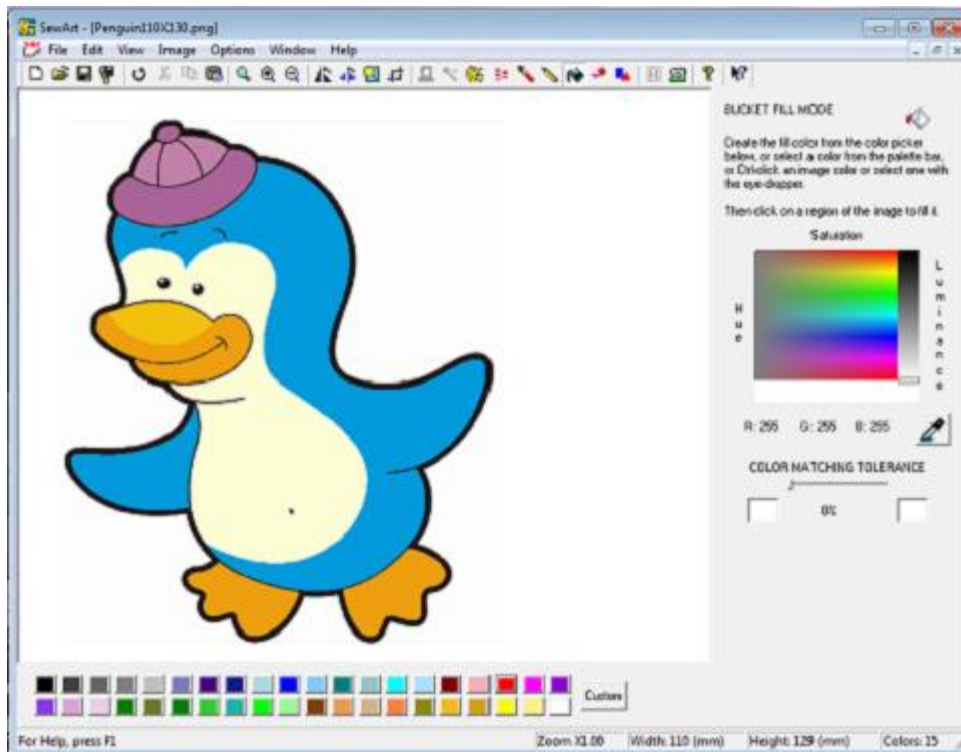

Figure 1.

Bucket fill mode showing the tutorial image.

After selecting the fill color, the bucket cursor (which automatically changes to a bucket when you move the mouse over the image). Then click the bucket (left mouse) to "pour" a fill color

into the region of the image over which the tip of the bucket hovers. For example, if the bucket is over the white background, this can be used to distinguish the background area of the image - which generally is **not** to be sewn - from regions in the image (like the white vest of the penguin) that **should** be sewn. This same method may be used to change one or more of the image colors.

An advanced application of this command is to fill (blend) small color variations within a relatively large region of the image where [paint-brushing](#) may be too slow or prone to error (for example, at the boundaries of the region). Typically this would be done *after* [color reduction](#) and [color merging](#) were already applied to the image. This blending effect requires that you select a non-zero *blending tolerance*. Move the *color matching tolerance* slider from 0% upwards (gradually) towards 100%, then click the bucket tool in the desired region. Gradually increase the tolerance percent until the bucket fill yields the desired degree of blending. Increasing the tolerance too much will cause the bucket fill to *bleed* into adjacent areas. If this undesirable effect occurs, then press *Ctrl-Z* immediately to recover the previous unblended state.

An example of *advanced* "tolerance-assisted" filling is shown in Fig. 2. (This example is *not* taken from the tutorial example which has no regions demonstrating this effect):

Figure 2. Tolerance fill to reduce

dithering

The top image shows a region of a *GIF* file. Note the cross-hatching (*dithering*) in the brown region, which is undesirable for stitching since it would cause a tremendous amount of jumping from one thread location to the next. The bottom image was obtained using the bucket tool, using the following steps: 1) the eye-dropper was dragged over the top image and the desired brown color was selected; 2) the tolerance slider was incremented up to 40% (this was determined by trial and error - it may be a different value for different images); and 3) the bucket tool dragged over the same area and clicked. Note that now all the very small-scale color variations have been removed, and the brown region would now be considered suitable for stitching with **SewArt** since it is *uniformly* filled with a *single* solid (brown) color.

Bucket fill blending is sometimes a useful alternative to color reduction, at least for small regions of the image. Figure 3 shows the effect of bucket filling on the tutorial image, without (left) and with (right) tolerance blending. On the left, the (default aqua) bucket fill tool was clicked on the right part of the penguin's beanie with the blending tolerance set to zero. (It has been recolored to aqua for purposes of this tutorial, but in practice the fill color would be subsequently changed back to the original wine color.) Note that the fill is irregular since there are small-scale variations in color of the original image. This shows very clearly why some form of reduction or blending is required prior to sewing the image: otherwise the irregular (aqua) colored region would be stitched rather than the desired smooth full upper 1/3 of the beanie.

SewArt

Figure 3. Tolerance fill for the beanie

cap region of the tutorial example.

The right image in Fig. 3 shows the effect of bucket filling after setting the tolerance to 20%, and then clicked the bucket tool on the same region again. Now the entire 1/3 part of the beanie has been *uniformly* filled with the same solid color. As a result, this region is ready to be stitched.

To exit *Fill Mode*, re-click the bucket toolbar button or click one of the other available toolbar buttons.

If you are using this help as a tutorial, click on the Home button (upper right) to return to the main page.

Shortcuts

Toolbar:

6.12 Eraser

Use this toolbar command to erase parts of the image. After clicking this button to activate *Eraser Mode*, you may choose the eraser size (see the figure below). The cursor will change into an eraser when it is dragged over the image. Hold down the left mouse button to erase the part of the image under the eraser. You can choose the eraser *color* either from the image itself by using the eyedropper tool, or from the color palette at the bottom of the workspace screen. Unlike the [Pencil](#) and [Paintbrush](#) tools, eraser size does NOT change when zooming in or out. This means you can erase very small, selected areas of the image by zooming in to a particular region with the [magnifier glass](#) tool.

SewArt

ERASER MODE 

Click the image and drag the eraser to remove or recolor the underlying pixels.

Select the eraser color from the palette bar, or Ctrl-click an image color or select one with the eye-dropper.

Eraser size (all Zooms)

Click this toolbar button again to exit *Eraser Mode*.

Shortcuts

Toolbar:

6.13 Shapes

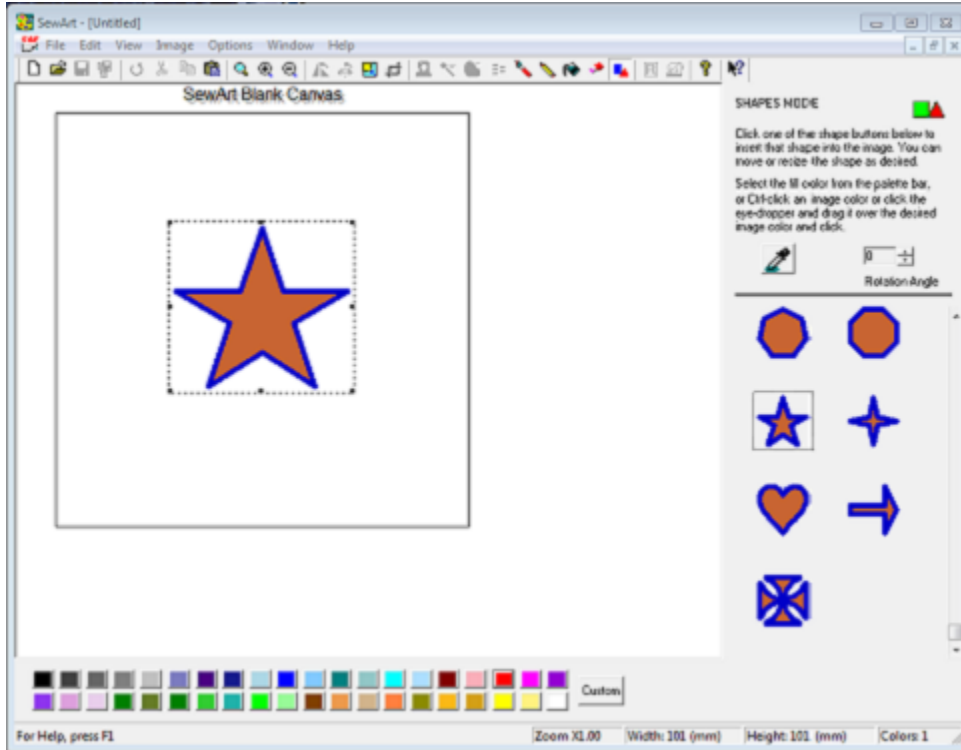

Use this toolbar command to add various shapes to an existing image or blank canvas. Clicking this button enters **SewArt** into *Shapes Mode*.

Shapes created with this editor exist in a separate *image layer* and can only be edited while the Shapes editor is open. Once this mode is closed - either by clicking the shapes toolbar button again (to toggle it off) or clicking another toolbar button - **all** the shapes entered during the editing session become part of the image and can be removed by the usual *Undo* (Ctrl-Z) mechanism. Note that *all* shapes entered during the current editing session will be removed by a single *Undo* operation.

New shapes may be pasted into the image by clicking on one of the shape icons in the Shapes editor (see figure below). The fill color of the active (selected) shape can be changed by using the dropper tool to select a color in the image or by clicking on one of the colors in the palette toolbar at the bottom of the workspace. The active shape may be rotated by increments of 1 degree by clicking on the spin control above the "Rotation Angle" label.

SewArt

While in *Shapes Mode*, shapes can be edited by clicking on them. A selection rectangle appears around the shape which then can be moved, resized, and/or deleted (press the **Delete** key). The selection rectangle will disappear when you click outside the shape or click on another shape or exit *Shapes Mode*. Note that the currently-selected shape will automatically be on top of all other shapes. This means if two (or more) shapes overlap, the top-most one will be the last one to be selected.

Shortcuts

Toolbar:

6.14 Convert to Redwork

Use this toolbar command to convert the image to a redwork outline, that can be saved to an embroidery file by later clicking the [convert to stitches](#) button. When you click this button, the options menu shown below will pop-up:

You can choose *Outline* to convert a filled image into outline stitches. Choose the *Centerline* option if the image is already outlined. Note that this option will preserve (and thin down to a single pixel) existing outlines in the figure. For example, if you have created a stick-figure using

SewArt

the drawing tools in the Blank Canvas, you would want to use centerlining to convert the image to an outline.

After selecting the appropriate option, the image will be automatically converted to outlines *or* center-lines. The resulting "redwork" image can be edited with the pencil or paintbrush tools to either remove unwanted segments of the drawing, or to add to (or connect existing parts of) the image. When you are ready to save the redwork image to an embroidery file, click the [Convert to Stitches](#) toolbar button to open the [outline toolbar](#).

If you want to create your own redwork image from a blank canvas, then you should click this button *before* beginning to draw. This will avoid splitting single thin lines into parallel *pairs* of lines.

Shortcuts

Toolbar:

6.15 Convert to Stitches

Use this toolbar command to convert the image to stitches which can be saved to an embroidery file in several popular embroidery file formats: Brother® (*.pes), Janome® (*.jef), Husqvarna® (*.hus), Pfaff® (*.vip), or Singer® (*.xxx).

When you click this button, the [Stitch Toolbar](#) will appear, indicating that **SewArt** has entered *Stitch Mode*. From the stitch toolbar you control properties of the stitches in any region of the image that you want to sew, including the stitch angle, presence or absence of underlay, fill pattern and stitch length. (If the image is a [Redwork](#) image, then you can select the type of outline stitches to use. The remainder of this topic describes the steps needed to convert a filled image to stitches. For use of the Outline and Appliqué options, see the [Stitch Toolbar](#) for more information.)

SewArt does not support a satin stitch for area-filling the image. However, you can choose from a variety of *pattern fills* as described below. You may set these properties from the toolbar and/or edit them in the stitch list after the image has been sewn. Also, the cursor will change to a "sewing needle" when you are over the image. If you have previously sewn *and* saved this image and have reopened it, you will be asked if you want to import the existing stitch list. If you answer "yes," all the stitches from the previous session of **SewArt** for this file will be restored. You can clear the current stitch list by clicking the *Clear Stitches* button. **This clearing operation cannot be undone.**

Follow the steps below to perform the actual conversion of the digital image to an embroidery pattern file. Refer to the Fig. 1 as needed. It shows **SewArt** in *Stitch Mode*, and the associated color stops entered into the stitch list (the right tool info pane). The colors sewn in the image are shown *hatched*. The "Auto-sew Image" button was clicked and the white background was chosen as the transparency color not to be sewn.

SewArt

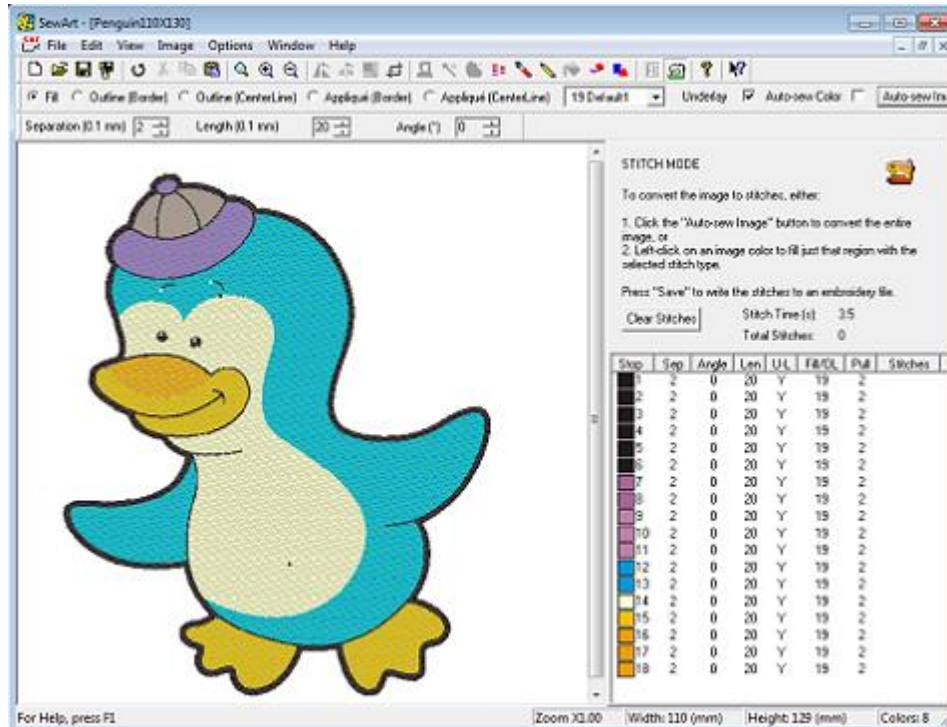

Figure 1. Stitch Mode for the tutorial image, after clicking Auto-Sew Image and choosing the white background as the transparency color (the color that is *not* sewn).

You may end a sewing session at any time by clicking the *End Sew Mode* button. If you have not saved the stitches to a file, you will be asked to do so at that time. Even if you decline, the stitches will be retained in memory *for the current session of SewArt*, so these stitches will be retrieved the next time you enter *Stitch Mode* but before closing this work session. However, the stitches will be *permanently saved only* if you decide to [save](#) them before closing **SewArt**.

There are just two steps involved in converting the image to into stitches that are saved in an embroidery file:

1. "Stitch" the Image (on screen)

The process of converting the image to stitches is very simple in **SewArt**. You can choose between completely manual stitching (which gives you the most control), auto-sewing an entire color, or auto-sewing the entire image. These options are described here:

1. **Manual stitching:** click on a region of the pattern that you want sewn. The point you click - the *seed point* - will show up as a colored rectangle on the screen. You can change the type of pattern fill by first selecting the new pattern fill from the drop-down box and the clicking again on the region to be refilled. The new pattern fill will appear. If you know the number of the pattern fill, you can also edit that in the stitch list in the row of the color you wish to change. Also, you can add an outline stitch to a filled region by first changing the stitch type to an outline (or appliqué) and then click again on that region.
2. **Auto-sew Color:** click the *Auto-sew Color* check box on the toolbar. Then click a color and *all* disconnected regions of the image with that color will be sewn.

SewArt

3. **Auto-sew Image:** click the *Auto-sew Image* check box on the toolbar. A drop-down menu will appear with a choice to sew all colors (including the background) or to choose a *transparency* color that will *not* be sewn. Once you made this selection and chosen the transparency color if required, stitching of the image will begin automatically.

Important Note: use the *auto-sew* options with some care. Unless the image is *clean* (in the sense that it contains few outlier points), *auto-sew* could take considerably longer than manually clicking on the individual color regions. If there are numerous outlier points - which are barely visible and which make a negligible contribution to the image quality - the *auto-sew* option will nevertheless have to check each of those points.

You may want to edit certain features of the auto-sewn pattern before saving it - see the section below that describes how to edit the stitch list.

2. Save the Embroidery Pattern and Stitch List

Click the [Save](#) button on the [main toolbar](#) to write the contents of the stitch list to an embroidery file. This will open a [File Save As](#) dialog for you to enter the file name if the file was not previously saved in this session. There is an option to enter a scale factor in the *Design Scale Factor* box, which allows you to adjust the size of the pattern as a multiple of the image size. The default value (1.0) means the embroidery file size will be the same as the image size you are editing. The aspect ratio (width-to-height ratio) of the sewn pattern will be the same as that of the image regardless of the value of the scale factor. You can choose the minimum number of stitches to be sewn in any color block (the default is 10).

After saving the stitches to the embroidery file, you may continue editing the image or adjusting the pattern parameters in the stitch list. If for any reason you decide to end your stitching session, click the **End Sew** button. If you have made any changes to the stitch list, you will be asked to save them at this time.

If you save the pattern and stitch list, the next time you open the image file in **SewArt** you will have the option to read in that information to continue further editing of the stitches, as described below.

Congratulations! You have now converted your image into an embroidery file!

Once you have created the stitch list as described in step 1 above, and before proceeding to saving it as an embroidery file in step 2, you may want to edit the stitch list. Editing can also be done after the image conversion is complete and you have viewed the image in an embroidery editor. If for any reason you want to modify the embroidery file you created, just reload the stitch list into **SewArt** and apply some (or all) of the editing features described below.

Choosing the starting point ("seed") for sewing

When you click the left mouse button, the tip of the "sewing needle" cursor defines the starting point (*seed*) from which **SewArt** will fill that region with stitches to match the image color. A judicious placement of the seed will minimize jumps in the final stitching.

For example, it is advisable to choose an extremity of the region - far left or right, top or bottom - so sewing can proceed in one direction only. You should **never** choose a seed in the middle of the region! To obtain the best sew outs, the thread should flow in one direction for each section (region) of the embroidery design. For a region, click the tip of the "needle" cursor at the farthest point perpendicular (at right angles) to the chosen **stitch angle**. Sewn regions are identified as showing hatched "threads" instead of a solid color fill.

SewArt

Figure 2 (taken from an embroidery editor, *not* from **SewArt**) shows the seed point as the red dot (where the tip of the needle cursor was clicked). The cursor was clicked at the farthest point *and* at 90 degrees to the angle chosen in **SewArt** (a 45 degree angle was used for this example.) The underlay stitches at 90 degrees to the chosen angle. Note that the embroidery stitches flow away from the red dot (seed point) in one continuous direction to the other side of the region.

Figure 2. Schematic of the Stitch Angle, showing a 45-degree angle for the fill stitch.

Often the recommended angles to use are the diagonals (45 and 225, or 135 and 315 degrees) which avoid the weaker points at the top, bottom and sides of the hooped fabric where the fabric is more likely to *give* (pull away from the hoop). However, other angles may be more appropriate when trying to produce a textured appearance (for example, similar objects arranged on an arc).

Different sides of an odd-shaped region should be tested to find the best angle to use. Use the **resew** option (see below) to restitch as required.

After the clicked region has been sewn, continue to click on other regions of the image until all parts of the image you want in your final embroidery pattern are "sewn" in this manner.

Pattern Fill

Click on the scroll arrow of the pattern fill combo box to select a pattern fill to use for the fill stitch. This will drop-down a list of available fill patterns to choose from. Use the up-down arrows to scroll through the patterns. An image of the selected pattern will appear next to the fill list. Click on one of these patterns to make it the active pattern that will be used the next time an area of the image is stitched. You can click on the [Print Pattern](#) (File menu) menu item to print a catalog of all the available fill patterns.

Pull Compensation

Sometimes large area fills can cause different parts of the pattern to literally pull apart when sewn. (This depends on the material and backing used.) For this reason, a small pull compensation (or offset) can be added to individual patterns (the "Pull" column in Fig 1.) As a default, a value of "2", corresponding to a pull offset of 0.2 mm in the direction of the fill, is added to all fills. This can be adjusted up a (to 4-6) for larger area fills, or down (0-1) for smaller area fills, depending on whether any gaps between adjacent fills need to be closed.

Edit the Stitch List

At any time during the stitching process, you may edit the values in the stitch list (such as the stitch angle, length, underlay and fill settings). Just click on the item in the list and type in the modified data. Tabs and arrow-keys can be used to easily navigate through the list to the item(s) to be edited. For example, suppose you stitched the pattern initially so that all stitches are at the same angle. Before the final pattern file is saved, you can change angles for different parts of the pattern. To do this, click on the appropriate angle entries in the stitch list and edit them by

SewArt

entering the desired values. Note that angles are measured from the *horizontal line* (which is the default, or 0 degrees). Thus, an angle of 90 degrees corresponds to stitches in the *vertical* direction.

Helpful hint:

A contiguous range of stitch property values can be changed to the same value by clicking one of the header buttons at the top of the stitch list. For example, suppose the image was stitched with *Underlay* on (checked) for all parts of the pattern. But there are some thin outlines in the image that do not require (and indeed should not have) underlay. Click on the *U-L* (underlay) column header button and a dialog box will pop-up allowing you to enter the range of color stop numbers, and the value (either "Y" for underlay, or "N" for no underlay). Clicking *OK* will then automatically change all the underlay values in the entire range.

Delete or Insert Color Stops

To see which sewn region of the image corresponds to one of the color stops in the stitch list, click that color stop button to highlight the associated part of the image. A pop-up menu will appear with options to **Delete** that color (from the stitch list, *not* from the image), or to **Insert** another color stop **before** the one that was just clicked. You can re-click on any region to sew it out again after making any modifications. If the **insert (before)** option is selected, a "blank" black color block will be inserted before the active color stop. The next image area that is clicked will be placed in that position in the stitch list. This may be useful if you want to add a particular part of the pattern somewhere other than at the end of the stitch list.. Ignore this pop-up (by clicking on the **Close menu** option) if you do not want to perform any of these operations.

Move Color Stops

To move a color stop to a different position in the stitch list, hold down the *Shift* key and left-click the color stop. Then **drag** (by holding down the left mouse button while moving the cursor) the color stop to the position in the list you want to place it, and **drop** it (by releasing the mouse button). Color stops that are dragged up (towards lower color stop positions) will be placed *above* the stop they are dropped on, and vice versa for stops that are dragged down.

Shortcuts

Toolbar:

6.16 PAS Editor

Use this toolbar command to open the PAS Creator application (Fig. 1) used to edit existing (or create new) Programmable Stitch files (PAS files).

Programmable stitches appear in the pattern fill drop-down box on the [stitch toolbar](#). They are used by **SewArt** for selecting the stitch points for filling a pattern. In Fig. 1, an existing PAS file ("S & S.pas") has been opened for editing. The "Motif View" displays how the resulting stitch points would appear in an area fill. After finishing any changes to the design, be sure to Save them before closing the editor.

New PAS images can also be created (File->New) and saved. You can click free-hand shapes or use the Edit->Paste option to paste an image from the clipboard into the editor workspace to use as a "template" for the new PAS shape. With the left mouse button, click new points using the template as a guide. For example, you might import your company logo and then click around that to create a new pattern fill with that shape.

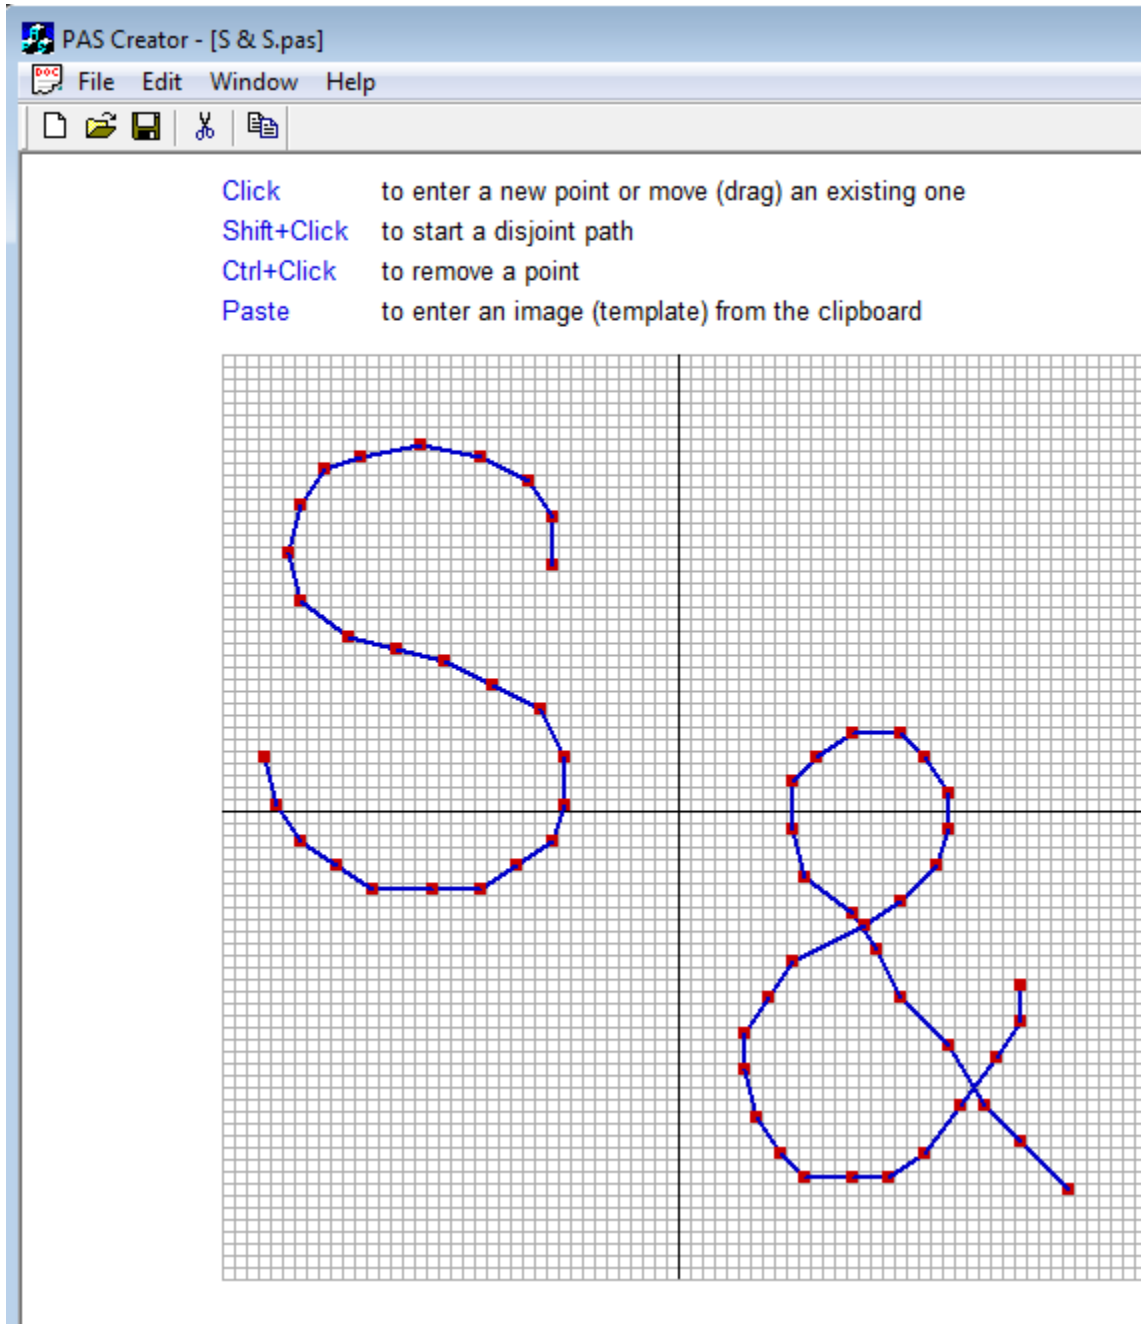

Figure 1.

7. Options commands

7.1 Grid

Use this menu item to choose the separation, line thickness and color for the optional grid used in **SewArt**. The grid may be toggled on or off in the [View menu](#).

7.2 Units

SewArt

Use this menu item to choose between metric and Imperial (American) units of measure in **SewArt**.

7.3 Parity

Use this menu item to choose between left-handed and right-handed tool cursors in **SewArt**.

7.4 Canvas

Use this menu item to select the default width and height (inches) for the blank-canvas opening screen in **SewArt**. This is particularly useful if you are creating your own image with the pen and brush tools. The canvas will be automatically resized whenever an image is imported into **SewArt**.

7.5 Language Support

Click this [Options](#) menu item to select the language used for this **SewArt** session. You must download the language support resources file (DLL) from the **SewArt** [webpage](#) and put it in the **SewArt** folder on your computer.

8. Window commands

8.1 New Window

Use this command to open a new window with the same contents as the active window. You can open multiple document windows to display different parts or views of a document at the same time. If you change the contents in one window, all other windows containing the same document reflect those changes. When you open a new window, it becomes the active window and is displayed on top of all other open windows.

8.2 Cascade

Use this command to arrange multiple opened windows in an overlapped fashion.

8.3 Size

Use this command to display a four-headed arrow so you can size the active window with the arrow keys.

After the pointer changes to the four-headed arrow:

1. Press one of the DIRECTION keys (left, right, up, or down arrow key) to move the pointer to the border you want to move.
2. Press a DIRECTION key to move the border.
3. Press ENTER when the window is the size you want.

Note: This command is unavailable if you maximize the window.

Shortcut

Mouse: Drag the size bars at the corners or edges of the window.

SewArt

8.4 Tile

Use this command to arrange multiple opened windows in a non-overlapped fashion.

8.5 All Windows

SewArt displays a list of currently open document windows at the bottom of the Window menu. A check mark appears in front of the document name of the active window. Choose a document from this list to make its window active.

9. Help commands

9.1 Help Topics

Use this command to display the opening screen of Help. From the opening screen, you can jump to step-by-step instructions for using **SewArt** and various types of reference information.

Once you open Help, you can click the Contents button whenever you want to return to the opening screen.

9.2 Auto-Update

Use this toggle command to allow (prevent) automatic updating of **SewArt** software. When this menu item is checked (unchecked), auto-updating is allowed (prevented). With auto-updating allowed, the [S & S website](#) will be checked whenever the application is opened (but not more than once daily) for available updates. If there is an update available, the user will be given the opportunity to install it. The installation will *automatically* close the **SewArt** workspace, remove the older version, install the update, and restart the application.

9.3 Update Now

Use this command to search the **S & S website** *at any time* for the availability of an update for **SewArt**. If an update is found, the user is given a choice to install it.

9.4 About SewArt

Use this command to display the copyright notice, version number and registration information for your copy of **SewArt**.

Shortcuts

Toolbar:

9.5 Change (History) Log

Use this command to view a log file of all the changes made to **SewArt** during its development.

9.6 Context Help

SewArt

Use this command to obtain context-sensitive help for toolbar and menu items. When you (single left) click this toolbar button, the cursor changes to a "?" icon. Then click on the item for which you want help, and the help manual will open to an appropriate topic.

Shortcuts

Toolbar:

10. Digitizing Topics

10.1 Blank Canvas

When **SewArt** opens, the workspace contains a 100 X 100 mm image called a *blank canvas*. If you want to create your own artwork to sew, you can use the [paintbrush](#), [pencil](#) and [bucket](#) tools to draw and color images on the "canvas". You may [save](#) your artwork and [convert](#) it to stitches like any other image.

The balloon below was created (by someone with limited artistic ability!) using the paintbrush to create a solid red ellipse. Note that when "writing" on the blank canvas, all the colors are *inverted* by default, until you uncheck the *inverse color* button. This is done to allow you to write with a black pen or pencil on a white canvas. Next, the pencil tool was used to create a green free-hand string for the balloon.

10.2 Change Fill Pattern

When in *Stitch Mode*, click the *Fill* scroll arrow on the [stitch toolbar](#) to open the pattern selection drop-down list. A bitmap of the presently selected pattern (the one showing in the edit box) will be displayed. Use the up and down arrow keys to scroll through the list of available pattern fills. Every time a new pattern is selected (highlighted in blue), its bitmap will be displayed next to the drop-down box. To select a pattern to use for filling, click on it. This will close the list and the name of the selected pattern will appear in the edit box.

If you decide at any time to change the pattern for a region (color stop) of the image, you may either directly edit the stitch list entry for the color stop *number* associated with the pattern. Alternatively, you may re-click on the pattern after you have selected a new fill style.

10.3 Change Paint Tool Color

SewArt

When one of the painting tools ([pencil](#), [paintbrush](#), or [paint bucket](#)) is active, its color may be changed in one of several ways:

1. hold down the Control key and click the tool cursor over the part of the image whose color you wish to use
2. click the normal (arrow) cursor on a color on the palette tool bar which appears at the bottom of the screen when one of the paint tools is active
3. click the "eye dropper" button. This will cause the cursor to change into an eye-dropper when you are over the image, and click the eye-dropper on the color you wish to use

For the paint bucket tool, you can mix a custom color with the color picker tool.

10.4 Remove Speckles

Most raster images - represented by formats such as *.bmp, *.jpg, *.gif, *.png, *.tif - will require some image *processing* before they are suitable for sewing a high-quality embroidery file pattern.

Most vector images - represented by formats such as *.emf, *.eps, *.wmf - already have performed some type of image processing and may only require minimal processing before being sewn.

What determines when an image is suitable to be sewn? The simple answer is that all the visible (large-scale) colored regions are comprised of single colored pixels *and* there are very few (or no) *speckles* in the image.

What are speckles?

Digitized images very often display some color *aliasing* at boundaries between different colored regions. This aliasing effect introduces a mixture of differently colored pixels in a thin (usually only a few pixels wide) boundary region between the different solid colored regions. These pixels - referred to here as *speckles* - are generally disconnected from one another and would lead to a very unpleasing sew-out if they were each stitched separately. (The needle would skip around from speckle to speckle, rather than sew in a nice smooth solid fill!)

The example in Fig. 1 is taken from a logo file that was captured and saved with the permission of the embroidery website's owner. Speckles are clearly visible and are due to the image capture process. In addition, there are many *hidden* speckles not apparent to the naked eye. To view those speckles with **SewArt**, first [reduce](#) the color number if possible (without altering the image quality; in the present example, we choose 15 distinct colors), then click on the [merge colors](#) button (see Fig. 2).

Figure 1. JPG image taken from a prominent embroidery website (with permission). Speckles are clearly visible to the naked eye.

Note that there are only five solid areas clearly visible in the logo file (excluding the white background). However, after color reduction there are still 15 colors remaining. This suggests the presence of *hidden* colors and possible speckles. For example, clicking the sixth color stop button (the salmon color) reveals that it is comprised almost entirely of speckles (Fig. 2). Without further image processing ("despeckling"), this color would produce a disconnected, low-quality embroidery stitch-out due to the numerous (and chaotic) jumps of the needle from speckle to speckle.

To remove these speckles, click the "Despeckle" button while this color is selected. This eliminates (essentially) all these speckles by merging them with the nearest color neighbor(s). This is different than the effect of clicking the "Merge" button, which would change ALL the speckles to a *single* dominant color. Despeckling is a local operation which will match local speckle color to local neighboring colors and is preferred in this situation. Any remaining speckles can be removed by moving the cursor - which has now become an "eraser" cursor - over them and left-clicking the mouse to erase them.

This process can be applied to all color stops until either the stop has been merged with another color (hold down the Shift key while clicking a color to be merged; then it will be merged with the next color that is clicked) or despeckled. Remember that the *Undo* (Ctrl-Z) operation can be applied at any time to remove an unwanted merge or despeckle operation. Alternatively, the "Merge Range" and "Despeck(le) Range" buttons can be used to merge or despeckle groups of color stops satisfying certain image area-coverage criteria. For example, all buttons with area coverage less than 0.50% could be despeckled with a single click in this way.

SewArt

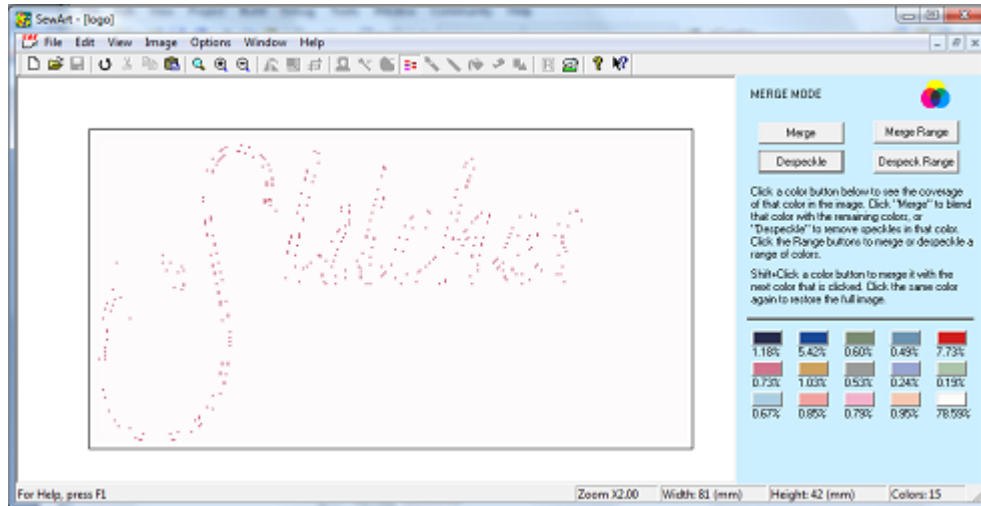

Figure 2. In Merge Mode, clicking on the sixth color stops shows the (hidden) speckles associated with that color.

Alternative methods to eliminate speckles

The Merge Mode operations of Merge and Despeckle offer the greatest control over individual colors and how they are processed.

There are at least two other methods for eliminating speckles. One is to use the image processing [wizard](#), which includes speckle removal as part of its step-by-step guided processing. Another is to use the image [Posterization](#) toolbar command.

10.5 Resize or Change Density

After you create an embroidery file with **SewArt**, it is possible to change the size, stitch density, fill pattern and/or angle.

Important note: If you want to preserve the stitch order of a previously-sewn pattern, **do not** resize the image file (or the stitch list will be cleared!) It is much easier to resize the pattern when you save it (as described below). Here is the simple procedure for editing the embroidery file:

Reopen the image file and click the "Convert" (sewing-machine) icon on the [main toolbar](#). This will get you into *Stitch mode*. You have the option at this time to reload the previously stitched embroidery file associated with the image. Then follow the directions for editing the stitch list, which are given in the [Conversion](#) section. In particular, to change the density just change the value of the *separation* settings. If you want to change the separation values for *all* the color stops, it might be easier to clear the stitch list, set the desired separation value on the sewing toolbar, and then re sew the entire pattern. Finally, click the [File/Save As](#) menu item. Here is where you can choose to resize the pattern sewn, by entering a scale factor value (1.0 means no resizing, 2.0 means double the size, 0.5 means halve the size, compared to the nominal image size).

In addition, you may edit the embroidery file in a separate embroidery file editor.

10.6 Transparency Color

To avoid sewing the background, use the [bucket fill](#) tool to flood the background part of the image with a *transparency* color that will not be sewn. Use the interactive color mixing feature of the bucket fill to select a unique color not in the image pattern. Alternatively, if you have checked the *Auto-sew Image* box on the [Stitch Toolbar](#), then a drop down list will appear that allows you to choose either to sew all colors or to click on an image color that will be treated as transparent (not sewn).

Otherwise, simply avoid clicking on the background color and it will not sew-out. If you click it by mistake, you can delete it from the stitch list before the embroidery file is written and saved.

11. Toolbars

11.1 Main Toolbar

The main toolbar (shown below) is displayed across the top of the application window, below the menu bar. The toolbar provides quick mouse access to many image-processing and stitching tools available in **SewArt**.

The magnifier glass is a toggle button. This means that once it is clicked, it appears in a *active* state (looks like it is *pressed-in*) on the toolbar until it is clicked a second time. While depressed, the cursor will appear as a magnifying glass over the image.

The five right-most toolbar buttons are also toggle buttons. Unlike the magnifier button, these are *mutually exclusive* which means that *only one* of these buttons can be *active (pressed-in)* at the same time. Thus, when you click one of them, and another button in this group is already pressed-in, then that button will be cleared first before the new button becomes *active*.

To hide or display the main toolbar, choose **Toolbar** from the **View** menu (or press ALT+V, T).

Click	To
-------	----

Open a new empty blank canvas.

Open an existing image file. **SewArt** displays the Open dialog box, in which you can locate and open the desired file.

Save the active image and stitch file with its current name. If you have not named the image, **SewArt** displays the Save As dialog box. If you are in stitch-mode, then the embroidery file and stitch-list file will be saved instead.

Save the active image and stitch file with a new name by displaying the Save As dialog box.

SewArt

Cut the part of the image inside the selection rectangle.

Copy the part of the image inside the selection rectangle, to be dragged and dropped elsewhere.

Paste the image file stored in the Windows clipboard into the active window.

Undo the previous operation.

Rotate image

Reflect (mirror) image

Resize image

Crop Image (remove parts of the image not included in stitch pattern)

Posterize an image (reduce colors and speckles)

Start the image-processing wizard.

Reduce number of colors in image

Merge and despeckle colors in image

Paint brush to fill parts of an image with a solid color

Pencil to fill individual points or lines in the image

Paint bucket to fill large regions of the image uniformly

Eraser to remove parts of the image

Add shapes to the image

Convert image to redwork

SewArt

Opens stitching mode to convert a graphics image to an embroidery file.

About **SewArt**.

Context help for individual selected items.

11.2 Status Bar

The status bar (shown below) is displayed across the bottom of the application window. It provides information about the pattern being displayed in **SewArt**, as well as containing a zoom control for zooming in and out of the image.

The left area of the status bar previews actions associated with menu items (as you navigate through menus) or toolbar buttons as you "flyover" them with your cursor. The right part of the status bar indicates information about pattern properties:

INDICATOR	DESCRIPTION
APPLICATION STATUS	Shows status of selected menu or toolbar button, or prompts for Help
ZOOM	Shows and adjusts zoom factor of pattern (100% indicates the original size of the pattern is displayed)
WIDTH	Shows width of pattern
HEIGHT	Shows height of pattern
COLORS	Shows the number of colors in the pattern

11.3 Stitch Toolbar

The stitch toolbar is displayed across the top of the workspace when *Stitch Mode* has been activated by pressing the [Convert to Stitches](#) button on the main toolbar. There are two types of stitch toolbars described below which appear depending on whether the mode is for filling or outlining the image.

Stitch Mode Toolbar

This bar is split into two separate toolbars (see Fig. 1). One of the bars displays tools for editing pattern properties (like underlay, fill, outline or appliqué style), while the other has tools for setting stitch properties (such as separation, length and angle). Both can be moved to other positions in the workspace window by clicking and dragging the grab-bar at the left of the toolbar.

SewArt

These toolbars provide quick mouse access to features used to sew out the pattern file corresponding to the current image in the **SewArt** workspace. The drop-down combo box shown in the top toolbar changes content depending on the **stitch style** that is selected.

Figure 1. The SewArt stitch-mode toolbar

Stitch Styles

The various stitch styles are selected by clicking on one of the four radio buttons on the stitch mode toolbar:

- Fill**
 When the *Fill* is checked (as shown in Fig.1), then the combo box contains the pattern fill styles that are available for solid fills (see Fig.2). Click on the down scroll arrow to open the combo box. Use the mouse or the Up/Down Arrow Keys on your keyboard to scroll through the list of available patterns and to display an image of the pattern. In Fig.2, the diam01 pattern (#19) is highlighted by pressing the Down arrow key, and the pattern appears to the right of the combo list. Once the desired pattern is found, click on it with your left mouse button to select it and close the combo list. You may also print a *catalog* of all the stitch patterns by clicking the [File/Print Patterns](#) menu item. You may create additional fill patterns or edit existing ones with the [PAS editor](#) .

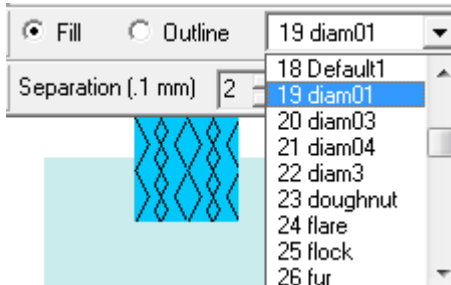

Figure 2. Fill stitch pattern combo box

When the Outline or one of the Appliqué stitch options is checked, the second row of controls on the stitch toolbar automatically changes to the outlining toolbar shown in Fig. 3. Note that the Angle scroll and underlay options are hidden in this mode. The Satin Height and Length controls on this toolbar are used to change the properties of the satin outline (or appliqué) stitch (shown schematically in Fig. 4).

Figure 3. The outline toolbar.

SewArt

Figure 4. Dimensions of the satin outline/appliqué stitch. "H" (height) is the half height (for satin and bean stitches) and "L" (length) is the stitch-to-stitch running length.

For outline stitches, the border (or centerline) of the color region is used to place the stitches. Use the Centerline option to outline thin lines. Otherwise, use the Border option.

- Outline (Border or Centerline)** When *Outline* is checked, the combo box fills with several outlining stitches (Running, Bean, Satin). Scrolling through the combo list with the up/down arrow keys will give depictions of the stitch types. In Outline mode, the Angle control becomes inactive.
- Appliqué (Border)** The border appliqué style saves three separate color blocks when it is sewn. (In **SewArt** only one color stop appears in the thread list to represent all the appliqué stitches). The first color block is comprised of a loosely-stitched running stitch **border** used for placing the appliqué pattern cutout material. After that block is stitched, the material can be placed on the fabric inside the indicated border. The next color block is a shorter-length set of running stitches used to **tack-down** the material. It is stitched in a color that is different from the first and third color blocks, to avoid being joined as a single block on some embroidery machines. The final color block is a set of **finish satin** stitches (see Fig. 4) and is sewn in the original color of the image.

The table below summarizes the various buttons and boxes on the stitch mode toolbar, and their functionality.

Click	To
Fill/Outline/Appliqué	Select stitch style (pattern fill, outline or appliqué stitches)
Fill/Outline Combo Box	Open a drop-down combo box for selecting pattern fills or outline stitches
Underlay Check Box	Add (checked) underlay stitch to the pattern
Auto-sew Color	Automatically sew ALL the same colors (as the one clicked) in the image
Auto-sew Image	Automatically sew the entire image.
Separation	Set the density of the fill (in fill mode), with lower separation translates to higher density. In outline mode, set running separation of satin outline stitch
Length/Width	Set the average stitch length for underlay. In outline mode, sets half-width of satin stitch
Angle	Adjust the stitch angle of the fill (horizontal fill corresponds to 0 degrees)

Redwork-Stitch Mode Toolbar

This toolbar appears automatically when the *Redwork* toolbar button has been clicked, indicating that the image has been previously converted to outlines or center-lines:

SewArt

Stitch Type	1 Running	Separation (0.1 mm)	6	Satin Width (0.1 mm)	20	Sew Outline
-------------	-----------	---------------------	---	----------------------	----	-------------

Click	To
Stitch Type Combo	Select either a running, bean, or stitch for the outline
Separation	Set the average separation for the stitch (in 0.1 mm units)
Satin Width	Set the half-width for the satin stitch
Sew Outline	Preview the redwork outline before saving the stitches

11.4 Workspace

The workspace for **SewArt** consists of the blank area containing the image (see figure below), the [main toolbar](#), the main menu, the [title bar](#), and the [status pane](#).

- Title Bar - displays the name of the image file currently opened in SewArt
- Main Menu - provides drop-down lists of actions (like File/Open, Edit cut/copy/paste, etc.) See the menu commands for more information
- Main Toolbar - provides buttons to click that control various actions for editing and stitching images
- Status Pane - shows information about the file (zoom state, size, number of colors)

12. Sew commands

12.1 Auto Sew Color

Click this button to automatically sew (convert to stitches) all parts of the image with the same color as the next selected (clicked) color.

12.2 Auto Sew Image

Click this button to automatically sew (convert to stitches) all colors in the image. A pop-up will appear with the following options (click on one):

- Set Transparent Color - this will set one color (usually the background) that will *not* be sewn during the conversion to stitches. The cursor will become the pencil tool and move this tool to the part of the image with the transparent color and click there.
- Sew All Colors - select this option to convert every color in the pattern to stitches

12.3 Fill

Click this radio button to select from one of the various fill stitches available in SewArt. When this option is checked, the next pattern color will be sewn using the selected fill.

12.4 Outline

Click one of these radio buttons to outline the next part of the pattern that is clicked for sewing.

For thin (existing) outlines, use the Centerline option. Otherwise, to outline a filled region, use the Border option.

12.5 Appliqué (border)

Click this radio button to use a border appliqué stitch for the next pattern color that is clicked (for sewing). You may select one of the outlining stitches (usually bean or satin) for the top stitch.

12.6 Appliqué (centerline)

Click this radio button to use an appliqué stitch, centered on the middle of the pattern, for the next pattern color that is clicked (for sewing). You may select one of the outlining stitches (usually bean or satin) for the top stitch.

SewArt

Appliqué (CenterLine)

12.7 Add Appliqué to Embroidery File

SewArt can be used to add a [border appliqué](#) (or satin stitch only) to an existing embroidery file.

If **SewArt** was used to create the embroidery file from an image file, then just open the image in **SewArt** and add the border appliqué in the Stitch Mode.

For the case when the original image file is NOT available, it is still possible to add an appliqué (or satin) border to the embroidery file pattern. The steps required to do this are described below, assuming that the **SewWhat-Pro** editor is used to open the embroidery file and create the image file on the Windows clipboard. (Modifications to this technique using other embroidery editors should be straightforward.)

Step 1: Open the embroidery file in **SewWhat-Pro** and turn off the grid lines. Select *Texture* from the View menu so that the image is filled (figure of the black cat below). Make a note of the hoop size used (in this example, the hoop was 100 X 100 mm).

Step 2: From the Edit menu of **SewWhat-Pro**, click on *Copy* to place a copy of the embroidery pattern on the Clipboard. If you wish to appliqué only certain color blocks of the pattern, first select those blocks before copying to the Clipboard.

Step 3: Open **SewArt**. From the [Edit menu](#) there, click [Paste](#) to place a copy of the image file into the **SewArt** workspace.

Step 4: To guarantee that the appliqué will fit the original pattern *exactly*, open the [Resize tool](#) and enter the hoop size of the pattern from **SewWhat-Pro**. In this example, the pattern copied into **SewArt** from the clipboard was 93 X 93 mm and needed to be resized to the actual hoop size (100 X 100 mm).

SewArt

Step 5: Using the image editing tools (brushes, bucket-fill, etc), make a solid color image of the original pattern (figure at left below). In this example, we filled the image with a solid red color and filled in some of the background separating the main body from the head, paw, and tail.

Step 6: Now open the Stitch-Mode window, select the satin-stitch properties, and sew the border appliqué or outline (middle figure above). Save this and merge it with the original embroidery file in **SewWhat-Pro** (figure on the right above). Note how the appliqué fits around the original design *exactly*, due to the calibration in **Step 4**.

12.8 Underlay

Check this check box to add underlay stitches to the next fill pattern that is sewn. Underlay is only applied for area fill and not for outlines or appliqués.
