

Temperature Probe

CMSS 2000-SL

Laser Sighted Non-Contact
Temperature Probe

Features

- *Proven method.*
- *High and low alarms.*
- *Calculates minimum, maximum, differential, and average temperatures.*
- *Data Logging.*
- *Expanded temperature range of -25°F to +1100°F (-30°C to +600°C).*
- *Circular laser sighting to pinpoint the target.*
- *Features automatic shut off.*

The non-contact thermometer senses the energy of an object with an infrared detector. The energy of the object consists of transmitted, emitted, and reflected energy enabling a user to assess the temperature of a bearing as it is operating. The thermometer lens, when pointed at an object, collects energy onto the infrared detector producing a signal that the microprocessor translates as a reading on the backlit display. As the trigger is squeezed, the object temperature is continuously measured by the infrared detector. This allows for fast and accurate real-time readings.

Simply point, shoot and read. No contact with hot surfaces or moving parts means safer, faster, and easier temperature measurements.

This instrument features a -25°F to +1100°F (-30°C to +600°C) temperature range; laser sighting; LCD backlight; MAX, MIN, ΔT, and AVG temperatures; recall last reading, HI and LOW audible and visual alarms; °C or °F selectable; low battery indicator; recall last reading; and adjustable emissivity.

Units are molded from high-strength, solvent-resistant plastic. The optics are recessed for added environmental protection. A cable/strap anchor is provided for the belt clip.

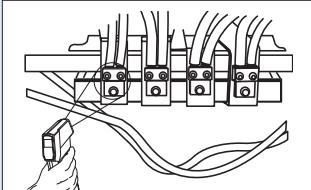

Hard Case

A water resistant, dust-proof case which holds the unit (includes belt clip) and measures 9.6" x 6.6" x 2.0" (245mm x 169mm x 52mm) is included.

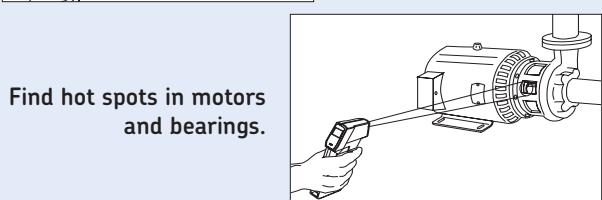

Temperature Probe CMSS 2000-SL

www.skf.com/reliability

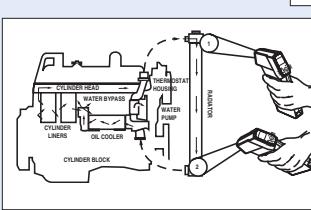

Applications

Find hot spots in electrical connections.

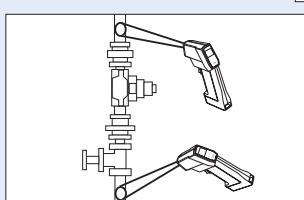

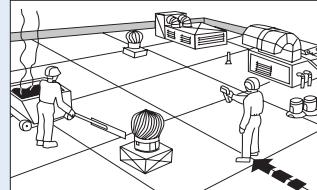

Find hot spots in motors and bearings.

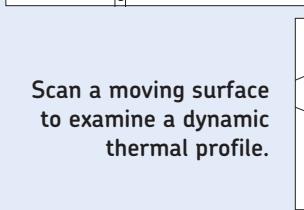

Examine temperature differences in engine blocks to eliminate costly breakdowns.

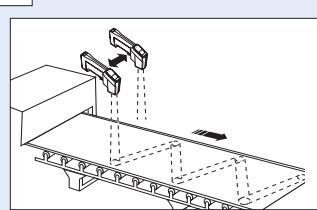

Verify the temperature of asphalt, welded membranes and rooftop HVAC components.

Measure a steamtrap line for temperature differences. Make sure that the diameter of the pipe fills the field-of-view.

Scan a moving surface to examine a dynamic thermal profile.

How the Sensor Works

Infrared thermometers sense the energy of an object, which consists of transmitted energy, emitted energy, and reflected energy. An infrared thermometer's lens, pointed at an object, collects and focuses the energy onto an infrared detector inside the instrument producing a signal that the thermometer's microprocessor translates and displays on the LCD.

Some shiny or highly polished objects reflect infrared energy as well as emit it (transmitted energy for most objects is zero). Emissivity values quantify the emitting and reflecting characteristics of objects. The CMSS 2000-SL Temperature Probe can compensate for the object's emissivity value when they calculate the emitted energy of the object.

For most applications, objects being measured have high emissivities (painted, worn or oxidized metals, plastics, rubber, paper). It is not necessary to change the emissivity value, factory set at 0.95, for such applications.

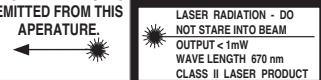

NOTE

Non-contact thermometers are not recommended for use in measuring shiny, polished, or unoxidized metals such as aluminum, brass, chromium and stainless steel.

This instrument conforms to the following standards:

- EN50081-1:1992, Electromagnetic Emissions
- EN50082-1:1992, Electromagnetic Susceptibility

Tests were conducted using a frequency range of 27 – 500 MHz with the instrument in three orientations. The average error for the three orientations is $\pm 1.0^{\circ}\text{C}$ at 3 v/m throughout the spectrum. However, between 230 MHz and 500 MHz at 3 v/m, the instrument may not meet its stated accuracy.

Display

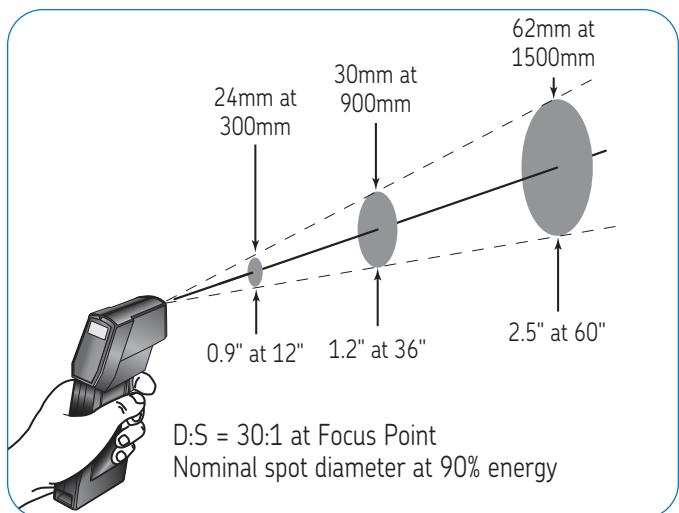

Measuring Temperature

Units measure the surface temperature of objects. To measure temperature, pull and hold the trigger while pointing at the target to be measured (See Distance and Spot Size). A temperature reading appears on the display. If the thermometer is subject to large changes in ambient temperatures (hot to cold or cold to hot), allow 30 minutes for temperature stabilization before taking measurements to ensure accuracy.

Distance and Spot Size

To achieve an accurate temperature reading, unit must be the correct distance from the targeted object. The circular

laser is made up of eight (8) laser spots, that form a circle to show the approximate area being measured called "spot size". A singular laser spot shows the center of the spot size. This spot size gets larger the farther away you are from the target. The ratio of the Distance-to-Spot Size, or D:S, is shown in the diagram below. The laser dot is offset 0.4 inches (12mm) above the target center.

NOTE
The unit measures the average surface temperature inside the measurement spot.

Storing Data

The thermometer is capable of storing up to 12 data locations. The infrared temperature, temperature unit ($^{\circ}\text{C}$ or $^{\circ}\text{F}$) and emissivity are also stored.

Enhanced Modes

The CMSS 2000-SL Temperature Probe feature adjustable HI or LO Alarm and adjustable emissivity. These units sense and update five temperature values simultaneously, each time you measure the temperature of an object. The values, which are stored in memory and can be recalled later, are current temperature, MAX temperature, MIN temperature, ΔT (difference between MAX and MIN), and AVG (average) temperature.

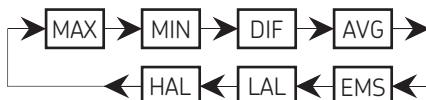

- **To Recall last reading.** The unit will hold the last reading for 7 seconds. Release the trigger and press the Mode button (B). This is a "read-only" condition. By continually pressing Mode, you can cycle through all modes to review previous readings. When the trigger is reactivated, the unit will begin measuring in the last mode selected.

Temperature Probe

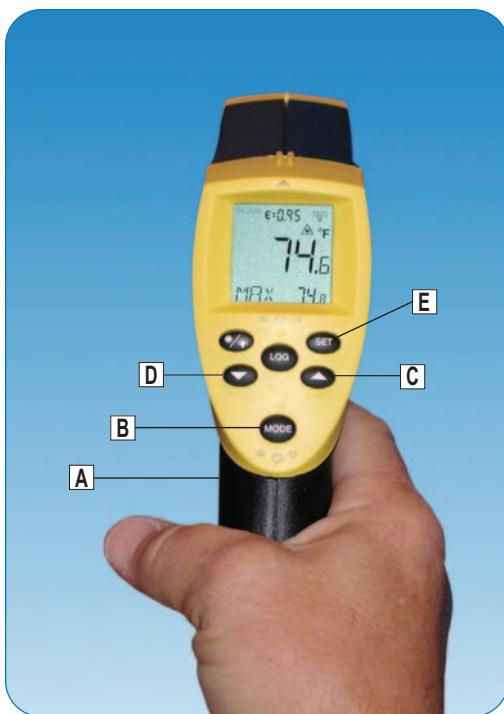

CMSS 2000-SL

Mode Display Codes

- To select Maximum (MAX), Minimum (MIN), Differential (DIF), and Average (AVG) temperature calculations, or to set the Emissivity value (EMS), pull trigger (A) and press the Mode button (B) until the appropriate code appears. Press the up (C) or down (D) arrows to set temperature parameters.

- To set High (HAL) or Low (LAL) alarms, pull trigger (A) and press the Mode button (B) until the appropriate code appears. Press the up (C) or down (D) arrows to set temperature parameters, then press the Set button (E) to activate.

Specifications

Temperature Range: -30°C to +600°C (-25°F to +1100°F)

Accuracy: +23°C (+73°F) and up, $\pm 1\%$ or $\pm 1^\circ\text{C}$ ($\pm 2^\circ\text{F}$), whichever is greater.

-18°C to +23°C (0 to +73°F) $\pm 2^\circ\text{C}$ ($\pm 3^\circ\text{F}$)

-26°C to -18°C (-15°F to 0°F) $\pm 2.5^\circ\text{C}$ ($\pm 4^\circ\text{F}$)

-32°C to -26°C (-25°F to -15°F) $\pm 3^\circ\text{C}$ ($\pm 5^\circ\text{F}$)

Repeatability: $\pm 1\%$ of reading, or $\pm 1^\circ\text{C}$ ($\pm 2^\circ\text{F}$), whichever is greater

Response Time: ≤ 500 mSec, 95% response

Spectral Response: 7 to 18 micrometers

Emissivity: 0.3 to 1.0 digitally adjustable

Temperature Display: °C or °F (selectable), 3.5 digit LCD

Ambient Operating Range: 0 to +50°C (+32°F to +120°F)

Relative Humidity: 10 to 95% relative humidity noncondensing, at up to +30°C (+86°F)

Storage Temperature: -25°C to +70°C (-13°F to +158°F) without battery

Weight: 320gm (11.3 oz)

Dimensions: 137mm x 41mm x 196mm (5.4 inches x 1.6 inches x 7.7 inches)

Power: 9V Alkaline or NiCad battery

Battery Life (Alkaline): 16 hours (laser used 50%, backlight used 50%)

Ordering Information

CMSS 2000-SL Temperature Probe, including Multilingual User Manual (English, French, German, Portuguese, and Spanish).

Optional Accessories

CMPK 60^{plus} Bearing Analysis Kit (English) includes:

- CMSS 2000-SL Temperature Probe
- TMEH1 OilCheck Monitor
- CMVP 40 Vibration Pen^{plus}

CMPK 70^{plus} Bearing Analysis Kit (Metric) includes:

- CMSS 2000-SL Temperature Probe
- TMEH1 OilCheck Monitor
- CMVP 50 Vibration Pen^{plus}
