# **1 Environment and Requirement Analysis**

## **1.1 Project Description**

This project, an online grocery ordering and delivery service, is meant to teach CMSC424 students to analyze project requirements in order to successfully design, implement, document, and demonstrate a database system, in our case, based on the web programming language PHP with an MySQL database backend. The web interface will support purchasing groceries from a nearby store, and then dispatch a delivery driver with the purchased merchandise to the customer's address. Customers will be able to prepare a shopping basket of items, and will specify a "delivery window" during which they will be home to receive the goods.

## **1.2 Phase I Purpose**

Phase I of the project involves determining the environment and requirements, as well as analyzing and specifying the details of the system. Here, we will investigate the information needs of and the activities within the grocery delivery enterprise and determine the boundary of our design problem. We will also divide the functions from the Top-Level Information Flow Diagram into reasonably independent tasks until each task is small enough to be clearly understood, and until the documents used by each task can be conveniently expressed in terms of data elements that cannot be divided any further.

## **1.3 Phase II Purpose**

Phase II of the project involves designing a conceptual schema (E-R data model), along with a logical data model (Relational Schema) of the database. We will also obtain the design and specification of the software, which includes creating pseudocode of each task. This is done at the same time as the design of the database schema to catch most of the errors before the implementation of the program.

## **1.4 Phase III Purpose**

Phase III of the project involves the implementation and testing of the application. In this phase, the conceptual schema and task design specifications are transformed into actual schema definitions (DDL) and application program modules (program code). After the database is created, sample data is entered into the system for later testing. After program coding is completed, through testing is done using the sample data to ensure the application is working as desired. This testing is documented in testing efforts, and should include erroneous cases and how the system detects and handles these cases appropriately. A user manual is then created to describe how to use the system appropriately. Finally the system is analyzed for any limitations and possibilities for improvements are created to address these limitation.

## 1.4 Assumptions

- Parts of New Customer Setup/Customer Data Update are assumed to be handled offline (ie credit check, username and password creation, etc).
- Actual billing of credit cards & checks is outside of the scope of this project and are assumed to be valid and approved by the banking company. Cash, as an impractical payment method, is not allowed.
- For the purpose of the project, the Developers are also the Administrative Staff
- Actions handled outside of the scope of the project (such as delivery people printing and then returning with and filing bills and dispatch tickets) are assumed to be completed.
- Routes are based on distances from the warehouse (\$5 for <= 3 mile radius, \$7 for > 3 and <= 5 mile radius, \$10 for > 5 miles).
- Employees other than drivers will be handled in another application.
- Vehicles are assigned a Vehicle Number and are managed in another application.
- Delivery times will be estimated by Google Maps, and will not take into account any traffic, accidents, weather, etc.
- Costs of products are assumed to not change (other than sales) for simplicity.
- The adding and changing of products is assumed to be handled offline by developers.
- Maryland has a 6% sales tax on all candy, soda, and prepared foods (salad bar, headed foods, deli products, etc).
- Dispatch Tickets and Bills are printed automatically at the warehouse upon order, and are collected in batch to dispatch drivers at the beginning of a time range.
- Delivery drivers write the Date & Time dispatched, arrived, and returned on the Dispatch Ticket, and turn the ticket in when they return. At a later time, an Administrator will enter this information, plus date & time and amount paid into the system in the Administrative Options section.
- Any credit back from customer comments is handled manually on a case by case basis outside of the system.
- In production, “background tasks” would be run automatically, but for simplicity a script to check for tasks to run will be run on demand by Administrators.

## 1.5 Technical/Conceptual Problems and Solutions

### 1.5.1 Technical Problems

**Problem:** No easy way to gather product data to populate the database in the future.

**Solution:** Plan a custom script to scrape data off of Safeway's site and populate DB.

**Problem:** Needed a way to map customer addresses and get distance from warehouse.

**Solution:** Implemented the Google Maps API.

**Problem:** Needed a way to estimate delivery times

**Solution:** Implemented a Traveling Salesman Problem solver for Google Maps that maps each currently pending order for the same date, time range, and driver, and then gives the upper bound of the estimated time that the driver would arrive back at the warehouse after visiting each customer.

**Problem:** Needed a way to run recurring tasks on a schedule.

**Solution:** Created a "background tasks" feature that queried the database for scheduled tasks to run given the days/times/frequencies/etc. This script is assumed to be run every minute by a process on the server in order to automate the procedure.

### 1.5.2 Conceptual Problems

**Problem:** Not enough details known on the workings of a grocery delivery service.

**Solution:** Research various existing services to thoroughly understand the requirements.

**Problem:** Design was overly complicated and impossible to model given constraints.

**Solution:** Created additional assumptions to simplify design.

**Problem:** Delinquent customers need to be deactivated after a certain period of time, but still need to be able to access the site in order to view their balance.

**Solution:** Create a field in the database "Active" which, when set to false, will disallow a customer from placing an order, but will still allow them to login to the site.

## 2 System Analysis and Specification

### 2.1 Procedures

The grocery delivery system will provide a web interface that allows a customer to browse products, select products to purchase, and create orders. The system will process the order to dispatch a driver to the designated location.

#### 2.1.1 User Procedures

The user will visit the main web page of the grocery system. From there, he can utilize the web interface to create orders or initiate queries based on prior transactions. The queries will be formulated into MySQL commands in order to communicate with the MySQL backend database. The results from the MySQL queries will then be formatted appropriately for display to the user in the web browser.

#### 2.1.2 Administrator Procedures

The administrators will first find the source of product information from preexisting grocery websites to be used as the basis for the inventory in the new system. The administrators will also need to develop an inventory management system to ensure that products are kept in stock at reasonable quantities. They will also be responsible for hiring a sufficient number of drivers to handle the deliveries processed through the website.

#### 2.1.3 Developer Procedures

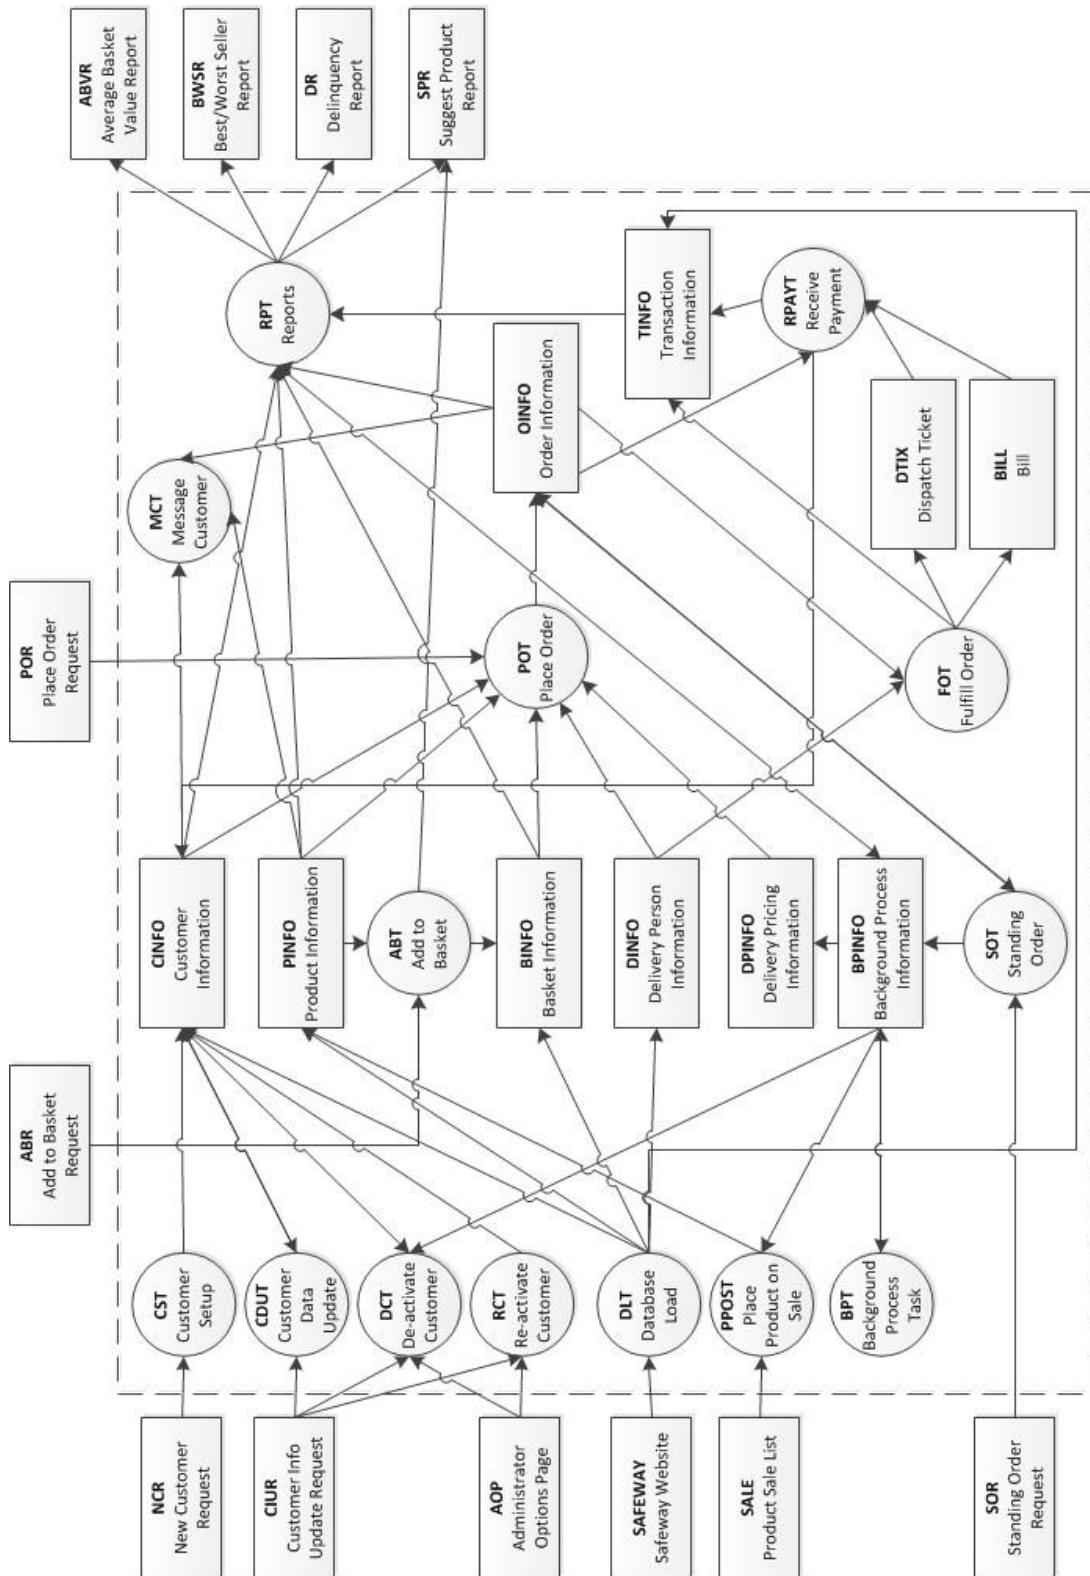

The developer will need to consider the interactions of multiple components when creating the system. The data will be stored on a MySQL server, where the developer will need to implement an efficient structure to manage the data. The MySQL server will interface with the web server upon client-initiated requests. The data flow will be bidirectional, as queries are processed on the MySQL server and then returned to the web server for formatting.

#### 2.1.1 Server Procedures

The Apache web server will run PHP in order to facilitate communication with the MySQL server. The main page will provide an opportunity for either the user or an administrator to log in. If a user logs in, the server will display a page providing the options available, such as placing a new order or initiating queries based on prior orders. Selecting a query will result in backend processing by the server to format the request for data from the MySQL database. It will then receive the response and format it appropriately for display to the user. In the case that an administrator logs in instead of a customer, a different set of queries and reports will be available, but they will be processed in the same way.

## 2.2 Documentation

### 2.2.1 Top-Level Information Flow Diagram

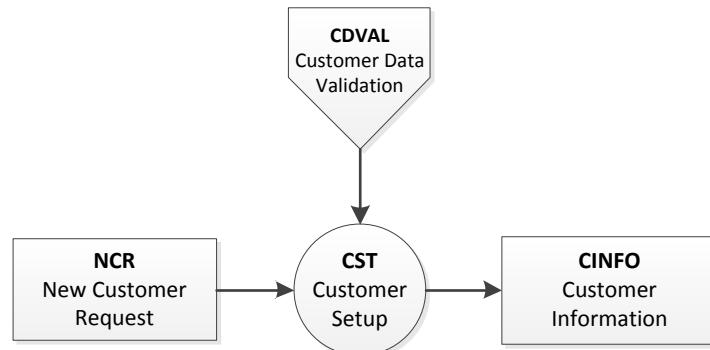

## 2.2.2 Tasks, Subtasks, and Task Flow Diagrams

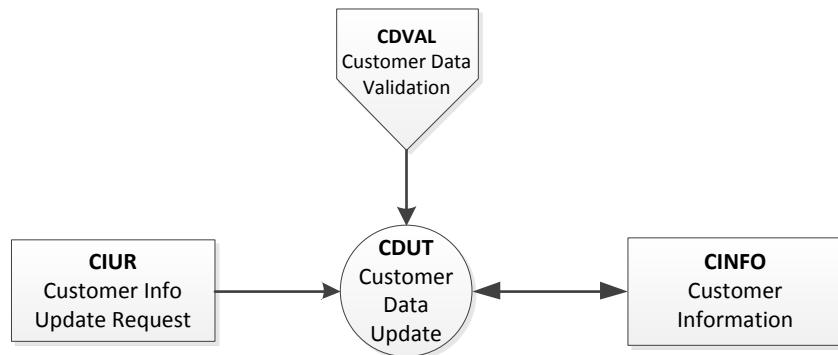

**TASK NUMBER:** CST  
**TASK NAME:** Customer Setup  
**PERFORMER:** New Customer  
**PURPOSE:** Allows the setup of a new customer after receiving customer data  
**ENABLING COND:** New Customer Request (NCR) has been received  
**DESCRIPTION:** Receives incoming data from a New Customer Request (NCR) and analyzes for credit record, delivery address (to be assigned to a route) and computes distance, then enters customer data into the Customer Information (CINFO) structure  
**FREQUENCY:** Once per new customer  
**DURATION:** Short  
**IMPORTANCE:** High  
**MAXIMUM DELAY:** 1 minute  
**INPUT:** New Customer Request (NCR)  
**OUTPUT:** Customer Information (CINFO)  
**DOCUMENT USE:** CIF: Customer Information Form  
**OPS PERFORMED:**

- 1) Analyze data: credit record (offline), assign delivery address to route, compute distance
- 2) Insert data into Customer Information (CINFO)

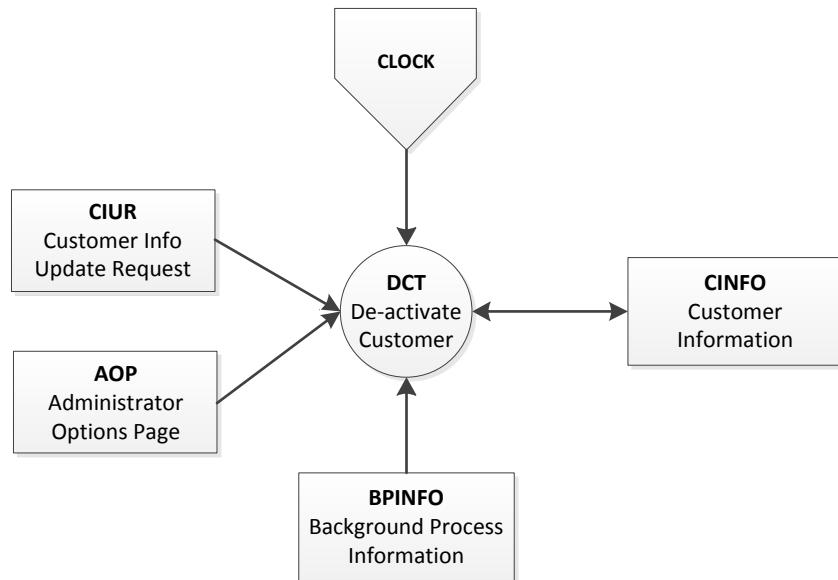

**SUBTASKS:** None  
**ERROR COND:** If fields are missing, customer address is outside of delivery range, or if customer credit record returns unfavorable, return error

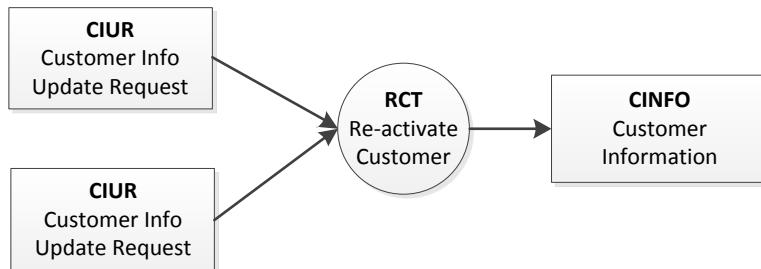

TASK NUMBER: CDUT  
 TASK NAME: Customer Data Update  
 PERFORMER: Customer  
 PURPOSE: To allow customer to update profile data  
 ENABLING COND: Customer exists in Customer Information (CINFO)  
 DESCRIPTION: Allows customers to update any profile information, including address, credit card, etc. May result in need to recalculate distance or recheck credit record.  
 FREQUENCY: Infrequently  
 DURATION: Short  
 IMPORTANCE: High  
 MAXIMUM DELAY: 1 minute  
 INPUT: Customer Info Update Request (CIUR); Customer Information (CINFO)  
 OUTPUT: Customer Information (CINFO)  
 DOCUMENT USE: CIF: Customer Information Form  
 OPS PERFORMED:  
     1) Update information in Customer Information (CINFO) with new data  
     2) If needed, rerun recalculate distance or recheck credit record  
 SUBTASKS: None  
 ERROR COND: If fields are missing, customer address is outside of delivery range, or if customer credit record returns unfavorable, return error

TASK NUMBER: DCT  
 TASK NAME: De-activate Customer  
 PERFORMER: Customer, Administrative Staff, or System  
 PURPOSE: De-activate customer record (but not delete) from system  
 ENABLING COND: Customer exists in Customer Information (CINFO); Customer is not already de-activated  
 DESCRIPTION: Marks a customer as inactive in the database, either by Administrative action (if the customer is delinquent for some period of time) or customer decision  
 FREQUENCY: Infrequently  
 DURATION: Short  
 IMPORTANCE: Low  
 MAXIMUM DELAY: 1 day  
 INPUT: Customer Info Update Request (CIUR) or Administrator Options Page (AOP)  
 OUTPUT: Customer Information (CINFO)  
 DOCUMENT USE: CSF: Customer Status Form  
 OPS PERFORMED: Update Customer Information to set ACTIVE = FALSE  
 SUBTASKS: None  
 ERROR COND: If customer is already de-activated, return error

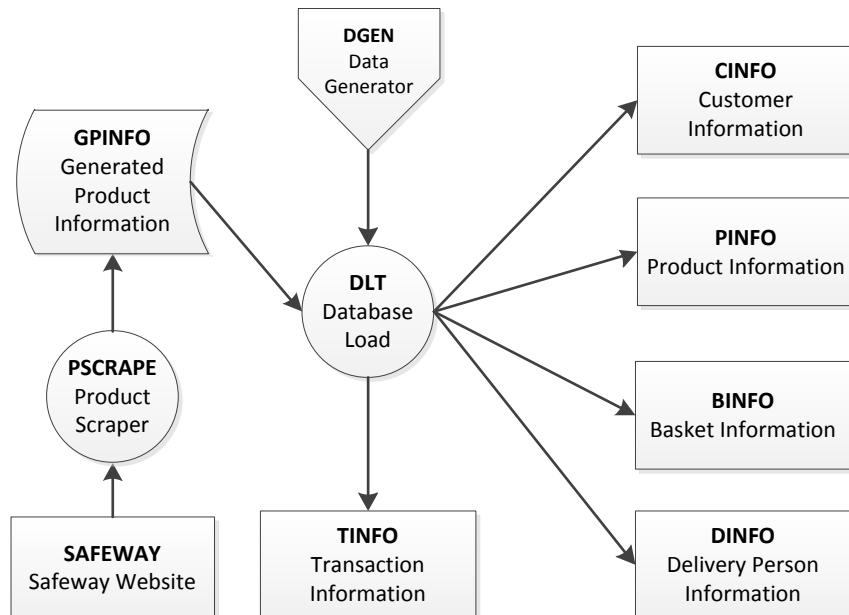

TASK NUMBER: RCT  
 TASK NAME: Re-activate Customer  
 PERFORMER: Administrative Staff  
 PURPOSE: Re-activate customer record in system  
 ENABLING COND: Customer exists in Customer Information (CINFO); Customer is not currently activated  
 DESCRIPTION: Marks a customer as active in the database  
 FREQUENCY: Infrequently  
 DURATION: Short  
 IMPORTANCE: Low  
 MAXIMUM DELAY: 1 minute  
 INPUT: Administrator Options Page (AOP)  
 OUTPUT: Customer Information (CINFO)  
 DOCUMENT USE: CSF: Customer Status Form  
 OPS PERFORMED: Update Customer Information to set ACTIVE = TRUE  
 SUBTASKS: None  
 ERROR COND: If customer is not de-activated, return error

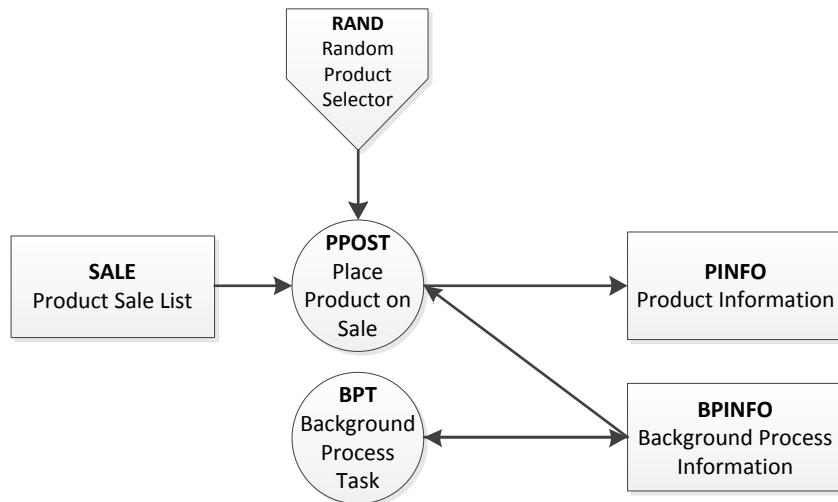

TASK NUMBER: DLT  
 TASK NAME: Database Load  
 PERFORMER: Database Administrator  
 PURPOSE: Populate the database  
 ENABLING COND: The database has been created  
 DESCRIPTION: Populates the database with products, customers, delivery drivers, and randomly generated baskets and transactions  
 FREQUENCY: Once  
 DURATION: Medium  
 IMPORTANCE: Very high  
 MAXIMUM DELAY: N/A  
 INPUT: Safeway Website data (SAFEWAY)  
 OUTPUT: Product Information (PINFO); Customer Information (CINFO); Basket Information (BINFO); Delivery Person Information (DINFO); Transaction Information (TINFO)  
 DOCUMENT USE: DLF: Database Load Form  
 OPS PERFORMED:
 

- 1) Generate and execute Product, Customer, and Delivery Driver insert queries
- 2) Generate and execute insert queries of baskets using a random number generator to generate M baskets with anything between 1-N number of items per basket, spread over the different times of the day with a binormal distribution on time with peaks around noon and 6 pm

 SUBTASKS: None  
 ERROR COND: None

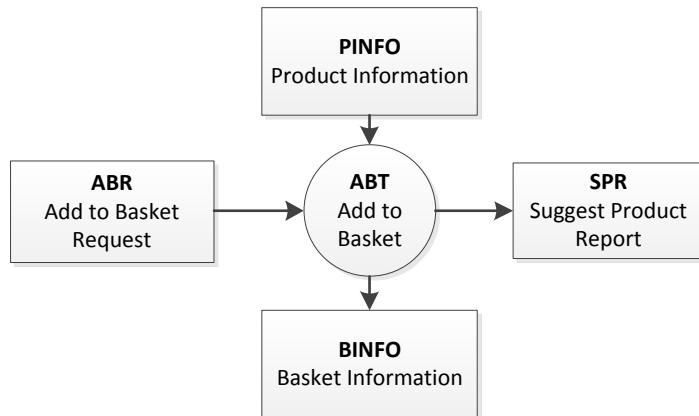

TASK NUMBER: PPOST  
 TASK NAME: Place/Unplace Product on Sale  
 PERFORMER: System  
 PURPOSE: Places an item on sale and notifies customers/removes a sale price from an item  
 ENABLING COND: Products exist in Product Information (PINFO); It is time for a task in Background Process Information (BPINFO) to run (specifically this PPOST task)  
 DESCRIPTION: Weekly process that inputs a list of products to put on sale, updates the price in Product Information (PINFO) and sends out a message to customers who have purchased the items in the past, or removes a sale price from a product.  
 FREQUENCY: Weekly  
 DURATION: Short  
 IMPORTANCE: Medium  
 MAXIMUM DELAY: 12 hours  
 INPUT: Product Sale List (SALE); Background Process Information (BPINFO)  
 OUTPUT: Product Information (PINFO)  
 DOCUMENT USE: PSF: Product Sale Form  
 OPS PERFORMED: 1) Generate and execute Product update query to reflect sale price  
                   2) Run Message Customer (MCT) to alert customers of sale price  
 SUBTASKS: Message Customer (MCT)  
 ERROR COND: If product appears in Product Sale List (SALE) but not in Product Information (PINFO) return error (for this product); If Message Customer (MCT) returns an error, return same error.

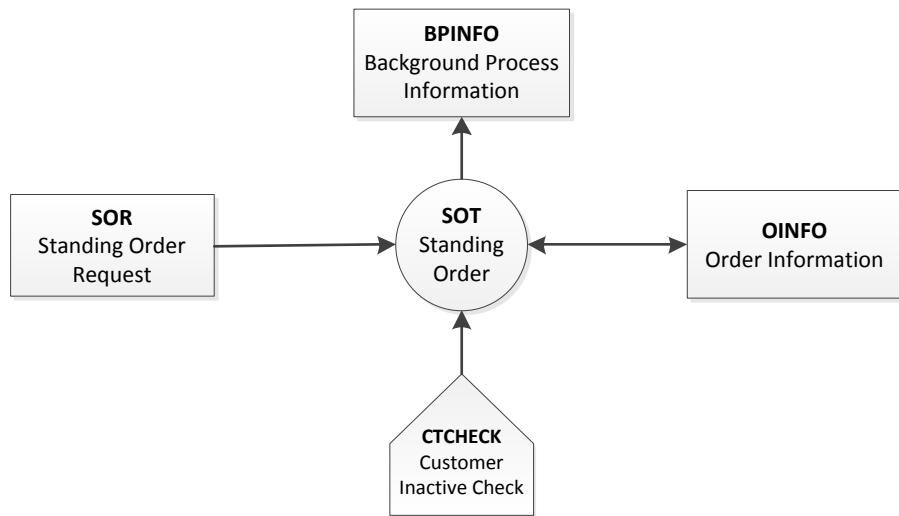

TASK NUMBER: BPT  
 TASK NAME: Background Process Task  
 PERFORMER: System  
 PURPOSE: Execute a background process subtask at a designated date/time  
 ENABLING COND: See subtask  
 DESCRIPTION: General task used to determine when to run, and to actually run, a subtask designated in Background Process Information (BPINFO)  
 FREQUENCY: See subtask  
 DURATION: See subtask  
 IMPORTANCE: See subtask  
 MAXIMUM DELAY: See subtask  
 INPUT: Background Process Information (BPINFO); See subtask  
 OUTPUT: Background Process Information (BPINFO); See subtask  
 DOCUMENT USE: [internal]  
 OPS PERFORMED: 1) Start designated subtask  
                   2) See subtask  
 SUBTASKS: Place Product on Sale (PPOST); Place Order (POT); Generate Delinquency Report (RPT.3)  
 ERROR COND: See subtasks

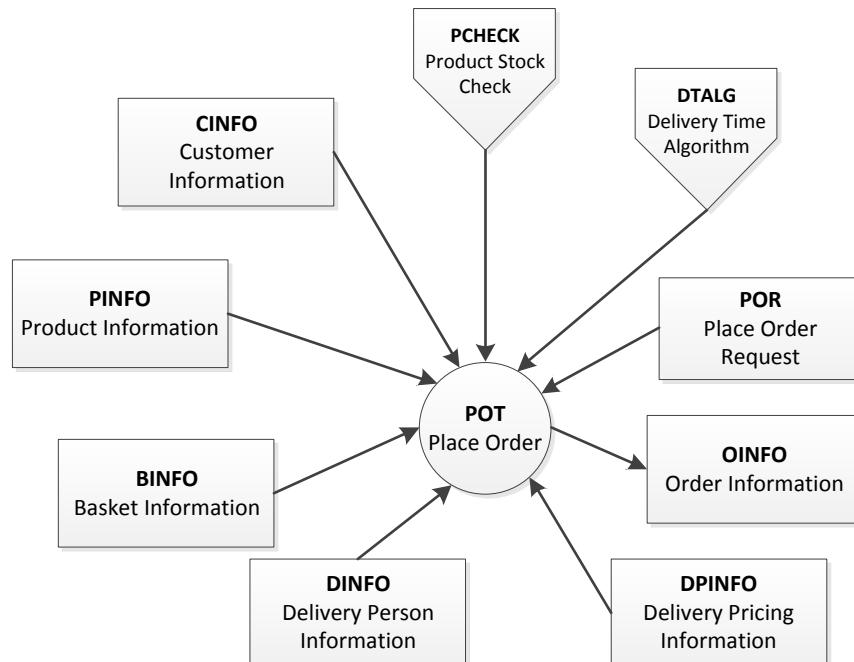

TASK NUMBER: ABT  
 TASK NAME: Add to Basket  
 PERFORMER: Customer  
 PURPOSE: Adds a product to a customer's basket (creating basket if necessary)  
 ENABLING COND: Customer exist in Customer Information (CINFO); Products exist in Product Information (PINFO);  
 DESCRIPTION: Adds a product selected by the Customer into his/her basket  
 FREQUENCY: Frequently  
 DURATION: Short  
 IMPORTANCE: High  
 MAXIMUM DELAY: 10 seconds  
 INPUT: Add to Basket Request (ABR); Product Information (PINFO)  
 OUTPUT: Basket Information (BINFO)  
 DOCUMENT USE: APBF: Add Product to Basket Form  
 OPS PERFORMED: Generate and execute insert query to add product to customer basket  
 SUBTASKS: None  
 ERROR COND: If customer or product does not exist, return error.

TASK NUMBER: SOT  
 TASK NAME: Standing Order  
 PERFORMER: Customer  
 PURPOSE: Starts or stops a Standing Order  
 ENABLING COND: Order exists in Order Information (OINFO)  
 DESCRIPTION: Allows a customer to designate (or deactivate) a “standing order” that occurs on set delivery times  
 FREQUENCY: Varies  
 DURATION: Short  
 IMPORTANCE: High  
 MAXIMUM DELAY: 1 minute  
 INPUT: Standing Order Request (SOR); Order Information (OINFO)  
 OUTPUT: Background Process Information (BPINFO); Order Information (OINFO)  
 DOCUMENT USE: SORF: Standing Order Request Form  
 OPS PERFORMED: Enable or disable Standing Order in Background Process Information (BPINFO)  
 SUBTASKS: None  
 ERROR COND: If order does not exist in Order Information (OINFO) return error.

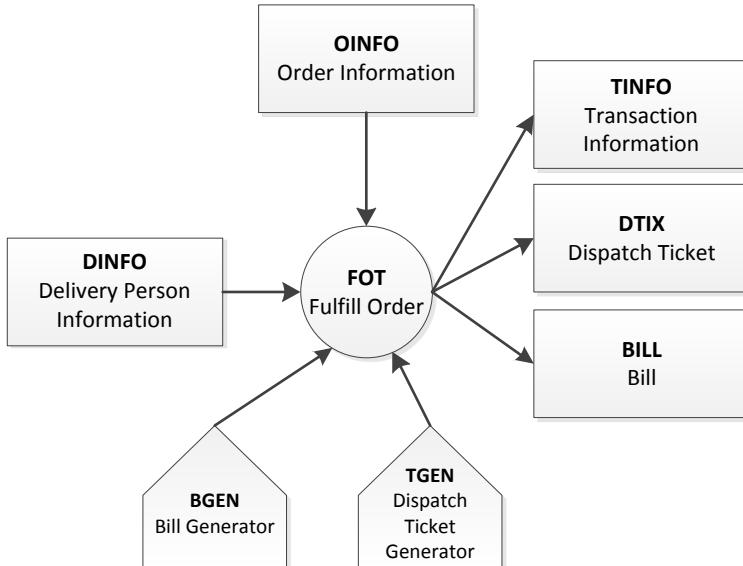

TASK NUMBER:	POT
TASK NAME:	Place Order
PERFORMER:	Customer/System
PURPOSE:	Allows a customer to place an order
ENABLING COND:	Customer exist in Customer Information (CINFO); Products exist in Product Information (PINFO); Basket is present in Basket Information (BINFO); Delivery Person is available in Delivery Person Information (DINFO); The customers address exists in Delivery Pricing Information (DPINFO);
DESCRIPTION:	Customer supplies order, payment method, and delivery time, and the system calculates the availability of the products and an estimate for the delivery time. Can also be run by system acting on a Standing Order
FREQUENCY:	Frequently
DURATION:	Medium
IMPORTANCE:	Very high
MAXIMUM DELAY:	1 minute
INPUT:	Place Order Request (POR); Customer Information (CINFO); Product Information (PINFO); Basket Information (BINFO); Delivery Person Information (DINFO); Delivery Pricing Information (DPINFO);
OUTPUT:	Order Information (OINFO)
DOCUMENT USE:	POF: Place Order Form
OPS PERFORMED:	<ol style="list-style-type: none"> <li>1) Check the availability of the products in the basket, return any errors</li> <li>2) Calculate the total cost, including delivery fees</li> <li>3) Estimate the earliest possible delivery time (from available delivery people)</li> <li>4) If the order is accepted, activate the Fulfill Order subtask</li> </ol>
SUBTASKS:	Fulfill Order (FOT)
ERROR COND:	If any of the enabling conditions are not met, return an error.

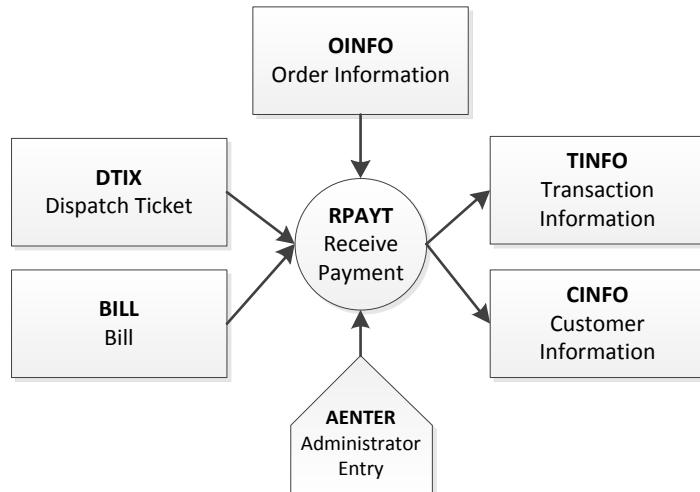

TASK NUMBER: FOT  
 TASK NAME: Fulfill Order  
 PERFORMER: System  
 PURPOSE: Fulfils a customer's order  
 ENABLING COND: Valid order exists in Order Information (OINFO)  
 DESCRIPTION: Accepts order and generates dispatch ticket and bill, records transaction information and dispatches delivery person.  
 FREQUENCY: Frequently  
 DURATION: Short  
 IMPORTANCE: Very high  
 MAXIMUM DELAY: 1 minute  
 INPUT: Order Information (OINFO); Delivery Person Information (DINFO)  
 OUTPUT: Transaction Information (TINFO); Dispatch Ticket (DTIX); Bill (BILL)  
 DOCUMENT USE: [internal]  
 OPS PERFORMED:  
     1) Generate a "dispatch ticket" and a "bill"  
     2) Determine who will deliver the order and when  
     3) Generate and execute insert statement for generated documents in Transaction Information (TINFO)

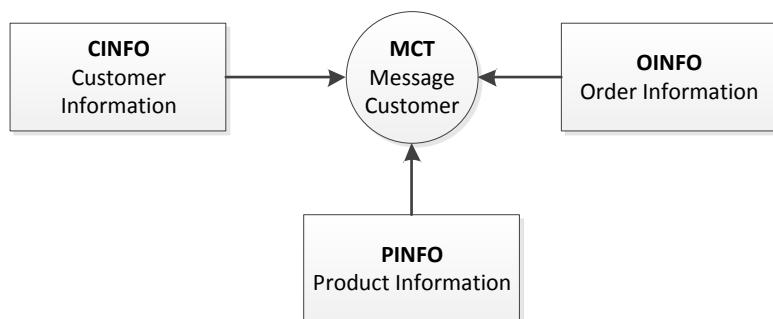

SUBTASKS: None  
 ERROR COND: If the order does not exist, return an error.

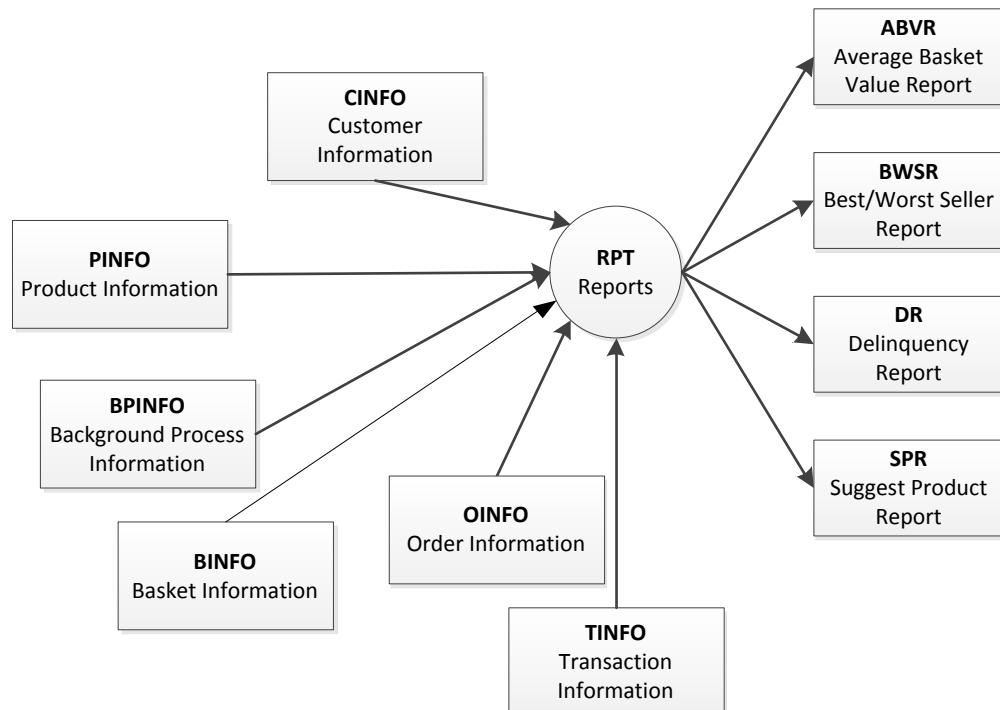

TASK NUMBER: RPAYT  
 TASK NAME: Receive Payment  
 PERFORMER: System  
 PURPOSE: Updates customer account balance & transaction log  
 ENABLING COND: Order exists in Order Information (OINFO)  
 DESCRIPTION: A payment is received from a customer and his/her account balance and the transaction log are updated accordingly. Also records and comments from customer on dispatch ticket.  
 FREQUENCY: Frequently  
 DURATION: Varies  
 IMPORTANCE: Very high  
 MAXIMUM DELAY: Varies  
 INPUT: Bill (BILL); Dispatch Ticket (DTIX); Order Information (OINFO)  
 OUTPUT: Transaction Information (TINFO)  
 DOCUMENT USE: [internal]  
 OPS PERFORMED: 1) Generate and execute update query on customers account balance  
                   2) Generate and execute insert statement for transaction in Transaction Information (TINFO)  
 SUBTASKS: None  
 ERROR COND: If the order does not exist, refuse the payment and return an error.

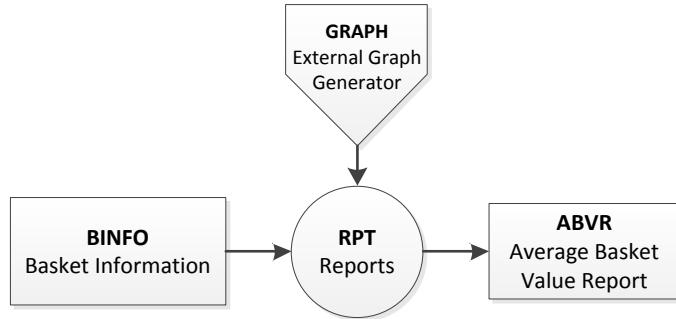

TASK NUMBER: MCT  
 TASK NAME: Message Customer  
 PERFORMER: System  
 PURPOSE: Send a message to a customer  
 ENABLING COND: The customer exists in Customer Information (CINFO)  
 DESCRIPTION: Sends a message to a customer (for a variety of reasons, including delinquency notice, sale notice, order placement, etc)  
 FREQUENCY: Frequently  
 DURATION: Short  
 IMPORTANCE: Medium  
 MAXIMUM DELAY: 1 minute  
 INPUT: Customer Information (CINFO); Optionally: Product Information (OINFO); Order Information (OINFO)  
 OUTPUT: A message to a customer  
 DOCUMENT USE: CMF: Customer Message Form  
 OPS PERFORMED: Send message parameter to customer parameter  
 SUBTASKS: None  
 ERROR COND: If message send fails, return error.

TASK NUMBER:	RPT
TASK NAME:	Reports
PERFORMER:	System/Administrative Staff
PURPOSE:	Generate a variety of system reports
ENABLING COND:	Customers have been set up (CST); Database has been loaded (DLT); Background processes are running (BPT); Orders have been placed (POT); Orders have been fulfilled (FOT);
DESCRIPTION:	Generates system reports on a variety of subjects, including Average Basket Values, Best/Worst Sellers, Delinquency Reports, and Suggested Products based on data recorded by the program and generated either on a schedule or on demand (see subtasks for more details)
FREQUENCY:	See subtasks
DURATION:	See subtasks
IMPORTANCE:	See subtasks
MAXIMUM DELAY:	See subtasks
INPUT:	Customer Information (CINFO); Product Information (PINFO); Order Information (OINFO); Transaction Information (TINFO); Background Process Information (BPINFO)
OUTPUT:	Average Basket Value Report (ABVR); Best/Worst Seller Report (BWSR); Delinquency Report (DR); Suggest Product Report (SPR)
DOCUMENT USE:	RRF: Report Request Form
OPS PERFORMED:	See subtasks
SUBTASKS:	Generate Average Basket Value Report (RPT.1); Generate Best/Worst Seller Report (RPT.2); Generate Delinquency Report (RPT.3); Generate Suggest Product Report (RPT.4)
ERROR COND:	See subtasks

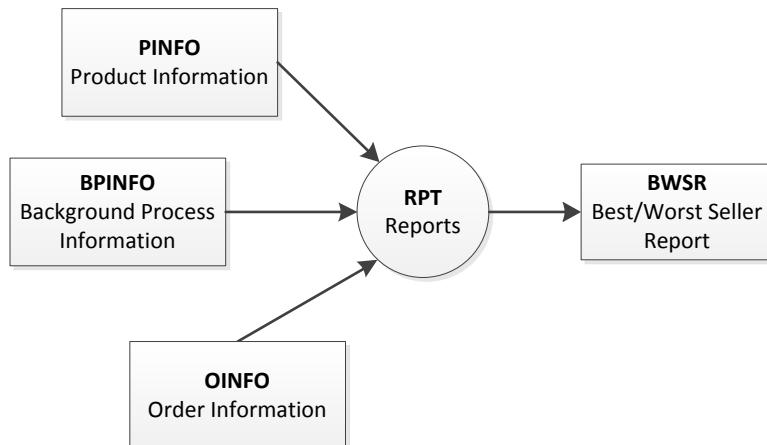

TASK NUMBER: RPT.1  
 TASK NAME: Generate Average Basket Value Report  
 PERFORMER: Administrative Staff  
 PURPOSE: Gather statistical information on average basket value  
 ENABLING COND: Customers have been set up (CST); Database has been loaded (DLT);  
 Background processes are running (BPT); Orders have been placed (POT);  
 DESCRIPTION: Generates a report on demand detailing the average basket value at a range of times, from hours, to days, to weeks, and etc. This report will display each days hourly average, or each weeks daily average, etc.  
 FREQUENCY: On demand by Administrative Staff  
 DURATION: Medium  
 IMPORTANCE: Very high  
 MAXIMUM DELAY: 1 minute  
 INPUT: Basket Information (BINFO)  
 OUTPUT: Average Basket Value Report (ABVR)  
 DOCUMENT USE: ABVRF: Average Basket Value Form  
 OPS PERFORMED:  
     1) Request time frame to report  
     2) Generate and execute query to average basket value for given time interval  
     3) Display results in report form, including graph of hourly/daily intervals  
 SUBTASKS: None  
 ERROR COND: If no baskets have been created, return error

TASK NUMBER: RPT.2  
 TASK NAME: Generate Best/Worst Seller Report  
 PERFORMER: System/Administrative Staff  
 PURPOSE: Find the best and worst selling products  
 ENABLING COND: Customers have been set up (CST); Database has been loaded (DLT); Background processes are running (BPT); Orders have been placed (POT);  
 DESCRIPTION: Generates a weekly report to find the best and worse selling products (by category) to ensure stock, as well as suggest products to be put on sale or to be discontinued (and start subtask if instructed by Administrator)  
 FREQUENCY: Weekly, or on demand by Administrative Staff  
 DURATION: Medium  
 IMPORTANCE: High  
 MAXIMUM DELAY: 1 minute  
 INPUT: Product Information (PINFO); Order Information (OINFO); Background Process Information (BPINFO)  
 OUTPUT: Best/Worst Seller Report (BWSR)  
 DOCUMENT USE: BWSRF: Best/Worst Seller Report Form  
 OPS PERFORMED:
 

- 1) Request time frame to report / Use weekly time frame
- 2) Generate and execute query to average basket value for given time interval
- 3) Display results in report form, including graph of hourly/daily intervals
- 4) Suggest, and place items on sale (if approved by Administrator)

 SUBTASKS: Place Product on Sale (PPOST)  
 ERROR COND: If no products have been ordered, return error

TASK NUMBER: RPT.3  
 TASK NAME: Generate Delinquency Report  
 PERFORMER: System  
 PURPOSE: Alert Customers of delinquency issues  
 ENABLING COND: Customers have been set up (CST); Database has been loaded (DLT); Background processes are running (BPT); Orders have been placed (POT); Orders have been fulfilled (FOT);  
 DESCRIPTION: Generates a report of customers with an outstanding balance that exceeds some maximum and who have not ordered any products more than some specified time, sends them a delinquency notice and de-activates them.  
 FREQUENCY: Daily  
 DURATION: Medium  
 IMPORTANCE: Very high  
 MAXIMUM DELAY: 1 minute  
 INPUT: Customer Information (CINFO); Order Information (OINFO); Transaction Information (TINFO); Background Process Information (BPINFO)  
 OUTPUT: Delinquency Report (DR)  
 DOCUMENT USE: DRF: Delinquency Report Form  
 OPS PERFORMED:
 

- 1) Generate and execute query to find all customers with an outstanding balance that exceeds some maximum and who have not ordered any products more than some specified time
- 2) Call MCT to send customer a delinquency notice
- 3) Call DCT to de-activate customer

 SUBTASKS: Message Customer (MCT); De-activate Customer (DCT)  
 ERROR COND: If no orders have been placed, return error

TASK NUMBER: RPT.4  
 TASK NAME: Generate Suggest Product Report  
 PERFORMER: System  
 PURPOSE: Gather statistical information on average basket value  
 ENABLING COND: Customers have been set up (CST); Database has been loaded (DLT); Background processes are running (BPT); Orders have been placed (POT); Customer has transaction history.  
 DESCRIPTION: Generates a list of recommended products based on prior purchases.  
 FREQUENCY: Upon customer request.  
 DURATION: Short  
 IMPORTANCE: Medium  
 MAXIMUM DELAY: 1 minute  
 INPUT: Basket Information (BINFO); Product Information (PINFO)  
 OUTPUT: Suggest Product Report (SPR)  
 DOCUMENT USE: SPRF: Suggest Product Report Form  
 OPS PERFORMED:
 

- 1) Generate query to search Product Information (PINFO) for items similar to the item just added to the basket
- 2) Execute query and receive results
- 3) Display results on basket page and suggest Customer adds recommended products to basket as well

 SUBTASKS: Add to Basket (ABT)  
 ERROR COND: None

### 3 Conceptual Modeling

#### 3.1 E-R Model Graphical Schema

## 4 Logical Modeling

### 4.1 Logical Schema

#### CUSTOMERS

CustomerID	FirstName	LastName	AddressStreet	AddressCity	AddressState	AddressZip	
Gender	Username	Password	Email	Balance	BalanceDate	Active	AdminUser

**Note:** The BalanceDate stores the last date that the Customer's account balance was updated.

#### PAYMENT\_TYPES

CustomerID	PaymentID	PaymentType	PaymentInfo
------------	-----------	-------------	-------------

**Note:** The PaymentInfo stores a credit card number or a balance limit, depending on PaymentType.

#### PRODUCT\_CATEGORIES

Category_IDX	Category
--------------	----------

#### PRODUCT\_SUB\_CATEGORIES

Category_IDX	Sub_Category_IDX	Category
--------------	------------------	----------

#### PRODUCTS

ProductID	Description	cat	subcat	Manufacturer	Price	Taxable	SaleStatus	SalePrice	Stock
-----------	-------------	-----	--------	--------------	-------	---------	------------	-----------	-------

#### BASKETS

BasketID	CustomerID	ProductArray	LastModified	Active
----------	------------	--------------	--------------	--------

**Note:** The ProductArray will be a comma separated list of ProductIDs parsed by the application.  
Active will indicate whether the basket is a current or past order.

#### DELIVERY\_PEOPLE

DriverID	RouteID	Name	Address	WorkHours	Salary	Vehicle
----------	---------	------	---------	-----------	--------	---------

**Note:** The Vehicle field is assumed to be a Vehicle Number managed by a separate application.

#### DELIVERY\_ROUTES

RouteID	LowerRange	UpperRange	Price
---------	------------	------------	-------

**Note:** Routes are assumed to be based on distance, ie a <= 1 mile radius, a >1 and <= 2 mile radius, etc.

#### ORDERS

OrderID	CustomerID	BasketID	PaymentID	DeliveryDate	DeliveryTimeRange	DriverID
BasePrice	SalesTax	DeliveryCharge				

### STANDING\_ORDERS

StandingOrderID	OrderID	Frequency	StartDate	EndDate	Active
-----------------	---------	-----------	-----------	---------	--------

### TRANSACTIONS

TransactionID	OrderID	StandingOrderID	TicketNum	BillNum	DateTimeOrdered
Comments	Date	Date	Date	Date	AmountPaid

### BACKGROUND PROCESSES

ProcessID	TaskID	Days	Times	Frequency	LastRan
-----------	--------	------	-------	-----------	---------

**Note:** TaskIDs will be identifiers of hard coded tasks, and will be used to decide which task to run.  
 Days will be an array of seven 0 or 1s, for true/false. Times will be an array of 24 hour times.  
 Frequency will be an amount of hours between runs.

## 4.2 Data Definition Language

### CUSTOMERS

```
CREATE TABLE `CUSTOMERS` (
  `CustomerID` int(11) NOT NULL auto_increment,1
  `FirstName` varchar(50) NOT NULL,
  `LastName` varchar(50) NOT NULL,
  `AddressStreet` varchar(75) NOT NULL,
  `AddressCity` varchar(50) NOT NULL,
  `AddressState` varchar(2) NOT NULL,
  `AddressZip` varchar(5) NOT NULL,
  `Gender` varchar(6) NOT NULL,
  `Username` varchar(16) NOT NULL,
  `Password` varchar(32) NOT NULL,
  `Email` varchar(75) NOT NULL,
  `Balance` varchar(6) NOT NULL default '0',
  `BalanceDate` date default NULL,
  `Active` varchar(1) NOT NULL default 'Y',
  `AdminUser` tinyint(1) NOT NULL default '0',
  PRIMARY KEY  (`CustomerID`),
  UNIQUE KEY `Username` (`Username`)
) ENGINE=InnoDB;
```

### PAYMENT\_TYPES

```
CREATE TABLE PAYMENT_TYPES (
  CustomerID int(11) NOT NULL,2
  PaymentID tinyint(4) NOT NULL,
  PaymentType enum('Credit Card','Checking Account') default NULL,
  PaymentInfo varchar(75) NOT NULL,
  PRIMARY KEY  (CustomerID,PaymentID),
  CONSTRAINT `PAYMENT_TYPES_ibfk_1` FOREIGN KEY (`CustomerID`) REFERENCES
  `CUSTOMERS` (`CustomerID`)
) ENGINE=InnoDB;
```

---

<sup>1</sup> The CustomerID is a common foreign key to many relations

<sup>2</sup> CustomerID is a foreign key to the CUSTOMERS table used in the CUSTOMER HAVE PAYMENT TYPES relation

## PRODUCT\_CATEGORIES

```
CREATE TABLE PRODUCT_CATEGORIES (
    CATEGORY_IDX tinyint(2) NOT NULL,
    CATEGORY varchar(75) NOT NULL,
    PRIMARY KEY (CATEGORY_IDX)
) ENGINE=InnoDB;
```

## PRODUCT\_SUB\_CATEGORIES

```
CREATE TABLE PRODUCT_SUB_CATEGORIES (
    CATEGORY_IDX tinyint(2) NOT NULL,3
    SUB_CATEGORY_IDX tinyint(2) NOT NULL,
    CATEGORY varchar(75) NOT NULL,
    PRIMARY KEY (CATEGORY_IDX, SUB_CATEGORY_IDX),
    CONSTRAINT PRODUCT_SUB_CATEGORIES_ibfk_1 FOREIGN KEY (CATEGORY_IDX)
        REFERENCES PRODUCT_CATEGORIES (CATEGORY_IDX)
) ENGINE=InnoDB;
```

## PRODUCTS

```
CREATE TABLE PRODUCTS (
    ProductID varchar(10) NOT NULL,
    Description varchar(75) NOT NULL,
    cat tinyint(2) NOT NULL,4
    subcat tinyint(2) NOT NULL,5
    Manufacturer varchar(100) default NULL,
    Price float NOT NULL,
    Taxable tinyint(1) default NULL,
    SaleStatus tinyint(1) default NULL,
    SalePrice varchar(6) default NULL,
    Stock int(4) default NULL,
    PRIMARY KEY (ProductID),
    KEY cat (cat),
    KEY subcat (subcat),
    CONSTRAINT PRODUCTS_ibfk_1 FOREIGN KEY (cat) REFERENCES PRODUCT_CATEGORIES
        (CATEGORY_IDX)
) ENGINE=InnoDB;
```

## BASKETS

```
CREATE TABLE BASKETS (
    BasketID int(11) NOT NULL auto_increment,
    CustomerID int(11) NOT NULL,6
    ProductArray varchar(2000) default NULL,
    LastModified datetime NOT NULL,
    Active tinyint(1) NOT NULL default '1',
    PRIMARY KEY (BasketID),
    KEY CustomerID (CustomerID),
    CONSTRAINT BASKETS_ibfk_1 FOREIGN KEY (CustomerID) REFERENCES CUSTOMERS
        (CustomerID)
) ENGINE=InnoDB;
```

---

<sup>3</sup> CATEGORY\_IDX is a foreign key to the PRODUCT\_CATEGORIES table used in the SUBCATEGORY\_OF\_CATEGORY relation

<sup>4</sup> cat is a foreign key to the PRODUCT\_CATEGORIES table used in the PRODUCT\_OF\_CATEGORY relation

<sup>5</sup> subcat is a foreign key to the PRODUCT\_CATEGORIES table used in the PRODUCT\_OF\_SUBCATEGORY relation

<sup>6</sup> CustomerID is a foreign key to the CUSTOMERS table used in the CUSTOMERS\_HAVE\_BASKETS relation

## DELIVERY\_PEOPLE

```
CREATE TABLE DELIVERY_PEOPLE (
    DriverID int(11) NOT NULL auto_increment,
    RouteID int(11) NOT NULL,7
    `Name` varchar(100) NOT NULL,
    Address varchar(150) NOT NULL,
    WorkHours varchar(10) NOT NULL,
    Salary float NOT NULL,
    Vehicle int(11) NOT NULL,
    PRIMARY KEY (DriverID),
    KEY RouteID (RouteID),
    CONSTRAINT DELIVERY_PEOPLE_ibfk_1 FOREIGN KEY (RouteID) REFERENCES
        DELIVERY_ROUTES (RouteID)
) ENGINE=InnoDB;
```

## DELIVERY\_ROUTES

```
CREATE TABLE DELIVERY_ROUTES (
    RouteID int(11) NOT NULL auto_increment,
    LowerRange float NOT NULL,
    UpperRange float NOT NULL,
    Price float NOT NULL,
    PRIMARY KEY (RouteID)
) ENGINE=InnoDB;
```

## ORDERS

```
CREATE TABLE ORDERS (
    OrderID int(11) NOT NULL auto_increment,
    CustomerID int(11) NOT NULL,8
    BasketID int(11) NOT NULL,9
    PaymentID tinyint(4) NOT NULL,10
    DeliveryDate date NOT NULL,
    DeliveryTimeRange varchar(15) NOT NULL,
    DriverID int(11) NOT NULL,11
    BasePrice float NOT NULL,
    SalesTax float NOT NULL,
    DeliveryCharge float NOT NULL,
    PRIMARY KEY (OrderID),
    KEY CustomerID (CustomerID),
    KEY BasketID (BasketID),
    KEY PaymentID (PaymentID),
    KEY DriverID (DriverID),
    CONSTRAINT ORDERS_ibfk_1 FOREIGN KEY (CustomerID) REFERENCES CUSTOMERS
        (CustomerID),
    CONSTRAINT ORDERS_ibfk_2 FOREIGN KEY (BasketID) REFERENCES BASKETS
        (BasketID),
    CONSTRAINT ORDERS_ibfk_3 FOREIGN KEY (DriverID) REFERENCES DELIVERY_PEOPLE
        (DriverID)
) ENGINE=InnoDB;
```

<sup>7</sup> RouteID is a foreign key to the DELIVERY\_ROUTES table used in the DELIVERY PERSON ASSIGNED A ROUTE relation

<sup>8</sup> CustomerID is a foreign key to the CUSTOMERS table used in the CUSTOMER PLACES A ORDER relation

<sup>9</sup> BasketID is a foreign key to the BASKETS table used in the ORDERS CONTAIN BASKETS relation

<sup>10</sup> PaymentID is a foreign key to the PAYMENT\_TYPES table used in the ORDERS PAID BY PAYMENT TYPE relation

<sup>11</sup> DriverID is a foreign key to the DELIVERY\_PEOPLE table used in the ORDERS DELIVERED BY DELIVERY PEOPLE relation

## STANDING\_ORDERS

```
CREATE TABLE STANDING_ORDERS (
    StandingOrderID int(11) NOT NULL auto_increment,
    OrderID int(11) NOT NULL,12
    Frequency int(11) NOT NULL,
    StartDate date NOT NULL,
    EndDate date NOT NULL,
    Active int(1) NOT NULL default '1',
    PRIMARY KEY (StandingOrderID),
    UNIQUE KEY OrderID (OrderID),
    CONSTRAINT STANDING_ORDERS_ibfk_1 FOREIGN KEY (OrderID) REFERENCES ORDERS
        (OrderID)
) ENGINE=InnoDB;
```

## TRANSACTIONS

```
CREATE TABLE TRANSACTIONS (
    TransactionID int(11) NOT NULL auto_increment,
    OrderID int(11) NOT NULL,13
    StandingOrderID int(11) default NULL,14
    TicketNum int(11) NOT NULL,
    BillNum int(11) NOT NULL,
    DateTimeOrdered datetime default NULL,
    DateTimeDispatched datetime default NULL,
    DateTimeArrived datetime default NULL,
    DateTimeReturned datetime default NULL,
    DateTimePaid datetime default NULL,
    AmountPaid varchar(7) default NULL,
    Comments varchar(500) default NULL,
    PRIMARY KEY (TransactionID),
    UNIQUE KEY OrderID (OrderID),
    UNIQUE KEY `TicketNum` (`TicketNum`),
    UNIQUE KEY `BillNum` (`BillNum`),
    KEY `StandingOrderID` (`StandingOrderID`),
    CONSTRAINT TRANSACTIONS_ibfk_1 FOREIGN KEY (OrderID) REFERENCES ORDERS
        (OrderID),
    CONSTRAINT `TRANSACTIONS_ibfk_2` FOREIGN KEY (`StandingOrderID`) REFERENCES
        `STANDING_ORDERS` (`StandingOrderID`)
) ENGINE=InnoDB;
```

## BACKGROUND\_PROCESSES

```
CREATE TABLE BACKGROUND_PROCESSES (
    ProcessID int(11) NOT NULL auto_increment,
    TaskID varchar(10) NOT NULL,
    Days varchar(13) NOT NULL default '0,0,0,0,0,0,0,0',
    Times varchar(500) NOT NULL,
    Frequency int(11) NOT NULL,
    LastRan datetime default NULL,
    PRIMARY KEY (ProcessID)
) ENGINE=InnoDB;
```

---

<sup>12</sup> OrderID is a foreign key to the ORDERS table used in the STANDING ORDER OF ORDER relation

<sup>13</sup> OrderID is a foreign key to the ORDERS table used in the TRANSACTION FOR ORDER relation

<sup>14</sup> StandingOrderID is a foreign key to the STANDING\_ORDERS table used in the TRANSACTION FOR STANDING ORDER relation

## 5 Task Emulation

### 5.1 Task Design Specification

#### **Customer Setup**

While no data/error in data

Prompt for customer data (First & Last Name, Address, Sex, Age, Email, Payment Info)

If data includes credit card number, then run credit check (offline)

Analyze address to compute distance and assign to delivery route

Run query "INSERT INTO CUSTOMERS (FirstName, LastName, Address, Sex, Age, Email, Active) VALUES (\$firstName, \$lastName, \$address, \$sex, \$age, \$email, 1)" to create new customer

Run query "INSERT INTO PAYMENT\_TYPES (CustomerID, PaymentType, PaymentInfo) VALUES (\$customerID, \$paymentType, \$paymentInfo)" to create new customer's payment information

#### **Customer Data Update**

Run query "SELECT \* FROM CUSTOMERS WHERE CustomerID = \$customerID" to get current customer information

While no data/error in data

Prompt for customer data (First & Last Name, Address, Sex, Age, Email, Payment Info)

If data includes a new credit card number, then run credit check (offline)

If address has changed, analyze new address to compute distance and assign to delivery route

Run query "UPDATE CUSTOMERS SET FirstName = \$firstName, LastName = \$lastName, Address = \$address, Sex = \$sex, Age = \$age, Email = \$email WHERE CustomerID = \$customerID" to update customer information

Run query "UPDATE PAYMENT\_TYPES SET PaymentType = \$paymentType, PaymentInfo = \$paymentInfo WHERE CustomerID = \$customerID" to update current customer's payment information OR run query "INSERT INTO PAYMENT\_TYPES (CustomerID, PaymentType, PaymentInfo) VALUES (\$customerID, \$paymentType, \$paymentInfo)" to create new customer's payment information

#### **De-activate Customer**

Run query "UPDATE CUSTOMERS SET Active = 0 WHERE CustomerID = \$customerID" to de-activate customer

#### **Re-activate Customer**

Run query "UPDATE CUSTOMERS SET Active = 1 WHERE CustomerID = \$customerID" to re-activate customer

### **Database Load**

Parse input HTML from Safeway to create array of product information

For each product in array

Run query "INSERT INTO PRODUCTS (Description, Category, Manufacturer, Supplier, Price, Taxable, SaleStatus, SalePrice, Barcode, Stock) VALUES (\$description, \$category, \$manufacturer, \$supplier, \$price, \$taxable, 0, NULL, \$barcode, \$stock)" to create new product

For each randomly generated customer

Run query "INSERT INTO CUSTOMERS (FirstName, LastName, Address, Sex, Age, Email, Active) VALUES (\$firstName, \$lastName, \$address, \$sex, \$age, \$email, 1)" to create new random customer

Run query "INSERT INTO PAYMENT\_TYPES (CustomerID, PaymentType, PaymentInfo) VALUES (\$customerID, \$paymentType, \$paymentInfo)" to create new random customer's payment information

For each randomly generated delivery driver

Run query "INSERT INTO DELIVERY\_PEOPLE (RouteID, Name, Address, WorkHours, Salary, Vehicle, CostPerMile) VALUES (\$routeID, \$name, \$address, \$workHours, \$salary, \$vehicleNumber, \$costPerMile)" to create new random delivery driver

\$N = rand()

\$M = rand()

For \$i=0 to \$M do

\$productArray = array()

For \$j=0 to \$N do

\$productArray += random Product ID

Run query "INSERT INTO BASKETS (CustomerID, ProductArray, LastModified) VALUES (\$randomCustomerID, \$productArray, \$randomDateTime)" to create new basket

### **Message Customer**

Run query "SELECT Email FROM CUSTOMERS WHERE CustomerID = \$customerID" to get current customer email address

Generate and send email to customer email with message \$message

### **Add to Basket**

If CustomerID or ProductID are invalid, then exit and return error.

Run query "SELECT BasketID, ProductArray FROM Baskets WHERE CustomerID = \$customerID" to get current Basket ID

If BasketID exists

\$updatedProductArray = \$productArray + \$newProductID

Run query "UPDATE Baskets SET ProductArray = \$updatedProductArray, LastModified = \$now WHERE BasketID = \$basketID" to update the basket

Else

Run query "INSERT INTO Baskets (CustomerID, ProductArray, LastModified, Active) VALUES (\$customerID, [\$newProductID], \$now, 1)" to create basket

### **Place/Unplace Product on Sale**

If ProductID is invalid, then exit and return error.

If action = set

Run query "UPDATE Products SET SaleStatus = 1, SalePrice = \$salePrice WHERE ProductID = \$productID" to get mark the product as on sale

Else if action = remove

Run query "UPDATE Products SET SaleStatus = 0, SalePrice = NULL WHERE ProductID = \$productID" to get mark the product as not on sale

### **Background Process Task**

Run query "SELECT \* FROM BACKGROUND\_PROCESSES WHERE Days LIKE '%\$todayDay%' OR Times LIKE '%\$todayTime%'" to get the list of tasks to run.

For each TaskID returned

If TaskID is invalid, skip

If \$now >= LastRan + Frequency

Run task with TaskID

Run query "UPDATE BACKGROUND\_PROCESSES SET LastRan = \$now WHERE ProcessID = \$processID" to update the time the task last ran (now)

### **Standing Order**

If orderId invalid, exit and return error.

Get current \$standingOrderID:

Run query: "SELECT StandingOrderID FROM Standing\_Orders WHERE orderId = \$orderId"

If exists, run query: "UPDATE Standing\_Orders SET Frequency = \$Frequency, StartDate = \$startDate, EndDate = \$endDate, Active = \$Active WHERE StandingOrderID = \$standingOrderID"

Else, insert new record:

Run query: "INSERT INTO Standing\_Orders (OrderId, Frequency, StartDate, EndDate, Active) VALUES (\$orderId, \$frequency, \$startDate, \$endDate, \$active)"

### **Place Order**

If CustomerID or BasketID is invalid, exit with error.

Get customer balance: "SELECT Balance FROM Customers WHERE CustomerID = \$customerID"

Set \$productArray = Result of query: "SELECT ProductArray from Baskets WHERE BasketID = \$basketID"

For each productID in \$productArray

Check stock: Run query "SELECT stock FROM Products where ProductID = \$productID"

If insufficient stock, remove from array and generate error message.

Update product array associated with order:

Run query: "UPDATE Baskets SET ProductArray = \$productArray WHERE BasketID = \$basketID"

Get address associated with customer: "SELECT Address FROM Customers WHERE CustomerID = \$customerID"

Calculate distance based on address to find \$range.

Get \$routeID and \$deliveryCost: "SELECT RouteID, Cost FROM Delivery\_Routes WHERE Range = \$range"

Find \$driverID for route: Run query: "SELECT driverID FROM Delivery\_People WHERE routeID = \$routeID"

If no available driver, exit with error.

Calculate \$salesTax = .06 \* \$basePrice

Increase customer balance: "UPDATE Customers SET Balance = (\$balance + \$basePrice + \$salesTax + \$deliveryCost)"

Create order record: Run query "INSERT INTO ORDERS (BasketID, PaymentID, DeliveryDate, DeliveryTimeRange, DriverID, BasePrice, SalesTax, DeliveryCharge) VALUES (\$basketID, \$paymentID, \$deliveryDate, \$deliveryTimeRange, \$driverID, \$basePrice, \$salesTax, \$deliveryCost)"

### **Fulfill Order**

If OrderID not valid, exit with error.

Run query: "INSERT INTO TRANSACTIONS (OrderID) VALUES (\$orderId)"

Create tickets and bill, dispatch driver.

Update transaction record with times, comments upon delivery.

### **Receive Payment**

If orderId is not valid, exit with error.

Find associated \$transaction: "SELECT TransactionID FROM Transactions WHERE orderId = \$orderId"

If no valid \$transaction, exit with error.

Get current \$balance: "SELECT Balance FROM Customers WHERE CustomerID = \$customerID"

Update transaction record: "UPDATE Transactions SET AmountPaid = \$amountPaid, DateTimePaid = %currentDateTime%"

Decrease customer balance: "UPDATE Customers SET Balance = (\$balance - \$amountPaid)"

### **Generate Average Basket Value Report**

Begin with empty array \$baskets

Run query: "SELECT BasketID FROM Baskets WHERE \$startRange < LastModified AND \$endRange > LastModified"

Insert basketID's from query into \$baskets

For each basketID in \$baskets:

Get \$productArray: Run query: "SELECT productArray FROM Baskets WHERE BasketID = \$basketID = \$basketID"

For each \$productID in \$productArray, add value to \$sum: "SELECT price FROM products WHERE productID = \$productID"

Divide \$sum by number of baskets.

Display average value and graph.

### **Generate Best/Worst Seller Report**

Find orders in last week: "SELECT OrderID, BasketID FROM Orders WHERE DeliveryTime > (\$now - 1week)"

For each basketID

For each productID

Add to \$productsSold[]

Sort products sold by quantity.

Run query "SELECT productID FROM Products GROUP BY Category"

For each Category, sort find lowest number of products sold (lowest value indices in array). Of these, select \$numToPutOnSale.

Find highest number of products sold from each category (highest valued indices in array).

Display best and worst selling products.

Display \$numToPutOnSale of lowest selling products as recommendation for sale items.

### **Generate Delinquency Report**

Run query: "SELECT CustomerID FROM Customers WHERE balance > 0 AND balanceDate < \$maximumDormant" to get delinquent customerID's.

For each customerID:

Use Message Customer (MCT) task to send message.

Call De-activate Customer (DCT)

### **Generate Suggest Product Report**

If no item added, return blank section.

Get \$category of \$mostRecentProduct: "SELECT Category FROM Products WHERE ProductID = \$mostRecentProduct"

Run query "SELECT productID FROM Products WHERE Category = \$Category AND Stock > 0"

Sort productID's by price, choose nearest 4 to \$mostRecentProductPrice.

Display results below basket on check-out page.

## 6 Program Source Code

### 6.1 Primary Page Code

```
Background Tasks (backgroundtasks.php)
<?php
    // This file will be run automatically by a scheduled task every hour or so on the server

## 7 User Manual

### 7.1 Accessing eGroceries

To access eGroceries, you will first need an internet connected computer. The address for the eGroceries website is <http://eGroceries.antiemotion.com> and is best viewed in the Google Chrome or Mozilla Firefox web browser.

### 7.2 Navigating eGroceries

eGroceries has three basic sections, including Shopping, User Account Control, and Administrator Options. Each section represents a group of related functions/webpages.

#### 7.2.1 Shopping

##### Shop by Aisle

(*Related Tasks & Queries: Product Query, Category & Subcategory Query, Basket Update Query*)

To shop aisle to aisle, a primary aisle may be chosen from the last hand navigation of any page on the site. Alternatively, the “Shop By Aisle” header is a link to a table based layout of graphical representations of the Aisles (kindly provided by Safeway) that also links to the same category page. This category page is another breakdown of the products into common items such as “Baby Accessories” or “Bacon” into similar graphical representations (again kindly provided by Safeway). On the next page is the actual list of products for that aisle and category that displays a small image of the product (provided once again by Safeway), a product description, manufacturer, price (and sale price, if applicable) as well as a link to add the product to the basket. For simplicity, to add more than one of the same item to the basket, a “Add Another to Basket” link will appear on items already in the basket. After adding a product to the basket, a success message is displayed (with a link to your basket if you are done shopping) above an area where suggested products are printed in a row (based on the manufacturer of the item added to the basket). After choosing products, or if an item is wished to be removed from the basket, you must go to the View Basket page.

##### Search

(*Related Tasks & Queries: Product Query, Dynamic Search Query*)

The search screen allows for simple product searching with the option of searching descriptions, categories (aisles), manufacturers, and price ranges. You also have the option to hide all results that you have purchased in the past. The search query is built dynamically from these fields, and supports partial searches for descriptions and manufacturers. Products are then displayed in the same manner as on aisle category pages as described above.

##### View Basket

(*Related Tasks & Queries: Product Query, Basket Update Query*)

Although the View Basket page looks very similar to the category page of an aisle, the links have been changed to “Remove from Basket” and a subtotal of the base cost of the products is displayed at the bottom of the table. After verifying all of the products, you may click the “Checkout Now” button at the bottom of the page.

## **Checkout**

*(Related Tasks & Queries: Order Placement, Order Fulfillment, Product Query, Order Query)*

The checkout page again mimics the View Basket page, but now with a simplified view of just product description and price, and also includes sales tax, delivery fee, as well as a grand total. If any items in your basket are out of stock (or your order would decrease the stock to below 0) the item will be removed from your basket and a warning message will be displayed. The delivery fee is calculated by querying the database for your address, and then plotting the position, along with the position of the warehouse (the CSI building), on a Google Maps instance controlled by the Google Maps API. This is then used to calculate the distance, and assign the address to a delivery route (based on mile radius - \$5 for <= 3 mile radius, \$7 for > 3 and <= 5 mile radius, \$10 for > 5 miles). Next, you are prompted to select a delivery date and time range (9am – 1pm, 1pm – 5pm, 5pm- 9pm) ranging from todays date (and up to 1 hour before the later end of the time range – if available) to up to one week in the future. At this point, a complicated script is run to calculate the estimated time of arrival of your order. This script first queries the database for all pending orders for your route, on your chosen date and during your chosen time range and plots all of their points, along with the warehouse, and your address, on an instance of Google Maps. At this time, an open sourced script (by Geir K. Engdahl) runs to solve the “Traveling Salesman Problem” of finding the faster route from the warehouse, to each customer, and then back again. Using the results of the estimated time required to complete the route as a maximum bound, the time plus the beginning time of the selected time range is used to calculate the estimated time of arrival (for simplicity). Finally, a payment method is required to be chosen to pay for the order. If no payment methods exist for the customer, an error will be displayed and they will be asked to add a payment method before continuing. If a checking account is selected as a payment method whose balance is less than that of the grand total of an order will result in an error message after submitting an order. To complete the checkout, you may click the “Confirm Check” button at the bottom of the page. (Note: if an account is listed as inactive/disabled in the database, a customer is NOT allowed to complete a checkout, and will immediately be displayed an error to contact an administrator to reactivate their account.) At this point, a new order is entered into the database that links the basket you have approved, the payment method chosen, delivery date & time range, driver of the route, as base/sale/delivery totals to your CustomerID (and is given a unique OrderID). Then, a new ticket and bill are created and stored in plain HTML on the server as an html file. This will ensure that individual product prices are saved for later display, and will generate the printed ticket a driver will use to deliver the goods to the customer. These ticket and bill numbers, as well as the date and time of the order placement, are tied to an OrderID and stored in a transactions table in the database. Next, the balance of the customer is decremented by the grand total of the order, and the basket is marked as inactive in the database (to allow the customer to create a new basket, yet to save the list of products for future queries). Finally, the stock of the product is decremented in the database, and the customer is redirected to the Order History page for their newly placed order.

## **7.2.2 User Account Control**

### **Register New User**

*(Related Tasks & Queries: Customer Setup)*

The registration page is the first stop for new customers. To begin, a customer will enter their personal information, as well as pick a username and password (stored as an MD5 hash in the database) to access the system. All fields are required, and an error message will display at the top if any question is left blank. The system will also check that the username is unique before completing registration. After submission of the form, a new customer record is created from the supplied information, with a default balance of \$0 and a status of active. (Note that to make the user an Administrator, the database entry must be manually updated to mark the user as an AdminUser.) After the entry has been created, the customer is redirected to the Sign In page.

### **User Sign In**

*(Related Tasks & Queries: Customer Login)*

The User Sign In page consists of simply a username and password prompt that checks for an existing username and MD5 hash of the provided password in the database, and if valid, assigns the user a session that stores the user's account information for easy access (updated every page load). After authentication, a customer is redirected to the My Account page.

### **My Account**

*(Related Tasks & Queries: Customer Data Update, Balance Query)*

The My Account page is both a customer information update section, as well as a navigation area for common customer actions (discussed below). The top section is a simplified version of the registration page, which generates a dynamically created update query to update the database. The map displayed to the right is the graphical representation of the Google Maps API function to calculate the customer's distance from the warehouse (as described in Order Checkout). The bottom section contains buttons that link to other pages, as well as the result of the Balance Query for the customer, which displays a negative balance if they have a pending order that has not yet been delivered and paid for, or else \$0.

### **Change Password**

*(Related Tasks & Queries: Customer Data Update)*

The Change Password page simply allows a customer to change their account password by prompting for the current and new password (as well as confirming the new password). After confirming the old password is valid and the new password matches the confirmation, the customer record in the database is updated with the new password.

## **Manage Payment Methods**

*(Related Tasks & Queries: Customer Data Update)*

This page allows a customer to update or add a new payment method to their account. To edit an existing entry, click the edit icon in the action column next to the entry to change. The textboxes will then activate and allow customers to update the payment details (note that credit card numbers are censored on display, and will only be updated if a valid 16 digit number is entered). For simplicity, it is assumed that a customer sends a voided check to eGroceries with checking account information, and only prompts the customer for their account limit. After editing, click the save icon in the action column to update the database. Alternatively, to add a new payment entry, use the last row to enter new information, and click the save icon.

## **Account Status**

*(Related Tasks & Queries: De-activated/Re-activate an Active/De-activated customer)*

The Account Status page allows a user to deactivate their account if they no longer wish to use the eGroceries system. If the user wishes to reactivate their account, they may also do so on this page.

## **View Past Orders**

*(Related Tasks & Queries: Order Query, Product Query)*

To view pending or processed orders, a customer may visit the View Past Orders page to get a list of Order IDs, Delivery Date/Times, Payment Methods, Order Totals, and Amount Paid. Entries also have a link to a page listing details of the order, including a list of products purchased, the order totals (base, sales tax, delivery fee, total), delivery information (address, date & time, estimated arrival if pending), as well as a link to view the generated Bill that was/will be delivered to the customer.

## **Modify Standing Orders**

*(Related Tasks & Queries: Standing Order Management, Order Query, Product Query)*

In order to create a standing (recurring) order, a customer must first place an order, and then visit the Modify Standing Orders page to select the order. A list of current standing orders is displayed above a list of past, non-standing orders. Existing standing orders are listed by ID, Start & End Date, Frequency of the order, Order Total, a link to the Bill, and an indication whether the standing order is active or inactive. To add or modify a standing order, the customer selects an order and clicks the “Make/Modify Standing Order” button. This will bring the customer to a page listing details of the order (similar to the View Past Orders page). Below the order details, the customer may specify a Starting and Ending date for the standing order, how often the order should occur (Frequency), and finally may specify if the standing order is active or inactive (in case the customer goes on vacation for example). Standing orders are then checked by a background process task to automatically submit a copy of the order every time the frequency reoccurs.

## **View Transaction History**

*(Related Tasks & Queries: Customer Transaction History, Order Query)*

In order to search for all transactions between any two dates, customers may visit the View Transaction History page. The two dates provided are used to query the database for all orders that were placed, dispatched, arrived, returned, or paid during the time period. These dates, as well as the order total and amount paid are displayed in a table, where each row links to the Order History page for that order.

### **7.2.3 Administrator Options**

#### **Manage Users**

*(Related Tasks & Queries: De-activated/Re-activate an Active/De-activated customer)*

The Manage Users page allows administrators to activate or deactivate a customer. A table is displayed with the ID, Name, Account Balance, and Status of each account, with a button to either Activate or Deactivate a user (based on their current status).

#### **Place Products on Sale**

*(Related Tasks & Queries: Place Product on Sale, Product Query)*

Every week, a random selection of products needs to be put on sale (after removing the sales from the previous week). In addition to the automatic background task for this, an Administrator is allowed to manually perform this task, which updates the database to remove all of the current sales, as well as selecting about 10% of the products from each subcategory, and assigning them a sale price of a random amount of 5-15% off.

#### **Reports**

*(Related Tasks & Queries: Product Query, Order Query, Balance Query, Customer Transactions)*

The Reports section of the Administrator page allows Administrators to run one of three reports on data in the database. (Note that the Suggest Product report is integrated in the “Add to Basket” task and is displayed on the shop page as discussed above.)

Average Basket Value: This report creates a dynamic line graph that details the average value of a basket between every hour in three time periods: today, yesterday, and last week. The average is calculated by a complex query that adds up the total values of all of the baskets that fall into that hourly range, and divides by the number of orders fitting the requirements, and then graphs the results.

Best/Worst Seller Report: This report returns a list of the top 10 of both the top selling, and the worst selling products, their category and sub-category, price, and amount sold. For the worst selling products, there are also action buttons that allow an administrator to either place the product on sale in an attempt to increase sales, or remove the product from the system altogether.

Delinquency Report: This report runs a duplicate of the automated task that runs daily, in which the system will search for a list of each customer that has an account balance exceeding \$25, and whose balance has not been updated in over a week. The system then sends out a message via email to the customer notifying them that they are delinquent, their balance, and that their account has been listed as inactive (disallowing the customer to place another order, but still allowing them to log in to the website).

## 8 Testing Efforts

### 8.1 Tests Performed

#### **Page Security**

A series of tests were performed to ensure secure pages (such as My Account, Checkout, and Administrative Options) were inaccessible by unauthorized users. The server correctly identified and returned an error for unauthorized access.

#### **Registration/Customer Account Update Page Validation**

The eGroceries Registration page, as well as the My Account Customer Account Update Page, was tested to ensure that data met loose requirements. First off, data was tested that involved invalid SQL characters (such as apostrophes), then other types of invalid data such as previously used usernames and incomplete sets of form entries. The server was able to replace invalid data, and display a warning for missing data as well.

#### **Change Password Test**

The change password account page was tested to ensure that the all fields were required, the old password was checked, and that the new password and the confirmation password were also checked to be identical. The system correctly handled both cases.

#### **Out of Stock Product Test**

A test was performed to ensure products that were out of stock could not be ordered. The server correctly warned the user and removed the product from the basket before checkout could occur.

#### **Checking Account Limit Check**

The system was tested to ensure that any order paid with a Checking Account with a total that would exceed the accounts limit would produce an error. The system correctly identified the case and prevented an order from being completed

#### **Rollback of Changes on Checkout Failure**

The system was rigged to test a failsafe built in to undo changes if an order fails. For example, after an order entry was created and a ticket and bill created, a transaction entry entered was simulated to fail, and caused the system to delete the order just created, in effect “undoing” the order until the problem could be resolved.

## 9 System Limitations & Possibilities for Improvement

### 9.1 System Limitations

Below are a few system limitations due to the simplified model used for the program.

1. Currently the system only supports US based addresses, based on state abbreviations vs. a dedicated dropdown list of states. The addresses are not validated and are assumed to be correct.
2. Payment methods are overly simplified and are not validated besides a check for a 16 digit number for a credit card number, or a price for a checking account balance.
3. Currently, accounts disabled due to outstanding balances on an account are able to be reactivated by a customer on the Account Status page.
4. Standing orders are handled overly simply.
5. The system currently does not support refunding customer money for unsatisfactory products.

### 9.2 Possibilities for Improvement

If this were a production system, a few basic improvements could be implemented for a better/more secure shopping experience.

1. Street addresses and Email addresses on the registration & customer account update page could be validated.
2. Sign in and checkout could be secured with SSL for security.
3. More options for searching past orders could be added.
4. More search options could be added to product search.
5. Support for specifying quantities of products to add to a basket vs. adding one at a time.
6. Product suggestions could be expanded by searching purchase history for the customer, or other relations rather than just by manufacturer.
7. The script to estimate delivery time could be further tuned to use the estimated arrival time of the delivery driver to the customers address vs. the upper bound of the estimated time of the driver returning to the warehouse.
8. More administrator options could be added, such as manually updating customer information, managing product information, manually placing a product on sale, etc.
9. Support for the case where a customer does not pay for the entire price of an order, or the case where items are not found satisfactory and money is given back to the customer.

## 10 Credits and References

### 10.1 System Credits

The eGroceries system was created and coded by Stephen Eskin and Jeff Lasser. All PHP, HTML, Javascript code (unless otherwise noted) and database queries are originally created. The script used to scrape Safeway's site and populate the database was created and run by Stephen, while the rest of the database load script was created and run by Jeff. Database design was a cooperative effort between Stephen and Jeff, and the majority of product code was contributed by Stephen, with parts of the User Account Control and Administrative Options contributed by Jeff. The project phase reports were created and maintained by both Stephen and Jeff, and both did research required to create the reports. Certain scripts used (such as for mapping and delivery estimates) are open sourced algorithms integrated into original code, and are detailed below.
