1 Introduction

Thank you for buying Embedded Artists' *LPC2148 Education Board* based on NXP's ARM7TDMI LPC2148 microcontroller.

This document is a User's Guide that describes the *LPC2148 Education Board* hardware design and some basic software interface principles with the hardware. There is a separate document describing program development that also includes a lot of experiments that will guide you through the art of embedded program development.

1.1 Contents

The box received when ordering the LPC2148 Education Board contains the following:

- The LPC2148 Education Board.
- A USB cable of type: mini-B-to-A, for powering and communicating with the boards from a PC.
- CD-ROM with additional material and programs, including complete and evaluation versions of different development environments.

An optional JTAG interface can be used for debugging during program development. The interface is not strictly needed but can be needed for more advanced debugging.

1.2 Features

Embedded Artists *LPC2148 Education Board* with NXP's ARM7TDMI LPC2148 microcontroller lets you get up-and-running quickly. The small form factor board offers many unique features that ease your learning curve and program development.

- NXP ARM7TDMI LPC2148 microcontroller with 512 KByte program Flash and 32+8 KByte SRAM
- 12.0000 MHz crystal for maximum execution speed and standard serial bit rates
 - Phase-locked loop (PLL) multiplies frequency with five; 5 x 12 MHz = 60 MHz
- 32.768kHz RTC crystal
- Onboard Peripherals
 - 2x16 character LCD with background light
 - Joystick switch
 - UART-to-USB bridge interface on UART #0
 - USB 2.0 device interface
 - RGB-LED, each color can be controlled via PWM signal
 - 8 LEDs
 - Temperature sensor (LM75) on I²C bus
 - Pushbutton on P0.14 (interrupt input)
 - 8x8 LED matrix, controlled via shift registers in the SPI bus
 - MMC/SD memory card interface
 - Step motor (bipolar driving)

- Interface to Max Stream XBeeTM module (note that XBee module is not included)
- Piezoelectric buzzer
- 2 Analog inputs
- Low-pass filtering of PWM signal
- 1 Analog output
- Reset button
- Connectors
 - Mini-B USB connector to UART#0 UART-to-serial bridge)
 - Mini-B USB connector to LPC2148 device interface
 - MMC/SD memory card connector
 - JTAG
 - 64 pin expansion connector, all LPC2148 I/O pins are available on connector
 - 2.1 mm power supply connector
- 2 Kbit I²C E²PROM for storing non-volatile parameters
- Onboard low-dropout voltage and reset generation.
 - Generates +3.3V (and +5V if 9-15VDC is used to power the board)
 - +3.3V available for external circuits, up to 300 mA
- Power supply
 - 9-15 VDC, ≥200 mA from 2.1 mm power connector
 - Can also be powered directly from any of mini-B USB connectors
- Simple and automatic program download (ISP) via UART-to-serial bridge channel
 - Circuit that automatically controls the bootloader from UART-to-serial bridge channel
- Dimensions: 156 x 110 mm
 - Four layer PCB (FR-4 material) for best noise immunity

1.3 Expansion Boards

The 64 pin expansion connector, with all LPC2148 I/O pins available, allows the *LPC2148 Education Board* to be expanded with new and exciting hardware. The experiments can be more advanced and complex by using the expansion boards. The list below presents the first set of available expansion boards. As seen, many of the boards are communication oriented.

- Ethernet board (10Mbps) with SPI interface
- BluetoothTM board with UART interface
- ZigBee[™] board with SPI interface
- MP3 decoder board with SPI interface
- Graphical monochrome LCD (240x128 pixels) with parallel interface
- Modem (UART#1) and RS485 board

Prototype board

1.4 ESD Precaution

Please note that the *LPC2148 Education Board* come without any case/box and all components are exposed for finger touches – and therefore extra attention must be paid to ESD (Electro-Static Discharge) precaution.

Make it a habit to always first touch the metal surface of one of the USB connectors or MMC/SD connector for a few seconds with both hands before touching any other parts of the boards. That way, you will have the same potential as the board and therefore minimize the risk for ESD.

Note that Embedded Artists does not replace boards that have been damaged by ESD.

1.5 Other Products from Embedded Artists

Embedded Artists have a broad range of LPC2xxx based boards that are very low cost and developed for prototyping / development as well as for OEM applications. Modifications for OEM applications can be done easily, even for modest production volumes. Contact Embedded Artists for further information about design and production services.

1.5.1 Design and Production Services

Embedded Artists provide design services for custom designs, either completely new or modification to existing boards. Specific peripherals and I/O can be added easily to different designs, for example, communication interfaces, specific analog or digital I/O, and power supplies. Embedded Artists has a broad, and long, experience in designing industrial electronics, in general, and with NXP's LPC2xxx microcontroller family, in specific. Our competence also includes wireless and wired communication for embedded systems. For example IEEE802.11b/g (WLAN), BluetoothTM, ZigBeeTM, ISM RF, Ethernet, CAN, RS485, and Fieldbuses.

1.5.2 LPC2xxx OEM / Education / QuickStart Boards and Kits

Visit Embedded Artists' home page, www.EmbeddedArtists.com, for information about other *QuickStart* boards / kits or contact your local distributor.

2 Board Design

This chapter contains detailed information about the electrical and mechanical design of the *LPC2148 Education Board*.

2.1 Board Schematics

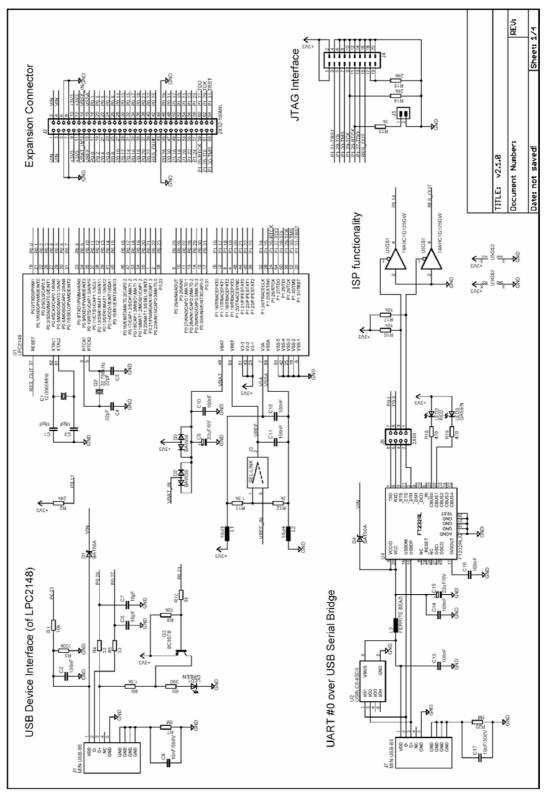

Figure 1 - LPC2148 Education Board Schematic v2.1, page 1

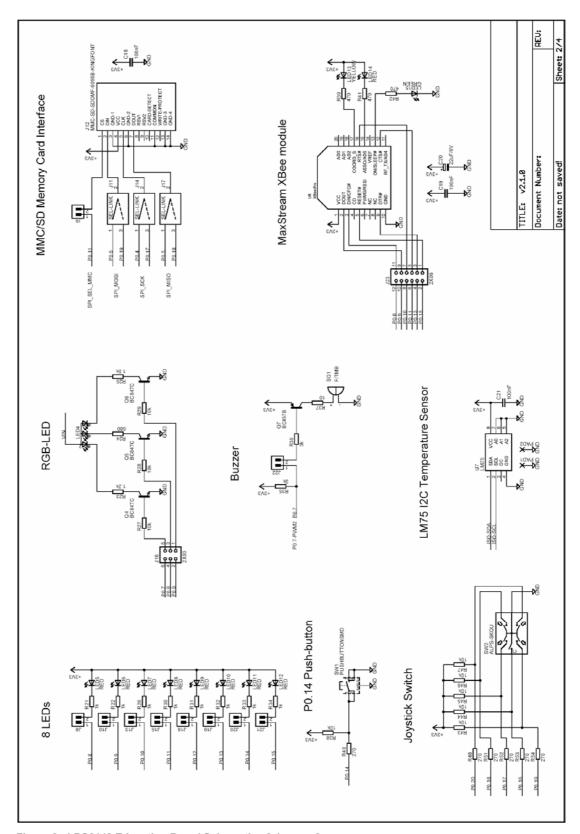

Figure 2 - LPC2148 Education Board Schematic v2.1, page 2

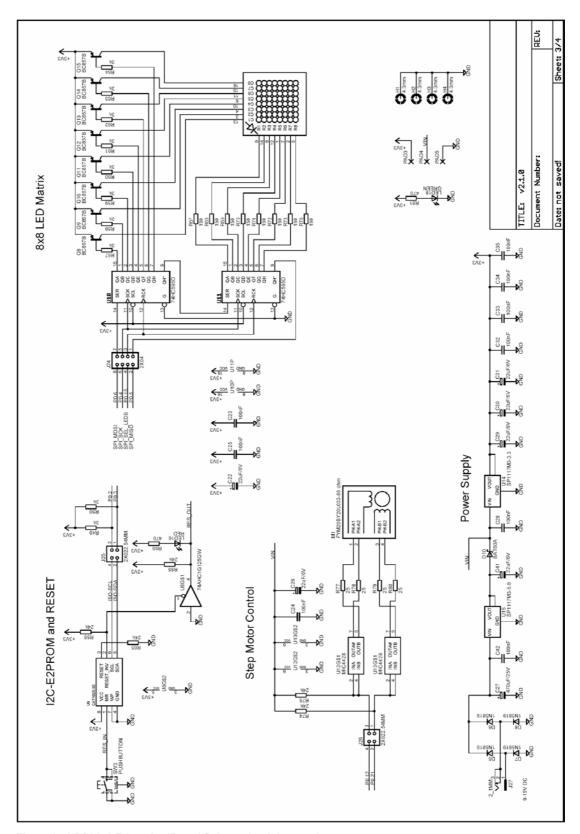

Figure 3 - LPC2148 Education Board Schematic v2.1, page 3

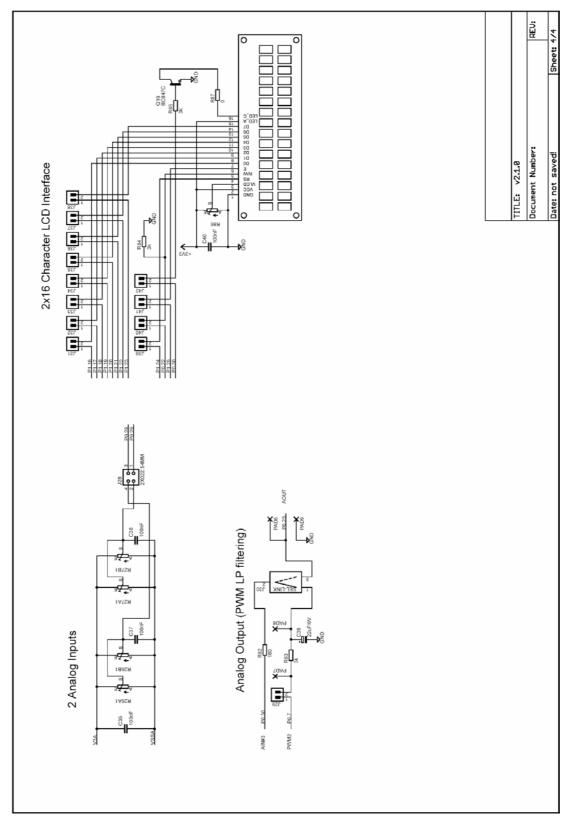

Figure 4 - LPC2148 Education Board Schematic v2.1, page 4

The following subsections describe in more detail each part of the design. Each schematic page is described in turn.

2.1.1 Page 1: CPU

The core part of the design is the NXP LPC2148 microcontroller. It's an ARM7TDMI-S CPU core with a lot of different peripheral units and on-chip memory (512 kByte FLASH and 32-8 kByte SRAM). There is no external memory bus interface. *Figure 5* below illustrates the CPU section of the design.

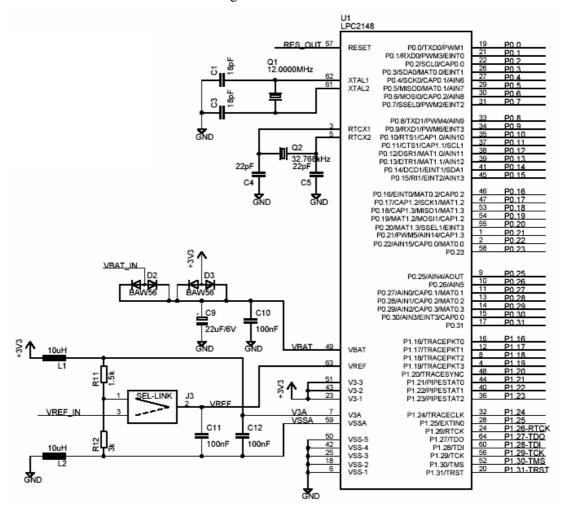

Figure 5 - LPC2148 Education Board Schematic, page 1: CPU

The microcontroller crystal frequency is 12.0000 MHz. This frequency has been selected in order to allow maximum execution speed (5 x 12 MHz = 60 MHz, which is the maximum frequency). The on-chip UART peripheral includes a fractional baud rate generator that allow standard baud rates to be generated from the 60 MHz base clock. The USB clock (48 MHz) is also generated from the 60 MHz clock without any problems.

There is also a 32.768 kHz crystal clock for the on-chip real-time clock peripheral unit or RTC for short. The microcontroller can be placed in a very low power mode while the RTC operates and keeps track of time. Power for the RTC (during these low power modes) comes from the VBAT input pin. Power is sourced either from the +3.3V power supply or the external VBAT_IN signal (available on the expansion connector), depending on which one have highest voltage.

The LPC2148 also contains an Analog-to-Digital Converter or ADC for short, as well as a Digital-to-Analog Converter (DAC). These two peripheral units need a reference voltage, which is supplied from the VREF input pin.

Jumper J3 selects two different sources for VREF. The CPU power supply (+3.3V) is used and divided by 3/2. The power supply is low-pass filtered for noise immunity. The precision of the power supply is 1%. Alternatively an external precision voltage is used, the VREF_IN pin on the expansion connector.

2.1.2 Page 1: UART#0 and ISP

UART#0 on the LPC2148 is connected to a USB-to-serial bridge chip (FT232RL from FTDI). The serial interface is not a full interface, only the receive and transmit signals are connected to UART#0. There are two UART channels on the LPC2148 and only channel #1 has all control signals needed for a full modem implementation. Channel #0 only has receive and transmit signals. Channel #1 is free and used by some of the expansion boards.

There are two LEDs connected to the USB-to-serial bridge chip. These indicate Rx and Tx activity and can be a good help when determining if a connection with the board is working properly.

Even though the CPU clock crystal is 12.000 MHz, any standard baud rate can be generated since both UART channels have a fractional baud rate generator. 'Fractional' means that the clock frequency does not have to be divided by an even integer value. It can also be divided by a fractional value, which means that a lot more baud rates can be achieved from basically any clock crystal frequency. There is even an *autobauding* capability, meaning that basically any baud rate can be detected. Read more about this functionality in the LPC2148 datasheet.

The interface can be disconnected by removing the jumpers on J6, in case an external UART interface is to be designed (for example on a prototype board).

Finally there is a special circuit to automate the ISP feature (In-System Programming). With the help of two control signals (RTS and DTR), the processor can be placed in the bootloader mode. The bootloader uses UART#0 for downloading new program images into the processor (either into FLASH or into RAM). DTR controls the processor reset and RTS can pull signal P0.14 low. If the processor samples P0.14 low after reset the bootloader is entered, else the application code is executed. The automatic ISP functionality can be disabled by removing the two bottom jumpers on J6. Note that some terminal programs (notably WindowsTM Hyperterminal) control the RTS/DTR signals in an unfavorable way so that the board always enters bootloader mode or is always in reset more. In these cases, the jumpers must be removed or a serial cable with only receive and transmit signals must be used.

Figure 6 below illustrates the USB-to-serial interface and ISP part of the design.

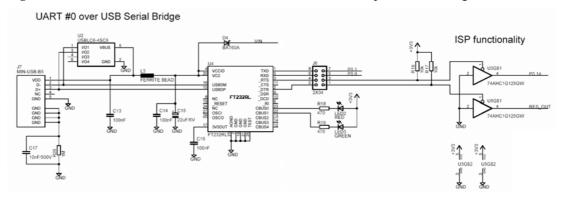

Figure 6 - LPC2148 Education Board Schematic, page 1: USB-to-serial and ISP

2.1.3 Page 1: USB

The LPC2148 also contains a USB 2.0 device interface as one of its peripheral units. *Figure* 7 below illustrate the USB part of the design. Low-pass filtering is added for noise immunity. The USB interface supports the Soft Connect functionality and voltage sense (see

LPC2148 User's Manual for more information about these functions). The Soft Connect feature is controlled by IO-pin P0.31 and is activated by placing a 1.5 kohm resistor between the D+ signal and +3.3V. A green LED also is on when the resistor is resent. The voltage sense feature is handled by IO-pin P0.23, which is connected to VCC of the USB interface.

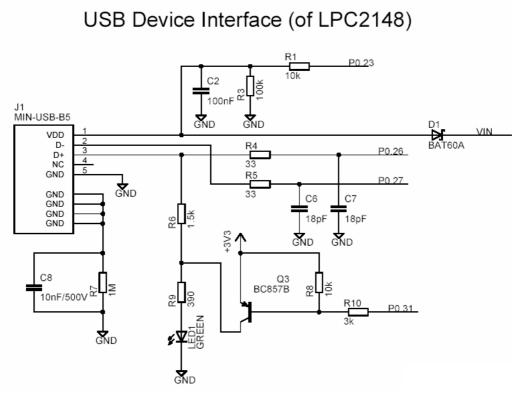

Figure 7 - LPC2148 Education Board Schematic, page 1: USB

2.1.4 Page 1: JTAG

The JTAG interface is a standard 20-pin (2x10) connector with shoulders – 'standard', at least in the ARM world. The JTAG interface shares 6 general IO-pins (GPIOs) and is enabled by shorting jumper J5, i.e., pulling P1.26 low during reset. When the JTAG interface is enabled, the 6 IO-pins cannot be used for other purposes than the JTAG interface. *Figure* 8 below illustrates the JTAG part of the schematics.

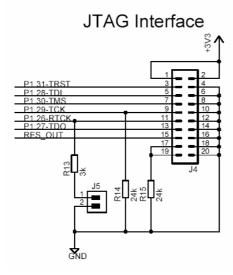

Figure 8 - LPC2148 Education Board Schematic, page 1: JTAG

To use the JTAG interface of the *LPC2148 Education Board* a special JTAG interface pod must be used. This pod must be integrated with a debugger in order to do anything useful with it. There exist many different manufacturers of JTAG interface pods.

2.1.5 Page 1: Expansion Connector

The *LPC2148 Education Board* is not just a monolithic design. Via the expansion connector, it's possible to expand the design. All LPC2148 pins are available on the expansion connector, which is a standard 2x32 pin list with 100 mil pin spacing. *Figure 9* below illustrates the expansion connector part of the design.

VIN VIN VIN VIN 9 +3V3 9999 +3V3 +3V3 11 +3V3 GND VBAT IN13 VREE_INGND **VRE** 17 P0.0 P_{0.2} 19 P0.3 0 21 P0 4 P0.5 ю 0 P0.6 23 P0P0.10 29 31 P0.14 P0.15 ю 33 P0.16 P0.17 P0.21 39 P0 23 99 RES OUT1 99 45 P0.30 47 49 51 P1.18 ю P1.20 53 P1.22 P1.24 P1.27-TDO 59 P1.28-TDI P1 29-TCK 0 O P1.31-TRST O 2X32-100MIL

Expansion Connector

Figure 9 - LPC2148 Education Board Schematic, page 1: Expansion Connector

The power voltages, +5V and +3.3V, are available on the expansion connector. Note that the current consumption of external circuitry on the expansion boards must be low. The onboard +3.3V voltage regulator can only supply up to 300 mA to external circuits. Note also that an external power supply (+9-15 VDC) must be able to deliver all needed current. In the case that the USB port is used to power the board, the total current consumption must be less than 500 mA. Else the USB host in the other end will shut down current delivery completely.

2.1.6 Page 2: LEDs

The port pins of the LPC2148 microcontrollers have a 4 mA driving capacity, enough to directly drive LEDs. *Figure 10* below illustrates the 8 LEDs in the design. The LEDs are connected to pin P0.8 – P0.15 and are red. The 1kohm resistors limit the current to about 2 mA. A low output pin drives current through the LEDs and they will light. Each LED can be individually enabled or disabled via jumpers:

- J8 P0.8
- J10 P0.9

- J13 P0.10
- J15 P0.11
- J18 P0.12
- J19 P0.13
- J20 P0.14
- J21 P0.15

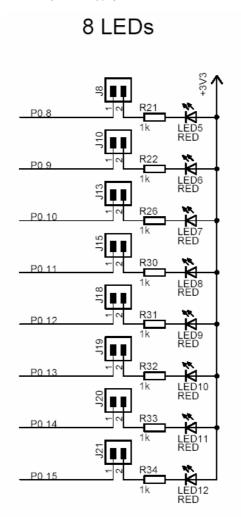

Figure 10 - LPC2148 Education Board Schematic, page 2: LEDs

2.1.7 Page 2: Push-button

The signal P0.14 can be configured as an interrupt input pin on the processor. A push-button is connected to this signal so it's possible to pull the signal low. There is a pull-up resistor (10 kohm) on the signal, which is also needed for the ISP feature. The signal P0.14 must be sampled high after reset in order to start normal program execution; else the internal bootloader will be activated. *Figure 11* below illustrates the push-button part of the design.

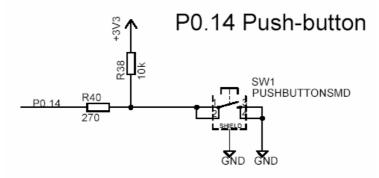

Figure 11 - LPC2148 Education Board Schematic, page 2: Push-button

Joystick Switch

2.1.8 Page 2: Joystick-switch

There is a joystick-switch on the board and Figure 12 below illustrates this part of the design. The switch has five internal switches, one for the four directions and one center, push-down switch. All of the input pins (P0.16 – P0.20) can be programmed as interrupt inputs, either directly as an EINTx-pin or via a CAPture-pin, which in turn can generate an interrupt.

SW2 ALPS-SKQU

P0 17 R53 P0.19

Figure 12 - LPC2148 Education Board Schematic, page 2: Joystick-switch

2.1.9 Page 2: RGB-LED

There is a full color RGB-LED that can be controlled by PWM (Pulse Width Modulated) signals. The intensity of each LED can easily be controlled by adjusting the pulse width of the signals. The list below explains the signal connections.

- Red LED, controlled by signal P0.7 PWM2
- Blue LED, controlled by signal P0.8 PWM4
- Green LED, controlled by signal P0.9 PWM6

The PWM signals are available as alternative signals on the pins and are generated from the PWM peripheral unit. Figure 13 below illustrates the RGB-LED part of the design.

Note that the LEDs are driven from the +5V power supply. This is because the forward voltage drop of the blue LED is typically around 3.5V, which is more than the 3.3V power supply for the LCP2148.

The RGB-LED can be disconnected by removing the three jumpers on J16. Also note that the signals P0.8 – P0.10 are used for other parts of the design also, for example for controlling the buzzer, the motor control, analog output, as well as for the individual LEDs (see *Figure 10*).

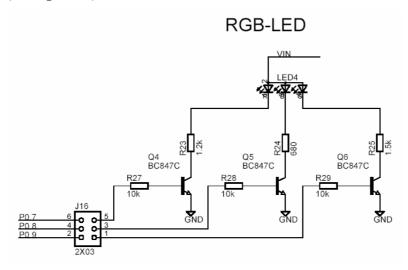

Figure 13 - LPC2148 Education Board Schematic, page 2: RGB-LED

2.1.10 Page 2: Buzzer

There is also a small piezoelectric buzzer on the *LPC2148 Education Board*. Figure 14 below illustrate the buzzer part of the design. By pulling pin P0.7 low, current will flow through the buzzer and a relatively sharp, single-tone frequency will be heard.

The alternative PWM feature of pin P0.7 (the PWM2 signal) can be used to modulate the buzzer to oscillate around different frequencies. It's not the pulse width feature that is used to change the frequency. Only the volume of the sound will be changed by alternating the pulse width. Instead, it's possible to change the frequency of the PWM signal, and this will also change the frequency of with the buzzer oscillate.

The buzzer can be disconnected by removing jumper J22, and this is also the default position for this jumper since the buzzer sound can be quite annoying if always left on.

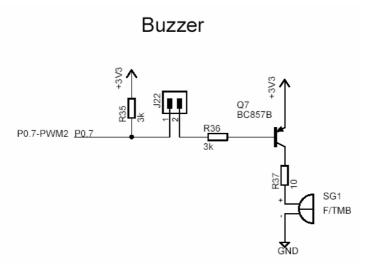

Figure 14 - LPC2148 Education Board Schematic, page 2: Buzzer

Note that signal P0.7 is shared with several other parts of the design, for example the motor control, the red LED in the RGB-LED, analog output, and the individual LEDs (see *Figure 10*).

2.1.11 Page 2: Temperature Sensor

Figure 15 below illustrates the temperature sensor part of the design. The interface is very simple; a LM75 temperature sensor is connected to the I²C interface. Note that the jumpers on J25 (see reset and I2C-E2PROM part) must be mounted to connect the I2C interface with the LPC2148.

The address of the LM75 is 0x90. Consult the LM75 datasheet for details about how to read the temperature.

LM75 I2C Temperature Sensor

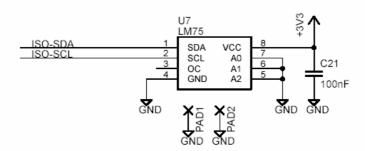

Figure 15 - LPC2148 Education Board Schematic, page 2: Temperature Sensor

2.1.12 Page 2: MMC/SD Interface

The SPI bus of the LPC2148 can be used to interface a MMC/SD memory card, when operating in the simpler MMC mode. Pin/signal P0.11 is used as device select. NXP has published an application note describing how to implement the low-level interface (reading and writing sectors on the memory card). See *AN10406: Accessing SD/MMC card using SPI on LPC2000* for details. *Figure 16* below illustrates the MMC/SD interface part of the design.

The interface can be disconnected from the LCP2148 by removing jumpers J9, J11, J14, and J17. Also note that bottom jumper on J24 (SPI_MISO to P0.5 the SPI interface for the 8x8 LED matrix) should not be installed since this output is not a three-state output and will hence collide with the MISO signal (DOUT on the MMC/SD interface). There is also no typical need to have this jumper installed so this is normally not a problem.

It's possible to change if SPI channel #0 or #1 is connected to the MMC/SD memory card interface, by changing jumpers J11, J14 and J17. The default is SPI channel #0.

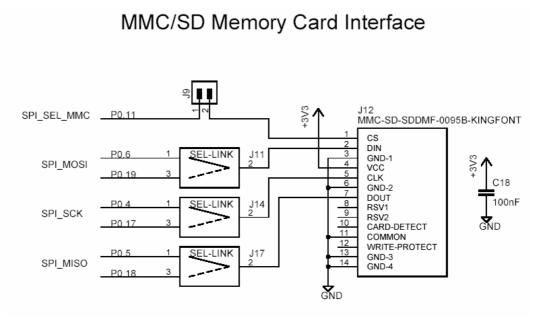

Figure 16 - LPC2148 Education Board Schematic, page 2: MMC/SD Interface

Note that the switches for 'card detect' and 'write protect' are not connected at all in this design.

2.1.13 Page 2: MaxStream XBee Interface

There is a connector for MaxStream's XBee modules. Both XBee and XBee Pro modules can be used. Note that the XBee module is not included and must be purchased separately. The module is connected to UART channel #1. Up to four control signals can be used to control the interface (can be selected with jumpers on J23). Three LEDs indicate status of the module.

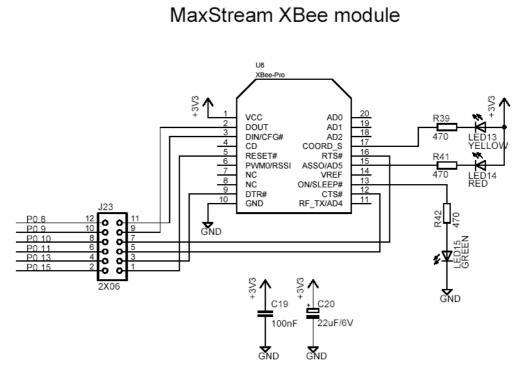

Figure 17 - LPC2148 Education Board Schematic, page 2: XBee interface

2.1.14 Page 3: Reset Generation and I2C E2PROM

The rest generation is handled by a mixed-signal chip, CAT1025 from Catalyst Semiconductor. The reset signal will be held active (i.e., low) until the supply voltages, +3.3V, is within margins. The reset duration is typically 200 mS (consult the CAT1025 datasheet for exact details, also included on the CD-ROM). The output reset signal is an open-collector / open-drain output. An external reset source can also control the reset generator. *Figure 18* below illustrates this part of the design. There is also a reset pushbutton (SW1) and both the signals RES_IN and RES_OUT are available on the expansion connector. Note that an external driver of these signals should be an open-collector / open-drain driver. There is also a red LED that lights when the reset signal is active.

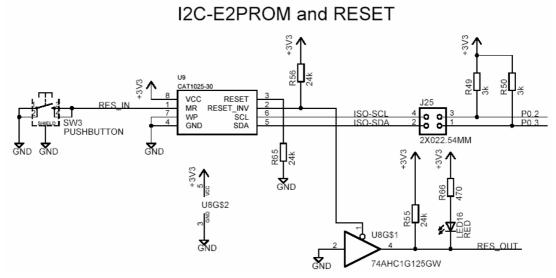

Figure 18 - LPC2148 Education Board Schematic, page 3: Reset Generation and I2C E2PROM

The CAT1025 chip also contains a 2kbit E²PROM accessible via the I²C interface. The LPC2148 microcontroller has two on-chip I²C communication channels. Channel #0 is used for communicating with the E²PROM. The other channel can optionally be used on an expansion board. More peripheral units are easily connected to the two-wire I²C bus, just as long as the addresses do not collide. The address of the 2kbit E²PROM is 0xA0. The I²C interface to the CAT1025 can be disconnected from the LPC2148 by removing jumpers on J25.

Note that the pull-up resistors (which are always needed on I²C busses) are included on the board. These pull-up resistors are 3000 ohm each. If using the second I²C channel do not forget to connect pull-up resistors to these signals also. Note that this must be done even if the I²C functionality is not used/enabled. Pins P0.11 and P0.14 are open-drain I/Os and must have pull-up resistors when configured as outputs. This is unfortunately easy to forget, but they are included on the *LPC2148 Education Board*.

2.1.15 Page 3: 8x8 LED Matrix with SPI Interface

The 8x8 LED matrix is the most advanced circuit on the board, at least when it comes to controlling it. *Figure 19* below illustrate the 8x8 LED matrix part of the design. Two shift registers (serial-input, parallel-output), 74HC595, are used to control the eight columns and rows respectively. 16 bits must be shifted (= 2 bytes) in order to update the two shift registers. The first byte sent controls the rows and the second byte the columns. A zero bit in the first byte will light LEDs for the corresponding row and a zero bit in the second byte will light LEDs for the corresponding column. In order to display arbitrary patterns on the display a time-multiplexing mechanism must be implemented where each column (or row) is

updated one at a time in a circular pattern. The update frequency must be higher than 100 Hz in order not to see flickering on the LEDs.

The LPC2148 microcontroller has two on-chip SPI serial communication channels. The shift registers are accessed via the SPI bus, channel #0, and signal P0.15 is used as device select pin. SPI mode 0 can be used to shift data into the shift registers. SPI channel #0 is also shared with the MMC/SD interface.

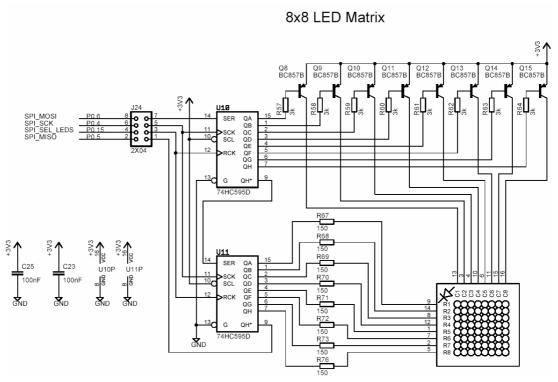

Figure 19 - LPC2148 Education Board Schematic, page 3: 8x8 LED Matrix with SPI Interface

The 8x8 LED matrix circuit can be disconnected from SPI channel #0 by removing the jumpers on J24. Normally, the bottom jumper on J24 (SPI_MISO on P0.5) should not be inserted since the output from U11 is not three-states when the shift registers are not enabled by device select signal P0.15. If inserted, the output from U11 will collide with the data output (DOUT) from the MMC/SD interface. The only reason to have this jumper inserted would be to read back the last two bytes shifted into the shift registers (and there is no typical reason to do this).

2.1.16 Page 3: Step Motor Control

The board includes a small bipolar step motor with a propeller mounted so movements can easily be observed. Signals P0.12 and P0.21 are used to control the movement of the step motor. Bipolar control of a step motor means that the current must flow in one (of two possible) directions through the windings. Two output buffers (4428-type drivers) make sure the motor windings are driven correctly. To rotate the axis one of the following two output patterns must be used.

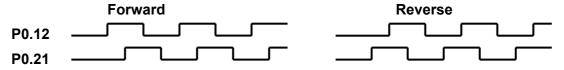

Figure 20 below illustrates the step motor control part of the design.

Step Motor Control

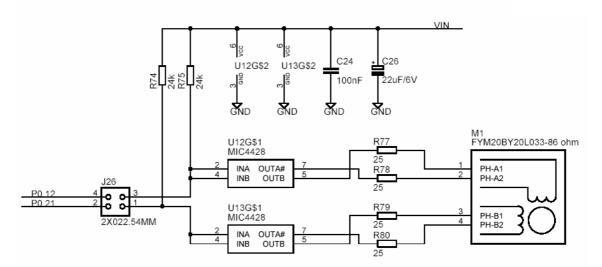

Figure 20 - LPC2148 Education Board Schematic, page 3: Step Motor Control

2.1.17 Page 3: Power Supply

The power supply uses conventional low-dropout voltage regulators, the Sipex SP1117. The LPC2148 need only a single +3.3V voltage and has an internal 1.8V regulator for powering the core. Some other processors in the LPC2xxx series require both a +3.3V and a +1.8V voltage. For a full specification of the SP1117 voltage regulator see the datasheet from Sipex (also included on the CD-ROM).

Figure 21 below illustrates the voltage regulator part of the design. As seen, power can come from either an external power adapter via a standard 2.1 mm power connector or from the two USB connectors (see schematic page #1 for details). Diode D10 and the diodes on the USB interfaces feeds the VIN power signal. The diodes are needed in order for any power supply input to feed the power and for blocking the USB interfaces from being reverse-fed. Normally, power is taken from the USB connector, but in some cases the 2.1 mm connector can be used, for example when the power need for expansion boards is high and the USB cannot supply the needed current (≥500mA).

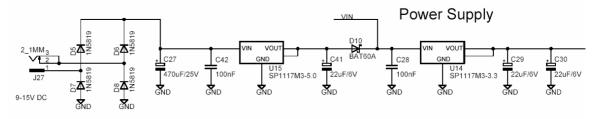

Figure 21 - LPC2148 Education Board Schematic, page 3: Power Supply

There are three pads to ease measurements of the incoming (+5V) voltage and the generated (+3.3V) voltage, see PAD3 – PAD5. A green LED indicates the presence of +3.3V voltage.

2.1.18 Page 4: Analog Inputs

The LPC2148 has 14 analog inputs connected to two different 10-bit ADC (Analog-to-Digital Converter). The conversion time is as short as 2.44 us and the input pins VREF and VSSA are used as conversion reference. *Figure 23* below illustrates the analog input part of the design. As seen, two trim-potentiometers are used to generate a variable voltage to

analog input #1 (P0.28) and #2 (P0.29). Note that the analog inputs are counted from analog input #0, but this input is not used in this design.

The signals P0.28 and P0.29 can be used as general purpose pins if the analog inputs are not used and in this case the analog voltages can easily be removed by removing the two jumpers on J28.

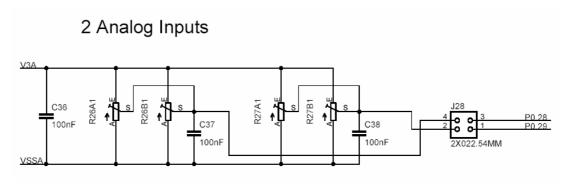

Figure 22 - LPC2148 Education Board Schematic, page 4: Analog Inputs

2.1.19 Page 4: Analog Outputs

The LPC2148 has one analog output, available as an alternative function on pin P0.25. *Figure 23* below illustrate the analog output part of the design. Via jumper J29 it is possible to connect the analog input to analog input #3 (P0.30). There are also special pads to make it easier to measure the analog voltage (PAD6 and PAD9).

It's also possible to generate an analog output voltage by filtering a PWM signal. Also in this case, the alternative PWM2 signal on P0.7 is used and low-pass filtered. It's possible to measure the result with analog input #3. An oscilloscope can with advantage be used to measure the PWM signal before and after the low-pass filtering. The cut-off frequency is $1/(2\pi RC)$ = about 2 Hz, which means that any PWM signal with a reasonable high frequency will be adequately low-pass filtered. It's also possible to measure if the remaining ripple is what can be expected from a simple 1-pole low-pass filter like this.

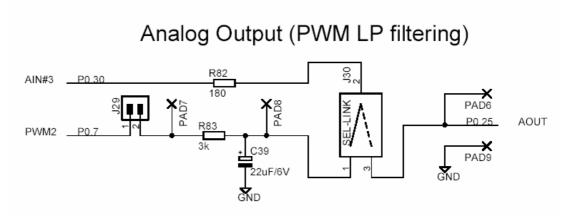

Figure 23 - LPC2148 Education Board Schematic, page 4: Analog Outputs

2.1.20 Page 4: 2x16 Character LCD

The final part of the LPC2148 Education Board is the 2x16 character LCD. The interface to the LCD is a simulated memory bus. 11 pins are needed to create an 8-bit interface; 8 data bits (D0-D7), 1 address bit (RS), 1 read/write bit (R/W), and one control signal (E). It's also possible to control the backlight via signal P0.30. The LCD controller is a standard KS0070B or equivalent, which is a very well-known interface for smaller character based LCDs.

Figure 24 below illustrate the LCD part of the design and which pins are used for the interface. All pins can be disconnected from the interface if needed, via jumpers J31 – J42. The LCD is powered from the +3.3V power supply. The display contrast adjustment (via R86) is not mounted since the currently used LCD does not need adjusted.

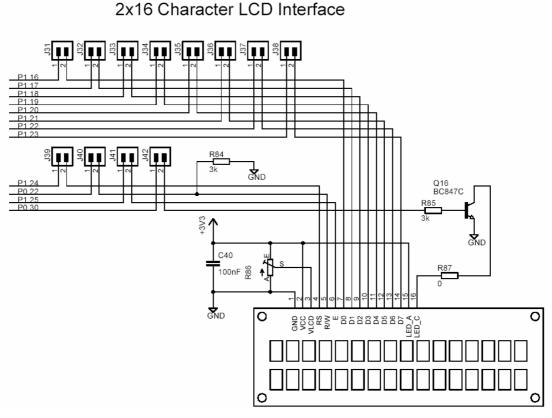

Figure 24 - LPC2148 Education Board Schematic, page 4: 2x16 Character LCD

There are two options to reduce the number of pins used for the interface.

- Do not use the R/W pin and save one pin (P0.22). Normally, there is only a need to write to the display controller. In this case, the R/W signal can be tied low permanently (R84) and jumper J40 is removed.
- Use the 4-bit interface instead of the 8-bit interface. The LCD controller can operate from a 4-bit interface. In this case, data bus pins D4 D7 are just used. In this case 4 pins will be free (P1.16 P1.19) for other use. If combined with the option above, five pins will be freed.

2.2 Jumpers

The LPC2148 Education Board is full of jumpers in order to be able to connect/disconnect all different parts of the external circuits. *Figure 25* below illustrates all jumpers and explains to what part of the design they belong.

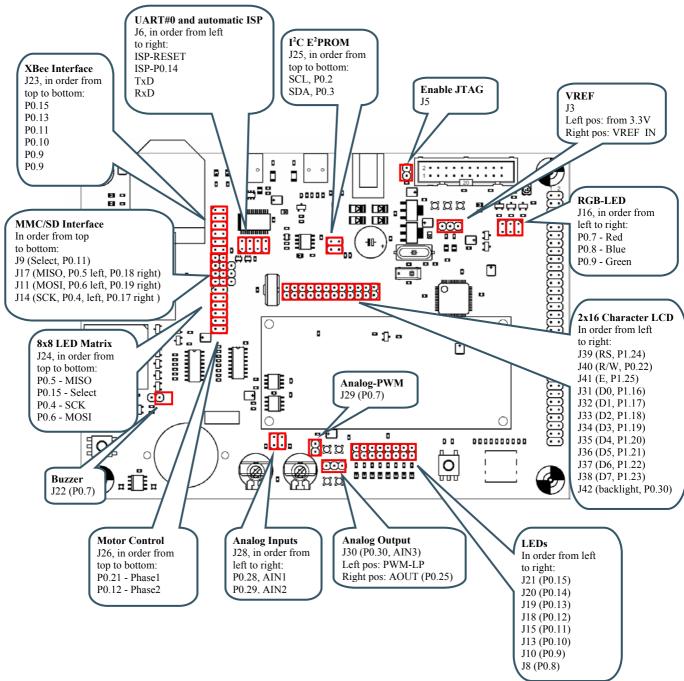

Figure 25 - LPC2148 Education Board Jumpers

2.2.1 Illegal Jumper Combinations

Note that some jumpers are mutual exclusive and should not be inserted simultaneously.

- MISO signal (P0.5) on SPI channel #0. Do not have bottom jumper on J24 inserted simultaneously as the MMC/SD interface is used. See explanation in *section 2.1.12*
- P0.7 is a commonly used signal that is used for the buzzer, the red LED in the RGB-LED, and individual LED.
- Many of the signals for the individual LEDs (P0.8 P0.15) are also used for other parts of the design. It does not damage the electronics if the LEDs are connected, and in some cases it might even be useful to have LED indicators for some signals.

2.3 Connectors

Figure 26 below illustrate the position of all external connectors on the LPC2148 Education Board.

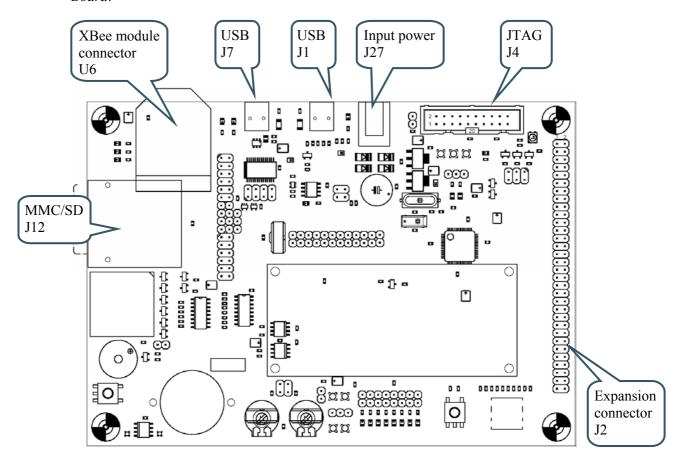

Figure 26 - LPC2148 Education Board External Connectors

2.4 Important Components

Figure 27 below illustrates the position on the board for some important components in the design.

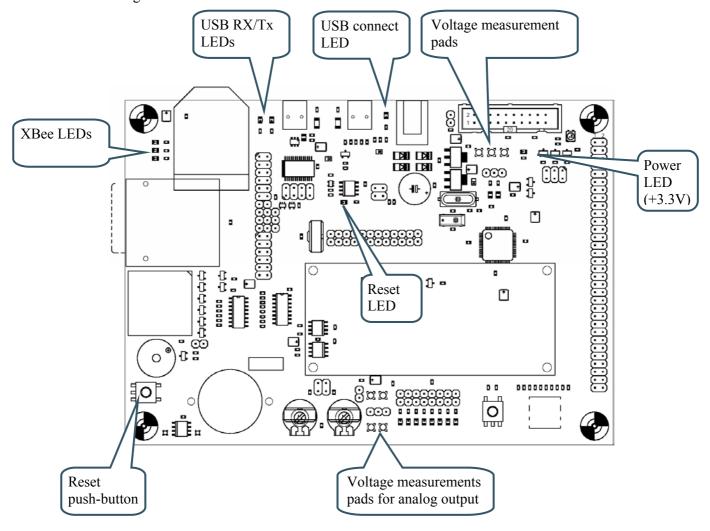

Figure 27 - LPC2148 Education Board Important Components

2.5 Mechanical Dimensions

Figure 28 below contains a drawing of the board that includes mechanical measures. As seen, the board is 156 x 110 mm large with mounting holes 144 x 98 mm apart.

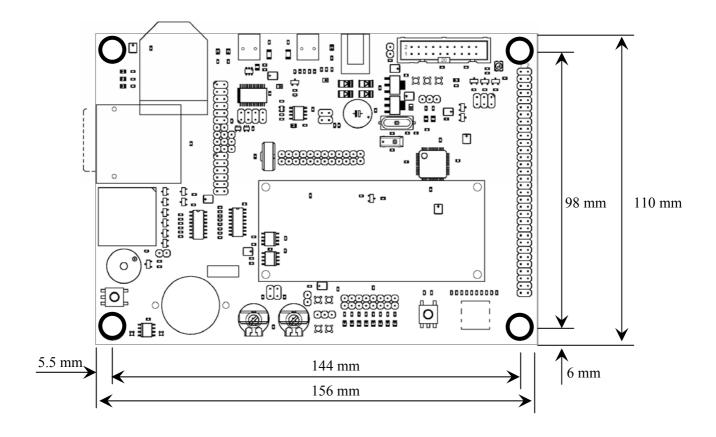

Figure 28 - LPC2148 Education Board Mechanical Dimensions

3 Getting Started

3.1 Test program

The *LPC2148 Education Board* comes preloaded with a test program. This program can be used to verify that the board operates correctly.

- Download the test program (by using the hex-file for the test program)
- Insert all jumpers according to default positions
- Push the reset button
- Watch the running-one on the individual LEDs.
- Also watch the printed information on the terminal (se below)
- After that a test loop is entered:
 - o Printed message on the LCD and flashing of backlight
 - Scrolled message on 8x8 LED matrix
 - o PC-mouse emulation over USB and joystick-switch
 - o Dimming of RGB-LEDs
 - o Running the step motor forward and backward

A terminal program should be attached to the USB-to-serial mini-B USB connector. The test program will output test information regarding the I²C and E²PROM test, MMC/SD test, as well as the RTC crystal test. Also, the UART/USB channel can be tested by typing characters in the terminal program. The settings for the terminal program are: 38.4 kbps, 8 data bits, no parity bits, and one stop bit (i.e., 8N1).

3.2 Program Development

Consult the *QuickStart Program Development User's Manual* for more information about the *QuickStart Build Environment* from Embedded Artists, and program development for the ARM7 in general.

3.3 Program Download via ISP

UART#0 can be used to download program code into the internal FLASH of the LPC2148. The ISP (In-System Programming) feature of the LPC2148 is then used. ISP is enabled after reset by pulling pin P0.14 low. In order to enable automated ISP invocation, the *LPC2148 Education Board* allows control of both the reset signal and P0.14, via the USB-to-serial bridge (FT232RL from FTDI). Reset is controlled by the DTR serial signal and P0.14 via RTS. NXP has release a download program (no longer supported) and there is also the open source LPC21ISP program. FlashMagic from ES Academy is however the recommended ISP download program to use. The program can be downloaded from: http://www.flashmagictool.com/

Figure 29 below illustrates the jumper settings when enabling the automatic ISP functionality.

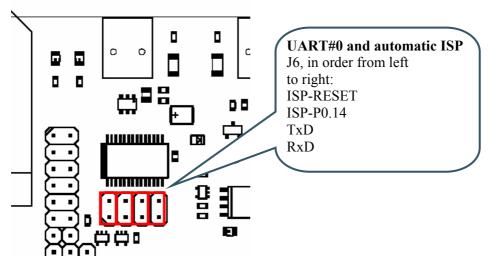

Figure 29 - ISP Jumpers, enable automatic ISP

Some terminal programs can control the DTR/RTS signals when connected to the board so that the board is constantly in reset or always enabling ISP mode. In that case, the automatic ISP functionality must be disabled. *Figure 30* below illustrates the jumper settings then disabling the automatic ISP.

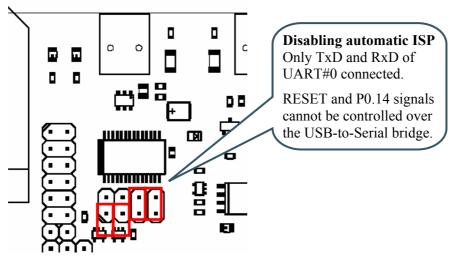

Figure 30 - ISP Jumpers, disable automatic ISP

Note that the USB-to-Serial bridge chip must have its driver installed on the PC FlashMagic and the terminal program is running from. *Section 3.4* below describes the installation procedure.

3.4 FTDI USB Driver

A USB driver must be installed on your PC computer in order for the USB-to-UART chip (FT232R) to function. Make sure to download the latest version of the driver, which can be found at the following URL: http://www.ftdichip.com/Drivers/VCP.htm (search for a FT232R driver for your operating system). Latest version of the driver (at the time of writing this document) is 2.00.00.

When the *LPC2148 Education Board* is connected to the PC (via an USB cable) the PC will ask for a driver. Unpack/unzip the downloaded driver file and browse to the position of the driver files. After successful driver installation, a COM port will be created. Before

communication with the Board can take place the UART settings must be correctly set. The following description is valid for WindowsTM XP, but other operating systems have similar dialog windows. See the USB driver documentation for details, if needed.

To change UART settings, first open the System Properties dialog, as illustrated in the figure below.

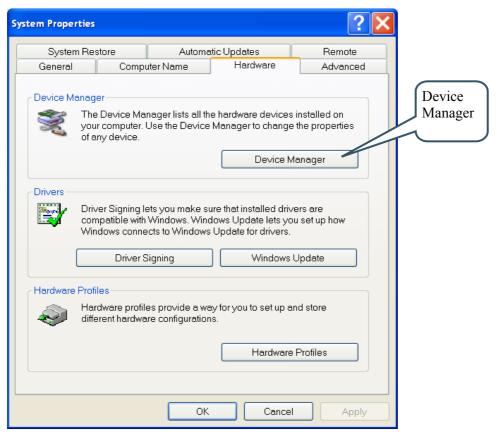

Figure 31 - System Settings Dialog

Then select the *Device Manager* and then open the *Ports* list, as illustrated in *Figure 32* below.

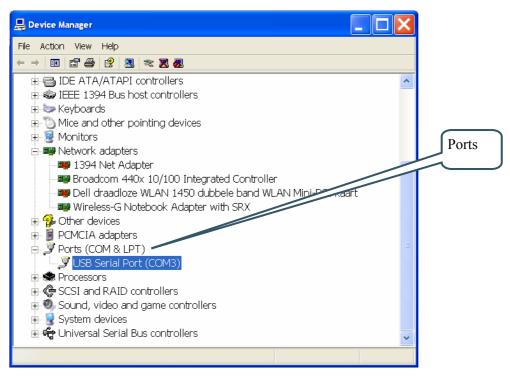

Figure 32 - Device Manager Dialog

The new COM port (USB Serial Port) will be listed under the *Ports* list. Right-click on the new USB Serial Port and select *Properties*, as illustrated in *Figure 33* below.

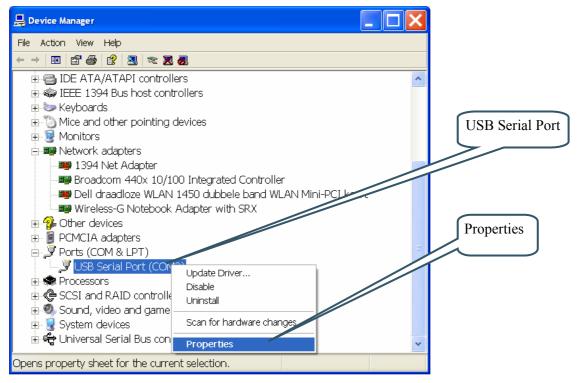

Figure 33 - Device Manager Port Dialog

Set 38400 bits per second, 8 data bits, none parity, 1 stop bit, and none flow control, as illustrated in *Figure 34* below. Then select *Advanced* settings.

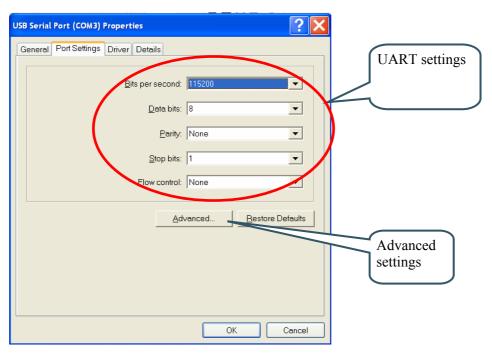

Figure 34 - USB Serial Port Properties Dialog

Set the desired COM port number under the *Advanced* settings dialog. NXP's FLASH Utility program (for ISP program download) needs, for example, a COM port number between 1 and 5. Very often the COM port number selected but the USB Serial Port is higher than this, so this needs to be changed manually.

It is common that all COM ports with low numbers are listed as occupied, but test to change to a low number anyways. Very often it's no problem at all to do this.

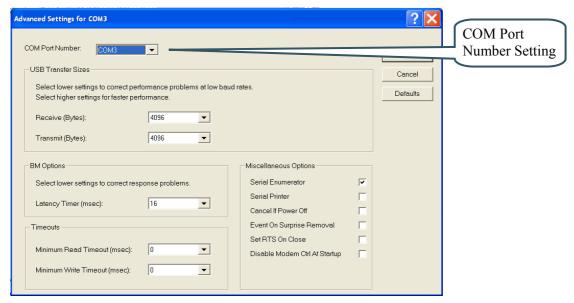

Figure 35 - Advanced USB Serial Port Properties Dialog

Finally it's time to test if you have successfully installed and configured the USB Serial Port. Start a terminal program. Connect to the correct COM port, with 38400 bits per second, 8N1, no flow control. Remember to not have the USB-ISP jumpers inserted.

3.4.1 USB Driver Behavior

Sometimes the USB COM port does not enumerate properly when the board in connected to the PC. This is a known "feature" of the USB driver. If you experience this problem, just unplug the board shortly and then plug in again. A new COM port that can be accessed properly should be created the second time.

This problem may occur after every time you start (i.e., power cycle) your PC.

If the ISP jumpers are inserted, pressing the reset button is often required in order to startup the board (it can be placed in bootloader mode during startup due to RTS/DTR signal handling by the USB driver during startup).

4 CD-ROM and Product Registration

The accompanying CD-ROM contains a lot of information and programs that will easy your program development! Note that there may be newer versions of different documents and programs available than the ones on the CD-ROM. See *Section 4.2* for information about the product registration process, which allows you to always have access to the latest versions.

4.1 CD-ROM

The following is included on the CD-ROM:

- The preloaded test program as a HEX-file.
- The two different ISP download programs.
- Datasheets of all circuits on the *LPC2148 Education Board*.
- *QuickStart Build Environment* from Embedded Artists, which contains a complete setup of a build environment for GCC.
- A complete development environment: Rowley Associates CrossWorks for ARM, 30-day evaluation version.
- A complete development environment: IAR Embedded Workbench for ARM, Kickstart Edition with 32 Kbyte program size limit.
- Another complete development environment: GCC, GNUARM distribution, including compiler, linker, make, and debugger.
- The program Programmers Notepad, which is a very good program development editor and project manager.
- The Eclipse development environment including the CDT (C/C++ Development Tools) project.

4.2 Product Registration

By registering as a customer of Embedded Artists you will get access to more valuable material that will get you up-and-running instantly:

- Access to a Real-Time Operating System (RTOS), in the form of a library that can be used for non-commercial applications.
- Access to a number of sample applications that demonstrated different (peripheral) functions in the LPC2148 processor.
- Access to the latest versions of all information and programs on the CD-ROM.

Registering is easy and done quickly.

- 1) Go to http://www.EmbeddedArtists.com, select Support and then Register.
- 2) Type in the products serial number (can be found on the *LPC2148 Education Board* or on the package carrying the board) along with your personal information.

5 Further Information

The LPC2148 microcontroller is a complex circuit and there exist a number of other documents with a lot more information. The following documents are recommended as a complement to this document.

- [1] NXP LPC2148 Datasheet http://www.nxp.com/acrobat/datasheets/LPC2141_42_44_46_48_2.pdf
- [2] NXP LPC2148 User's Manual http://www.nxp.com/acrobat/usermanuals/UM10139_1.pdf
- [3] NXP LPC2148 Errata Sheet http://www.nxp.com/acrobat/erratasheets/2148.pdf
- [4] ARM7TDMI Technical Reference Manual. Document identity: DDI0029G http://www.arm.com/pdfs/DDI0029G 7TDMI R3 trm.pdf
- [5] ARM Architecture Reference Manual. Document identity: DDI0100E Book, Second Edition, edited by David Seal, Addison-Wesley: ISBN 0-201-73719-1 Also available in PDF form on the ARM Technical Publications CD
- [6] ARM System Developer's Guide Designing and Optimizing System Software, by A.N. Sloss, D Symes, C. Wright. Elsevier: ISBN 1-55860-874-5
- [7] Embedded System Design on a Shoestring, by Lewin Edwards. Newnes: ISBN 0750676094.
- [8] GNU Manuals http://www.gnu.org/manual/
- [9] GNU ARM tool chain for Cygwin http://www.gnuarm.com
- [10] An Introduction to the GNU Compiler and Linker, by Bill Gatliff http://www.billgatliff.com
- [11] LPC2000 Yahoo Group. A discussion forum dedicated entirely to the NXP LPC2xxx series of microcontrollers. http://groups.yahoo.com/group/lpc2000/
- [12] The Insider's Guide to the NXP ARM7-Based Microcontrollers, by Trevor Martin. http://www.hitex.co.uk/arm/lpc2000book/index.html

Especially note document [3]. There exist a number of bugs in the processor that is important to be aware of.

Note that there can be newer versions of the documents than the ones linked to here. Always check for the latest information / version.

Datasheets for all circuits on the *LPC2148 Education Board* are included on the accompanying CD-ROM.

6 App.A – 10M Ethernet Expansion Board

This chapter contains detailed information about the electrical design of the board.

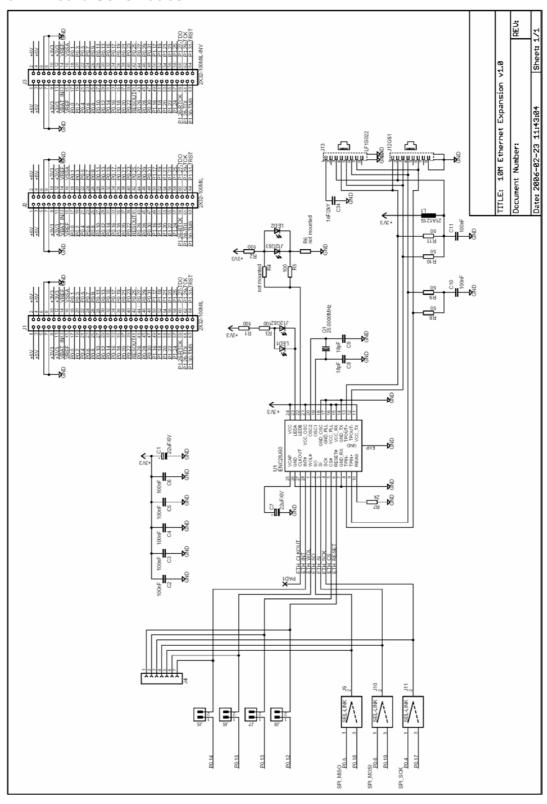

Figure 36 – 10M Ethernet Expansion Board Schematic

The design is centered on the ENC28J60 Ethernet controller from Microchip. It's a very nice chip with SPI interface. Only 6 signals are needed (4 for SPI channel, reset and interrupt). The datasheet of the chip explain all details. Especially note the errata sheet that indicates a minimum SPI clock frequency of 8 MHz. This is not possible to achieve with SPI channel #0, but luckily it is with the SSP channel (also commonly referred to as SPI channel #1). If SPI channel #0 is used it is alternatively possible to create a software workaround for the problem (simple read the PHY-registers after a write operation – rewrite the value if not correct).

It is possible to select with jumpers which SPI channel to connect the ENC28J60 to, see picture below.

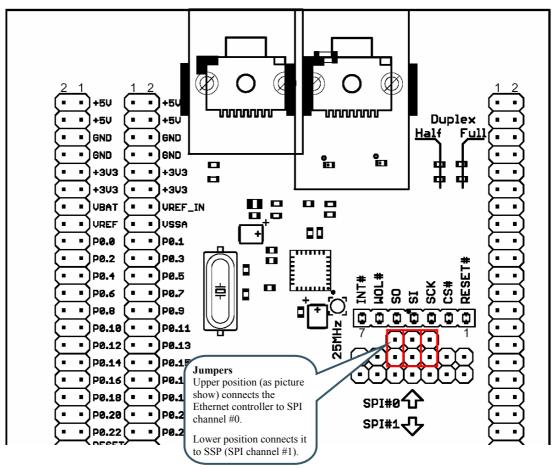

Figure 37 - 10M Ethernet Expansion Board Jumpers

The 10M Ethernet Expansion Board power consumption is low enough to let the USB power (of the LPC2148 Education Board) also feed this expansion board, i.e., no external power supply is needed for this board.

7 App.B – Bluetooth Expansion Board

This chapter contains detailed information about the electrical design of the board.

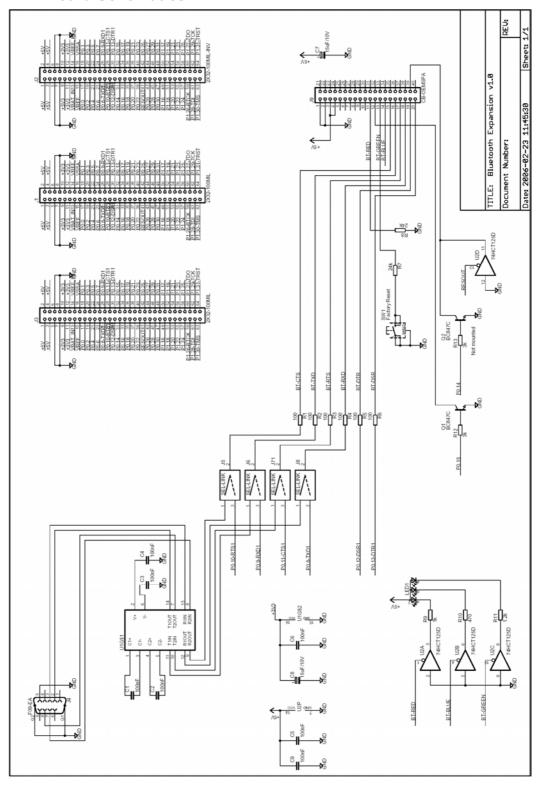

Figure 38 – Bluetooth Expansion Board Schematic

The main part of the design is to interface the *LPC2148 Education Board* to the Bluetooth module from connectBlue. The Bluetooth module is unique in the sense that it is a complete product that is Bluetooth qualified (all Bluetooth products on the market must be certified to the Bluetooth standard, and this is called Bluetooth qualification). Products based on these modules from connectBlue do not require any further Bluetooth qualification.

Download product documentation from connectBlue's homepage for details about the Bluetooth modules, http://www.connectblue.com.

Two different Bluetooth module series can be used; OEMSPA1x/3x or OEMSPA31x/33x. The *Bluetooth Expansion Board* is delivered with either OEMSPA13i or OEMSPA311i. They are compatible in most aspects.

The *LPC2148 Education Board* communicates with the Bluetooth module via UART #1. Some of the modem signals can be used but are not required. The serial interface to the modules is programmable. The default is to use RTS/CTS flow control but this can be disabled by software.

It is possible to communicate directly with the Bluetooth module via the on-board RS232 interface. Communication can take place via a simple terminal program or via an external application program. The default communication setting is 57.6 kbps, 8N1, RTS/CTS flow control. Note that the Bluetooth module will get default values (i.e., factory reset values) by pressing the switch during power-up of the module.

When placing the four jumpers to the DSUB side, the module's serial channel is connected to the on-board RS232 serial interface (i.e., the DSUB). When the jumpers are to the module's side, the serial channel is connected to the LPC2148's UART #1. See picture below for details.

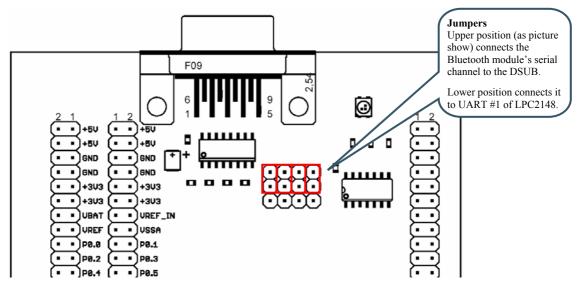

Figure 39 - Bluetooth Expansion Board Jumpers

Note that the rest control of P0-.14 is not active. The transistor base resistor is not mounted.

Communication status is indicated via a RGB-LED. See the module's documentation for details.

The Bluetooth module is powered with +3.3V from the *LPC2148 Education Board*. USB powering (of the *LPC2148 Education Board*) is typically possible since the peak current consumption of the Bluetooth module is 150 mA (peak current is 70 mA for OEMSPA311i).

8 App.C – Graphical LCD Expansion Board

This chapter contains detailed information about the electrical design of the board.

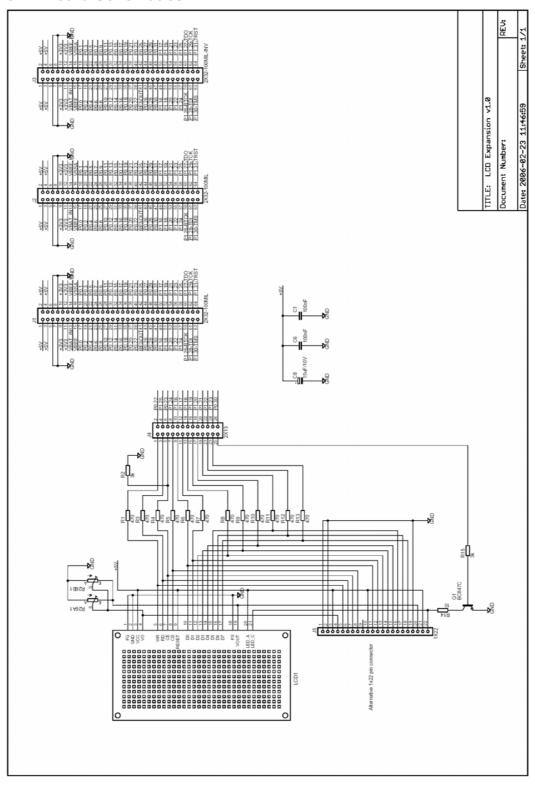

Figure 40 – Graphical Expansion Board Schematic

The graphical monochrome display has 240x128 pixels and contains an on-board LCD controller based on T6963C from Toshiba. The controller has a standard 8-bit parallel MCU interface. The LPC2148 must simulate this interface since it has no external address/databus.

13 pins are needed to create an 8-bit interface; 8 data bits (D0-D7), 1 address bit (CD), 1 read signal (RD), 1 write signal (WE), and 1 chip enable signal (CE). It's also possible to control the backlight via signal P0.30. All pins can be disconnected from the LPC2148 pins, if needed, by removing the jumpers.

The pins used for this interface are the same as for creating the bus interface to the 16x2 character LCD on the *LPC2148 Education Board*. Therefore it is important to note that all jumpers for the LCD interface on the *LPC2148 Education Board* must be removed before the *LCD Expansion Board* is connected. See picture below.

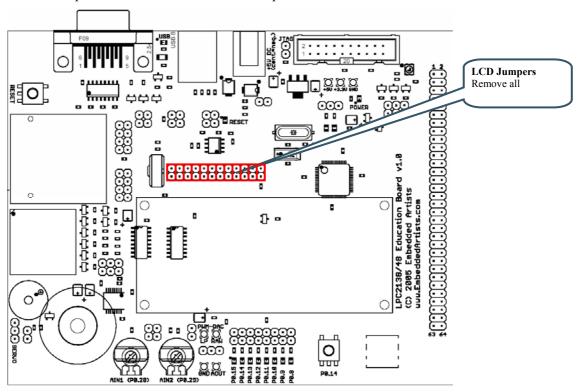

Figure 41 - LCD Jumpers on LPC2148 Education Board

It's possible to adjust the display contrast with a small trim-potentiometer on the *LCD Expansion Board*.

The LCD is powered from the +5V power supply. +5V power is no problem since all pins on the LPC2148 are +5V tolerant and a high logic level from the CPU (powered by +3.3V) is also interpreted as a high logic level by the LCD. Display contrast is adjusted via trimpotentiometer R53.

There are two different connectors for the display on the LCD Expansion Board. One has 21 pins and the other has 22 pins. This is just for allowing more options when selecting the LCD. The currently used display is the 240 x 128 pixel monochrome graphical LCD SMG210128A from Sunman.

9 App.D – UART & RS485 Expansion Board

This chapter contains detailed information about the electrical design of the board.

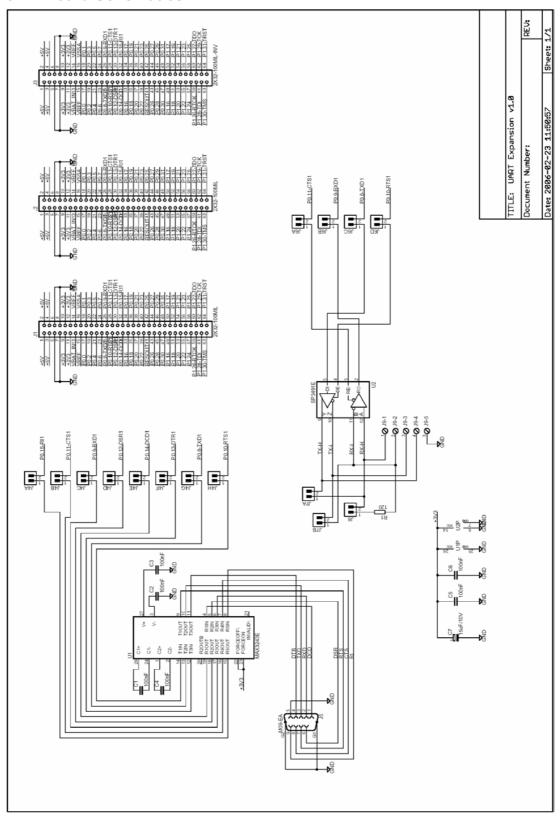

Figure 42 – UART & RS485 Expansion Board Schematic

The *UART & RS485 Expansion Board* contains the SP3243E full modem RS232 interface and the SP3491E RS422/485 interface from Sipex. Both interfaces include on-chip ESD protection.

The LPC2148 communicates with the *UART & RS485 Expansion Board* via UART channel #1. Note that both interfaces cannot be used at the same time since UART #1 is used by both interfaces. All signals in UART #1 (i.e., P0.8 – P0.15) can be disconnected by removing jumpers.

The RS232 interface contains control for all signals. The DSUB is a male connector.

The RS485 interface can actually be used as either a RS422 or RS485 interface. If jumpers J7A/B are inserted the Rx and Tx lines are connected and the interface is a RS485 interface (i.e., a half-duplex two-write interface). If the jumpers are removed the Rx and Tx signals are separated (i.e., a full-duplex 4-wire interface).

With jumper J8 it is possible to add a 120 ohm termination resistor, which some applications need

The interface circuits are powered with +3.3V from the *LPC2148 Education Board*.

10 App.E – MP3 Decoder Expansion Board

This chapter contains detailed information about the electrical design of the board.

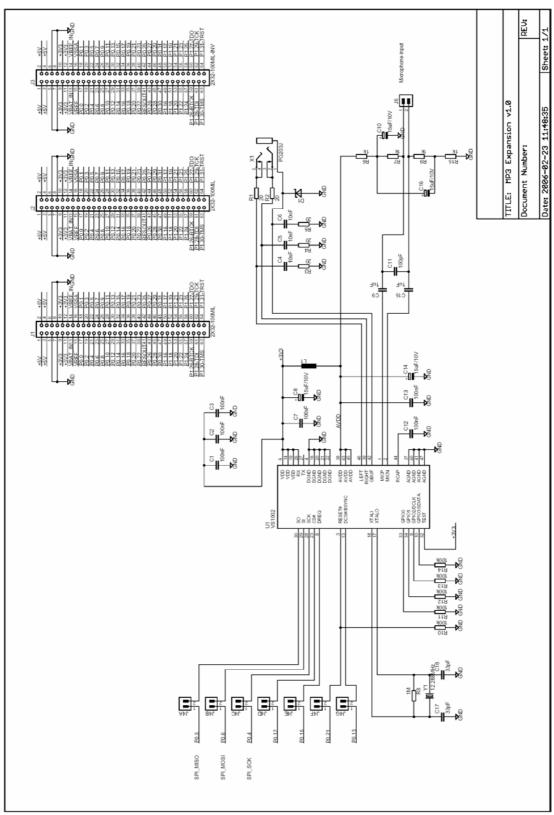

Figure 43 – MP3 Decoder Expansion Board Schematic

The MP3 Decoder Expansion Board is based on the well-known MP3 decoder chip vs1002 from VLSI (http://www.vlsi.fi). The LPC2148 communicates with the vs1002 decoder chip module via SPI channel #0. Four other signals (other than the three SPI signals) are needed for the interface. See the vs1002 datasheet for details about the interface.

The audio is available via a 3.5mm headphone connector. No external amplifier is needed for small headphones. A microphone input is also available (note that microphone is not included) for recording audio. The circuit is powered with +3.3V from the *LPC2148 Education Base Board*.

11 App.F – ZigBee Expansion Board

This chapter contains detailed information about the electrical design of the board.

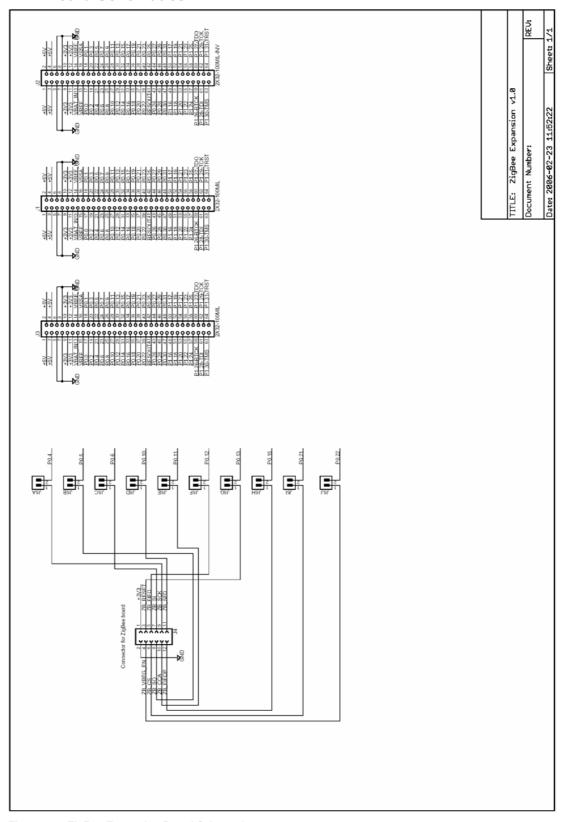

Figure 44 – ZigBee Expansion Board Schematic

The ZigBee Expansion Board is based on the well-known RF-circuit CC2420 from Chipcon/Texas Instruments (http://www.chipcon.no). The LPC2148 communicates with the ZigBee interface via SPI channel #0. The interface is 10 signals in total. See the CC2420 datasheet for details about the interface.

The CC2420 and all RF parts of the design are placed on a separate board (2.4GHz RF card AC163027-2 from Microchip). The schematic above only illustrates the signals to the connector to the RF board. Detailed schematic for the RF board is delivered when purchasing the *ZigBee Expansion Board*.

The circuit is powered with +3.3V from the *LPC2148 Education Base Board*.

12 App.G – Prototype Expansion Board

This chapter contains detailed information about the electrical design of the board.

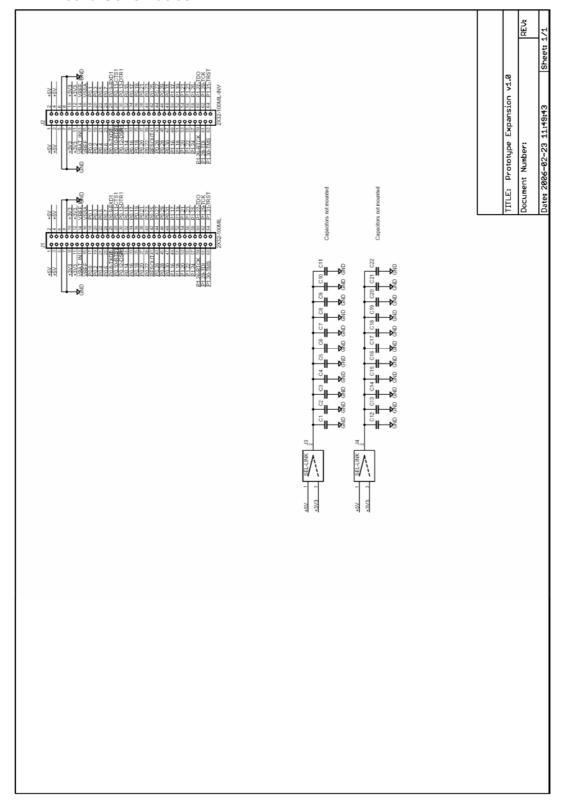

Figure 45 – Prototype Expansion Board Schematic

The *Prototype Expansion Board* allows you to build your own design and interface it to the *LPC2148 Education Board*. All signals on the expansion connector can easily be accessed.

The board contains a large 100 mil prototype area, a smaller 50 mil prototype area, two 50 mil areas for SOIC chips, and a 0.65 mm area for SSOP chips.

Solder pads for bypass capacitors are placed between the solder pad rows for the SOIC areas. It is possible to feed these bypass capacitors with either +3.3V or +5V, selectable via two jumpers. See electrical schematic above.
