

## Troubleshoot EtherNet/IP Networks

## Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

---

### IMPORTANT

Identifies information that is critical for successful application and understanding of the product.

---

Labels may also be on or inside the equipment to provide specific precautions.

**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

---

This manual contains new and updated information. Changes throughout this revision are marked by change bars, as shown to the right of this paragraph.

### New and Updated Information

This table contains the changes made to this revision.

Topic	Page
Added Additional Resources tables.	5
Added flowchart for Assigning IP Addresses to EtherNet/IP Devices.	8
Added Reset to Factory Default section	14
Added Optimize an EtherNet/IP Network section	16
Added Access Web Browser Diagnostics	17
Updated Speed section	19
Updated Duplex section	19
Updated Autonegotiate section	20
Updated CPU section	21
Updated Interface Errors section	21
Updated CIP MSG Connections section	23
Updated CIP Connection Timeouts section	24
Updated TCP Connections section	24
Updated I/O Packets per Second section	25
Updated HMI Packets per Second section	25
Updated Missed Packets per Second section	26
Added Network Status (NET)	30

Resource	Description
EtherNet/IP QuickConnect Application Technique, publication <a href="#">ENET-AT001</a>	QuickConnect with ArmorBlock I/O Modules.
Network Resiliency Using Ring Topologies White Paper, publication <a href="#">ENET-WP010</a>	Discussion about using ring topologies to reduce installation costs.
CIP Motion: Performance Without Compromise, publication <a href="#">ENET-WP027</a>	Understanding networks and protocols in various industries.
Time Synchronization Protocol/1756-TIME Module, publication <a href="#">ENET-WP030</a>	Understanding various Time Synchronization protocols.
Runtime/Online Addition of 1756 I/O Over EtherNet/IP, publication <a href="#">LOGIX-WP006</a>	Understanding Runtime process extensions and the addition of Runtime I/O.

**Table 5 - Diagnostics**

Resource	Description
Troubleshoot EtherNet/IP Networks App Technique, publication <a href="#">ENET-AT003</a>	Assigning IP addresses to devices and troubleshooting slow or intermittent networks.
Also included are several Knowledgebase Tech Notes with useful diagnostic and troubleshooting information.	

**Table 6 - Segmentation**

Resource	Description
Network Segmentation Methodology Application Guide, publication <a href="#">ENET-AT004</a>	Methods for plant-wide and site-wide networks with OEM Convergence-ready Solutions.
Stratix 5700 Network Address Translation White Paper, publication <a href="#">ENET-WP032</a>	A hardware Layer 2 implementation that provides for automation applications where performance is critical.
Stratix 5700 Network Address Translation Quick Start, publication <a href="#">IASIMP-QS038</a>	Configuring and Verifying NAT by using the Device Manager Web Interface.

**Table 7 - Security**

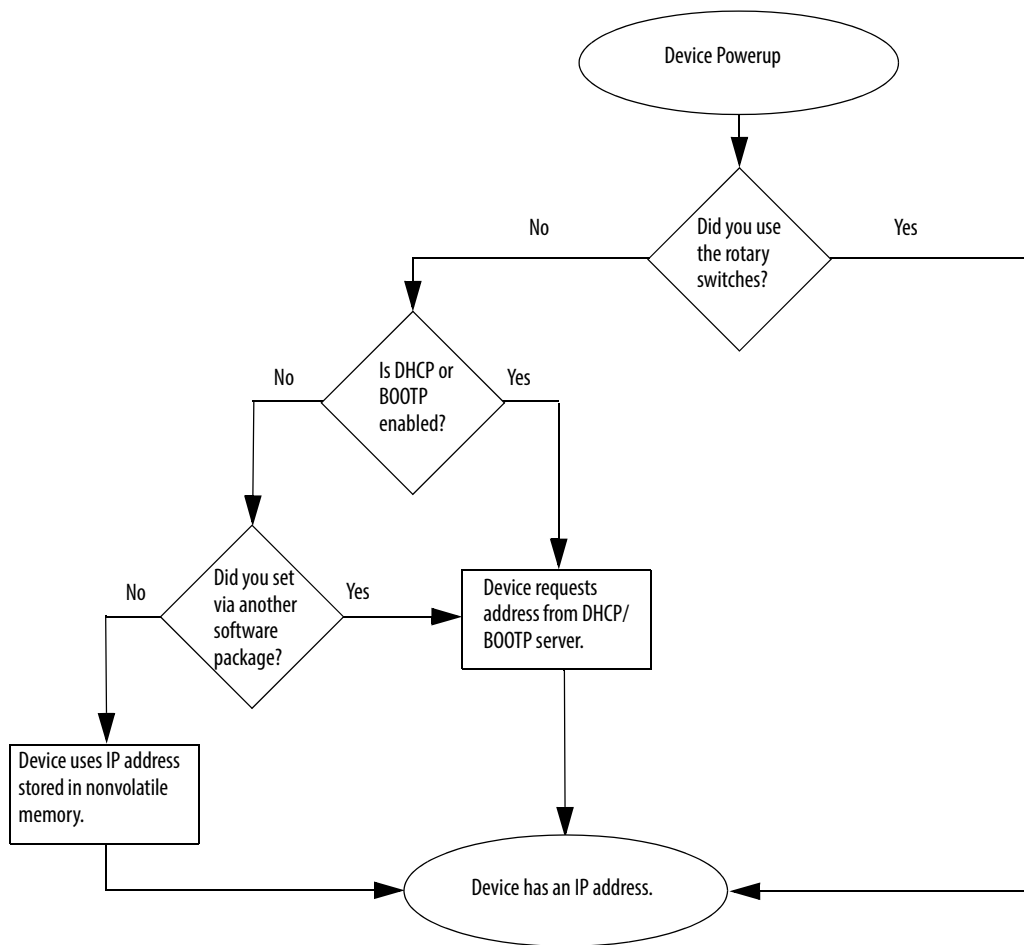

Resource	Description
Design Considerations for Securing Industrial Automation and Control System Networks, publication <a href="#">ENET-WP031</a>	Discussion of security, security framework, switch hardening, and threat management.
Scalable Secure Remote Access Solutions for OEMs, publication <a href="#">ENET-WP025</a>	Discussion of remote access formats and solutions.
1756-EN2TSC User Manual, publication <a href="#">ENET-UM003</a>	Architecture, connections and configurations to various clients, and diagnostics.
Industrial Security Best Practices, publication <a href="#">SECUR-AT001</a>	Overview of security including layered security, product and system security, and defense-in-depth.

## Assign IP Addresses to EtherNet/IP Devices

Topic	Page
Set an IP Address via Rotary Switches	8
Assign an IP Address with a BOOTP/DHCP Server	9
Assign an IP Address with RSLinx Software	11
Assign an IP Address within the Studio 5000 Environment	13
Reset to Factory Default	14

One step in troubleshooting an EtherNet/IP network is to make sure each device on the network has a valid IP address. This chapter explains different methods to assign IP addresses. Select the method and software package you are most comfortable with.

For more information, see EtherNet/IP Drawings Quick Reference, publication [IASIMP-QR023](#).

## ■ Set an IP Address via Rotary Switches

If your device has rotary switches they look similar to the following figure..

At powerup, the device reads the rotary switches to determine if they are set to a valid number for the last portion of the IP address, that is, if the numbers are in the range from 001...254.

If the settings are a valid number, these conditions result:

- IP address = 192.168.1.xxx (where xxx represents the switch settings)

- Subnet mask = 255.255.255.0
- Gateway address = 192.168.1.1
- The device does not have a host name assigned, nor does it use any Domain Name System

We recommend that you set the rotary switches to a valid number before installing the device.

**WARNING:** When you change switch settings while power is on, an electrical arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

The device attempts to use the BOOTP/DHCP server to set the IP address if the rotary switches are not set to a valid number.

## Assign an IP Address with a BOOTP/DHCP Server

The BOOTP/DHCP server is a standalone server you can access from either of these locations:

- Programs > Rockwell Software > BOOTP-DHCP Server

If you have not installed the server, you can download and install it from <http://www.ab.com/networks/ethernet/bootp.html>.

- Tools directory on the Studio 5000 installation CD

---

**IMPORTANT**

Before you start the BOOTP/DHCP server, make sure you have the device's hardware (MAC) address. The hardware address is on a sticker on the side of the communication device and uses an address in a format similar to the following: 00-0b-db-14-55-35

---

You can use the BOOTP/DHCP server to set the device's IP address if either of these conditions exists at powerup:

- The device does not have rotary switches and the device is BOOTP/DHCP enabled.
- The device's rotary switches are set to an invalid number and the device is BOOTP/DHCP enabled.

For large, isolated networks, it can be more convenient and safer to use a BOOTP/DHCP server rather than Studio 5000 Logix Designer or RSLinx® software. The BOOTP/DHCP server also limits the possibility of assigning duplicate IP addresses.

If you use the BOOTP/DHCP server in an uplinked subnet where an enterprise DHCP server exists, a device can get an address from the enterprise server before the Rockwell Automation utility even sees the device. If necessary, disconnect from the uplink to set the address and configure the device to retain its static address before reconnecting to the uplink. This is not a problem if you have node names configured in the device and leave DHCP enabled.

To set the device’s IP address with a BOOTP/DHCP server, follow these steps.

- 1. Start the BOOTP/DHCP software.
- 2. From the Tools menu, choose Network Settings.
- 3. If appropriate for the network, type the Subnet Mask, Gateway address, Primary and/or Secondary DNS address, and Domain Name.

- 4. Click OK.

The Request History panel displays the hardware addresses of devices issuing BOOTP requests.

- 5. Double-click the hardware (MAC) address of the device to be configured.

The New Entry dialog box appears with the device’s Ethernet Address (MAC).

6. Type an IP Address, Hostname, and Description for the device.

7. Click OK.
8. To permanently assign this configuration to the device, select the device and click Disable BOOTP/DHCP.

When power is cycled, the device uses the assigned configuration and does not issue a BOOTP request.

If you do not click Disable BOOTP/DHCP, on a power cycle, the host controller clears the current IP configuration and begins sending BOOTP requests again.

## Assign an IP Address with RSLogix Software

Use RSLogix software to set the IP address if one of the following conditions exist:

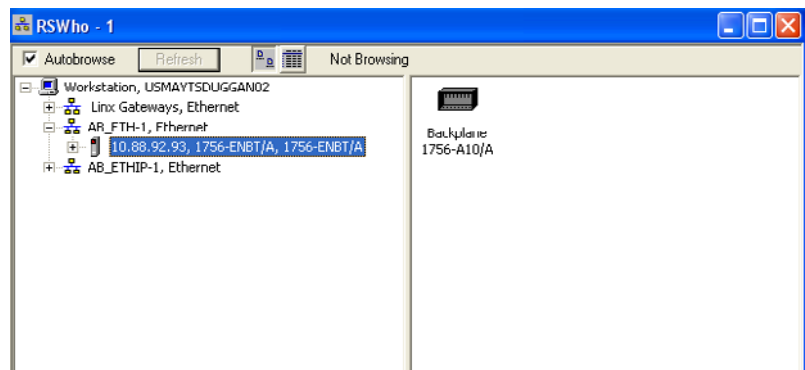

- A BOOTP server is not available.
- The EtherNet/IP communication device is connected to another network.

To use RSLogix software to set the communication device's IP address, follow these steps.

1. From the Communications menu, choose RSWho.

The RSWho dialog box appears.

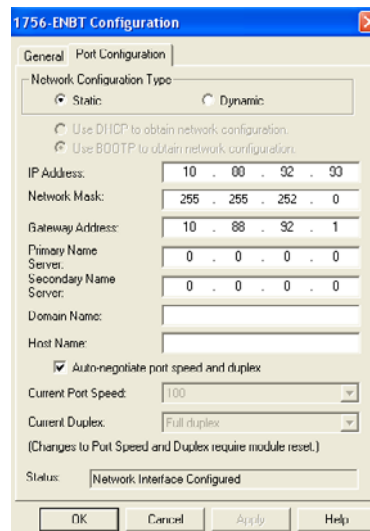

2. Navigate to the Ethernet network.

3. Right-click the EtherNet/IP device and choose Module Configuration.

The Module Configuration dialog box appears.

4. Click the Port Configuration tab.

5. For Network Configuration Type, click Static to permanently assign this configuration to the port.

---

**IMPORTANT** If you click Dynamic, on a power cycle, the controller clears the current IP configuration and resumes sending BOOTP requests.

---

6. Type this information in the appropriate fields:
  - IP address
  - Network mask address
  - Gateway address
  - Primary server name
  - Secondary server name
  - Domain name
  - Host name

## 7. Configure the port settings.

To	Then
Use the default port speed and duplex settings	Leave Auto-negotiate port speed and duplex checked. This setting determines the actual speed and duplex setting.
Manually configure your port's speed and duplex settings	Follow these steps. 1. Clear the Auto-negotiate port speed and duplex checkbox. 2. From the Current Port Speed pull-down menu, choose a port speed. 3. From the Current Duplex pull-down menu, choose the appropriate Duplex value, that is, Half Duplex or Full Duplex.

## 8. Click OK.

## Assign an IP Address within the Studio 5000 Environment

If a Logix Designer project is online with a controller that communicates to or through the EtherNet/IP communication device, you can use the Logix Designer application to assign an IP address.

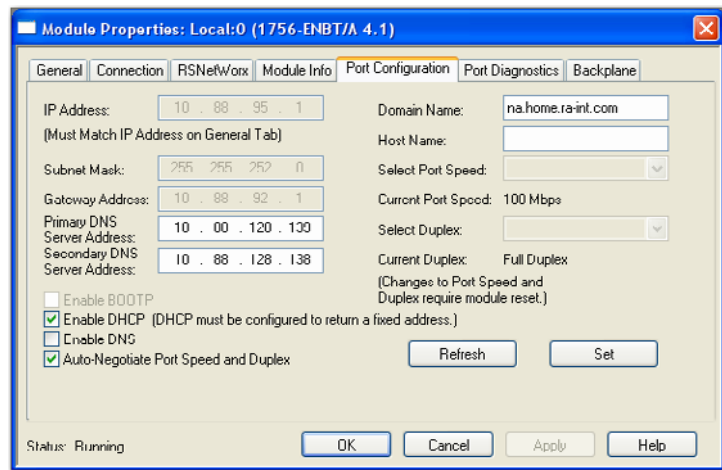

To use the Logix Designer application to set the communication device's IP address, follow these steps.

1. In the Controller Organizer, right-click the EtherNet/IP device and choose Properties.

The Module Properties dialog box appears.

- Click the Port Configuration tab.

- In the IP Address field, type the IP address.
- In the other fields, type the other network parameters, if needed.

### IMPORTANT

The fields that appear vary from one EtherNet/IP device to another.

- Click Apply.
- Click OK.

## Reset to Factory Default

You can reset the device's IP address to its factory default value with the following methods:

- If the device has rotary switches, set the switches to 888 and cycle power.
- If the device does not have rotary switches, use a MSG instruction to the reset the IP address.

For more information on resetting the network IP address to its default value with a MSG instruction, see Knowledgebase Answer ID 55362, Reset device to factory defaults. You can access the article at <http://rockwellautomation.custhelp.com/app/answers/list>.

## Troubleshooting Intermittent or Slow EtherNet/IP Networks

Topic	Page
Optimize an EtherNet/IP Network	16
Common Network Issues	16
Access Web Browser Diagnostics	17
Speed	19
Duplex	19
Autonegotiate	20
CPU	21
Interface Errors	21
CIP Connections	23
TCP Connections	24
I/O Packets per Second	25
HMI Packets per Second	25
Missed Packets per Second	26

Use this guide to evaluate EtherNet/IP parameters that can help isolate network issues. This section assumes that the system was working, but now there is an issue.

For more information, see EtherNet/IP Drawings Quick Reference, publication [IASIMP-QR023](#).

## Optimize an EtherNet/IP Network

Make sure the switch has the required features.	For EtherNet/IP control, use an industrial-grade switch.						
	<table> <tr> <th>Required or Recommended</th><th>Switch Feature</th></tr> <tr> <td>Required</td><td>Full-duplex capability on all ports</td></tr> <tr> <td>Recommended</td><td> <ul style="list-style-type: none"> <li>VLAN</li> <li>Autonegotiation and manually configurable speed/duplex</li> <li>Wire-speed switching fabric</li> <li>SNMP</li> <li>IGMP snooping constrains multicast traffic to ports associated with a specific IP multicast group</li> <li>Port diagnostics</li> <li>Port mirroring (required for troubleshooting)</li> <li>STP for loop prevention</li> <li>QoS</li> </ul> </td></tr> </table>	Required or Recommended	Switch Feature	Required	Full-duplex capability on all ports	Recommended	<ul style="list-style-type: none"> <li>VLAN</li> <li>Autonegotiation and manually configurable speed/duplex</li> <li>Wire-speed switching fabric</li> <li>SNMP</li> <li>IGMP snooping constrains multicast traffic to ports associated with a specific IP multicast group</li> <li>Port diagnostics</li> <li>Port mirroring (required for troubleshooting)</li> <li>STP for loop prevention</li> <li>QoS</li> </ul>
Required or Recommended	Switch Feature						
Required	Full-duplex capability on all ports						
Recommended	<ul style="list-style-type: none"> <li>VLAN</li> <li>Autonegotiation and manually configurable speed/duplex</li> <li>Wire-speed switching fabric</li> <li>SNMP</li> <li>IGMP snooping constrains multicast traffic to ports associated with a specific IP multicast group</li> <li>Port diagnostics</li> <li>Port mirroring (required for troubleshooting)</li> <li>STP for loop prevention</li> <li>QoS</li> </ul>						
Data transmission depends on the controller.	<p>The type of Logix controller determines the data transmission rate.</p> <p>ControlLogix and SoftLogix controllers transmit data at the RPI you configure for the device.</p> <p>CompactLogix controllers transmit data at powers of 2ms (such as 2, 4, 8, 16, 64, or 128). For example if you specify an RPI of 100 ms, the data actually transfers at 64 ms.</p>						
Data transmission rate depends on the RPI.	<p>An EtherNet/IP network broadcasts I/O information to the controller based on the RPI setting. With change of state (COS) enabled and:</p> <ul style="list-style-type: none"> <li>No data changes, the EtherNet/IP device produces data every RPI.</li> <li>Data changes, the EtherNet/IP device produces data at a maximum rate of RPI/4.</li> </ul>						
Select unicast EtherNet/IP communication whenever possible.	<p>To reduce bandwidth use and preserve network integrity, some facilities block multicast Ethernet packets. Multicast is a more efficient method for transmitting data with multiple consumers and redundancy applications.</p> <p>You can configure multicast or unicast connections for:</p> <ul style="list-style-type: none"> <li>Produced and consumed tags by using the Logix Designer application</li> <li>I/O devices by using the Logix Designer application.</li> </ul> <p>Unicast connections help with the following:</p> <ul style="list-style-type: none"> <li>Enable produced and consumed tag communication to span multiple subnets</li> <li>Reduce network bandwidth.</li> <li>Simplify configuration for EtherNet/IP network devices because of unicast default setting for the Logix Designer application.</li> </ul>						

## Common Network Issues

### Assumption 1: The network was previously functioning

If you cannot see an EtherNet/IP device on the network, first check the hardware:

- Check device power. Verify the indicator lights are on and the device is installed properly.

- Check communication. A missing or defective cable could lead to an intermittent Link status indicator. The Link status indicator indicates if a cable is connected to a switch or other device and that the device is powered. The link is either up or down.

If you remove the Ethernet cable from a device that is local to the diagnostics controller, Link status is bad (down), but the controller can still read diagnostics across the Logix5000™ backplane.

If you remove the Ethernet cable from a device that is directly connected to the network, the device becomes inactive. For this situation, the Link status of the device is not accessible (nothing is accessible) because you cannot communicate with the device.

## Assumption 2: The EtherNet/IP device has a valid IP address

If you cannot see the device on the network and it has power, verify the device has an IP address and that the subnets are set correctly (see the previous chapter).

## Access Web Browser Diagnostics

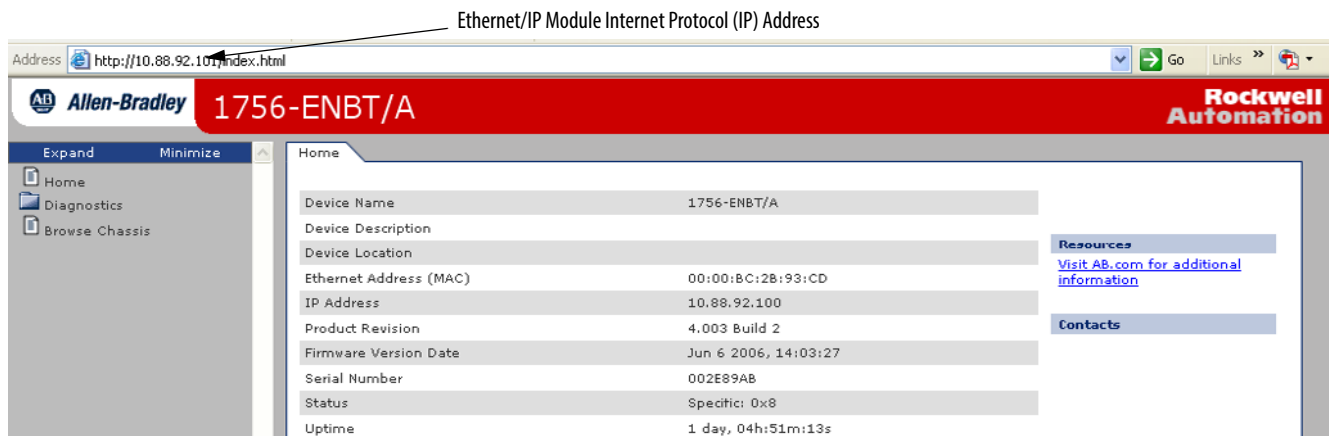

To troubleshoot most possible problems with your EtherNet/IP communication module, you need to access the module's diagnostic web pages.

<b>IMPORTANT</b>	<p>The number and type of diagnostic fields vary by module catalog number, the Studio 5000 environment version and module firmware revision.</p> <p>For example, this chapter describes the diagnostic web pages for these modules:</p> <ul style="list-style-type: none"> <li>• 1756-EN2TR EtherNet/IP communication module</li> <li>• 1756-ENBT EtherNet/IP communication module</li> </ul>
------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

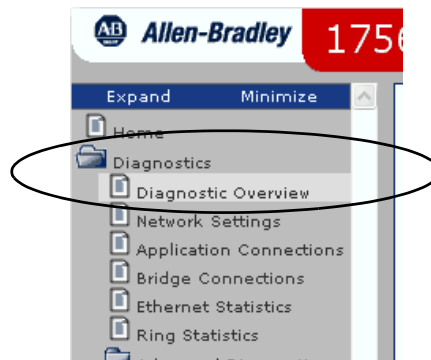

To access your EtherNet/IP communication module diagnostic web pages, follow these steps.

1. Open your web browser.
2. In the Address field, type your EtherNet/IP communication module internet protocol (IP) address and press Enter.

The diagnostic web home page appears.

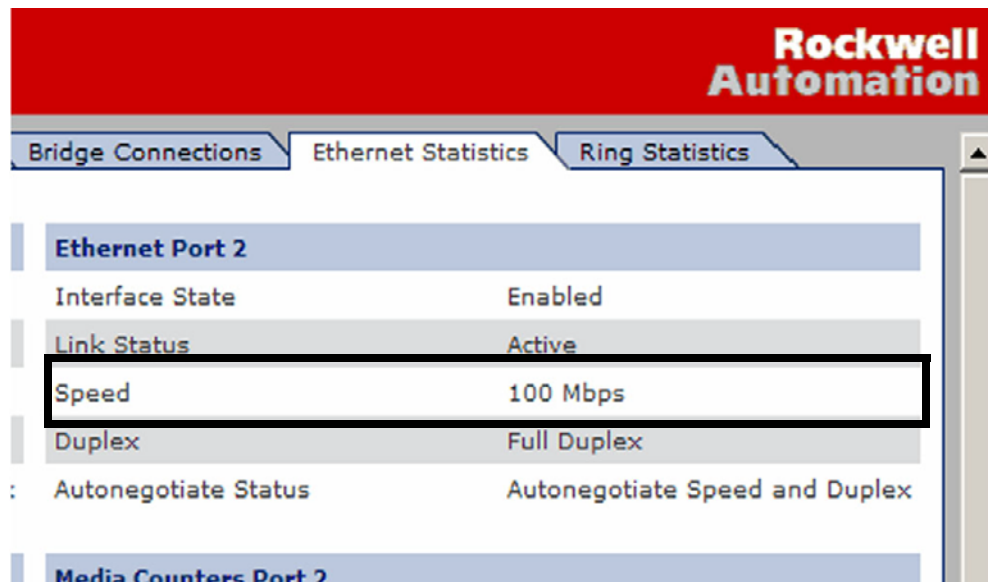

Open the Diagnostics folder in the left-most navigation bar and click the link for each diagnostic web page you need to monitor.

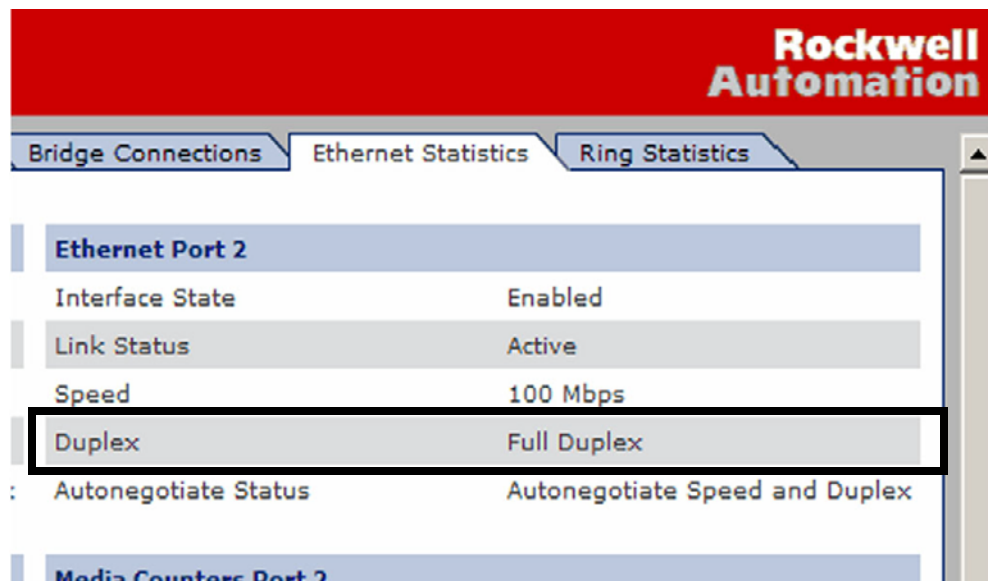

## Speed

This example shows the Ethernet Link Speed is 100 Mbps. This speed is considered normal if you have an Ethernet switch. If you see 10 Mbps, verify whether the cabling is unable to support 100 Mbps (hence, speed was set to 10 Mbps on purpose), or if there another reason that it was set low (such as cable length too long or specific device characteristics).

## Duplex

The Ethernet Link Duplex setting can be Half Duplex or Full Duplex. The duplex setting for each device and the switch port must be identical to avoid errors. Duplex is determined at powerup. If you change the duplex setting for a device, cycle power after the change.

## Duplex Mismatch Corrective Actions

If the network issue is a duplex mismatch, it probably occurred because either the switch port or the EtherNet/IP device did not autonegotiate properly (usually due to a connected device, such as a switch or fiber/copper converter). Follow these steps to correct the duplex mismatch.

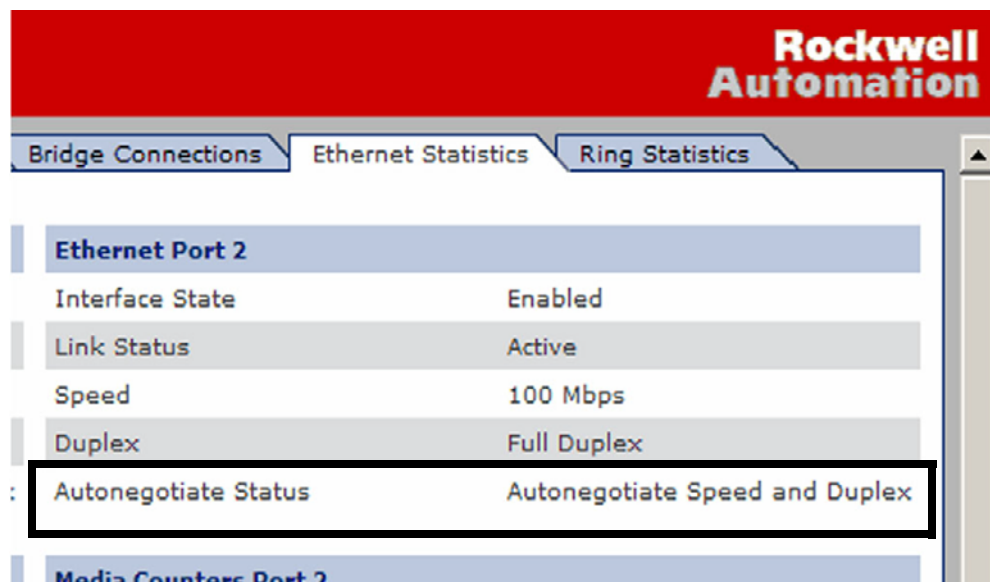

1. Configure both the EtherNet/IP device and the corresponding Ethernet switch port for a forced operation, not autonegotiation.

For example, specify 100 Mbps and Full Duplex.

2. If the duplex mismatch still exists, verify that the firmware and software versions on both the EtherNet/IP device and the connected device (switch or converter) are current and no problems are reported by the vendor.

## Autonegotiate

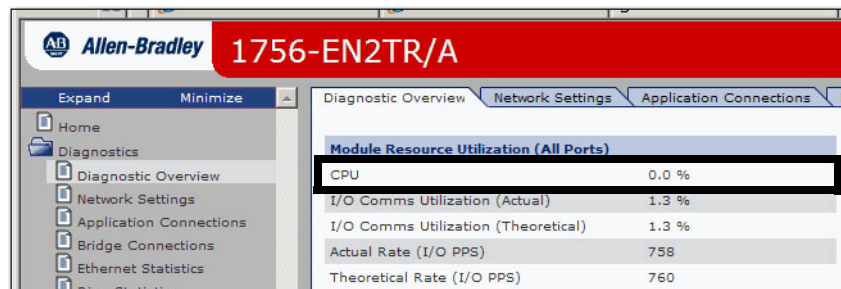

Most devices support autonegotiate and the capability to force both the speed and duplex. Because autonegotiate is the out-of-the-box default, it is easy to use when replacing a device or switch.

Investigate if you see a device running forced. Forced is a legitimate configuration but you need to configure both the switch port and the end-device in the same manner (such as 100 Mbps and Full Duplex). Verify the settings.

## CPU

Device CPU use cannot exceed 100%. As a conservative recommendation, do not exceed 80% of device capacity. This provides capacity for applications such as web browsers and program downloads.

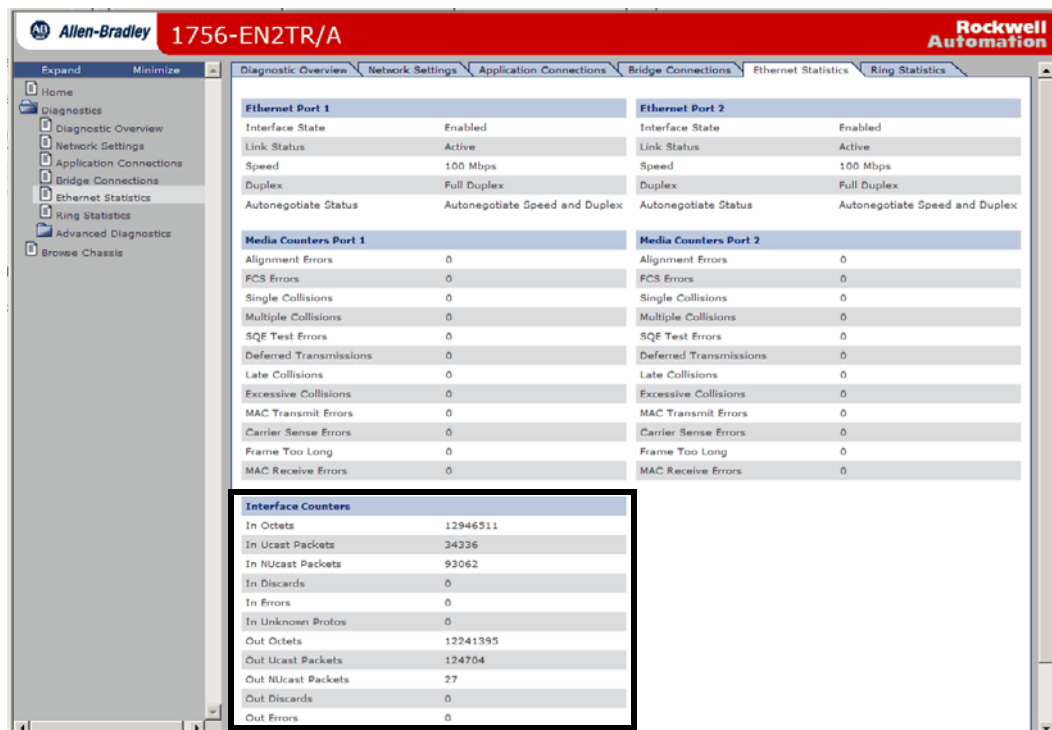

If CPU use is higher than 80%, possible solutions include the following:

- Make RPI values larger (slower).
- Use rack optimization.
- Make less critical traffic less frequent (such as MSG instructions and HMI data).
- Add another EtherNet/IP device and divide the traffic load.

## Interface Errors

The Interface Counters parameters include both in and out directions. Errors are 0.

If you have errors, check for a duplex mismatch (described above) or for induced noise. To check for induced noise, use the ping command. To use the ping command, follow these steps.

1. From the Start, choose Run.
2. Type cmd and press Enter.

3. Type ping -t xx.xx.xx.xxx (the IP address of the module) and press Enter.

```
C:\>ping -t 10.88.22.55

Pinging 10.88.22.55 with 32 bytes of data:
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
Reply from 10.88.22.55: bytes=32 time<1ms TTL=128
```

The ping command runs continuously. From this information, you can determine the following:

- If you see lost packets, investigate noise. See how much deviation.
- A jitter of more than 10 ms or a skipped reply can be caused by one of the following.
  - Something is busy (network or NIC)

However, a busy EtherNet/IP module probably is not the cause. From measurements, a 1756-ENBT module running at 100% CPU use replies in the range of 10...16 ms. If you find a heavily loaded EtherNet/IP module, reduce the load to about 90% to allow for some margin.

- Noise is corrupting packets and they are being dropped
- If communication is consistently bad, replace suspect hardware to isolate the trouble area, such as the following:
  - Cable
  - EtherNet/IP module (such as the 1756-ENBT module)
  - Switch port

## CIP Connections

The Current CIP Connections parameter shows how many EtherNet/IP (CIP) connections are in use. CIP connections are not the same as TCP connections. Every device is rated on the maximum number of CIP connections it can support. The recommendation is to not exceed 80% of the device capacity. In this example, there are currently 4 CIP I/O connections being used out of 32 available, which is 12.5% of the device capacity is being used and is well within the recommended utilization of 80%. If you are reaching the limit, try combining messages and then splitting them apart at the receiving end.

The screenshot displays the Allen-Bradley 1769-AENTR diagnostic interface. The left sidebar shows a navigation menu with options: Home, Diagnostics, Diagnostic Overview, Network Settings, Ethernet Statistics, I/O Connections, and Configuration. The main content area is titled '1769-AENTR' and has tabs for 'Diagnostic Overview', 'Network Settings', and 'Ethernet Statistics'. The 'Diagnostic Overview' tab is active, showing a 'Ring Status' section with network topology (Linear), status (Normal), ring supervisor (0.0.0.0), beacon interval (400), and beacon timeout (1960). Below this is a 'System Resource Utilization' section showing CPU utilization at 15% and module uptime at 18 days, 22h:12m:43s. A table titled 'CIP Connection Statistics' is highlighted with a black border, showing the following data:

CIP Connection Statistics	
Current CIP Msg Connections	0
CIP Msg Connection Limit	32
Max Msg Connections Observed	0
Current CIP I/O Connections	4
CIP I/O Connection Limit	32
Max I/O Connections Observed	4
Conn Opens	425
Open Errors	92
Conn Closes	16
Close Errors	0
Conn Timeouts	192

## CIP Connection Timeouts

CIP connection timeouts can occur for any of the following reasons:

- Induced noise on Ethernet cables
- Intermittent hardware (cable, switch, Ethernet device)
- Network changes (disconnect cable, shutdown power to a switch)

The screenshot shows the Allen-Bradley 1756-EN2TR/A diagnostic software interface. The left sidebar contains a tree view with categories like Home, Diagnostics, Network Settings, Application Connections, Bridge Connections, Ethernet Statistics, Ring Statistics, Advanced Diagnostics, TCP/IP Network, Miscellaneous, System Data, Tasks, and Event Log. The main window displays the 'Connection Manager Cmd Object Info' table.

Connection Manager Cmd Object Info	Value
CIP Common Service Requests	0
Unconnected Cmd Service Requests	64
FwdOpen Requests (Conn's Originated Remotely)	282
FwdClose Requests (Conn's Originated Remotely)	4
ConnOpen Requests (Conn's Originated Locally)	0
ConnClose Requests (Conn's Originated Locally)	0
GetConnTags Requests	0
Secondary FwdOpen Requests	0
Consumer Timeouts Received	0
Connections Closed due to a Timeout	0

## TCP Connections

A TCP connection is required for every device you are communicating with. This shows the total active TCP connections (in and out) for the device. Not all devices have the same capacity of TCP connections. In this example, there is a maximum of 2 connections and a 128 connection limit, which is less than 2% use. The recommendation is do not exceed 80% of device capacity.

Note that one TCP connection can be used for multiple CIP connections. TCP connections are used for everything, including HMI, RSLogix 5000, MSG instructions, I/O, and produced tags. If you are nearing the limit, check firmware revisions as this can change the limit.

The screenshot shows the Allen-Bradley 1756-EN2TR/A diagnostic software interface. The left sidebar is the same as the previous screenshot. The main window displays the 'Diagnostic Overview' tab, which includes sections for 'Module Resource Utilization (All Ports)', 'CIP Connection Statistics (All Ports)', and 'TCP Connections (Ethernet/IP Port)'. The 'TCP Connections (Ethernet/IP Port)' section is highlighted with a black box.

Module Resource Utilization (All Ports)	
CPU	0.0 %
I/O Comms Utilization (Actual)	1.3 %
I/O Comms Utilization (Theoretical)	1.3 %
Actual Rate (I/O PPS)	758
Theoretical Rate (I/O PPS)	760

CIP Connection Statistics (All Ports)	
Active Total	4
Active Messaging	1
Active I/O	3
Maximum Total Observed	7
Maximum Total Supported	259

  

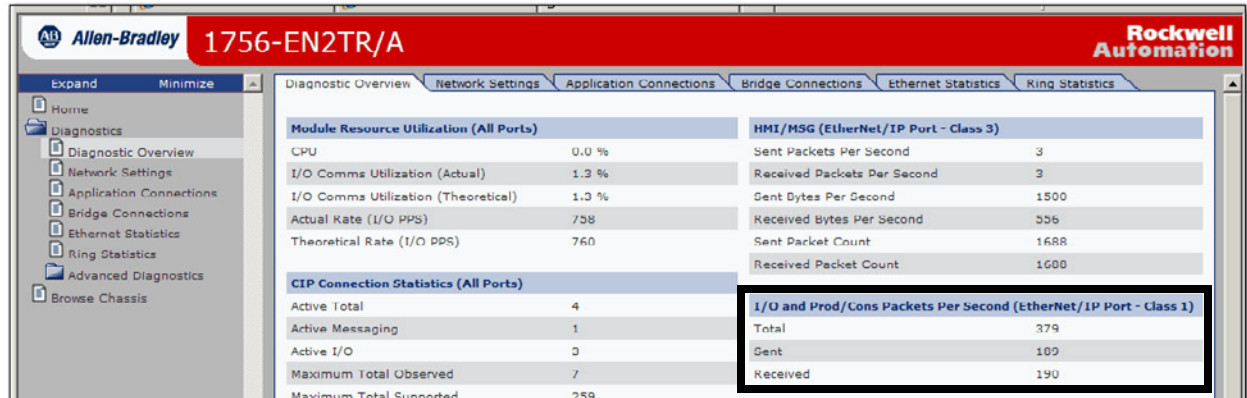

TCP Connections (Ethernet/IP Port)	
Active	2
Maximum Observed	2
Maximum Supported	128

Web Server

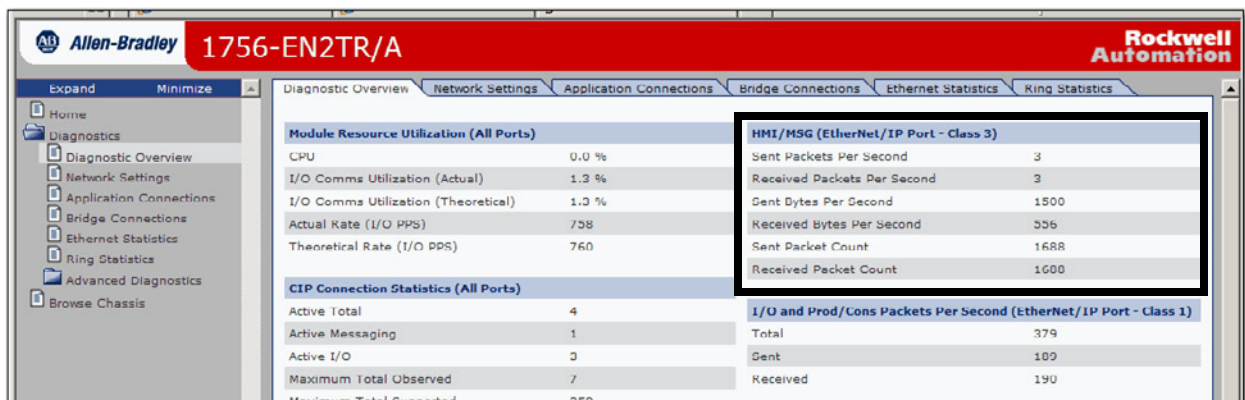

## I/O Packets per Second

Not all devices have the same capacity. For example, the 1756-ENBT has a capacity limit of 5000 pps. An I/O Comms Utilization value approaching or above 80% can necessitate an adjustment to the RPI. The recommendation is do not exceed 80% of device capacity.

## HMI Packets per Second

HMI packets per second (pps) describes the actual explicit message rate (sent and received). RSLinx connections and MSG instructions generate CIP traffic that is called explicit. HMI traffic is TCP-based, not UDP-based. Ethernet devices have a maximum rating for this traffic. For example, a 1756-ENBT device is rated at 900 pps.

If you are running a device at 900 HMI pps on a 1756-ENBT device, you are using 100% of that device. If you add implicit messaging (I/O), it takes bandwidth from HMI because it has higher priority than HMI messaging. The combination of CIP implicit (highest priority) and CIP explicit (second priority) cannot exceed 100% use.

For example, with a 1756-ENBT device, the combination of implicit and explicit messaging provides a total utilization for a device.

**Figure 1 - CPU Use is a Combination of I/O and HMI Traffic**

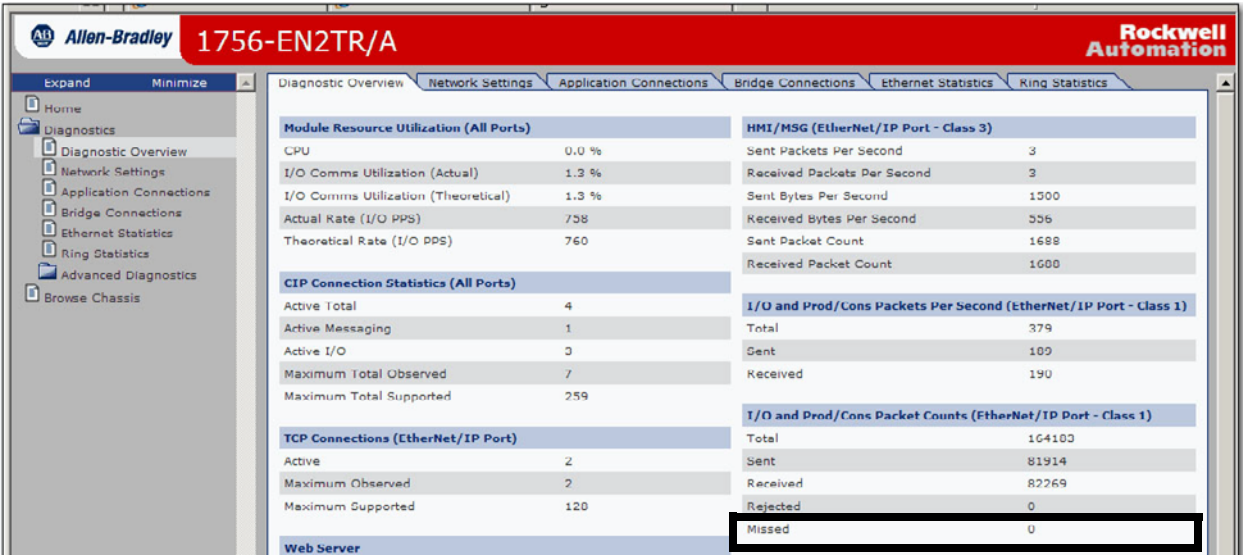

## Missed Packets per Second

Missed I/O packets describe I/O or produced tag packet loss. Because each packet is numbered, the loss of one or more packets can be detected. Missed packets (lost) indicate that packets were not received. For every CIP connection, every device receives packets from the other end of the connection. For example, a controller receives inputs from an input device and the input device receives heartbeats from the controller.

If you have missed packets, identify the communication path between the controller and target. For example, for a produced tag, identify the physical path between the producer and controllers. In this example, the web page shows Lost

status for each connection so you can determine precisely which connections are missing/losing packets.

In Logix Designer application, version 18 and later, the 1756-EN2x devices have the capability of identifying the lost packets for each connection. Not all products report missed/lost packets.

**IMPORTANT** The Missed I/O packets value is an excellent I/O diagnostic. However, do not depend on only this diagnostic. If the Missed value is not incrementing, also look at CIP connection timeouts to determine if any CIP connections are being lost. When a connection is lost, the CIP sequence count, used to detect Missed packets, does not increment.

## **Notes:**

## EtherNet/IP Status Indicators

Topic	Page
Network Status (NET)	30
Links Status (LINK) - Single EtherNet/IP Port	30
Links Status (LINK1 and LINK2) - Embedded Switch EtherNet/IP Ports	31

EtherNet/IP devices have common Ethernet/IP status indicators, in addition to module-specific indicators. The common EtherNet/IP indicators are the following:

- Network Status (NET) in all devices
- Links Status (LINK) - in devices with a single EtherNet/IP port
- Links Status (LINK1 and LINK2) in devices with dual, embedded EtherNet/IP ports

## Network Status (NET)

Indicates if CIP connections are established.

**Table 8 - 1756-ENBT, 1756-EN2F, 1756-EN2T, 1756-EN2TXT, 1756-EN2TRXT, 1756-EN2TSC, 1756-EWEB Devices Status Indicators**

Status	State
Off	One of these conditions exists: <ul style="list-style-type: none"> <li>The module is not powered. <ul style="list-style-type: none"> <li>Verify there is chassis power.</li> <li>Verify that the module is completely inserted into the chassis and backplane.</li> <li>Make sure the module has been configured.</li> </ul> </li> <li>The module is powered but does not have an IP address. Assign an IP address to the module.</li> </ul>
Flashing green	The controller has an IP address and one of these conditions exists: <ul style="list-style-type: none"> <li>The module has not established any CIP connections. <p>If connections are configured for this module, check the connection originator for the connection error code.</p> </li> <li>One or more connections have timed out. For example, an HMI or I/O connection has timed out. Reestablish the connection.</li> </ul>
Green	The device has established at least 1 CIP connection and is operating properly. If the device has an alphanumeric display, the IP address scrolls across the Module Status display.
Red	The module is in conflict mode. It shares an IP address with another device on the network. The module's current IP address scrolls across the Module Status display. The display scrolls: OK <IP_address_of_this_module> Duplicate IP <Mac_address_of_duplicate_node_detected> For example: OK 10.88.60.196 Duplicate IP - 00:00:BC:02:34:B4 Change the module's IP address.
Flashing green/ flashing red	The module is performing its power-up testing

## Links Status (LINK) - Single EtherNet/IP Port

Indicates the device's current state with respect to transmitting data on the EtherNet/IP network..

**Table 9 - 1756-ENBT, 1756-EN2F, 1756-EN2T, 1756-EN2TXT, 1756-EN2TRXT, 1756-EN2TSC, 1756-EWEB Devices Status Indicators**

Status	State
Off	One of these conditions exists: <ul style="list-style-type: none"> <li>The module is not powered. <ul style="list-style-type: none"> <li>Verify there is chassis power.</li> <li>Verify that the module is completely inserted into the chassis and backplane.</li> <li>Make sure the module has been configured.</li> </ul> </li> <li>No link exists on the port.</li> </ul>
Flashing green	Activity exists on the port.
Green	A link exists on the port

## Links Status (LINK1 and LINK2) - Embedded Switch Ethernet/IP Ports

Indicates the device's current state with respect to transmitting data on the EtherNet/IP network.

**Table 10 - 1756-ENBT, 1756-EN2F, 1756-EN2T, 1756-EN2TXT, 1756-EN2TRXT, 1756-EN2TSC, 1756-EWEB Devices Status Indicators**

Status	State
Off	One of these conditions exists: <ul style="list-style-type: none"> <li>• The module is not powered.               <ul style="list-style-type: none"> <li>– Verify there is chassis power.</li> <li>– Verify that the module is completely inserted into the chassis and backplane.</li> <li>– Make sure the module has been configured.</li> </ul> </li> <li>• No link exists on the port.</li> <li>• The port is administratively disabled (LNK2).</li> <li>• The port is disabled due to rapid ring faults (LNK2).</li> </ul>
Flashing green	Activity exists on the port.
Green	One of these conditions exists: <ul style="list-style-type: none"> <li>• A link exists on the port.</li> <li>• The ring network is operating normally on active ring supervisor (LINK2).</li> <li>• A ring partial network fault was detected on the active ring supervisor (LINK2).</li> </ul>

## **Notes:**

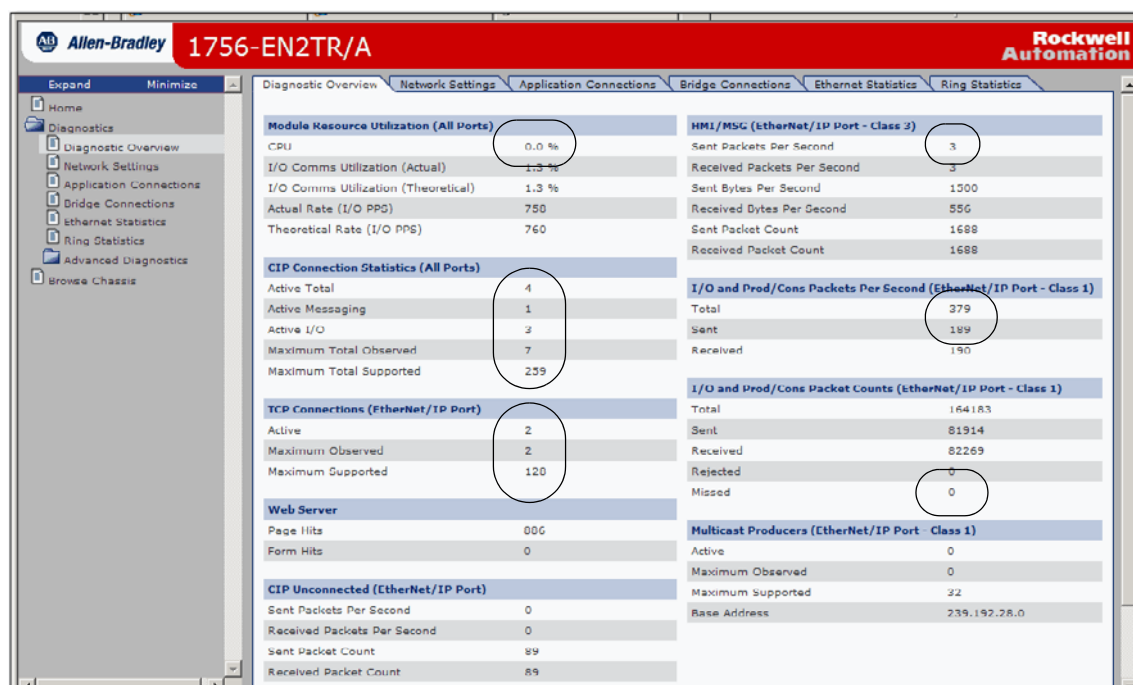

## Troubleshoot EtherNet/IP Issues in Controller Systems

Topic	Page
Review the Configuration and Status of the Device	33
Review Ethernet Status	36

### Review the Configuration and Status of the Device

These troubleshooting steps are generalized for the 1756-EN2TR but can be used for other ControlLogix adapters or controllers with embedded EtherNet/IP ports.

The Diagnostic Overview web page presents a summary of the current configuration and overall status of the device.

1. Review the Module Resource Utilization table to monitor your CPU utilization.

#### Module Resource Utilization (All Ports)

CPU 0.0 %

If the CPU utilization rate is	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	<ul style="list-style-type: none"> <li>Take steps to reduce your CPU utilization.</li> <li>Adjust your connection's requested packet interval (RPI).</li> <li>Reduce the number of devices connected to your device.</li> </ul> <b>Important:</b> Your EtherNet/IP communication device can function at 100% CPU capacity, but at or near this rate, you run the risk of CPU saturation and performance problems.

2. Review the CIP Connection Statistics (All Ports) table to monitor CIP connection usage.

#### CIP Connection Statistics (All Ports)

Active Total	4
Active Messaging	1
Active I/O	3
Maximum Total Observed	7
Maximum Total Supported	259

If the number of Active Total CIP connections is this percentage of the number of Maximum Total Supported	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of active total CIP connections. <b>Important:</b> Your EtherNet/IP communication device can function if the number of active total CIP connections is greater than 80% of the maximum total supported, but at or near this rate, you run the risk of performance problems.

3. Review the TCP Connections (EtherNet/IP Port) table to monitor TCP connection usage.

#### TCP Connections (EtherNet/IP Port)

Active	2
Maximum Observed	2
Maximum Supported	128

4. Review the HMI/MSG (EtherNet/IP Port - Class 3) table to monitor

If the number of Active Total TCP connections is this percentage of the number of Maximum Total Supported	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of active total TCP connections. <b>Important:</b> Your EtherNet/IP communication device can function if the number of active total TCP connections is greater than 80% of the maximum total supported, but at or near this rate, you run the risk of performance problems.

Class 3 messaging statistics.

HMI/MSG (EtherNet/IP Port - Class 3)	
Sent Packets Per Second	3
Received Packets Per Second	3
Sent Bytes Per Second	1500
Received Bytes Per Second	556
Sent Packet Count	1688
Received Packet Count	1688

If the number of Sent: Packets Per Second is this percentage of the device's capacity	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of Class 3 packets sent per second. <b>Important:</b> Your EtherNet/IP communication device can function at the 100% packets sent per second rate, but at or near this rate, you run the risk of performance problems.

5. Review the I/O and Prod/Cons Packets Per Second (EtherNet/IP Port - Class 1) table to monitor Class 1 messaging statistics.

I/O and Prod/Cons Packets Per Second (EtherNet/IP Port - Class 1)	
Total	379
Sent	189
Received	190

If the number of Sent is this percentage of the device's capacity	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of Class 1 packets sent per second. <b>Important:</b> Your EtherNet/IP communication device can function at the 100% packets sent per second rate, but at or near this rate, you run the risk of performance problems.

## 6. Review the Missed field in the I/O Packet Counter Statistics table.

I/O and Prod/Cons Packet Counts (EtherNet/IP Port - Class 1)	
Total	164183
Sent	81914
Received	82269
Rejected	0
Missed	0

This field shows how many I/O packets have been missed. Your EtherNet/IP communication device can lose I/O packets due to these conditions:

- Packets are produced faster than the connection's requested packet interval (RPI). This happens for change-of-state connections or a new consumer requesting a faster RPI than the first consumer.
- A packet is received out of sequence.

## Review Ethernet Status

The Ethernet Statistics web page presents the current configuration of an EtherNet/IP communication device and any errors that have occurred on the device.

The screenshot displays the Ethernet Statistics web page for an Allen-Bradley 1756-EN2TR/A device. The page is divided into two main sections for Ethernet Port 1 and Ethernet Port 2. Each section shows the interface state (Enabled), link status (Active), speed (100 Mbps), duplex (Full Duplex), and autonegotiate status (Autonegotiate Speed and Duplex). Below these, media counters for both ports show zero for all error types: Alignment Errors, FCS Errors, Single Collisions, Multiple Collisions, SQE Test Errors, Deferred Transmissions, Late Collisions, Excessive Collisions, MAC Transmit Errors, Carrier Sense Errors, Frame Too Long, and MAC Receive Errors. At the bottom, interface counters are listed for both ports, showing In Octets, In Ucast Packets, In Multicast Packets, In Discards, In Errors, In Unknown Protos, Out Octets, Out Ucast Packets, Out Multicast Packets, Out Discards, and Out Errors.

**IMPORTANT** Because this example shows the diagnostic web pages for a 1756-EN2TR device, diagnostic data is shown for two ports.

1. Review the values in the Ethernet Port 1 table.

Ethernet Port 1	
Interface State	Enabled
Link Status	Active
Speed	100 Mbps
Duplex	Full Duplex
Autonegotiate Status	Autonegotiate Speed and Duplex

If		And you	Then
Link Status	Active	Do not want to change the status	No action is required
	Inactive	Want to establish communication on the network	Reconfigure the device, or port, that is inactive.
Speed is	100 or 1000 Mbps	Do not want to change your port speed	No action is required. <b>Important:</b> 100 Mbps is the default port speed.
		Want to reduce your port speed to 10 Mbps	You must manually configure your device and reset your device.
	10 Mbps	Want to increase your port speed to 100 Mbps	Reset your device
		Do not want to change your port speed	No action is required.
Duplex is	Full	Are sending large amounts of data	No action is required. <b>Important:</b> Full Duplex is the default port setting. Full-duplex ports eliminate collisions because each device has separate channels for the transmission and receipt of large amounts of data.
		Are not sending large amounts of data	No action is required. <b>Important:</b> Delays due to collisions or switch traffic are usually negligible, but can become a problem if you need to send a lot of data.
	Half	Are sending large amounts of data	Change your device's Duplex setting to Full.
Autonegotiate Status <sup>(1)</sup> is	Speed and/or Duplex	Are using a fiber converter	Change your device's Autonegotiate status to None. <b>Important:</b> Fiber links do not support autonegotiation.
		Are not using a fiber converter	No action is required. <b>Important:</b> Speed and/or Duplex is the default setting. Autonegotiation enables devices to select the best way to communicate without you having to do any configuring. All devices with an Ethernet speed rating of 100 Mbps are required to support autonegotiation.
	None	Are not using a fiber converter	Change your device's Autonegotiate status to Speed and/or Duplex.

(1) When you use an EtherNet/IP communication device with multiple ports, make sure you use the same Autonegotiate Status configuration for both ports.

## 2. Review the values in the Media Counters Port 1 table.

Media Counters Port 1	
Alignment Errors	0
FCS Errors	0
Single Collisions	0
Multiple Collisions	0
SQE Test Errors	0
Deferred Transmissions	0
Late Collisions	0
Excessive Collisions	0
MAC Transmit Errors	0
Carrier Sense Errors	0
Frame Too Long	0
MAC Receive Errors	0

If	Then
Any media counters are greater than zero	You need to investigate further.
These errors are counted: <ul style="list-style-type: none"> <li>Alignment</li> <li>FCS</li> <li>Carrier Sense</li> </ul>	<p>A duplex mismatch exists between your EtherNet/IP communication device and the switch port.</p> <p>To clear the duplex mismatch:</p> <ol style="list-style-type: none"> <li>1. Configure the EtherNet/IP communication device and the corresponding Ethernet switch port for a forced operation, not autonegotiation.</li> <li>2. Verify that the firmware revision of your Logix controller and switch or converter are identical.</li> <li>3. If the revisions are not identical, replace the controller, switch or converter so that they match.</li> </ol>
Single Collisions or Multiple Collisions are greater than zero	<p>No action is required.</p> <p><b>Important:</b> If two stations attempt to transmit data simultaneously, the packets collide with each other. However, collisions are not errors and do not indicate a network problem. The number of network collisions can vary greatly due to traffic patterns or CPU utilization. Consequently, there is no set range of acceptable collisions for each outgoing packet. Collisions are a normal aspect of Ethernet networking.</p>
Late Collisions are greater than zero	<ol style="list-style-type: none"> <li>1. Check to see if a network segment is too long.</li> <li>2. Remove repeaters from between devices.</li> </ol>
Excessive Collisions are greater than zero	<p>Calculate your network's typical rate of excessive collisions and decide whether the rate of packet loss affects your network's performance.</p> <p><b>Important:</b> Excessive collisions indicate that your network has become congested. For each collision after the sixteenth, your network drops a packet.</p>
MAC Transit Errors are greater than zero	No action is required.
Frame Too Long is greater than zero	Limit the size of your tags to $\leq 500$ bytes.

## Troubleshoot Embedded Switch EtherNet/IP Networks

Topic	Page
General Solutions	39
Specific Issues	40

### General Solutions

Before you attempt to correct faults on your linear or DLR network, we recommend that you first take the following actions:

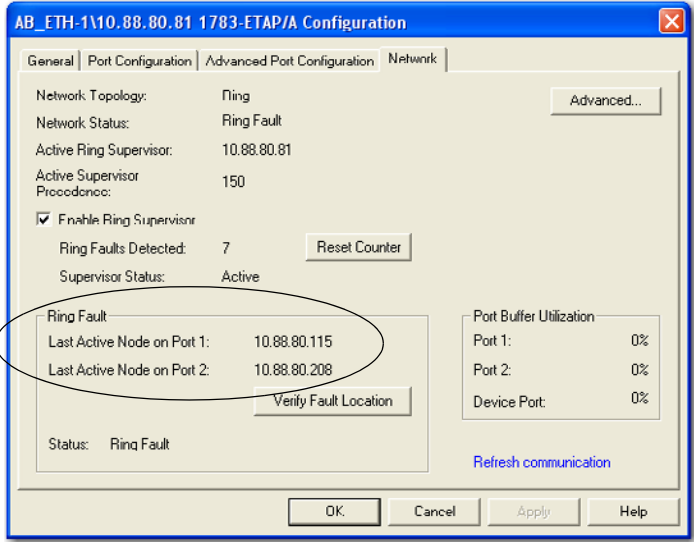

- DLR Network
  - Verify that you have configured at least one node as a supervisor and that Network Topology = Ring.
  - Verify that all cables on the network are securely connected to each device.
  - Verify that all devices that require an IP address have one assigned correctly.
  - Check the Network Status field on the active supervisor node's status page to determine the fault type.
- Linear Network
  - Verify that none of the nodes are configured as a supervisor on the network and that Network Topology = Linear.  
If any nodes on a linear network are configured as a supervisor, it can impact communication to other devices connected to the network.
  - Verify that all cables on the network are securely connected to each device.
  - Verify that all devices that require an IP address have one assigned correctly.

If the fault is not cleared once you have completed these general solutions, use [Table 11 on page 40](#) to troubleshoot issues specific to a DLR network or a linear network.

## Specific Issues

Use [Table 11](#) to troubleshoot possible specific issues on your network.

**Table 11 - Troubleshoot Specific Network Issues**

Issue	Description	Solution
Supervisor Reports a Ring Fault After Break in Network	<p>A link on the DLR network can be broken due to one of the following conditions:</p> <ul style="list-style-type: none"> <li>Intentionally, for example, because you are adding or deleting nodes but have not made all physical connections to restore the setup of the network with/without the node.</li> <li>Unintentionally, for example, because a cable is broken or a device malfunctions.</li> </ul> <p>When this fault occurs, the adjacent nodes to the faulted part of the network are displayed in the Ring Fault group and the Network Status field = Ring Fault.</p> <p>This screen shows the Ring Fault section with IP addresses appearing for the last active nodes. The faulted node is between nodes 10.88.80.115 and 10.88.80.208. If the IP address of either node is not available, the software displays the node's MAC ID.</p>  <p>Once the fault is corrected, the ring is automatically restored, and the Network Status field returns to Normal.</p>	<p>Take one of these actions:</p> <ul style="list-style-type: none"> <li>Determine where the fault condition exists and correct it.</li> <li>Click the Refresh Communication link to update the Ring Fault information to determine where the fault condition exists.</li> <li>Use Device Port Debugging Mode functionality on the 1783-ETAP tap to analyze a suspicious node.</li> </ul>
Supervisor Reports Ring Faults at System Power-up	<p>When a DLR network is powered-up, the supervisor can detect ring faults as a result of powering up before other devices on the network.</p>	<p>Use an MSG instruction to clear the faults.</p>

**Table 11 - Troubleshoot Specific Network Issues (Continued)**

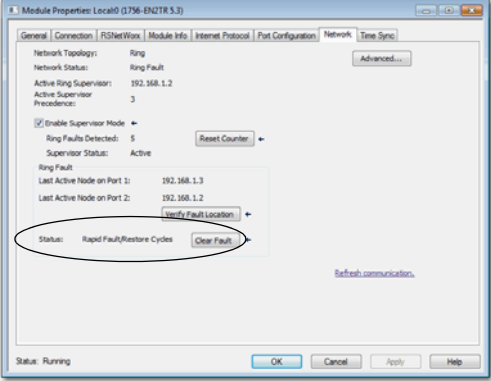

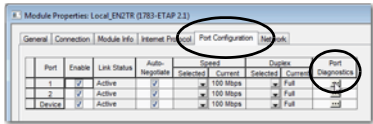

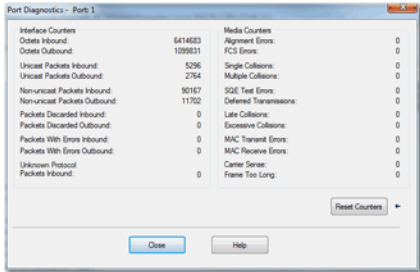

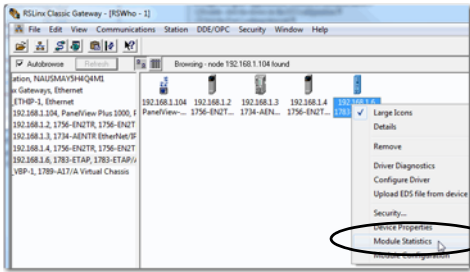

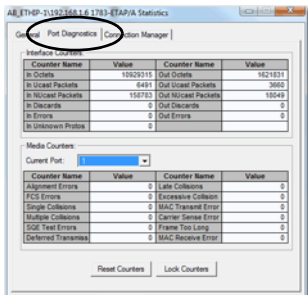

Issue	Description	Solution
Rapid Ring Fault	<p>When a Rapid Ring Fault occurs, the following events occur:</p> <ul style="list-style-type: none"> <li>• The active supervisor blocks traffic on port 2, resulting in possible network segmentation, that is, some nodes can become unreachable.</li> <li>• The Link 2 status indicator on the active supervisor is off.</li> <li>• As soon as the fault occurs, for both Logix Designer application and RSLinx Classic software, the Status field = Rapid Fault/Restore Cycles.</li> </ul>  <p>Any of the following can cause a Rapid Ring Fault:</p> <ul style="list-style-type: none"> <li>• 5 intentional disconnections/reconnections of a node from the network within 30 seconds</li> <li>• A duplex mismatch between two connected devices</li> <li>• Electromagnetic noise on the network</li> <li>• Unstable physical connections, such as intermittent connectors</li> </ul> <p>Given the nature of a Rapid Ring Fault, the Last Active Node information can be inaccurate when a Rapid Ring Fault condition is present</p>	<p>Multiple possible solutions exist.</p> <ul style="list-style-type: none"> <li>• For the disconnections and reconnections issue, no solution is required. Clear the fault when you have reconnected the device to the network permanently.</li> <li>• For the duplex mismatch issue, reconfigure the duplex parameters to make sure that they match between the devices.</li> <li>• For the electromagnetic noise issue, determine where the noise exists and eliminate it or use a protective shield in that location.</li> <li>• For the unstable connections issue, determine where they exist on the network and correct them.</li> <li>• Check the media counters for all devices on the network. The device with the highest media counter count is most likely causing the Rapid Ring Fault.</li> <li>• Remove devices from the network one by one. When you see the Rapid Ring Fault disappear after a device is removed, that device is causing the fault.</li> <li>• You can use Device Port Debugging Mode functionality on the 1783-ETAP tap to analyze a suspicious node.</li> <li>• Finally, your Beacon Interval or Timeout configuration can be inappropriate for your network. However, if you think you need to change these values, we recommend that you call Rockwell Automation technical support.</li> </ul> <p>Once the fault is fixed, click Clear Fault.</p>
Partial Fault Condition	<p>A partial network fault occurs when traffic is lost only in one direction on the network because a ring member is not forwarding beacons in both directions for some reason, such as because of a component failure.</p> <p>The active ring supervisor detects a partial fault by monitoring the loss of Beacon frames on one port and the fault location appears in the Ring Fault section of the Network tab.</p> <p>When a partial fault is detected, the active ring supervisor blocks traffic on one port. The ring is segmented due to the partial fault condition. The nodes near the faulted part of the network are displayed in the Ring Fault group with either IP addresses or MAC ID's for each node displayed.</p> <p>When this fault occurs the Network Status field = Partial Fault Condition.</p> <p>Once the fault is corrected, it automatically clears, and the Network Status field returns to Normal.</p>	<p>Determine where the fault condition exists and correct it.</p> <p>Use Device Port Debugging Mode functionality, also known as Port Mirroring, on a 1783-ETAP, 1783-ETAP1F, or 1783-ETAP2F tap to analyze a suspicious node.</p>

Table 11 - Troubleshoot Specific Network Issues (Continued)

Issue	Description	Solution
Media Counter Errors or Collisions	<p>The Port Diagnostics tab on the Statistics dialog box displays the number of physical layer errors or collisions.</p> <p>On a DLR network, it is not uncommon to see low levels of media counter errors. For example, if the network breaks, a low level of media counter errors appear. With a low level of media counter errors, the value typically does not continuously increase and often clears.</p> <p>A high level of media counter errors typically continues to increase and does not clear. For example, there is a mismatch of speed between two linked nodes, a high level of media counter errors appears, steadily increasing and not clearing.</p> <p>Complete the following tasks to access the Port Diagnostics tab.</p> <p><b>Logix Designer application, version 21.00.00 or later.</b></p> <ol style="list-style-type: none"><li>1. Double-click the device in the I/O Configuration.</li><li>2. Click the Port Configuration tab.</li><li>3. Click the ellipsis in the Port Diagnostics column for the appropriate port or device.</li></ol>  <p>The following screen shows port diagnostic information, including Media Counter data.</p>  <p><b>RSLink Classic software, version 3.51.00 or later.</b></p> <ol style="list-style-type: none"><li>1. Browse the network.</li><li>2. Right-click the device and choose Module Statistics.</li></ol>  <ol style="list-style-type: none"><li>3. Click the Port Diagnostics tab to see port diagnostic information, including Media Counter data.</li></ol> 	<p>Some example solutions include:</p> <ul style="list-style-type: none"><li>• Check for a mismatch of speed and/or duplex between two linked nodes.</li><li>• Verify that all cables on the network are securely connected to each device.</li><li>• Check for electromagnetic noise on the network. If you find it, eliminate it or use a protective shield in that location.</li></ul>

## Troubleshoot EtherNet/IP Issues in Devices for Distributed I/O

Topic	Page
Review the Configuration and Status of the Device	43
Review Ethernet Status	46

### Review the Configuration and Status of the Device

These troubleshooting steps are generalized for the 1769-AENTR but can be followed for other adapters

The Diagnostic Overview web page presents a summary of the current configuration and overall status of the device.

The screenshot displays the Allen-Bradley 1769-AENTR Diagnostic Overview web page. The interface includes a left-hand navigation pane with options like Home, Diagnostics, Diagnostic Overview, Network Settings, Ethernet Statistics, I/O Connections, and Configuration. The main content area is divided into several sections:

- Ring Status:** Network Topology (Linear), Network Status (Normal), Ring Supervisor (0.0.0.0), Beacon Interval (400), and Beacon Timeout (1960).
- System Resource Utilization:** CPU Utilization (15%) and Module Uptime (18 days, 22h:12m:43s).
- CIP Connection Statistics:** Current CIP Msg Connections (0), CIP Msg Connection Limit (32), Max Msg Connections Observed (0), Current CIP I/O Connections (4), CIP I/O Connection Limit (32), Max I/O Connections Observed (4), Conn Opens (425), Open Errors (92), Conn Closes (16), Close Errors (0), and Conn Timeouts (192).
- TCP Connections:** Active (1) and Maximum Observed (3).
- Module Settings:** Switches (169).
- 1769 Backplane Statistics:** Backplane Status (OK), Scans Completed (301011954), Maximum Scan time (2 msec), and Average Scan Time (2 msec).
- HMI/MSG Unconnected:** Sent Packet Count (450) and Received Packet Count (450).
- HMI/MSG Connected (Class 3):** Sent Packet Count (0) and Received Packet Count (0).
- I/O and Prod/Cons Packets Per Second:** Total (278), Sent (162), Received (116), Rejected (0), Capacity (Approximate) (10000), Actual Reserve (Approximate) (9722), and Theoretical Reserve (Approximate) (9721).

1. Review the System Resource Utilization table to monitor your CPU utilization.

System Resource Utilization	
CPU Utilization	15%

If the CPU utilization rate is	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	<ul style="list-style-type: none"> <li>Take steps to reduce your CPU utilization.</li> <li>Adjust your connection's requested packet interval (RPI).</li> <li>Reduce the number of devices connected to your device.</li> </ul> <b>Important:</b> Your EtherNet/IP communication device can function at 100% CPU capacity, but at or near this rate, you run the risk of CPU saturation and performance problems.

2. Review the CIP Connection Statistics (table to monitor CIP connection usage.

CIP Connection Statistics	
Current CIP Msg Connections	0
CIP Msg Connection Limit	32
Max Msg Connections Observed	0
Current CIP I/O Connections	4
CIP I/O Connection Limit	32
Max I/O Connections Observed	4
Conn Opens	425
Open Errors	92
Conn Closes	16
Close Errors	0
Conn Timeouts	192

If the number of Current CIP I/O Connections is this percentage of the number of CIP I/O Connection Limit	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of active total CIP connections. <b>Important:</b> Your EtherNet/IP communication device can function if the number of active total CIP connections is greater than 80% of the maximum total supported, but at or near this rate, you run the risk of performance problems.

3. Review the TCP Connections (EtherNet/IP Port) table to monitor TCP connection usage.

TCP Connections	
Active	1
Maximum Observed	3
Maximum Supported	96

If the number of Active TCP connections is this percentage of the number of Maximum Supported	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of active total TCP connections. <b>Important:</b> Your EtherNet/IP communication device can function if the number of active total TCP connections is greater than 80% of the maximum total supported, but at or near this rate, you run the risk of performance problems.

4. Review the HMI/MSG Connected (Class 3) table to monitor Class 3 messaging statistics.

HMI/MSG Connected (Class 3)	
Sent Packet Count	0
Received Packet Count	0

If the number of Sent Packets Count is this percentage of the device's capacity	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of Class 3 packets sent per second. <b>Important:</b> Your EtherNet/IP communication device can function at the 100% packets sent per second rate, but at or near this rate, you run the risk of performance problems.

5. Review the I/O and Prod/Cons Packets Per Second (EtherNet/IP Port - Class 1) table to monitor Class 1 messaging statistics.

I/O and Prod/Cons Packets Per Second	
Total	278
Sent	162
Received	116
Rejected	0

If the number of Sent is this percentage of the device's capacity	Then
0...80%	No action is required. <b>Important:</b> This is the optimal rate.
Greater than 80%	Take steps to reduce the number of Class 1 packets sent per second. <b>Important:</b> Your EtherNet/IP communication device can function at the 100% packets sent per second rate, but at or near this rate, you run the risk of performance problems.

## Review Ethernet Status

The Ethernet Statistics web page presents the current configuration of an EtherNet/IP communication device and any errors that have occurred on the device.

**Allen-Bradley 1769-AENTR** **Rockwell Automation**

Diagnostic Overview | Network Settings | **Ethernet Statistics** | I/O Connections

Expand Minimize

  - I/O Connections
- Configuration

Ethernet Port 1		Ethernet Port 2	
Interface State	Enabled	Interface State	Enabled
Link Status	Active	Link Status	Inactive
Media Speed	100 Mbps	Media Speed	100 Mbps
Duplex	Full Duplex	Duplex	Full Duplex
Autonegotiate Status	Complete	Autonegotiate Status	In Progress

Media Counters Port 1		Media Counters Port 2	
Alignment Errors	0	Alignment Errors	0
FCS Errors	0	FCS Errors	0
Single Collisions	0	Single Collisions	0
Multiple Collisions	0	Multiple Collisions	0
SQE Test Errors	0	SQE Test Errors	0
Deferred Transmissions	0	Deferred Transmissions	0
Late Collisions	0	Late Collisions	0
Excessive Collisions	0	Excessive Collisions	0
MAC Transmit Errors	0	MAC Transmit Errors	0
Carrier Sense Errors	0	Carrier Sense Errors	0
Frame Too Long	0	Frame Too Long	0
MAC Receive Errors	0	MAC Receive Errors	0

**Interface Counters**

In Octets: 1390635728

1. Review the values in the Ethernet Port 1 table.

Ethernet Port 1	
Interface State	Enabled
Link Status	Active
Media Speed	100 Mbps
Duplex	Full Duplex
Autonegotiate Status	Complete

If	Is	And you	Then
Link Status	Active	Do not want to change the status	No action is required
	Inactive	Want to establish communication on the network	Reconfigure the device, or port, that is inactive.
Speed	100 or 1000 Mbps	Do not want to change your port speed	No action is required. <b>Important:</b> 100 Mbps is the default port speed.
		Want to reduce your port speed to 10 Mbps	You must manually configure your device and reset your device.
	10 Mbps	Want to increase your port speed to 100 Mbps	Reset your device
		Do not want to change your port speed	No action is required.
Duplex	Full	Are sending large amounts of data	No action is required. <b>Important:</b> Full Duplex is the default port setting. Full-duplex ports eliminate collisions because each device has separate channels for the transmission and receipt of large amounts of data.
	Half	Are not sending large amounts of data	No action is required. <b>Important:</b> Delays due to collisions or switch traffic are usually negligible, but can become a problem if you need to send a lot of data.
		Are sending large amounts of data	Change your device's Duplex setting to Full.
Autonegotiate Status <sup>(1)</sup>	Speed and/or Duplex	Are using a fiber converter	Change your device's Autonegotiate status to None. <b>Important:</b> Fiber links do not support autonegotiation.
		Are not using a fiber converter	No action is required. <b>Important:</b> Speed and/or Duplex is the default setting. Autonegotiation enables devices to select the best way to communicate without you having to do any configuring. All devices with an Ethernet speed rating of 100 Mbps are required to support autonegotiation.
	None	Are not using a fiber converter	Change your device's Autonegotiate status to Speed and/or Duplex.

(1) When you use an EtherNet/IP communication device with multiple ports, make sure you use the same Autonegotiate Status configuration for both ports.

## 2. Review the values in the Media Counters Port 1 table.

Media Counters Port 1	
Alignment Errors	0
FCS Errors	0
Single Collisions	0
Multiple Collisions	0
SQE Test Errors	0
Deferred Transmissions	0
Late Collisions	0
Excessive Collisions	0
MAC Transmit Errors	0
Carrier Sense Errors	0
Frame Too Long	0
MAC Receive Errors	0

If	Then
Any media counters are greater than zero	You need to investigate further.
These errors are counted: <ul style="list-style-type: none"> <li>• Alignment</li> <li>• FCS</li> <li>• Carrier Sense</li> </ul>	<p>A duplex mismatch exists between your EtherNet/IP communication device and the switch port.</p> <p>To clear the duplex mismatch:</p> <ol style="list-style-type: none"> <li>1. Configure the EtherNet/IP communication device and the corresponding Ethernet switch port for a forced operation, not autonegotiation.</li> <li>2. Verify that the firmware revision of your Logix controller and switch or converter are identical.</li> <li>3. If the revisions are not identical, replace the controller, switch or converter so that they match.</li> </ol>
Single Collisions or Multiple Collisions are greater than zero	<p>No action is required.</p> <p><b>Important:</b> If two stations attempt to transmit data simultaneously, the packets collide with each other. However, collisions are not errors and do not indicate a network problem. The number of network collisions can vary greatly due to traffic patterns or CPU utilization. Consequently, there is no set range of acceptable collisions for each outgoing packet. Collisions are a normal aspect of Ethernet networking.</p>
Late Collisions are greater than zero	<ol style="list-style-type: none"> <li>1. Check to see if a network segment is too long.</li> <li>2. Remove repeaters from between devices.</li> </ol>
Excessive Collisions are greater than zero	<p>Calculate your network's typical rate of excessive collisions and decide whether the rate of packet loss affects your network's performance.</p> <p><b>Important:</b> Excessive collisions indicate that your network has become congested. For each collision after the sixteenth, your network drops a packet.</p>
MAC Transit Errors are greater than zero	No action is required.
Frame Too Long is greater than zero	Limit the size of your tags to $\leq 500$ bytes.

## Troubleshoot EtherNet/IP Issues in PowerFlex Drives

This chapter is based on the PowerFlex 755 Embedded EtherNet/IP Adapter, but can be used as a guideline for other PowerFlex EtherNet/IP applications.

Topic	Page
Enabling the Adapter Web Pages	<a href="#">49</a>
Viewing the Web Pages	<a href="#">49</a>
TCP/IP Configuration Web Page	<a href="#">51</a>

### Enabling the Adapter Web Pages

After the adapter is configured and operating, you can view its web pages. They present information about the adapter, the drive to which it is connected, and the other DPI devices connected to the drive such as a HIM.

By default the adapter web pages are disabled. To enable the adapter web pages, set **Parameter 52 - [Web Enable]** to '1' (Enabled) and then reset the adapter for the change to take effect.

### Viewing the Web Pages

1. On a computer with access to the EtherNet/IP network on which the drive/adapter is installed, launch a web browser such as Microsoft Internet Explorer, version 5.0 or later.

The computer can access the adapter web pages if it is connected to:

- The same network as the drive/adapter.
  - A network with access to the drive/adapter's network via a gateway device (for example, a router).
2. In the Address box, type the IP address of the adapter.
  3. Press Enter.

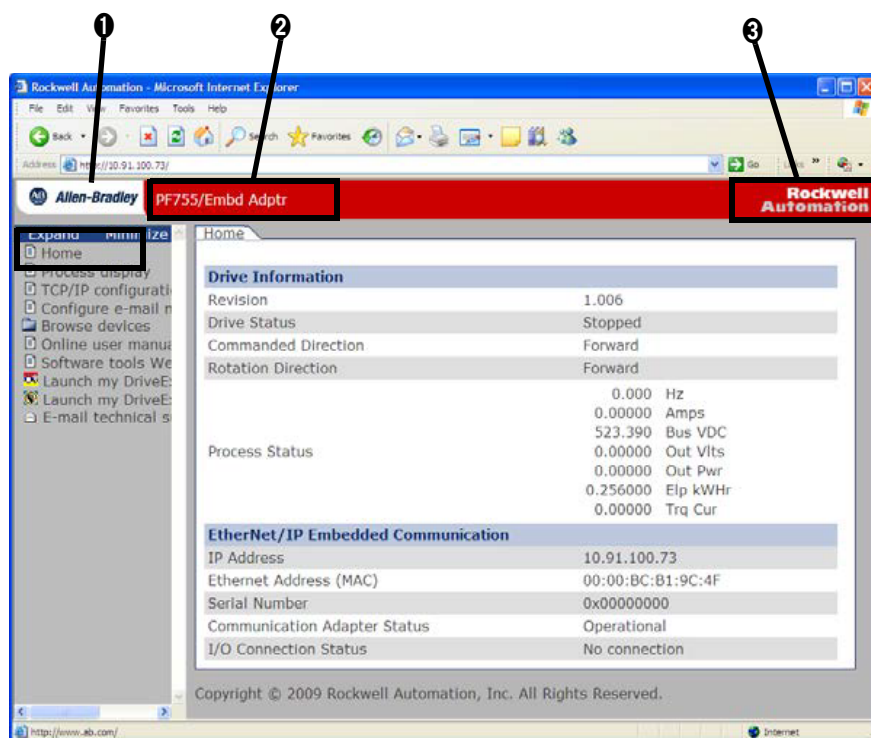

The adapter web Home Page ([Figure 2](#)) appears.

---

<b>IMPORTANT</b>	From the browser's View menu, choose Refresh to always re-display the adapter Home Page while viewing any of the adapter's other web pages.
------------------	---------------------------------------------------------------------------------------------------------------------------------------------

---

Figure 2 - Adapter Web Home Page Example

### Title Bar on Adapter Web Pages

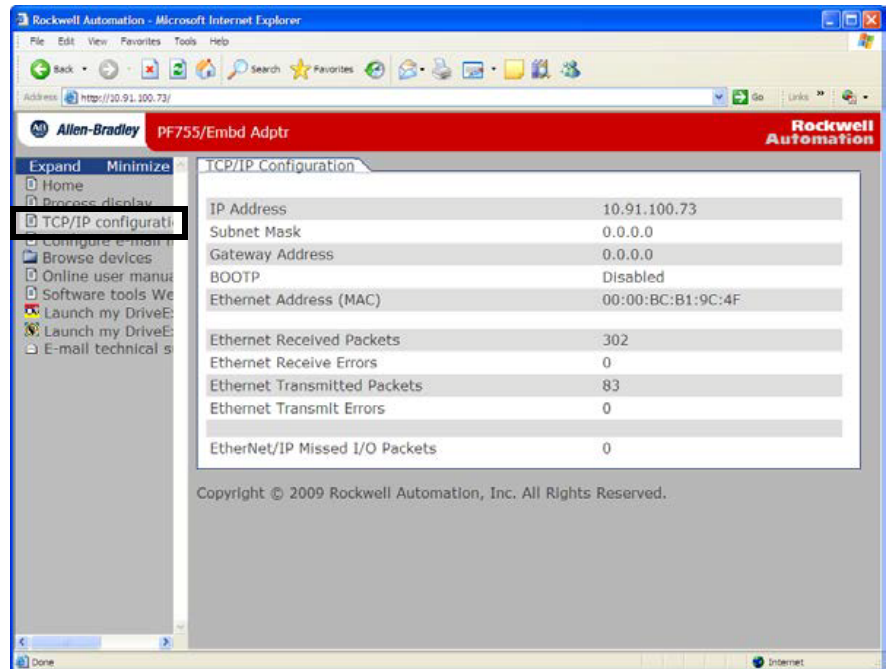

The title bar appears on the adapter Home Page and all of the adapter's other web pages. The title bar consists of three elements as shown in [Figure 2](#)

Title Bar Element	Description
① Allen-Bradley logo	This logo is a hyperlink. Click it to view the ab.com web Home Page.
② Adapter Title	Shows the adapter type or user-configured title.
③ Rockwell Automation logo	This logo is a hyperlink. Click it to view the Rockwell Automation web Home Page.

## TCP/IP Configuration Web Page

The TCP/IP Configuration web page provides information about the adapter's Ethernet settings and network activities. To view this web page, click the 'TCP/IP configuration' link (highlighted in [Figure 3](#)) in the navigation pane.

**Figure 3 - Example of TCP/IP Configuration Web Page**

Information	Description
IP Address	IP address of the adapter.
Subnet Mask	Subnet mask for the adapter's network.
Gateway Address	Address for the gateway device on the adapter's network.
BOOTP	Shows status for BOOTP, which may be used to configure the adapter's network information.
Ethernet Address (MAC)	Hardware address for the adapter.
Ethernet Received Packets	Number of packets that the adapter has received.
Ethernet Receive Errors	Number of receive errors reported by the hardware.
Ethernet Transmitted Packets	Number of packets that the adapter has sent.
Ethernet Transmit Errors	Number of transmit errors reported by the hardware.
EtherNet/IP Missed I/O Packets	Number of I/O connection packets that the adapter did not receive.

## Notes:

## Rockwell Automation Support

Rockwell Automation provides technical information on the Web to assist you in using its products.

At <http://www.rockwellautomation.com/support> you can find technical and application notes, sample code, and links to software service packs. You can also visit our Support Center at <https://rockwellautomation.custhelp.com/> for software updates, support chats and forums, technical information, FAQs, and to sign up for product notification updates.

In addition, we offer multiple support programs for installation, configuration, and troubleshooting. For more information, contact your local distributor or Rockwell Automation representative, or visit <http://www.rockwellautomation.com/services/online-phone>.

## Installation Assistance

If you experience a problem within the first 24 hours of installation, review the information that is contained in this manual. You can contact Customer Support for initial help in getting your product up and running.

United States or Canada	1.440.646.3434
Outside United States or Canada	Use the <a href="#">Worldwide Locator</a> at <a href="http://www.rockwellautomation.com/rockwellautomation/support/overview.page">http://www.rockwellautomation.com/rockwellautomation/support/overview.page</a> , or contact your local Rockwell Automation representative.

## New Product Satisfaction Return

Rockwell Automation tests all of its products to help ensure that they are fully operational when shipped from the manufacturing facility. However, if your product is not functioning and needs to be returned, follow these procedures.

United States	Contact your distributor. You must provide a Customer Support case number (call the phone number above to obtain one) to your distributor to complete the return process.
Outside United States	Please contact your local Rockwell Automation representative for the return procedure.

## Documentation Feedback

Your comments will help us serve your documentation needs better. If you have any suggestions on how to improve this document, complete this form, publication [RA-DU002](#), available at <http://www.rockwellautomation.com/literature/>.

Rockwell Automation maintains current product environmental information on its website at <http://www.rockwellautomation.com/rockwellautomation/about-us/sustainability-ethics/product-environmental-compliance.page>.
