INSTALLING THE AUDIO ADVANTAGE

MINIMUM SYSTEM REQUIREMENTS

PC	Pentium 450 MHz / compatible or higher with one available USB port.
RAM	128 MB System RAM
Hard Drive	Approximately 50 MB free space is required during the driver / application installation process.
Display	1024x768 High Color (24-bit)
Operating Systems	Windows® 98SE, Me, 2000, XP
CD-ROM Drive	CD-ROM or DVD-ROM drive required for software installation. A DVD drive, a compatible software DVD player application, and a high quality 5.1 Surround speaker system (five powered speakers plus a powered subwoofer) are required for playing back Dolby® Digital (AC-3) audio from DVD movies with the Audio Advantage.
Speakers	High quality stereo (2-speaker) sound system, stereo powered speakers or headphones are recommended to properly hear the Audio Advantage high-quality stereo audio playback. A digital speaker system or home theater A/V receiver with optical TOSLINK inputs is necessary for connecting the Audio Advantage optical digital output.

QUICK OUTLINE OF THE INSTALLATION PROCEDURE

Here's a quick outline of steps to begin using your Audio Advantage Micro:

1. Run the Setup program from the Audio Advantage CD.
2. When prompted by the setup program, insert the Audio Advantage Micro into a conveniently located USB port on your PC or Laptop. Then follow the on-screen setup instructions.
3. After the setup program is done, reboot your PC.
4. Connect your headphones or speakers to the 1/8" jack on the Audio Advantage, or use the included S/PDIF Optical Adapter and an optical fiber TOSLINK cable (not included) to connect an external digital audio system.
5. Click on the Turtle Beach Icon in the Systray on the right side of the Windows Start Bar. From the pop-up menu, select the Demo to hear what the Audio Advantage can do. Select the Control Panel to control the volume and effects settings.

INSTALLATION PROCEDURE

Do not insert the Audio Advantage into a USB port until after you've run the Setup program from the CD.

The audio software on your PC communicates with devices such as the Audio Advantage via software known as "drivers", which act as an interface between the audio hardware and software. Turtle Beach provides special drivers on the included CD that enable you to use the Audio Advantage with software applications running in Windows 98SE, Me, 2000 and XP. The CD also includes software programs that let you easily try the Audio Advantage's features.

Before proceeding with the installation, please make sure that the USB ports on your PC are enabled. Check your PC manual for information on how to do this.

TO INSTALL THE DRIVERS AND APPLICATIONS FROM THE CD

Be sure to note which USB port you're using to install the Audio Advantage. When you remove it and later reinsert it, you should use the same USB port. Otherwise, you'll be prompted to reinstall the drivers. This is because Windows will not recognize the USB device when it is inserted into a port other than the one from which it was initially installed.

1. Place the Audio Advantage CD into your CD ROM drive. If the installation menu does not appear within 30 seconds, click on the “**My Computer**” icon, browse to the root of the installation CD and run **SETUP.EXE**.
2. From the menu, select “**Setup Audio Advantage Micro**” then “**Install Drivers and Applications**”.
3. When prompted by the software installation, insert the Audio Advantage Micro into a free USB port, either directly or with the included USB extender cable. Power for the Audio Advantage is provided by the USB port, so you don’t need an external power adapter.
4. After inserting the Audio Advantage into the USB port, press “**Yes**” on the dialog screen and follow the instructions that appear during the install.
5. If the “**Add New Hardware Wizard**” is displayed, click on the **Cancel** button to end this process. Although Windows may prompt you to install the newly detected USB hardware, we will be installing the Turtle Beach driver from the CD, not the generic Windows USB audio driver.

If you’re installing under Windows XP...

If the following dialog box appears, explaining that the software has not passed Windows Logo testing or does not have a Digital Signature, click "Continue Anyway" or "Yes" (depending on the operating system).

If you’re installing under Windows Me...

When the following dialog appears, click on the **Advanced** button:

Next, select ‘Warn when installing unsigned devices’ and click ‘OK’

The final step is to select 'Yes' to continue the installation then click 'OK'.

At this point, installation will continue normally.

6. When prompted that the installation is complete, press the “Yes” button to reboot your PC.
7. After your PC reboots with the Audio Advantage is still plugged into the USB port, you should see a Turtle Beach Palm Tree Logo in the Systray located at the bottom right of your screen. Click on this icon to launch the pop-up menu, which under Windows XP includes the following items:
 - **Control Panel:** This launches the Audio Advantage Control Panel, which lets you set the various features. You can also launch the Control Panel by clicking on the Turtle Beach logo in the Windows Control Panel.
 - **Device Status:** This launches a dialog box that tells you if your system has detected the Audio Advantage in a USB port. (Note: This option is not available in Windows 98 or Me).
 - **Check for Updates:** This checks the Turtle Beach web site for new drivers or programs that you may want to download for updating your Audio Advantage.
 - **Demo:** This launches the Audio Advantage 3DPlay Demo program that’s useful for checking out the features and to see if the unit is operating.

The icon in the Systray will be a Turtle Beach Palm Tree when the Audio Advantage is plugged into the USB port and a dual LED when the Audio Advantage is unplugged.

8. Click on **Start → Programs → Turtle Beach Audio Advantage Micro** and you should see these Audio Advantage programs listed in the menu (for a description of these programs, see the previous section): **3D Player, Helicopter, Multi-channel** and **Rock War**. Use these programs to check out the audio features on your newly installed Audio Advantage.
9. To install the Voyetra Music Software demo programs, click on Voyetra Products in the Audio Advantage Setup program launched from the CD.

TO UNINSTALL THE AUDIO ADVANTAGE

If you ever want to remove the Audio Advantage drivers and applications from your PC, it can be done in one of two ways:

TO UNINSTALL FROM THE ALL PROGRAMS LIST:

1. Click on **Start → All Programs → Turtle Beach USB Audio → Uninstall Turtle Beach USB Audio**.
2. Follow the on-screen instruction.

TO UNINSTALL FROM THE WINDOWS CONTROL PANEL:

1. Open the Windows Control Panel (**Start → Settings → Control Panel**).
2. Open the **Add/Remove Programs** applet (**Add or Remove Programs** in Win XP). Select **Turtle Beach Audio Advantage** from the list and click on the **Add/Remove** button (**Change/Remove** in Win XP) to the lower right of the screen.

After you've uninstalled the programs, shut down your PC, remove the Audio Advantage board, then reboot your PC.

USING THE AUDIO ADVANTAGE MICRO

CONNECTING YOUR PC OR LAPTOP

To use Audio Advantage Micro with a PC or laptop, simply plug it into a USB socket and the dual LED icon should turn into the Turtle Beach “palm tree” Control Panel icon in the Systray on the right side of your screen. Use the included USB extender cable if the USB sockets on your PC or laptop are inconveniently located, such as on the back of the PC chassis.

If your PC or laptop has more than one USB socket, you should always use the same socket for plugging in the Audio Advantage. This will assure that the Audio Advantage will automatically be recognized by Windows and the Audio Advantage control panel will be available in the Systray.

If you insert the unit into a different USB socket you'll be prompted to reinstall the device drivers. If you intend to use the new USB socket instead of the original one, then simply reinstall the drivers as prompted. Otherwise, reinsert the unit into the same USB socket in which it was originally installed.

The Audio Advantage may be used with any stereo headphones with a 1/8” jack. The analog output will also drive powered stereo speakers.

Some USB hubs may have problems providing a consistent data stream for digital audio and may cause data stream packet loss. This could result in clicks or distortions on the USB audio from the Audio Advantage. If you experience this problem when the Audio Advantage is connected to your USB hub, do not use the hub and instead connect the Audio Advantage directly to the USB port on your PC or Laptop.

CHECKING AUDIO PLAYBACK

You can quickly check the audio playback from the Audio Advantage control panel by pressing the “Play” button on the Main Settings Tab. This will play an audio file on the left and right speakers, so you can hear if audio is being generated by the Audio Advantage. Activate the Audio Advantage control panel by clicking on the Turtle Beach icon in the Windows System Tray (on the right side of the Start Bar).

CHECKING THE DRIVER SETTINGS

If there's no audio, you can verify that the drivers were installed properly by checking Windows “**Device Manager**” in the “**System**” settings found in the Windows Control Panel. Open the Device Manager by clicking **Start → Control Panel → System → Hardware → Device Manager**. If you look under the “Sound, Video & Game” group in the devices list, you should see the USB driver for Audio Advantage listed if the unit is plugged into a USB port. When the unit is unplugged, this driver will no longer be listed.

SETTING THE AUDIO ADVANTAGE AS THE DEFAULT AUDIO DEVICE

Windows should automatically set the Audio Advantage as the default audio device when it's plugged into the USB port. If you have no sound output from the Audio Advantage, it's possible that it's not set as the default audio device.

To check if the Audio Advantage is selected as the default audio device, look at the Windows audio device settings by selecting **Start → Control Panel → Sounds and Audio Devices → Audio Tab** and select **Turtle Beach USB Audio** in the pull down menu.

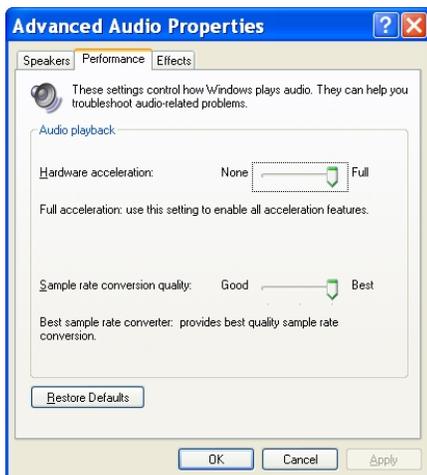

If this is OK and you still have no sound output, then check if the audio application you're using has a setting for the default device which overrides the Windows setting. For example, Windows Media Player allows you to change the device it uses for playback by selecting **Tools → Options → Devices → Speakers → Properties**. If the device is not set to Audio Advantage, the sound from Media Player will not use Audio Advantage.

Do not unplug the Audio Advantage while an application is using it to play audio or you may lock up the application or crash Windows. Always stop the playback function on any applications you are using before removing the Audio Advantage from the USB socket.

OPTIMIZING PLAYBACK PERFORMANCE

For optimum performance, adjust the System Hardware acceleration and Sample Rate Conversion Quality to Full and Best by clicking **Start → Control Panel → Sounds and Audio Devices → Audio Tab → Sound Playback Advanced Button → Performance Tab → Advanced Audio Properties Dialog.**

USING THE VIRTUAL SURROUND SOUND FEATURE

The Audio Advantage provides simulated 3D surround sound on speakers or stereo earphones using HRTF (Head Related Transfer Function) technology. The surround sound effect may be used to simulate 3D positional audio with PC games or to enhance the audio on stereo music and movies. The virtual surround sound feature can be activated on the Audio Advantage Control Panel’s “Effects” tab.

The virtual surround effect depends on the sound source used and the program playing the source material. For example, the surround sound effect will not operate on any source that is not digital, such as the analog signal from an internal CD player or the line and microphone inputs on your sound card.

LISTENING TO DVD AUDIO

When playing a DVD on your PC or laptop, the application playing the DVD should be set to “5.1 speaker” mode. This will route the 6 channel audio from the DVD to the Audio Advantage’s Surround Sound processor and convert the discrete 6 channels from the DVD into 6 virtual channels, thereby enabling the 3D effects on your headphones or speakers.

LISTENING TO ENHANCED STEREO SOURCES

When playing 2 channel stereo sources, such as MP3 music, the application playing the music (e.g. Windows MediaPlayer) will send stereo digital audio to the Audio Advantage surround sound processor. This will convert the stereo signal into simulated surround sound on your headphones or speakers, so that the stereo music will be “expanded”.

If the stereo music is played on older programs that use the Windows MCI interface (e.g. early versions of WinAmp) will not be converted into virtual surround sound because the MCI interface does not support the Direct Sound 3D virtualization features used by the Audio Advantage surround sound processor.

LISTENING TO 3D GAME AUDIO

When playing games using EAX2, A3D1 or DirectSound3D, the surround sound processor will convert the 3D positional sounds into HRTF positional audio so that the 3D effects of the game can be used in headphones or stereo speakers.

LISTENING TO MUSIC FROM CDS

If your CD ROM drive's audio output is using an analog connection to your sound card or motherboard audio, the music will not be processed by USB audio devices, including the Audio Advantage. This is because USB audio requires that the analog signal be converted to digital in order to be used as a USB audio stream.

If you have no sound when playing a CD in the PC's CD ROM drive, check that the “**Enable digital CD audio for this CD-ROM Device**” option is enabled in the CD drive's Properties settings (using Windows XP). Access this by clicking **Start → Control Panel → System → Hardware Tab → Device Manager → DVD, CD Drives → Right click on the name of the CD drive in question → Click Properties → Select Properties Tab.**

S/PDIF OPTICAL DIGITAL OUTPUT

To activate the S/PDIF Optical Digital Output, select S/PDIF from the Audio Advantage Control Panel Main Settings tab. The included S/PDIF optical adapter should be inserted into the headphone jack to enable connection of a TOSLINK fiber optic cable used for transferring the digital audio signal to external devices.

S/PDIF Digital Adapter (included)

Insert this adapter into the mini jack to connect a TOSLINK optical cable when using the digital audio output

TOSLINK Optical Cable (not included)

Insert a TOSLINK optical fiber cable into the S/PDIF adapter to connect the digital output to external digital audio equipment

The TOSLINK Optical Cable may be purchased at the Turtle Beach web site www.TurtleBeach.com.

The S/PDIF optical digital output may be used to transfer stereo audio in digital format to external digital audio devices, such as Mini Disc recorders, A/V receivers, professional audio equipment, etc. The data rate on the S/PDIF output is fixed at 48kHz.

The S/PDIF output may also be used to transfer multi-channel audio to an external system with built-in 5.1 decoder for Dolby® Digital or DTS® formats. This mode may be used for sending surround sound digital audio from a DVD played on your laptop or PC to an external digital speaker system or A/V home theater receiver. DVD playback of Dolby Digital or DTS signals requires a software DVD player that transmits this audio format.

USING THE CONTROL PANEL

The Audio Advantage Control Panel is installed from the Turtle Beach Installation CD. Once installed, the control panel can be launched by clicking on the Turtle Beach icon located in the Systray on the right side of the Windows Start menu, by clicking on **Start → Turtle Beach Audio Advantage Micro → Turtle Beach Control Panel**, or from the Windows Control panel by clicking on **Start → Control Panel → Turtle Beach icon**.
