

Spectrum Analyzers

RSA3000B Series Data Sheet

Features & Benefits

Discover

- DPX™ Live RF spectrum display provides an intuitive understanding of time-varying RF signals with color-graded displays based on frequency of occurrence
- Revolutionary DPX displays transients with >48,000 spectrum measurements per second

Trigger

- Tektronix exclusive Frequency Mask Trigger (FMT) offers easy event-based capture of transient RF signals by triggering on any change in the frequency domain

Capture

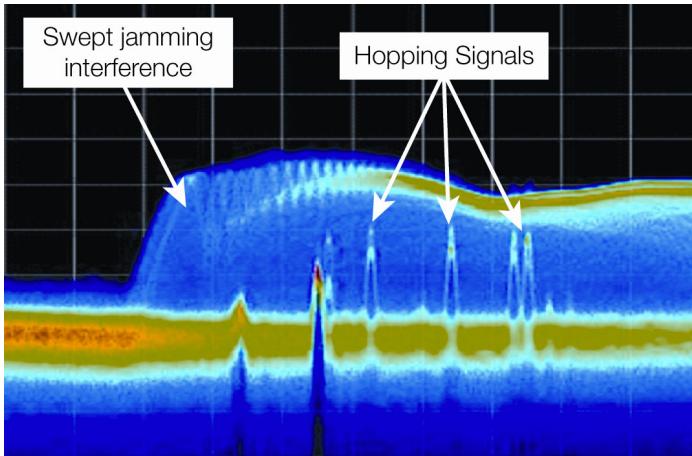

- DC to 8 GHz frequency range
- All signals in spans up to 36 MHz are captured into memory
- Up to 1.28 s acquisition length at 36 MHz bandwidth provides complete analysis over time without making multiple acquisitions
- Fully preselected and image-free at all times for full dynamic range at any capture bandwidth
- Interfaces with TekConnect® probes for RF probing
- Differential IQ input available

Analyze

- Extensive time-correlated vector spectrum analysis. Multidomain displays connect problems in Time, Frequency, Phase, and Amplitude for quicker understanding of cause and effect when troubleshooting
- Power measurements and signal statistics help you characterize components and systems: ACLR, Power vs. Time, CCDF, PDF, and real-time spectrum emission measurement with user-defined spectrum emission mask
- Pulse measurements including Pulse Width, Duty Cycle, and Pulse-to-Pulse Phase
- Offline analysis available with RSAVu software
- Analog demodulation analysis including Baseband, AM, FM, and PM measurements
- Audio distortion analysis of Baseband, AM, and FM with real-time spectrogram and graphical display of harmonics and spurious. Wide choices of lowpass filters, highpass filters, bandpass filters, and de-emphasis settings.

Applications

- RF debug of components, modules, or systems
- Find interference and unknown signals in spectrum monitoring and management
- Analyze time-variant behavior of standards-based and other radio systems
- Software Defined Radio (SDR) and field tactical radio transceiver measurements
- Characterize radar and pulsed RF signals
- Powerful vector signal analyzer functionality and signal source analysis capability
- Broad range of standard-specific options for analysis of RFID, 3GPP, 3GPP2, LTE (using RSA-LTE), WiMAX (using RSA-IQWIMAX), and WLAN systems
- Comprehensive analog demodulation and audio distortion measurement for tactical radio and sonar systems

Revolutionary DPX™ spectrum display discovers events that other analyzers miss. This is an off-the-air capture of a frequency-hopping signal jammed by large interference.

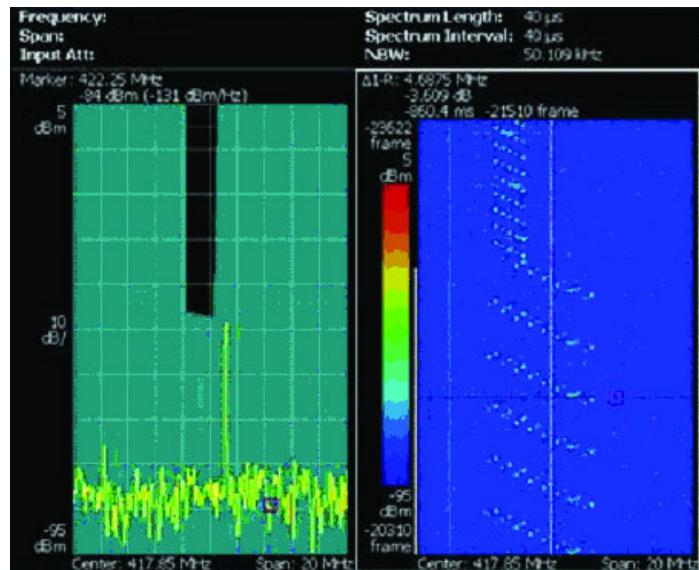

Discover and interpret complex behaviors of your time-variant signals

The RSA3000B Series makes it easy for you to discover design issues that other signal analyzers miss. The revolutionary DPX Live RF spectrum display offers an intuitive live color view of signal transients changing over time in the frequency domain, giving you immediate confidence in the stability of your design or instantly displaying a fault when it occurs. This live display of transients is impossible with other signal analyzers. Once a problem is discovered with DPX, the Real-Time Spectrum Analyzer (RTSA) can be set to trigger on the event in the frequency domain, capture a continuous time record of changing RF events and perform time-correlated analysis in all domains. You get the functionality of a high-performance vector signal analyzer, a spectrum analyzer, and the unique discover-trigger-capture-analyze capability of a Real-Time Spectrum Analyzer – all in a single package.

Characteristics

Discover

The DPX™ spectrum processing engine brings live analysis of transient events to spectrum analyzers. Performing more than 48,000 frequency transforms per second, transients as brief as 31 µs are displayed in the frequency domain. This is orders of

FMT and Spectrogram of a fast-hopped signal captured. The left side displays the user-defined Frequency Mask Trigger (FMT), while the right-side spectrogram displays the captured signal hopping pattern.

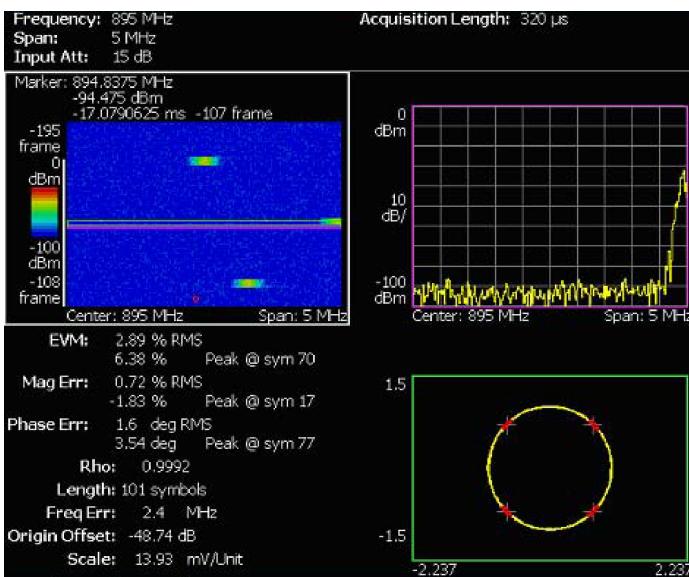

magnitude faster than conventional analysis techniques. Events are color coded by rate of occurrence onto a bitmapped display, providing unparalleled insight into transient signal behavior.

Trigger

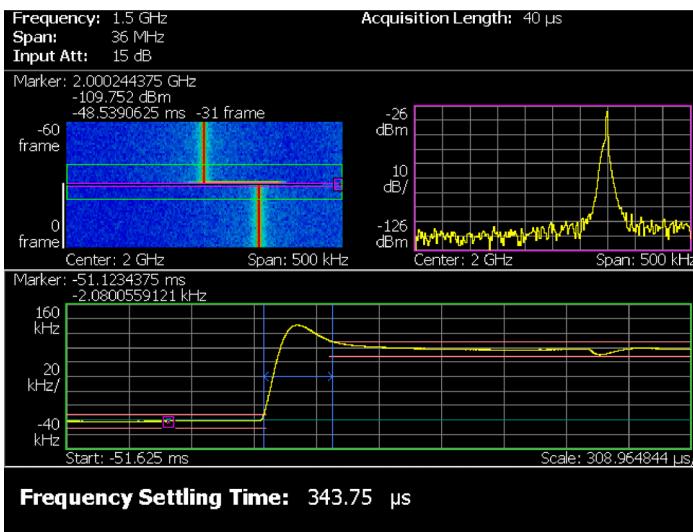

The optional Frequency Mask Trigger (FMT) makes it easy to trigger on signals in the frequency domain and capture transient signals in bandwidths up to 36 MHz. The FMT is simply configured to monitor all changes in frequency occupancy within the capture bandwidth. The Power Trigger, working in any capture bandwidth, fires at the instant in time when the RF input signal crosses a user-set power threshold. An external trigger is available for synchronization to test system events.

Capture

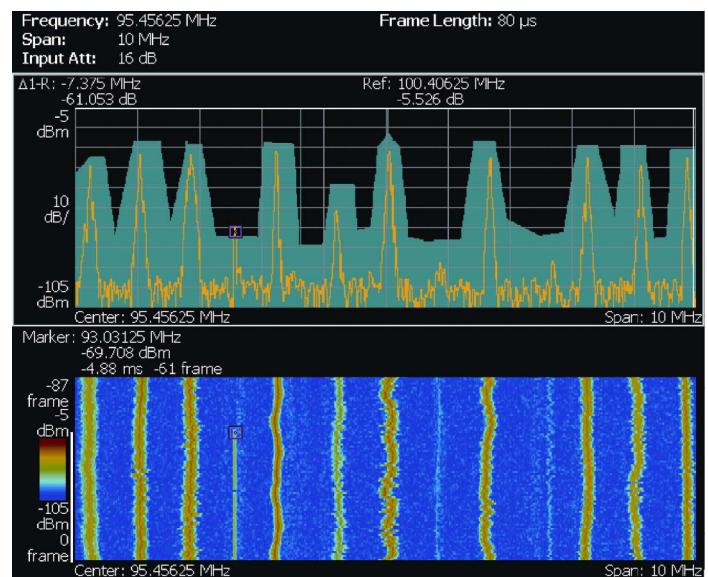

Unlike many SA/VSA combination instruments, the RTSA is fully preselected at all times for spurious and image rejection in any combination of capture bandwidth and frequency. Capture of small signals in the presence of large signals is enabled with up to 73 dB Spurious-Free Dynamic Range (SFDR) and class-leading image rejection in all capture bandwidths. Capture once with seamless acquisitions and make multiple measurements without recapturing. Record lengths vary depending upon the selected capture bandwidth: up to 1.28 seconds at 36 MHz, 2.56 seconds at 15 MHz, 51.2 seconds at 1 MHz, or 1.42 hours at 10 kHz bandwidth with optional FMT / Deep Memory.

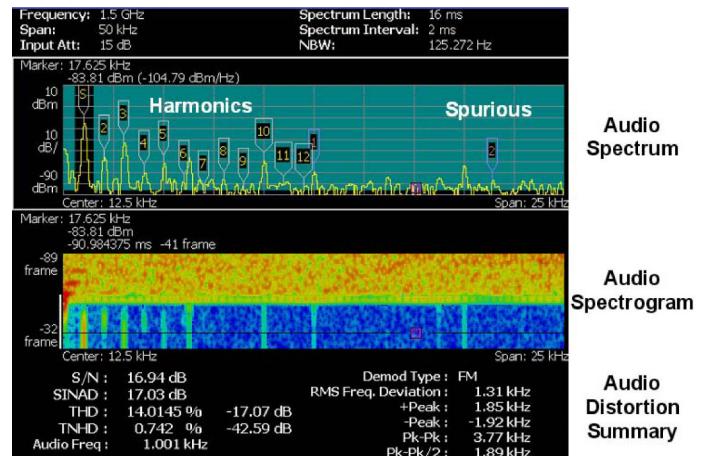

Unlike a conventional VSA's capability of quantifying the modulation quality only at the center frequency, the RSA3000B Series can demodulate a captured off-center hopped signal with view of the spectrogram (upper left), frequency versus amplitude (upper right), signal modulation quality (lower left) and Constellation (lower right).

The RSA3000B Series also provides automatic measurement of the frequency settling time with the built-in Modulation Domain analyzer.

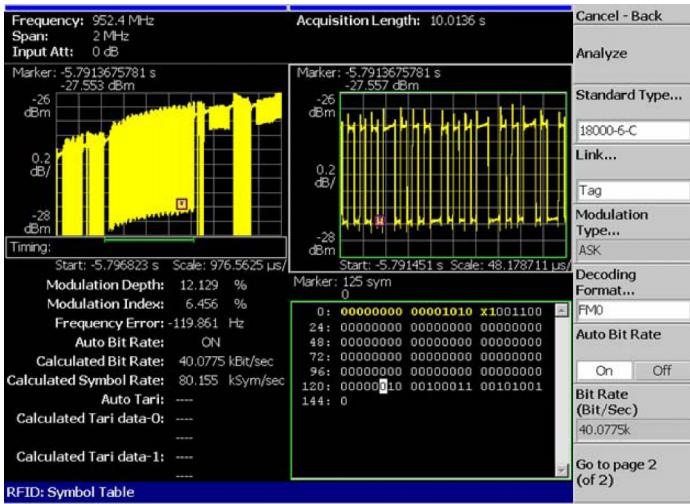

A Frequency Mask Trigger (FMT) was set to monitor the frequency domain for any changes in the spectrum, and it triggered on transient interference. The spectrogram (lower display) shows the time relationship between the desired good signal and the interfering transient signal. The spectrum display shows what was happening at the precise moment the interfering signal was present in the band. FMT is an essential tool for capturing interfering and unauthorized signals in the presence of desired emitters.

The Audio Spectrum and Spectrogram allow designers to understand the nature of distortion by viewing harmonics and nonharmonic components over time. Distortion parameters are calculated for each FFT frame in the Spectrogram display.

Data Sheet

The RSA3000B Series supports all of the latest RFID standards including ISO 18000-6, 18000-7, and ISO 15693. As a leading RFID test solution, this delivers the confidence you need from standards-based RF conformance tests to RF troubleshooting in the prototype lab tests.

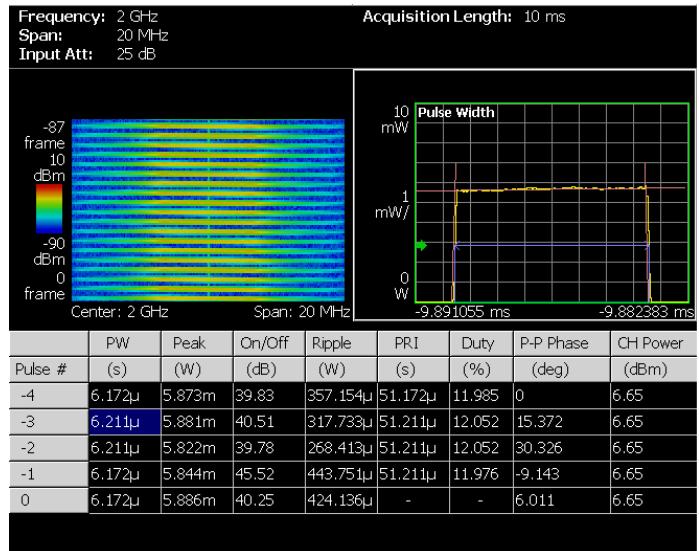

Analyze

The RTSA offers analysis capabilities that advance productivity for engineers working on components or in RF system design, integration and performance

RSA3000B Series Real-Time Spectrum Analyzer

Tektronix offers multiple models of RSA3000B Series Real-Time Spectrum Analyzer to meet a range of needs for frequency coverage, real-time bandwidth, and dynamic range. The table below summarizes the differences between the models.
